METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened and provides greater fuel flow through jet to nozzle). Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and leaner-than-standard metering rod calibrations. Check and adjust Metering Rod whenever rods removed and replaced or when pump stroke setting is changed.

Vacumeter Type Note—On these types, metering rod is linked to vacuum piston stem so that rod is controlled by vacuum piston within limits determined by throttle valve opening (lug on pump arm serves as stop for lip on piston link to prevent vacuum piston pulling metering rod down in jet beyond correct point for the particular throttle opening). These models adjusted in special manner (see instructions below).

Metering Rod Adjustment (except Vacumeter Types)—Take out screw and remove dust cover on float bowl cover. Unhook metering rod spring, disengage metering rod from arm on pump shaft, lift out rod being careful not to lose metering rod disc. Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical. Back off throttle lever stopscrew so that throttle valve tightly closed. Clearance between pin in arm on pump shaft and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending arm (use extreme care not to bend lower portion of arm to which throttle connector link is attached—this will disturb pump stroke setting). Remove gauge, install metering rod and disk, connect metering rod spring.

Metering Rod Adjustment (Vacumeter Type)—Remove metering rod (hung on pin on upper end of vacuum piston link) being careful not to lose metering rod disk. Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical. Back off throttle stopscrew so that throttle valve tightly closed. Clearance between pin on piston link and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending lip on piston link so that it contacts lug on pump arm (use special tool T109-105). Remove gauge, install metering rod and disc, connect metering rod spring.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ANTI-PERCOLATOR:—Saxophone Key Type. Consists of a main nozzle vent in the bowl cover controlled by a leather-faced, felt-backed metal cap which opens the vent when the throttle is closed to prevent any percolating discharge from the nozzle. The cap must be seated to close the vent when the throttle is opened beyond idling position.

Adjustment—Crack throttle open by inserting special gauge No. T109-29 (use .030" end for all models except Nash 435-S, .020" end for Nash) between edge of valve and carburetor wall on side opposite idle port. Bend anti-percolator rocker arm (use special tool T109-105) so that clearance between lip on rocker arm and pump arm is .005-.015" (use feeler gauge to check this clearance).
NOTE—T-109-29 Gauge used for both .020" and .030" settings.
Pontiac Note—Anti-percolator may also be adjusted after throttle stopscrew has been set for 7 MPH idle speed (turn screw in until it just contacts lowest step of fast idle cam, then turn screw in additional ½ turn) by rotating fast idle cam until stopscrew rests on highest step of arm and then bending the anti-percolator rocker arm until it just touches pump arm. Reset idle speed adjustment.

FLOAT LEVEL:—To check float level, remove float bowl cover, invert cover, measure from top edge of machined projection on cover at free end of float to top of soldered seam. See table below for float level on each model. Adjust by bending lip of float lever at valve needle.

Car Model	Carburetor	Float Level
Graham 107, 108	472-S, 473-S	3/8"
Hudson 40, 48	454-S	3/8"
Nash 4020	435-S	3/8"
Oldsmobile F & G-40	466-S, 467-S	3/8"
Pontiac 6 & 8	463-S, 462-S	7/16"
Studebaker 10A	410-S	¼"

Float Travel—Should be ½" (all models). To check, hold float bowl in normal position, note drop at free end of float. To adjust, bend two small float stop lips at hinge end of float.
Float Needle Valve & Seat—Furnished only in matched sets as follows:

Car Model	Carburetor	Part Number	Intake Hole
Hudson 40, 48	454-S	25-33S	#48
Nash 4020	435-S	25-34S	#46
Oldsmobile F & G-40	466-S, 467-S	25-75S	#46
Pontiac 6 & 8	463-S, 462-S	25-42S	#38
Studebaker 10A	410-S	25-34S	#46

THROTTLE VALVE SETTING:—When installing valves, see that trademark is up and on idle port side, install screws loosely, tap valve lightly to centralize it in bore, tighten screws securely. See that throttle valve stopscrew is backed off so that valve closes tightly, check throttle valve setting as shown in table below (idle ports are slotted type). Vacuum port height is distance from top of valve to bottom of port. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve position.

Car Model	Carburetor	Idle Port Opening	Vacuum Port Height
Hudson 40, 48	454-S	.120-.124"	.021-.029"
Nash 4020	435-S	.137-.141"	None
Oldsmobile F & G-40	466-S, 467-S	.158-.162"	.0-.004"
Pontiac 6 & 8	463-S, 462-S	.107-.111"	.022-.027"
Studebaker 10A	410-S	.010-.014"①	.054-.059"

①—Port opening below valve (on all other models, port opening above valve).

FAST IDLE:—Consists of a fast idle cam pivoted directly above the throttle lever so as to serve as a stop for the throttle stopscrew and linked to the automatic choke mechanism. See Climatic Control article in Carburetion Equipment Section for complete servicing directions.

Adjustment—To check, turn fast idle cam to normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against first step of cam (screw must not be on step), check clearance between lower edge of choke valve and air horn wall (use tool T109-85 —all models). Distance should be 5/8". To adjust, use tool T109-41 and bend offset portion of fast idle link.

TRIP LEVER:—Hudson Model 454-S—Should be adjusted after all other choke linkage adjustments have been made. This trip lever not used on other carburetor models.

Adjustment—Hold choke valve tightly closed with pin on fast idle cam resting at bottom of slot in fast idle link. Bend trip lever stop on fast idle link so that clearance between fast idle cam and lip on trip lever is .010".

CHOKE:—Plain type offset valve. See Climatic Control article in Carburetion Equipment Section for automatic choke servicing data.

Setting—Thermostatic coil housing should be set so that reference mark centered on scale on piston housing for all models except those listed in table below, and should be rotated counter-clockwise (Rich) or clockwise (Lean) for these special models as shown. To adjust, loosen two thermostatic coil housing attaching screws, rotate housing.

Car Model	Carburetor	Choke Setting
Graham 107	473-S	1 Notch Rich
Nash 4020	435-S	2 Notches Rich
Oldsmobile F & G-40	466-S only	2 Notches Rich
Pontiac 6 & 8	463-S, 462-S	1 Notch Rich
Studebaker 10A	410-S	1 Notch Rich
All Others		Centered

Unloader—Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall. See table below for correct clearance and checking gauge on each model. To adjust, bend cam on throttle lever (use Tool T109-41).

Car Model	Carburetor	Gauge Number	Choke Valve Clearance
Graham 107, 108	472-S, 473-S	——	½"
Hudson 40, 48	454-S	T109-81	7/16"
Nash 4020	435-S	T109-82	31/64"
Oldsmobile F & G-40	466-S, 467-S	T109-81	7/16"
Pontiac 6	463-S	T109-80	3/8"
Pontiac 8	462-S	T109-31	¼"
Studebaker 10A	410-S	T109-31	¼"

Choke Valve Lock—Prevents choke valve closing when throttle valve held wide open. To adjust, hold choke and throttle valves wide open, bend lip at lower end of fast idle link so that clearance between lip and lock on throttle lever is 1/32" (use tool T109-105).

TROUBLE SHOOTING:—Poor Idling Performance—If engine stalls while idling, low speed performance is unsatisfactory, or correct adjustment cannot be secured, remove idle tube (low speed jet) and clean with compressed air or install new tube. See that tube seats tightly at shoulder. Remove idle adjusting screw and clean low speed channels with air. If idle is rich, check metering rod linkage for binding and see that rod is not rubbing on dust cover. On Vacumeter types, see that vacuum piston is clean and operates freely.

Poor Acceleration—Check pump seasonal adjustment and pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger, corrosion or dirt in pump cylinder, ball check valves sticking or leaking. If plunger removed from cylinder, use loading tool when re-installing to avoid damaging plunger leather. On vacumeter types, make certain that vacuum piston is clean and operates freely in cylinder, examine spring under piston.

Carburetor Loads Up or Performance is Poor—Check and adjust float level. See that correct type metering rod installed (replace metering rod and jet as an assembly—check metering rod setting when installed). On vacumeter types, see that vacuum piston operates freely and vacuum channel open and clean.

SERVICING:—These carburetors serviced in same manner as WA1 models used on previous cars. *See 'Carter Downdraft Type WA1' carburetor article in Carburetor Section of manual (or 1939 Supplement) for complete instructions.*

409-S—STUDEBAKER PRESIDENT, MODEL 6C (1940)
*—Vacumeter type Carburetor.

NOTE:—Buick Models—These cars also use Stromberg carburetors Model AAV-16 (40, 50), AAV-26 (60, 70, 80, 90). See separate article for Stromberg data.

Cadillac V16—These carburetors same types as used on 1939 cars.

Hudson Six Model 430-SV—This carburetor same type as used on 1939 cars (430-S) with Vacuum Spark Port added. Used on first cars only.

Studebaker President—Stromberg Model AAO-161 carburetor (same as 1939 type) also used on this model. See separate article for Stromberg data.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Buick Models—These carburetors have Carter Car Starter Model 192-10U mounted on carburetor and operated by throttle valve shaft. See Carter Car Starter article in Electrical Equipment Section for adjustment and servicing data on this unit.

Buick 474-S—This carburetor used on cars after February 1, 1940, and has been changed from earlier 440-S type as follows: Choke Thermostatic Coil changed to new 'G' type (set at 1 Notch Lean), New type Spring-loaded Blocking Cam Type Unloader with Fast Idle Cam No. 181-49-S, and #40 choke suction hole. Fast idle setting should be .018" and Unloader setting 3/16" (see adjustment directions below).

Hudson (All Models)—Carburetors are installed with **eight** gaskets between carburetor and mounting pad on manifold. When installing carburetor, place four gaskets between manifold and heat deflector, four additional gaskets between deflector and carburetor. NOTE—Governor plate is installed between two top gaskets on new cars during breaking in period—when governor plate removed, gasket between plate and carburetor must be replaced so that total of four gaskets used between heat deflector and carburetor.

Nash-Lafayette 458-S—To correct warming up complaints, new Air Horn & Climatic Control Assembly No. 6-334S (replacing 6-357S) and Thermostatic Coil & Housing Assembly No. 170K64S (replacing 170B64S) should be installed. When this change made by dealers, new Hot air stove and tube assembly is also installed. NOTE—New thermostatic coil housing must be set on center index point (first type coil was set 1 Notch Rich).

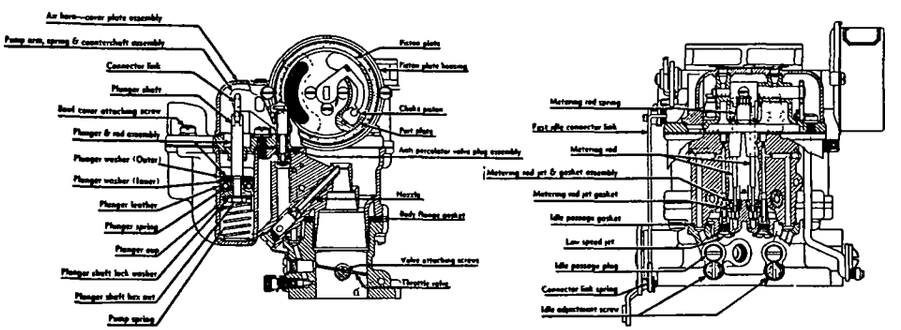
Nash 465-S Loading or Warming up slowly—Check hot air tubing. See that tubing not kinked at bends or pinched at point where it enters coil housing. See that tube tight in coil housing and hot air stove connections.

Oldsmobile 389-S—This model changed from type used on 1939 cars as follows: Relief passage to outside is now #38 drill size (was #42), Vacuum Piston & Pin Assembly (pin spun into piston) is Part No. 160-69S (replaces 160-63 piston and 150-82 pin).

Oldsmobile 389-S, 471-S Float Level Change—Float level should be set at 3/8" (was 9/32"). This new setting supersedes both the original 9/32" figure and the previously recommended setting of 13/32" (to correct hard starting).

Pontiac 469-S Poor Starting or Leanness during warm-up—To correct complaints of hard starting when cold or lean mixture during warming up period climatic control setting on carburetors with first type thermostatic coil (marked 170G16S on coil housing) should be changed to 4 Notches Rich. Later carburetors with new type thermostatic coil (marked 170F16S) must be set 1½ Notches Rich—see Pontiac Changes following.

Pontiac 469-S Metering Rod & other changes—Metering rod changed to new type No. 75-443 (replaces 75-424) and new rods released for 1 Size Lean and 2 Sizes Lean also—See Carter Jet Specification Table for complete metering rod data. Special metering rod gauge T109-27 must be used to check these new rods (gauge T109-104 used for first type rods). Relief passage to outside changed to #38 drill size (was #42) and new choke valve No. 7-113 used (replaces No. 7-90), new Trip Lever No. 14-219 (replaces 14-220—requires special Unloader Setting as given below), and new type Thermostatic Coil No. 170F16S (replaces 170G16S but has same standard setting as first type of 1½ Notches Rich). See note above for special setting of first type thermostatic coil only to correct hard starting and excessive leanness when cold.



NOTE—All carburetors equipped with the new type metering rod (75-443) and trip lever are marked '469-SM' for identification.

TYPE:—Same design as previous Carter WDO dual models (Standard and Vacumeter types) with Climatic Control (automatic choke), Fast Idle, Anti-Percolator, Unloader and Choke Valve Lock. See Climatic Control article in Carburetion Equipment Section for complete servicing directions on these units.

IDLING ADJUSTMENT:—Adjust carburetor only with engine warmed up and idling at hot or slow idling speed (choke valve wide open, fast idle inoperative). Idle adjusting screw provided for each carburetor barrel. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture and both screws just be adjusted exactly alike. See table below for approximate settings on each car model. Idle speed controlled by throttle lever stopscrew and should be set for speed shown in table. See car model 'T&E' page for complete carburetor tune up instructions on each car model.

Car Model	Carburetor	Idle Screw Setting	Idle Speed
Buick (all)	440-S, 48-S, 74-S	½-1¼ turns open	7-8 M.P.H.
Cadillac V16	407-S, 408-S	¼-1 turn open	7-8 M.P.H.
Graham 109	488-S	½-1½ turns open	7-8 M.P.H.
Hudson 6	430-SV, 461-S	¼-1¼ turns open	7 M.P.H.
Hudson 8	455-S	½-1½ turns open	7 M.P.H.
LaSalle	460-S	½-1½ turns open	7-8 M.P.H.
Nash-Lafayette	458-S	¼-1¼ turns open	7-8 M.P.H.
Nash 4080	465-S	½-1½ turns open	7-8 M.P.H.
Oldsmobile L-40	389-S, 471-S	½-1¼ turns open	6 M.P.H.†
Pontiac 40-29	469-S	¼-1¼ turns open	7 M.P.H.
Studebaker 6C	409-S	¼-1¼ turns open	8 M.P.H.

†—High Gear (Std. Trans.), 375 R.P.M. (Cars with Hydra-matic Trans.).

PERFORMANCE:—Should be satisfactory if Idling Adjustment and Accelerating Pump Setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods (for special operating conditions). Both metering rods must be same size and adjusted alike. See Trouble Shooting below.

METERING ROD (NON-VACUMETER TYPES):—Fuel metered by stepped metering rods (separate rod and jet used for each carburetor barrel) which are raised in metering rod jets as throttle is opened to permit greater fuel flow to nozzles. Metering rods used for both barrels must be same size and must be adjusted alike. Metering rods can be changed for special operating conditions such as high altitude (see Carter Jet Specification Table for standard and special lean metering rods). Setting should be checked whenever metering rods removed and replaced or when pump stroke setting is adjusted.

Metering Rod Removal—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and metering rods (on models with separate dustcover, take out two retaining screws and remove dust cover only). Remove pin spring from metering rod pin, slide pin out being careful not to lose metering rod springs, lift out metering rods and springs. Remove metering rod disks (remove small brass screw, take out metering rod disk retainer, lift disks out).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Metering Rod Setting—Back off throttle lever stopscrew so that throttle valves tightly closed, loosen anti-percolator arm screw. Install metering rod gauge (see table below for each model) in place of each metering rod, making certain that gauges seat in metering rod jets and are vertical. Install metering rod pin and pin spring in metering rod arm. Press down lightly on pump arm. Pin should rest on shoulders of notches in both gauges (bend arm slightly to equalize if necessary) with clearance of less than .005" between pin and each gauge. Tighten anti-percolator arm screw. Remove gauges and metering rod pin, install metering rods and disks, springs, pin and pin spring, hook metering rod springs on rods.

CAUTION—Anti-percolator must be checked after this adjustment completed.

Car Model	Carburetor	Metering Rod Gauge No.	Length
Cadillac V16	407-S, 408-S	T109-27	2.359"
Graham 109	488-S	T109-113	2.280"
Nash-Lafayette	458-S	T109-113	2.280"
Nash 4080	465-S	T109-113	2.280"
Pontiac 40-29	469-S	See Note	
Studebaker 6C	409-S	T109-27	2.359"

Pontiac Note—Use gauge No. T109-104 on carburetors with first type metering rods (75-424, 75-439, 75-440), gauge No. T109-27 for carburetors with later type rods (75-443, 75-444, 75-445). Carburetors with these later type metering rods are marked '469-SM'.

METERING ROD (VACUMETER TYPES):—Fuel for nozzles metered by metering rod and jet (independent rod and jet for each nozzle). Metering rods operated by single vacuum piston with throttle control (stop pin on pump arm limits piston travel so that metering rod lifted in accordance with throttle opening). No adjustment provided but metering rods can be changed to secure leaner-than-standard fuel mixture to compensate for special fuel or high altitude conditions (both rods must be same size and should be changed as a unit). Check metering rod setting whenever rods removed and replaced or when pump stroke setting is adjusted.

To Remove Metering Rods—Take out screws and remove dust cover or remove air horn and dust cover assembly (where these parts integral—see Service data for removal instructions). Remove pin spring from metering rod pin and slide pin from vacuum piston link being careful not to bend metering rod spring. Lift out metering rods, remove brass metering rod disc retainer by taking out brass screw, remove the two small metering rod discs from beneath retainer.

To Check Metering Rods—Back off throttle stopscrew so that throttle valves tightly closed. Install metering rod gauge (see table below) in place of one metering rod making certain that tapered end of gauge is seated in metering rod jet. Install metering rod pin in piston link, press piston and link down until metering rod pin contacts lip on anti-percolator arm. With piston down and throttle valve seated, clearance between metering rod pin and shoulder of notch in gauge should be less than .005". To adjust, bend lip on anti-percolator arm.

To Install Metering Rods—Make certain that discs are in place under disc retainer and that pin spring and metering rod springs are properly connected.

Car Model	Carburetor	Metering Rod Gauge No.	Length
Buick (all)	440-S, 474-S, 448-S	T109-113	2.280"
Hudson (all)	430-SV, 461-S, 455-S	T109-113	2.280"
La Salle	460-S	T109-113	2.280"
Oldsmobile	389-S, 471-S	T109-104	2.312"

ACCELERATING PUMP:—High pressure type with spring operation (pump operating lever and pump arm linked by small coil spring) except Studebaker Model 409-S which is Low Pressure type. Inlet ball check valve located in bottom of pump cylinder, outlet ball check valve under retainer plug in main body casting.

Pump Seasonal Adjustment—On some models, pump arm (under dust cover) has two or three holes for pump rod link connection to provide varied pump stroke for seasonal pump requirements. See car model 'T&E' page for recommended settings and seasonal changes.

Pump Stroke Adjustment—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and connector link (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed, check pump seasonal adjustment (connector link must be engaged in hole for correct stroke as shown in table below). Install Universal Pump Stroke Gauge T109-117S on rim of bowl cover at plunger shaft so that projection on gauge rests on top surface of connector link at pump shaft. Note gauge reading with throttle closed, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with figure shown in table below. Adjust by bending throttle connector rod at lower angle near throttle lever (use bending tool T109-75). CAUTION—Check metering rod setting and anti-percolator adjustment after adjusting pump stroke.

Car Model	Carburetor	Pump Stroke	Pump Setting
Buick (all)	440-S, 474-S, 448-S	21/64"	Medium Stroke
Cadillac V16	407-S, 408-S	16/64"	Long Stroke
Graham 109	488-S	34/64"	Long Stroke
Hudson (all)	430-SV, 461-S, 455-S	18/64"	Long Stroke
La Salle	460-S	26/64"	Non-Adj.
Nash-Lafayette	458-S	32/64"①	Long Stroke
Nash 4080	465-S	32/64"	Long Stroke
Oldsmobile	389-S, 471-S	19/64"	Non-Adj.
Pontiac 40-29	469-S	19/64"	Non-Adj.
Studebaker 6C	409-S	16/64"	Long Stroke

①—21/64" with link in inner hole (short stroke).

ANTI-PERCOLATOR:—Plunger Type (except Buick). Consists of a vent above each main jet well controlled by spring-loaded plunger type valves. Valves are opened by anti-percolator arm connected to throttle when throttle valves are closed to vent nozzles and prevent any 'percolating' discharge when carburetor is hot. Valves must be closed when throttle is opened (incorrect adjustment will cause flat spots).

Buick Models—Buick carburetors have suction type anti-percolators which are pressed in carburetor casting and require no adjustment. CAUTION—Do not remove these suction type anti-percolators, correct tube position is extremely important for proper operation.

Adjustment—Make this adjustment after metering rod setting and pump stroke setting have been adjusted (use extreme care not to disturb these settings). On models with integral air horn and dust cover, remove this assembly to expose anti-percolators (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed. On models listed in table below, insert special gauge (or feeler gauge of thickness listed) between anti-percolator stems and lips on anti-percolator arms—**do not use any gauge on other models.** Bend lips so that center of indicator line on each anti-percolator stem is flush with top of anti-percolator plug. Use extreme care to secure same adjustment on both anti-percolator units.

Car Model	Carburetor	Checking Gauge	Thickness
Cadillac V16	407-S, 408-S	T109-72	.015"
LaSalle	460-S	T109-72	.015"
Oldsmobile	471-S only		.010"
Studebaker 6C	409-S		.010"
All Others		None	None

FLOAT LEVEL:—To check float level (with bowl cover assembly removed), remove cover gasket, invert cover, measure from machined gasket seat on cover to top of float (check at both ends of float—settings must be alike). See table below for float level and special checking gauge for each model. To adjust, bend lip on float level at point where it contacts valve needle (do not bend float or arm).

Car Model	Carburetor	Float Level	Checking Gauge
Buick (all)	440-S, 474-S, 448-S	3/16"	T109-28
Cadillac V16	407-S, 408-S	13/64"	T109-39
Graham 109	488-S	3/16"	
Hudson (all)	430-SV, 461-S, 455-S	3/32"	T109-125
LaSalle	460-S	1/8"	
Nash-Lafayette	458-S	3/16"	
Nash 4080	465-S	3/16"	
Oldsmobile	389-S, 471-S	3/8"①	T109-126
Pontiac 40-29	469-S	5/16"	
Studebaker 6C	409-S	3/16"	

①—Was 9/32". New setting of 3/8" also supersedes 13/32" setting to correct hard starting when hot.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Needle Valve & Seat—Furnished only in matched sets as shown in table below. When installing assembly on Oldsmobile and Pontiac carburetors, see that clip on needle valve engages float lever.

Car Model	Carburetor	Part Number	Intake Hole Size
Buick 40, 50	440-S, 474-S	25-80S	#42
Buick 60, 70, 80, 90	448-S	25-59S	#38
Cadillac V16	407-S, 408-S	25-80S	#42

Hudson 8	455-S	25-59S	#38
La Salle	460-S	25-98S	#38
Nash-Lafayette	458-S	25-80S	#42
Nash 4080	465-S	25-59S	#38
Oldsmobile	389-S	25-74S	#38
Oldsmobile	471-S	25-100S	#38
Pontiac 40-29	469-S	25-74S	#38
Studebaker 6C	409-S	25-59S	#38

THROTTLE VALVE SETTING:—Install valves with trademark 'C' toward idle port side, use new attaching screws, install screws loosely, tap valves lightly to centralize them in bore, then tighten screws securely. Check valve setting with throttle lever stopscrew backed out so that valves tightly closed. Idle port figure is distance from top edge of valve to top of idle port. Vacuum spark port figure is distance from top edge of valve to top (or bottom as noted) of vacuum spark port. Shims furnished .002" thick (2-93), .005" thick (2-94) for throttle valve setting adjustment.

Car Model	Carburetor	Idle Port Opening	Vacuum Spark Port
Buick 40, 50	440-S, 474-S	.060-.066"	①.052-.056"
Buick 60, 70, 80, 90	448-S	.117-.123"	①.056-.060"
Cadillac V16	407-S, 408-S	.127-.133"	None
Hudson 6	430-SV, 461-S	.108-.112"	②.029-.033"
Hudson 8	455-S	.133-.137"	None
La Salle	460-S	.135-.141"	②.033-.037"
Nash-Lafayette	458-S	.060-.066"	②.033-.037"
Nash 4080	465-S	.162-.168"	None
Oldsmobile	389-S, 471-S	.140-.146"	②.029-.033"
Pontiac 40-29	469-S	.140-.146"	②.052-.056"
Studebaker 6C	409-S	③.009-.015"	②.029-.033"

①—Top of valve to bottom of port. ②—Top of valve to top of port.
③—Opening below lower edge of valve.

FAST IDLE:—Consists of a fast idle lever linked to the throttle valve lever and mounted directly below the fast idle cam on the choke valve shaft. To adjust, hold choke valve tightly closed, adjust fast idle arm screw so that clearance between throttle valve and carburetor wall on side opposite idle port is correct as shown in table below (use special checking gauge inserted between throttle valve and wall to check opening).

Car Model	Carburetor	Throttle Opening	Checking Gauge
Buick 40, 50	440-S, 474-S	.018"	T109-44
Buick 60, 70, 80, 90	448-S	.012"	See Note
Cadillac V16	407-S, 408-S	.026"	T109-114
Hudson (all)	430-SV, 461-S, 455-S	.018"	T109-44
La Salle	460-S	.023"	T109-149
Nash-Lafayette	458-S	.026"	T109-114
Nash 4080	465-S	.015"	T109-44
Oldsmobile	389-S	.018"	T109-44
Oldsmobile	471-S	.015"	T109-44
Pontiac 40-29	469-S	.010"	See Note
Studebaker 6C	409-S	.018"	T109-44

Note—Gauge No. T109-44 used for both .015" and .018" settings.

Buick 448-S Note—To make this adjustment, back off throttle stopscrew so that throttle valves tightly closed, hold choke valve closed, back off fast idle adjusting screw so that it clears high point of fast idle cam, turn fast idle screw in until there is a slight drag on the cam, then turn screw in ½ turn additional (this will give correct throttle opening of .012").

Hudson Note—Fast idle can also be adjusted on these models as follows: With throttle stopscrew set for correct idle speed of 7 MPH, open throttle so that clearance between stopscrew and stop on carburetor casting is .030", hold choke valve closed, turn fast idle screw in until it contacts fast idle cam.

Pontiac 469-S Note—If gauge not available for this adjustment, adjust in same manner as Buick 448-S (above), except that screw should be turned in additional ⅝ turn (for .010" throttle opening).

CHOKE:—Carter Climatic Control (automatic choke) is standard. See article in Carburetion Equipment Section for complete servicing and adjusting directions.

Setting—Thermostatic coil housing reference mark should be centered on mark on piston housing (for all models except those shown in table below) or should be rotated counter-clockwise (Rich), clockwise (Lean), the correct number of notches from the center mark as follows:

Car Model	Carburetor	Choke Setting
Buick 40, 50	440-S, 474-S	1 Notch Lean
Buick 60, 70, 80, 90	448-S	3 Notches Rich
Graham 109	488-S	1 Notch Rich
Nash-Lafayette	458-S	See Note
Nash 4080	465-S	1 Notch Rich
Pontiac 40-29	469-S	See Note
Studebaker 6C	409-S	1 Notch Rich
All Others		Centered

Nash-Lafayette Note—Carburetors with first type thermostatic coil (170B64S) should be set 1 Notch Rich. Carburetors with second type thermostatic coil (170K64S—used to improve warming up performance) should be centered.

Pontiac Note—Carburetors with first type thermostatic coil (marked 170G16S on housing) were set 1½ Notches Rich but setting should be changed to 4 Notches Rich to correct complaints of hard starting when cold and leanness while warming up. Carburetors with second type thermostatic coil (marked 170F16S on housing) should be set 1½ Notches Rich.

Unloader:—*Consists of a lip on the throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened when the throttle is wide open. To adjust, hold throttle valve wide open, bend lip on fast idle connector link so that clearance between upper edge of choke valve and air horn wall is correct as shown in table below (use specified gauge to check this opening).*

Car Model	Carburetor	Unloader Gauge	Clearance
Buick (all)	440-S, 474-S, 448-S	T109-28	3/16"
Cadillac V16	407-S, 408-S	T109-28	3/16"
Graham 109	488-S	——	11/64"
Hudson (all)	430-SV, 461-S, 455-S	T109-31	¼"
La Salle	460-S	T109-39	13/64"
Nash-Lafayette	458-S	T109-28	3/16"
Nash 4080	465-S	T109-34	9/64"
Oldsmobile	389-S	T109-31	¼"
Oldsmobile	471-S	T109-28	3/16"
Pontiac 40-29	469-S	T109-31	¼"
Pontiac 40-29	469-SM (See Note)	T109-28	3/16"
Studebaker 6C	409-S	T109-28	3/16"

Pontiac Note—These carburetors have new metering rods (above) and are marked '469-SM'.

Choke Valve Lock:—With unloader properly adjusted, choke valve will be locked in wide open position with throttle valves wide open. Choke valve will be released when throttle valves closed.

TROUBLE SHOOTING:—Same as for other Carter models (see preceding article).

SERVICING:—These carburetors serviced in same manner as previous models. ***See Carter 'Dual Type WDO with Climatic Control' and 'Dual Vacumeter Type' Carburetor articles in Carburetor Section of manual (or 1938 Supplement) for complete data.***

447-S—CHEVROLET CAB-OVER-ENGINE & DUBL DUTI PANEL TRUCK MODELS (1940)

This Carburetor same design as used on 1939 Cab-over-Engine models.

SPECIAL SERVICE NOTES:—Carburetor Gasket Caution—When installing carburetor on engine, use special slotted flange gasket 1A-41 and make certain that vacuum power cylinder port in carburetor mounting flange opens into this slot. If this port covered, carburetor mixture will be rich and gasoline consumption will be high.

Access to Carburetor for Adjustment & Servicing—See Chevrolet Shop Notes in 'M' Section for engine cover removal instructions.

ADJUSTMENT & SERVICING:—Same as for 1939 model. See 'Carter (BB) Updraft Carburetor' in 'C' Section of manual (or 1939 Supplement) for complete instructions and adjust carburetor to following specifications:

Idle Setting—Adjust idle screw for smooth idle (½-1¼ turns open). Set throttle stopscrew for idle speed of 300-375 R.P.M.

Accelerating Pump—Connect plunger in inner hole (short stroke) of throttle lever for summer operation, outer hole (long stroke) in winter.

Float Level—Top of float should be 1/32-1/16" below top edge of bowl with needle valve seated (remove bowl cover gasket when checking).

E6S1, 1*—CHRYSLER 6, C25 ROYAL & WINDSOR (1940) FIRST CARS
E6S2—CHRYSLER 6, MODEL C25 ROYAL & WINDSOR (1940) LATER CARS
E6N2—DE SOTO, MODEL S7 CUSTOM & DELUXE (1940) FIRST CARS
E6N3—DE SOTO, MODEL S7 CUSTOM & DELUXE (1940) LATER CARS
D6A2—PLYMOUTH, P9 ROADKING, P10 DELUXE (1940)
D6C2—PLYMOUTH, P9, P10 (1940) WITH AUTOMATIC CHOKE
B6P1—PLYMOUTH, P9, P10 ECONOMY MODELS (1940)
These carburetors same design as 1939 types except as noted below.

PRODUCTION CHANGES:—**Chrysler E6S1, E6S1*—**Model E6S1 carburetor used on first cars may be brought up to later E6S2 standards by installing new Metering Jet No. 159-89S (replaces 159-87S), and Idle Orifice Tube No. 123-39S (replaces 123-31S). Both of these parts must be installed together and this special Idle Orifice Tube 123-39S should not be used on E6S2 carburetors (use 123-31S).
E6S1* Note—Carburetors on which the above changes have been made at the factory are marked E6S1* on bowl cover for identification.
Chrysler Jet Changes—Main metering jet calibration has been changed (different parts used on E6S1, E6S1* and E6S2). See Carter (B&B) Jet Specification Table for complete data.
De Soto Jet Changes—Main metering jet calibration has been changed. See Carter (B&B) Jet Specification Table for complete data.

SPECIAL SERVICE NOTES:—Whenever body gasket 121-69 (between main body casting and air horn and bowl cover casting) is removed for carburetor servicing, use new gasket when reassembling. This is important to prevent air leaks at this point which will affect carburetor economy (carburetors are 'balanced' type with bowl vented through air horn).

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge through lower idle port and should be turned in for leaner mixture, out for richer mixture. Approximate idle screw settings given in table below. Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew. See car model 'T&E' page for complete carburetor tune up instructions.

Car Model	Carburetor	Idle Setting	Idle Speed
Chrysler	E6S1, S1*, S2	½-1½ turns open	6 MPH
De Soto S7	E6N2, N3	½-1¼ turns open	6 MPH
Plymouth	D6A2, C2	½-1¼ turns open	6 MPH
Plymouth Econ.	B6P1	½-1½ turns open	6 MPH

ACCELERATING PUMP:—Delayed action type. Same design as in 1939.
Seasonal Adjustment—Three holes provided in throttle lever for connector link engagement. Inner hole provides minimum stroke, center hole medium stroke, outer hole maximum stroke. See car 'T&E' page for recommended settings.
Pump Stroke Adjustment—To check, remove air horn and float bowl cover assembly, back off throttle stopscrew so that throttle valve closes tightly, connect pump connector link in correct hole of throttle lever (see table below), install Universal Pump Stroke Gauge T109-117S on bowl so that indicator lip on gauge rests on top of pump plunger shaft. Note gauge reading, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with table below. To adjust, bend horizontal portion of pump connector link.

Car Model	Carburetor	Pump Stroke	Pump Setting
Chrysler	E6S1, S1*, S2	26/64"	Medium Stroke
De Soto	E6N2, N3	26/64"	Medium Stroke
Plymouth	D6A2, C2	24/64"	Medium Stroke
Plymouth Econ.	B6P1	19/64"	Medium Stroke

VACUUM STEP-UP (ECONOMIZER):—No adjustment required but setting should be checked when carburetor reassembled after servicing to insure step-up valve closing. To check, push vacuum piston down in cylinder to end of stroke, check clearance between piston plate and head of step-up valve needle stem. Clearance should be 1/64-1/32". To adjust, bend piston plate slightly.
Vacuum Step-Up Spring—When servicing carburetor, make certain that correct step-up spring installed as follows: No. 61-135 (all models except B6P1), No. 61-134 (B6P1 only).

FLOAT LEVEL:—To check float level, remove air horn (integral with float bowl cover), use special gauge No. 1522-B, placing gauge on top edge of bowl with lugs extending down toward float on either side of soldered seam. Press lip of float lever against needle valve, float should contact both lugs on gauge. Adjust by bending float lever lip slightly at point where it contacts valve needle (do not bend float arm). If gauge not used, top of float (not soldered seam) should be 5/64" (plus or minus 1/64") on all models.
Float Needle Valve & Seat—Triangular type. Furnished only in matched sets as follows: No. 25-82S—#44 Intake Hole (all models except B6P1), No. 25-77S—#48 Intake Hole (Model B6P1 only).

THROTTLE VALVE SETTING:—When installing valves, insert attaching screws loosely, back throttle stopscrew off, tap valves lightly to centralize in bore, then fasten screws securely.
Setting—With throttle stopscrew backed off so that valve tightly closed, distance from top edge of valve to top of upper idle port should agree with 'Idle Port' figure in table below, and distance from top of valve to top of vacuum spark port should agree with 'Vacuum Spark Port' figure (except as noted).

Car Model	Carburetor	Idle Port Opening	Vacuum Spark Port
Chrysler	E6S1, S1*, S2	.088-.092"	.035-.041"
De Soto	E6N2, N3	.088-.092"	.035-.041"
Plymouth	D6A2, C2	.118-.120"	①.003-.009"
Plymouth Econ.	B6P1	.130-.134"	.035-.041"

①—Bottom of port above top edge of valve (top of port on other models).

CHOKE:—Offset type with poppet relief valve. Choke control on Plymouth models (without Automatic Choke) is semi-automatic (spring-loaded). Sisson Automatic choke Std. on Chrysler & De Soto, optional on Plymouth.
Fast Idle—Consists of a throttle shaft dog (throttle lever stop) pivoted below throttle shaft and linked to choke valve lever so that throttle opened to fast idle position when choke valve closed for starting. No adjustments required. NOTE—This Fast Idle not used on Plymouth B6P1 Economy Carburetor.

SERVICING:—Same as for carburetors used on previous models. ***See Carter (B&B) Downdraft Type Carburetor article in Carburetor Section of manual (or 1938 supplement) for complete data and note following points:***
Balance Tube—When servicing carburetor make certain that balance tube in air horn is open and clean. Always use new gasket between body casting and air horn to insure air tight joint at bowl cover. Any air leak at bowl cover will upset 'balance' feature and affect fuel economy.
Vacuum Step-up Passage—Passage opens on carburetor mounting flange and special gasket (with slots which register with this vacuum passage hole) must be used when installing carburetor on manifold. Shutting off of this vacuum passage hole will cause excessive fuel consumption.
Clogged Main Vent Tube—Will cause excessive richness at speeds above 50 MPH. To replace tube, use tool T109-42 to remove rivet plug beneath float bowl, then remove old vent tube and install new tube with tool T109-70. Make certain that tube seats tightly, install new rivet plug.

⑤—Supersedes 159-66S (now 3 Sizes Lean).

AA ⅞—Ford No. 922A-9510-A
FORD, ALL MODELS WITH '60' ENGINE (1940)

AA1—Ford No. 91A-9510-A
FORD, ALL '85' PASS. CAR MODELS (1940)
FORD, ALL '85' & '95' TRUCK MODELS (1940)
MERCURY, MODEL 09A (1940)

AA1—Ford No. 06H-9510
LINCOLN-ZEPHYR, MODEL 06H (1940)

NOTE:—Lincoln-Zephyr carburetor is new larger (1" type).

TYPE:—Dual or double barrel, plain tube, downdraft type. Carburetors are same design as used on corresponding 1939 car models except that Lincoln-Zephyr model is larger (1").

IDLE ADJUSTMENT:—Idle adjusting screw for each carburetor barrel controls fuel discharge through lower (closed throttle idling) port. Screws should be turned in for leaner mixture, out for richer mixture. Setting should be approximately ⅝-⅞ turns open from inner seated position. Manufacturer recommends that vacuum gauge be used for this adjustment and each idle screw adjusted in turn to secure highest steady reading of gauge. Idle speed controlled by throttle lever stopscrew and should be set for 5-7 MPH speed. See car model 'T&E' page for complete adjustment directions on car.

METERING JETS:—Main metering jets are non-adjustable type located in float bowl and acessible by removing plug on side of float bowl opposite each jet. Jets should be changed only to compensate for special operating conditions such as high altitude. See Chandler-Groves Jet Specification table for standard and leaner jet data.

ECONOMIZER:—Consists of a spring-loaded, vacuum diaphragm controlled, by-pass valve assembly screwed in lower face of main body casting so that valve extends into float bowl (diaphragm assembly fits in recess in throttle valve body casting and vacuum passage in casting connects diaphragm chamber with carburetor barrel below throttle valve). Vacuum economizer set at factory to open when vacuum decreases to 8½-9" of HG. (corresponding to engine speed of 3800 RPM). No adjustment provided.

ACCELERATING PUMP:—Pump cylinder and piston located in float bowl, operated by inverted 'L' shaped pump rod linked to throttle lever. Fuel is drawn into pump cylinder through inlet ball check valve at lower end when throttle is closed and is discharged through outlet check valve and pump discharge nozzle when throttle opened for acceleration (nozzle is located at upper edge of venturis and has two discharge holes so that fuel is discharged equally into each carburetor barrel). Pump piston connection to pump rod is through a driving spring on the piston stem which prevents loading up engine when throttle opened suddenly and also prolongs pump discharge (spring compressed at beginning of piston travel, expands at end of travel).

Capacity—As shown in table below in cc. per 10 strokes. Throttle lever stop-screw must be backed off to allow throttle to close completely and pump link must be connected in center hole.

Car Model	Carburetor	Pump Capacity
Ford '60'	922A-9510-A	9-13 cc.
Ford '85', Mercury	91A-9510-A	9-13 cc.
Lincoln-Zephyr	06H-9510	14-18 cc.

Adjustment—Three holes provided in throttle lever for pump link connection (these holes numbered 1-2-3 from throttle valve shaft outward). Inner (#1) hole provides minimum stroke, Center (#2) hole medium stroke, Outer (#3) hole maximum stroke. Recommended setting is #1 hole (Summer), #2 hole (Winter), #3 hole (Extreme cold weather). See car model 'T&E' page for settings.

NOTE—Pump link is locked in lower end of pump rod by a spring-loaded snap lock. To disengage lock, pull link shaft out of pump rod.

FLOAT LEVEL:—Fuel Level—Fuel level in bowl should be 11/16" ± 1/32" (Ford Models 922A-9510-A, 91A-9510-A), 19/32" ± 1/32" (Lincoln-Zephyr Model 06H-9510) below top edge (gasket seat) on bowl with 3 lbs. pressure (engine idling). If glass tube or other sight level indicator used to check level, use extreme care to eliminate all errors caused by capillary action of fuel in indicator tube.

Adjustment—Level can be adjusted by bending float arm at point where it contacts needle valve. Use extreme care to keep float level.

Float Needle Valve & Seat—Furnished in matched sets only as follows: Ford Part No. 78-9564 (All Ford & Lincoln-Zephyr carburetors).

CHOKE:—Offset type with poppet type relief valve to prevent over-choking.

THROTTLE-KICKER (STARTING):—Consists of a spring loaded lever pivoted on side of carburetor casting so as to contact cam on choke lever at upper end and throttle lever at lower end (through throttle stopscrew which is mounted on this starting lever). Lever is rotated by choke lever cam when choke valve closed for starting and opens throttle to starting position. No adjustment required.

TROUBLE SHOOTING:—Poor Idling Performance. Make certain that entire engine tuned up, check idle setting. If idle is lean, check for air leaks at manifold, check gaskets between carburetor throttle valve body and bowl casting. Remove idle adjusting needle and Idle Tubes, blow out channels with air, clean idle tubes with air. If idle is rich, check Vacuum Economizer valve, see that valve is seating properly, and that diaphragm is not leaking. Check gasket between throttle valve body and bowl casting (this gasket seals vacuum chamber which must be air tight).

Poor Running Performance. Check carburetor body gaskets, see that all carburetor body bolts are tight. Check metering jets for size. Blow out metering jet channel and main nozzle channels with compressed air. Check fuel level.

Poor Acceleration Performance. Check pump cylinder and channels for dirt which will prevent check-valves seating. See that piston leather is in good condition, check piston driving spring. To dismantle pump for cleaning (with air horn casting off carburetor), disconnect pump link, remove pump rod and piston assembly, inlet ball retaining spring and ball, discharge nozzle, and outlet check needle. Blow out all channels with compressed air. If pump is working properly, a fine, solid, steady stream should be discharged from each nozzle at instant throttle is snapped open.

Poor High Speed Performance. Check engine compression, breaker contacts and gap, spark plug gaps first. Check vacuum economizer valve, remove economizer and blow out economizer channels and restrictions with compressed air. Check fuel level and float level. Check fuel pump pressure.

Poor Economy or Gasoline Mileage. Check all parts of car which may cause this complaint (engine, valves, dragging brakes, etc.). Check fuel level and fuel pump pressure. Check metering jets for size. Manufacturer does not recommend use of leaner metering jets to secure fuel economy.

Number **MODEL AAV-16**

A-19181—BUICK, SERIES 40-40, 50 (1940)

MODEL AAV-26

A-19182—BUICK, SERIES 40-60, 70, 80, 90 (1940)

A-19192—BUICK, ABOVE MODELS WITH HEAVY DUTY AIR CLEANER.

A-19212—CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)

A-19172—PACKARD SUPER 8, '160' 1803, 4, 5; '180' 1806, 7, 8 (1940)

NOTE:—**Buick Models**—Carter WDO Type 440-S (40, 50), 448-S (60, 70, 80, 90) carburetors also used on these models. See Carter 'WDO' carburetor article for data on these types.

Buick 60, 70, 80, 90 Models—Carburetor used on cars with Heavy Duty (oil-bath) type air cleaner has special jet calibration and is not interchangeable with standard type. See Stromberg Jet Specification Table for complete data.

Buick Starting Switch—Delco-Remy Vacuum Switch No. 1990127 is mounted on carburetor and operated by throttle valve shaft. See article in Electrical Equipment Section for servicing data on this unit.

TYPE:—Aircraft type, duplex, downdraft carburetor similar to previous AAV-26 models (Model AAV-16 is new smaller carburetor of same design).

IDLE ADJUSTMENT:—Adjust only when engine warmed up so that Automatic Choke and Fast Idle inoperative (choke valve wide open, stopscrew on lowest step of fast idle cam). Set throttle stopscrew for correct 7-8 MPH (Buick, Cadillac), 6 MPH (Packard), idle speed. Turn each idle adjusting screw (one screw for each barrel, both screws must be adjusted alike) in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. These screws control fuel mixture discharge from lower (closed throttle) idle port. Recheck idle speed and readjust throttle stopscrew if necessary. See car model 'T&E' page for complete adjustment instructions. Check Fast Idle setting (see below).

Buick Note—If vacuum gauge used for idle adjustment, turn both idle adjusting screws out evenly in the 'rich' direction until vacuum reading is 1" lower than maximum.

METERING JETS:—Main metering jets are non-adjustable type located under plug at lower end of each nozzle. Jets should be changed only for special operating conditions such as high altitude (see Buick note above and Stromberg Jet Specification Table for complete jet data).

NOTE—Whenever main discharge nozzles are removed, use extreme care to remove all traces of old lead gasket from carburetor body and shoulder on nozzle. Use new lead gasket when installing nozzle to insure good seal between nozzle and body. Use tool T-19099 to remove main jet plug, tool T-24924 to remove and install main metering jet, tool T-24967 to remove and install main discharge jet.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.

NOTE—Use special tool T-24733 to remove vacuum power piston.

Setting—Vacuum piston opens valve with manifold vacuum of 4-6" of HG. corresponding to car speed of 65-70 M.P.H.

ACCELERATING PUMP:—Similar to design used on other 'AAV' carburetors with spring-loaded relief valve in piston head and duration spring on rod above piston (light spring above duration spring in dust washer retainer) except that strainer has been added below intake check valve (see Note below).

Capacity—Pump capacity per 10 strokes fast (F), slow (S) is shown in table below. Pump must be set for correct stroke (see Adjustment) as shown in table.

Car Model	Carburetor	Pump Capacity	Pump Setting
Buick 40, 50	AAV-16	11-15 cc. (F), 15-19 cc. (S)	Center
Buick 60, 70, 80, 90	AAV-26	10-14 cc. (F), 15-19 cc. (S)	Center
Cadillac	AAV-26	13-17 cc. (F), 18-22 cc. (S)	Minimum
Packard	AAV-26	22-25 cc. (S)	Maximum

Adjustment—Three holes (Buick), two holes (Cadillac, Packard), provided in throttle lever for pump rod engagement. Inner hole (short radius) provides minimum stroke, center hole medium stroke, outer hole (long radius) maximum stroke. See car model 'T&E' page for recommended settings and changes for seasonal requirements.

Pump Servicing Note—Strainer screen located in plug below pump intake check valve should be removed and cleaned frequently to insure satisfactory pump operation.

FAST IDLE & CHOKE RELEASE:—Check and adjust as directed below. See Stromberg Automatic Choke (with integral Fast Idle) article in Carburetion Equipment Section for description and complete servicing instructions.

Fast Idle Setting (Buick):—Close choke valve against #53 drill rod (insert drill between upper side of valve and air horn wall), check clearance between ear on locking lever on throttle valve shaft and lug on loose lever on fast idle cam stud (this lever linked to fast idle cam by torsion spring). These levers should just clear as throttle valve is opened and closed. To adjust, bend connecting rod between choke valve lever and fast idle cam using care not to bind the rod in the cam slot or to distort the fast idle cam return spring.

Cadillac—Open throttle and rotate fast idle cam so that stopscrew rests on high lobe of cam. Move choke valve toward closed position as far as possible, check choke valve opening by inserting drill rod between edge of valve and air horn wall. Choke valve opening should be .102" (#38 drill). To adjust, bend connecting rod between choke valve lever and fast idle cam loose lever at point near upper end. Use care not to cause bind in fast idle mechanism.

Packard—Check and adjust in same manner as Cadillac (above) except that choke valve opening should be 3/32".

Choke Release (All Models):—With throttle valve wide open, ear on throttle lever contacts lug on fast idle cam (Buick), fast idle cam loose lever (Cadillac, Packard) and opens choke valve to correct flooding. To check, open throttle wide, check choke valve opening by inserting 11/64" (.156-.187") drill rod between upper edge of choke valve and air horn wall. To adjust, bend ear on throttle lever slightly (use bending tool T-25056 on Cadillac and Packard models). Use care not to bind fast idle rod or distort fast idle cam spring.

FLOAT LEVEL:—**Fuel Level**—Should be 19/32" (Buick), 5/8" (Cadillac, Packard) below top edge (gasket seat) of float bowl with engine idling (4-5 lbs. pressure Buick, Cadillac; 3 lbs. pressure Packard). To check fuel level, remove plug in sight hole on side of bowl. Fuel level should be even with bottom of hole.

Float Height—Use special service tool T-24971 to check floats. Remove air horn and bowl cover assembly, invert cover and place tool on gasket. Top of floats should be 3/64" above tops of vertical guides (Buick), even with tops of guides (Cadillac, Packard) and sides of floats should be tangent to tool guides without any drag (to provide clearance between floats and bowl). Use extreme care to adjust both floats alike.

Float Valve & Seat—Part No. P-22499. Furnished only as matched sets. When installing, make certain that needle valve is clipped to float lever.

Float Bowl Vent—Bowl vented through opening on side of air horn directly below air cleaner collar.

THROTTLE VALVE SETTING:—To check throttle valve setting, back throttle stopscrew off so that valves are tightly closed, insert drill rods in idle port and vacuum port as follows: Idle Port—#60 (Buick), #56 (Cadillac, Packard), Vacuum Spark Port—#58 (All models). Then measure distance from edge of throttle valve to nearest side of drill rod. These settings given in table below (all figures are plus or minus .004").

Car Model	Throttle Valve	Idle Port	Vacuum Spark Port
Buick (AAV-16)	P-24684—5°	.022"	.041"
Buick (AAV-26)	P-24740—5°	.022"	.055"
Cadillac	P-24172—5°	.040"	.012"
Packard	P-24740—5°	.040"	.012"

CHOKE:—Stromberg automatic integral type. See article in Carburetion Equipment Section for complete servicing directions.

Choke Setting—Inverted 'V' mark on thermostat cover scale should coincide with reference mark on top of choke housing. To adjust, loosen three cover screws, rotate thermostat cover assembly.

CAUTION—When connecting heat tube to thermostat cover connection, do not use excessive pressure which may rotate cover and change choke setting.

SERVICE PARTS:—**Gasket Set**—No. J-5656-G (Buick AAV-16), J-5655-G (Buick AAV-26), J-5421-G (Cadillac, Packard).

Number **MODEL AAV-2**

A-18792—CHRYSLER 8, C26 TRAVELER, SARATOGA, NEW YORKER (1940)
CHRYSLER 8, C27 CROWN IMPERIAL (1940)

This carburetor same design as used on corresponding 1939 car models.

THROTTLE GUARD NOTE:—This unit used on cars with Fluid Drive to prevent engine stalling. See article in Carburetion Equipment Section for adjustment and servicing instructions.

TYPE:—Same design as previous AAV-2 models. See 1939 Supplement for description and fuel system operation.

IDLING ADJUSTMENT:—Idle adjusting screw for each barrel controls fuel discharge from lower idling port. Screws should be turned in for leaner mixture and out for richer mixture and must be set alike. Idle speed controlled by throttle lever stopscrew and should be set for 6 MPH idling speed with engine warmed up (choke valve wide open and fast idle inoperative). See tune up instructions on car model page for complete adjustment instructions on car.

METERING JETS:—Main metering jets are non-adjustable fixed type. Jets should be changed only for special operating conditions such as high altitude. See Jet Specification Table for standard jet calibrations for all models.
NOTE—Whenever main discharge jet located directly above main metering jet is removed, new lead gasket must be used in carburetor body to insure a good seal when jet is replaced. Use tool T-19099 to remove plug, tool T-24924 to remove and install main metering jet, tool T-24967 to remove and install main discharge jet.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.
NOTE—Use special tool T-24733 to remove vacuum power piston No. P-22803.
Setting—Vacuum piston opens valve with manifold vacuum of 5-7" of HG. corresponding to car speed of 70-75 MPH.

ACCELERATING PUMP:—**Capacity**—With pump set for maximum stroke, capacity per 10 strokes is 21-25 cc. (Slow), 27-31 cc. (Fast).
Adjustment—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See car model 'T&E' page for recommended settings.

FAST IDLE:—Consists of a stepped rotary cam linked to the choke valve lever and serving as a stop for the throttle lever stopscrew. Cam is rotated to fast idle position when choke valve closed for cold starting so that throttle valve held open slightly.
Adjustment—To check setting, hold stopscrew against first step of fast idle cam and check choke valve opening with ⅛" drill rod inserted between edge of choke valve and air horn wall. If opening not correct, adjust rod length (turn ball joint end on rod). Open throttle wide and again check choke valve opening with 7/32" rod. If opening not correct, bend extended arm of fast idle cam slightly.

FLOAT LEVEL:—**Fuel Level**—Should be ⅝" below top surface of float bowl with 3 lbs. pressure (engine idling) or approximately even with the bottom of the inspection hole on side of float bowl (take out plug to check level).
Float Height—Use special service tool, T-24971 when setting floats. Remove air horn and float cover assembly, invert, mount tool on cover gasket. Tool guides will also check float travel (floats must be free and not rub on bowl). Adjust floats by bending float lever. If tool not used, top of floats should be 1 11/32" above gasket on cover.
Float Valve & Seat—Part No. P-22499. Furnished only as matched sets.
Float Bowl Vent—Bowl vented to outside through opening in side of air horn directly below air cleaner collar.

THROTTLE VALVE SETTING:—When installing throttle valves, they must be set so that distance from upper lip of valve to lower edge of upper idle port is .040" (plus or minus .004") and distance from upper lip of valve to lower edge of vacuum spark port (use #56 drill inserted in port) is .015" (plus or minus .004") with throttle valve tightly closed.
Throttle Valves—Part No. P-22752, 5° type.

CHOKE VALVE:—Offset type. Sisson Automatic Choke is standard equipment. See Sisson Automatic Choke article in Carburetion Equipment Section.

SERVICE PARTS:—**Gasket Set**—No. J-5316-G.

MODEL AAO-161

STUDEBAKER PRESIDENT, MODEL 6C (1940)

This Carburetor same design as used on 1939 cars except as noted below.

NOTE:—This 1940 carburetor may be identified by number 6-85 stamped on float bowl cover.
Jet Changes for Increased Fuel Economy:—If greater fuel economy is desired, standard main metering jets may be changed to first smaller size (.045") with slight loss in performance. Second smaller size jets (.043") should only be used for operation at high altitudes. Both main metering jets should be changed at the same time and must be same size. See Stromberg Jet Specification Table for complete jet data.

TYPE:—Same design as used on 1939 cars except for improvements in Automatic Choke system as follows: New thermostatic coil used (may be indentified by figure '8' on outer face of coil housing). Hot air pipe is ⅛" in diameter and has a .075" reducer. Vacuum piston hole in throttle body changed to #56 drill size. ***See article in Carburetion Equipment Section for complete Automatic Choke and Fast Idle servicing data.***

IDLING ADJUSTMENT:—Must be made only with engine warmed up so that Fast Idle and Automatic Choke inoperative. Idle adjusting screws (one for each barrel) control fuel discharge and should be turned in for leaner mixture, out for richer mixture. Idle speed controlled by throttle stopscrew and should be set for 8 MPH. hot or slow idle. See tune up instructions on car model page for complete data.

FAST IDLE MECHANISM:—Same design as used on previous models (by-pass channel around throttle valve controlled by vacuum piston linked to choke valve. See article in Carburetion Equipment Section for adjustments to be made when servicing carburetor.
IMPORTANT NOTE—Whenever air horn and float bowl cover assembly is removed, remove throttle valve body first and unhook vacuum piston. If this is not done, vacuum piston link assembly may be damaged. When vacuum piston removed, see that it is installed with slot on side toward idle fuel cross-passage port.

METERING JETS:—Main metering jets are non-adjustable type. See Note above for recommended changes for increased fuel economy and Stromberg Jet Specification Table for complete instructions.

ECONOMIZER:—By-pass valve and jet located at bottom of accelerating pump cylinder and operated by pump piston. Should not require adjustment but setting can be checked by noting throttle valve opening when pump piston rests on seat of by-pass valve (less over-travel) with pump set for minimum stroke. Should be 5/16" (plus or minus 1/64"). No adjustment provided but pump 'walking beam' lever can be bent slightly to correct opening. NOTE—When re-installing lever make certain that ball end is toward carburetor.

ACCELERATING PUMP:—Same type as used on previous AAO-161 carburetors.
Capacity—16-20 cc. per 10 strokes when operated slowly with pump set for minimum stroke.
Adjustment—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See tune up instructions on car model page for recommended settings.

FLOAT LEVEL:—**Fuel Level.** Should be ⅝" below top surface of float bowl with 3 lbs. pressure (engine idling) or even with the lower edge of the inspection hole on the side of the bowl (take out plug to check level).
Float Height—Use special service tool, T-24971, to set floats. Remove air horn and float cover assembly (see Note in Fast Idle section for instructions to avoid damage to fast idle mechanism), invert cover, install tool on gasket. Tool guides will also check float travel (floats must be free and not rub on bowl). Adjust floats by bending float lever. If tools not used, top of floats should be 1 11/32" above gasket on cover.
Float Valve & Seat—Part No. 22499. Furnished only in matched set.
Float Bowl Vents—Bowl vented to outside through screened opening on side of air horn. Also vented through balance tube in air horn directly below air cleaner.

THROTTLE VALVE SETTING:—When installing valves see that distance from top edge of valve to lower edge of upper idle port is .020" plus or minus .004".

CHOKE:—Valve is offset type, operated by thermostatic spring coil coupled directly to choke valve shaft. See article in Carburetion Equipment Section for complete data.

SERVICE PARTS:—**Gasket Set**—Part No. J-5318-G.

Number **MODEL BXOV-26**
A-19162—PACKARD SIX, '110' MODEL 1800 (1940)

NOTE:—This model fitted with integral Fast Idle and Automatic Choke (thermostatic coil mounted on air horn and linked directly to choke valve shaft). See article in Carburetion Equipment Section for complete Fast Idle and Automatic Choke Servicing data.

THROTTLE GUARD NOTE:—Vacuum diaphragm type throttle guard used on all cars with Overdrive to prevent engine stalling at speeds below 20 MPH. See Packard Throttle Guard article in Carburetion Equipment Section for adjustment instructions.

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer.

Fuel System (Idling & Low Speed):—Fuel for idling taken from main jet well up through Idling Tube which meters the fuel to a cross-channel in which it is mixed with air admitted through Idle Air Bleed (air bleed passage opens into carburetor barrel below choke valve). Fuel mixture then taken down through channel to discharge ports at the throttle edge. For closed throttle idling, fuel discharged through lower port below throttle valve and controlled by idle adjusting screw (upper port above throttle valve serves as additional air bleed). As soon as throttle is cracked open for low speed running, additional fuel is discharged from this upper port also.

Driving Range (Below 65-70 MPH.)—As throttle is opened, suction increases on main discharge jet and this jet supplies fuel, the idling system dropping out. Fuel for main discharge jet is metered by main metering jet located at lower end of discharge jet. Discharge jet is air bled by High Speed Bleeder located directly above jet on auxiliary venturi support.

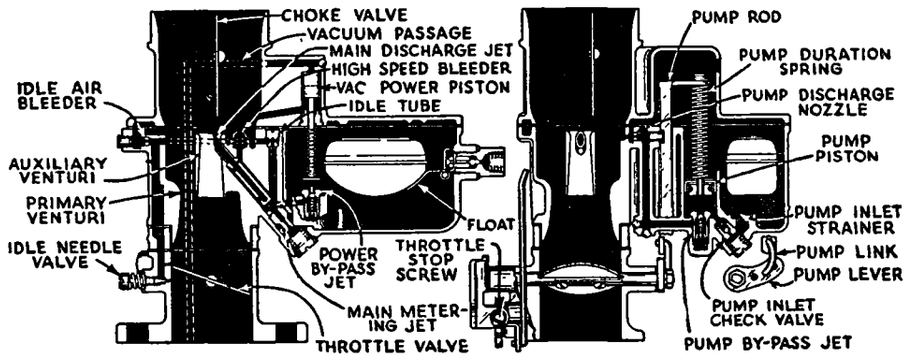
High Speed and Wide Open Throttle Operation—At speeds above 65-70 MPH. or whenever throttle held wide open so that manifold vacuum falls off, spring on vacuum piston forces piston down and opens by-pass valve. Fuel metered by the by-pass jet then flows directly to the main discharge jet.

IDLING ADJUSTMENT:—Adjust only when engine warm so that Automatic Choke and Fast Idle inoperative (choke valve wide open, throttle stopscrew on lowest step of fast idle cam) and engine idling at hot or slow idle speed. Idle adjusting screw controls fuel mixture discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture (standard setting approximately 1¼ turns open from inner seated position). Idle speed controlled by throttle lever stopscrew and should be set for 6 MPH. idle speed. See car model 'T&E' page for complete adjustment instructions on car. Check Fast Idle Setting.

METERING JETS:—Main metering jet is non-adjustable type located under plug at lower end of discharge jet. Jets should be changed only for special operating conditions such as high altitudes. See Stromberg Jet Specification table for complete jet data.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.
NOTE—Use special tool T-24733 to remove vacuum power piston No. P-24043.

Setting—Vacuum piston opens valve with manifold vacuum of 4-6" of HG. corresponding to car speed of 65-70 MPH.



ACCELERATING PUMP:—Operated by throttle lever through vertical pump rod under float bowl cover. Fuel is drawn into pump chamber through strainer screen and inlet ball check valve and is discharged through outlet valve and pump discharge nozzle located in side of mixing chamber above main venturi when throttle opened for acceleration. Pump piston has duration spring on piston rod (spring compressed on sudden throttle openings, subsequent spring expansion prolongs pump discharge).

Capacity—Pump capacity in cc. per 10 strokes with pump set for medium stroke (link in center hole of throttle lever) should be 11-14 ccs. (pump operated slowly).

Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model tune up page for recommended seasonal changes.
Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned at frequent intervals to insure satisfactory pump performance.

FAST IDLE & CHOKE RELEASE:—Fast idle mechanism consists of a fast idle lever and cam mounted below the throttle valve shaft so that the cam serves as a stop for the throttle stopscrew. Fast idle lever is linked to choke valve lever by connecting rod so that cam is rotated to the fast idle position when the choke valve closes for cold starting. Choke release mechanism consists of an ear on the throttle lever which engages a lug on the fast idle cam so that the cam is rotated and choke valve opened when the throttle valve is opened wide. Fast idle and choke release setting are both adjusted by bending connector rod as follows:

Adjustment—Hold throttle stopscrew on lowest step of fast idle cam and against edge of second step, move choke valve toward closed position as far as possible (do not force valve beyond point where fast idle cam and lever are stopped against throttle stopscrew). Check choke valve opening by inserting

11/32" drill rod between upper edge of valve and air horn wall. If choke opening not correct, adjust by bending connector rod at bend near choke valve lever.

FLOAT LEVEL:—**Fuel Level**—Set at ⅝" below top edge (gasket seat) of bowl with 3 lbs. pressure (engine idling). Adjust by bending float arm at point where it is attached to float (use tool T-24733).
NOTE—Float fulcrum pin is retained by spring clip seated in float seat recess. When installing fulcrum pin, see that spring clip is seated and that it engages notches at ends of pin.

Float Valve & Seat—No. P-24063 (.086" intake hole). Furnished only in matched sets.

Float Bowl Vent—Bowl is vented to outside atmosphere through slot in upper end of pump rod housing on bowl cover.

THROTTLE VALVE SETTING:—Valve is No. P-24059—20° type. To check valve setting, insert #56 drill in idle port, two #60 drills in vacuum spark control ports. With throttle stopscrew backed off and throttle valve closed tight, edge of valve should be flush with drills in ports (.006" maximum clearance between valve and idle port drill allowable).
NOTE—Additional #60 vacuum spark port is drilled at random below valve.

CHOKE:—Valve is offset plain type. Operated by automatic choke thermostatic spring coil which is linked directly to shaft. See article in Carburetion Equipment Section for Automatic Choke data.
SERVICE PARTS:—**Gasket Set**—Part No. J-5409-G.

MODEL BXO-26

STUDEBAKER COMMANDER, MODEL 10A (1940)

This carburetor same design as used on 1939 cars except as noted below.

NOTE:—This 1940 carburetor may be identified by number 6-84 stamped on float bowl.

Jet Changes for Increased Fuel Economy—Where greater fuel economy is desired, standard main metering jet may be changed to first smaller size (.058") with slight loss in performance. Second smaller size (.056") should only be used for high altitudes. See Stromberg Jet Specification Table for complete jet data.

TYPE:—Same design as used on 1939 cars except for improvements in Fast Idle and Automatic Choke system as follows:

Fast Idle—Fast idle cam now operated by gravity (pull-back spring not used) and choke release (wide open throttle kicker) made more positive in action.

Automatic Choke—Thermostatic coil housing thickness has been doubled and vacuum piston linkage has been simplified (not adjustable). ***See article in Carburetion Equipment Section for complete Automatic Choke and Fast Idle servicing data.***

IDLING ADJUSTMENT:—Must be made only when engine warmed up so that Fast Idle and Automatic Choke inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Idle speed controlled by throttle stopscrew and should be set for 8 MPH. idling speed. See tune up data on car model page for complete instructions.

METERING JETS:—Main metering jet is non-adjustable type. See Note above for recommended changes for increased fuel economy and Stromberg Jet Specification Table for complete jet calibrations.

ECONOMIZER:—By-pass valve and jet located at bottom of accelerating pump cylinder and operated by pump piston. Should not require attention but setting can be checked by noting throttle opening when pump piston rests on seat of by-pass valve (less over-travel) with pump set for medium stroke (link engaged in middle hole on lever). Should be 13/32" (plus or minus 1/64").

Adjustment—To adjust, remove cotter pin and turn adjusting nut at upper end of pump piston stem. Make certain that cotterpin replaced to lock setting. NOTE—When dismantling carburetor, do not disturb this nut to avoid necessity of resetting economizer when carburetor is assembled.

ACCELERATING PUMP:—Same type as used on previous BXO-26 carburetors.

Capacity—17-22 cc. per 10 strokes when operated slowly with pump set for medium stroke (pump link in center hole).

Adjustment—Three holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, center hole medium stroke, outer hole (long radius) maximum stroke. See tune up data on car model page for recommended settings.

FLOAT LEVEL:—Fuel Level. Set at 5/8" below top edge of float bowl with 3 lbs. pressure (engine idling). Can be adjusted by bending float arm at point where it is attached to float (use tool T-24733). NOTE—Float fulcrum pin is retained by clip seated in float seat recess. When installing pin, see that clip is seated and engages notches at each end of fulcrum pin.

Float Valve & Seat—No. P-21918. Furnished only in matched sets.

Float Bowl Vent—Bowl is vented to outside atmosphere through slot at upper end of pump rod housing on bowl cover.

THROTTLE VALVE SETTING:—Valve is No. P-23282. Should be set so that distance from upper edge of valve to lower edge of upper idle port is .010" plus or minus .004".

FAST IDLE SETTING:—Close throttle so that stopscrew is on lowest step of fast idle cam, move choke valve toward closed position until it is stopped by the stopscrew striking against the side of the next step on the fast idle cam (do not force valve beyond this position). Check choke valve opening by inserting 11/32" drill rod between upper edge of valve and air horn wall. If valve opening not correct, adjust by bending connector rod linking choke valve and fast idle cam. Make certain that linkage does not bind and that fast idle cam falls freely to slow idle position with throttle valve open.

CHOKE:—Choke valve is plain type offset valve. Operated by automatic choke mechanism (thermostatic coil linked directly to choke valve shaft. See Automatic Choke article in Carburetion Equipment Section for servicing data.

SERVICE PARTS:—Gasket Set—Part No. J-5319-G.

MODEL BXV-3

Number

A-18123—DODGE, D14 DELUXE, D17 SPECIAL (1940)

A-18133—*DODGE, EXPORT MODELS* (1940)

This carburetor same design as used on corresponding 1939 model.

TYPE:—Same design as previous BXV-3 model. See 1939 Supplement for description and fuel system operation.

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture. Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew and should be set for 7-8 MPH. hot idle speed. See car model tune up pages for adjusting instructions.

METERING JET:—Main metering jet is non-adjustable type and should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification table for complete jet data.
NOTE—Use tool T-19099 to remove main jet plug, tool T-24924 to remove and install main metering jet, tool T-24967 to remove and install main discharge jet.

ECONOMIZER:—Vacuum piston type. Consists of a vacuum piston in a cylinder in the air horn casting which controls the by-pass valve and jet assembly in the main body casting. No adjustment required. Economizer is set to open valve with vacuum of 4-6" of HG. corresponding to car speed of 65-70 MPH.
NOTE—Use tool T-24733 when removing vacuum piston No. P-24043.

ACCELERATING PUMP:—Capacity—With pump set for medium stroke (center hole in throttle lever), capacity in cc. per 10 strokes when pump operated slowly is 11-14 cc.

Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model tune up page for recommended seasonal changes.

Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned at frequent intervals to insure satisfactory pump performance.

FAST IDLE:—Consists of a cam pivoted directly below the throttle lever shaft and linked to the choke valve. Cam serves as stop for throttle lever stopscrew and opens throttle to fast idle position when choke valve is closed for starting. No adjustment required but stopscrew should be at high point of cam with choke valve fully closed.

FLOAT LEVEL:—Fuel Level—Should be 5/8" below top edge of float bowl with engine idling (3 lbs. pressure). Adjust by bending float lever arm at point where it is attached to float.

Needle Valve & Seat Assembly—Part No. P-24063. Furnished only as matched set. When installing float or needle valve make certain that spring clip is properly engaged in notches on float fulcrum pin.

CHOKE:—Valve is offset type with poppet type relief valve.

Automatic Choke—Sisson. See article in Carburetion Equipment Section for adjustment and servicing instructions.

THROTTLE VALVE SETTING:—Part No. P-24059 (20° type). To check throttle valve, insert #58 drill in idle port, two #60 drills in vacuum spark ports. With stopscrew backed off and throttle valve tightly closed, throttle valve edge should be flush with edge of drills (.006" maximum clearance between valve and idle port drill allowable). NOTE—An additional #60 vacuum spark port is drilled at random below throttle valve.

SERVICE PARTS:—Gasket Set—No. J-5968-G.

MODEL EE-22

LINCOLN, V12 MODELS (1940)

This Carburetor same type as used on 1939 Lincoln cars.

ADJUSTMENT & SPECIFICATIONS:—All adjustment and service operations same as for 1939 model. ***See Stromberg Model EE-22 carburetor article in Carburetor Section of manual for complete data and adjust to following specifications:***

Economizer Setting—Throttle valve opening at point where pump piston contacts economizer by-pass valve should be 21/64".

Pump Capacity—20-24 cc. (Slow), 17-21 cc. (Fast) per 10 strokes with pump set for maximum stroke.

Float Level—9/16" below top edge of bowl with engine idling (3 lbs. pressure).

Throttle Valve Setting—.030" from upper edge of throttle valves to lower edge of upper idle port with throttle valves tightly closed.

Number **MODEL EE-16**

A-18341—PACKARD EIGHT, '120' MODELS 1801, 1A (1940)

This Carburetor same design as used on 1939 Packard '120' models.

THROTTLE GUARD NOTE:—Vacuum diaphragm type throttle guard used on all cars with Overdrive to prevent engine stalling at speeds below 20 MPH. See Packard Throttle Guard article in Carburetion Equipment Section for adjustment instructions.

TYPE:—Same design as used on previous cars. Carburetor has integral Fast Idle and Automatic choke. See article in Carburetion Equipment Section for Automatic Choke and Fast Idle servicing data.

IDLING ADJUSTMENT:—Adjust only with engine warm so that Automatic Choke and Fast Idle inoperative (choke valve wide open, fast idle screw on lowest step of fast idle cam) and engine idling at hot or slow idling speed. Make certain that some clearance exists between fast idle adjusting screw and fast idle cam (on opposite end of throttle shaft from idling speed adjusting screw). Set throttle lever stopscrew for correct 6 MPH. idling speed. Turn idling adjusting screw for each carburetor barrel (both screws must be adjusted alike) in for leaner mixture or out for richer mixture. These screws control fuel discharge from lower (closed throttle) idling ports. Standard setting approximately 2-2½ turns open. Recheck idling speed adjustment. See car model tune up page for complete adjustment instructions. Check Fast Idle setting (below).

METERING JETS:—Main metering jets are non-adjustable type located under plug at lower end of each discharge jet. Jets should be changed only for special operating conditions such as high altitudes. See Stromberg Jet Specification table for complete jet data.

ECONOMIZER:—By-pass valve and jet located at bottom of pump cylinder which is operated by pump piston so as to permit continuous discharge from pump nozzle when throttle valve is wide open. Should not require attention but setting can be checked by noting throttle opening when pump piston rests on by-pass valve seat (less over-travel). Throttle opening should be 5/16" (plus or minus 1/64"). Check by inserting drill rod of correct size between throttle valve edge and carburetor wall.

Adjustment—Bend ball end of pump fulcrum lever (walking beam) slightly.

ACCELERATING PUMP:—Same design as used on previous EE-16 carburetors.

Capacity—17-21 cc. (slow), 11-15 cc. (Fast) per 10 strokes of the pump.

Adjustment—No adjustment provided.

Pump Servicing Note—Strainer screen located in plug below pump intake check valve should be removed and cleaned frequently to insure satisfactory pump operation.

FAST IDLE & CHOKE RELEASE:—Check and adjust as directed below. See article in Carburetion Equipment Section for complete servicing directions.

Fast Idle Speed—With throttle lever stopscrew set for correct hot or slow idle speed of 6 MPH., turn fast idle adjusting screw (on fast idle lever—do not confuse this screw with throttle lever stopscrew on opposite end of throttle valve shaft) in until it just contacts lowest step of fast idle cam, being careful not to exert pressure on screw or fast idle lever, then back screw out exactly ½ turn. This clearance will allow fast idle cam to rotate without any drag. Check entire fast idle mechanism for free movement but do not lubricate.

Fast Idle Setting—After setting both slow idle speed (throttle lever stopscrew adjustment) and fast idle speed (fast idle adjusting screw adjustment above), see that choke valve is wide open and close throttle valve completely so that throttle stopscrew is against stop on body. Hold throttle valve in this position and close valve by hand until fast idle screw strikes step on fast idle cam (do not force choke valve beyond this position which will bind fast idle rod or distort fast idle cam spring). Measure choke valve opening at this point by inserting drill rod between upper edge of valve and air horn wall. Opening should be 35/64". Adjust by bending fast idle rod at elbow near upper end.

Choke Release—Open throttle to wide open position so that choke valve is opened by ear on fast idle lever which contacts lug on fast idle cam. Measure choke valve opening by inserting drill rod between valve edge and air horn wall. Distance should be .156-.187" (11/64" drill). Adjust by bending ear on fast idle lever using extreme care not to damage fast idle rod and fast idle cam spring. CAUTION—Throttle valves must be opened by pressing lever on throttle lever end of shaft **not fast idle lever end.**

FLOAT LEVEL:—Fuel Level—Should be 15/32" below top edge of float bowl with engine idling. Adjust by bending float lever arm at point where it is attached to the float (use tool T-24733).

Float Needle Valve & Seat—Part No. P-23509. Furnished only in matched sets. When installing assembly make certain that needle valve has one corner down and is clipped to float lever.

Float Bowl Vent—Bowl vented to atmosphere through opening on side of air horn wall directly below air cleaner collar.

THROTTLE VALVE SETTING:—Throttle valves are No. P-23347 (Left), P-23357 (Right) 5° type. To check throttle valve setting, back off throttle stopscrew so that valves are tightly closed, measure distance from upper edge of throttle valve to lower edge of upper idle port. Should be .030" plus or minus .004".

CHOKE:—Stromberg automatic integral type. See article in Carburetion Equipment Section for complete servicing directions.

Choke Setting—Inverted 'V' mark on thermostat cover scale should coincide with reference mark on top of choke housing. To adjust, loosen three cover screws and rotate thermostat cover assembly.

CAUTION—When connecting heat tube to thermostat cover, do not use excessive pressure which may rotate cover and change setting.

DY-1A—CROSLEY, MODEL A (1939-40)

TYPE:—Single barrel, plain tube, downdraft type with high speed (Main) and low speed (Idle) adjustments.

Fuel System (Idling & Low Speed):—Fuel is metered by restriction at lower end of Idle Tube and flows up through tube (located in main nozzle—see illustration) where it is mixed with air admitted through Idle Air Bleed hole in side of idle tube. Fuel mixture is controlled by Idle Adjusting Screw (at upper end of tube) and flows through Idle Fuel Supply Channel in carburetor casting to Idle Discharge Ports at the throttle edge. For closed throttle idling, all fuel is discharged through lower port. As soon as the throttle is opened for low speed running, additional fuel is discharged through upper port also. Idle system supplies all fuel for car speeds up to approximately 18 M.P.H.

Speeds above 18 M.P.H.—At approximately 18 M.P.H., throttle valve opening causes reduced suction on idle ports and increased suction on main nozzle so that fuel is discharged at main nozzle and idle system drops out. Fuel for main nozzle is metered by Main Adjustment Screw and is mixed with air admitted through holes in nozzle from main nozzle air bleed channel opening into air horn above choke valve. This air is metered by Main Nozzle Air Bleed Restriction located in air bleed channel at top of carburetor main casting.

ADJUSTMENT:—Make adjustments in order as listed below. Preliminary adjustment will allow engine to be started and warmed up (other adjustments should not be made until engine thoroughly warm).

Preliminary Adjustment:—Close Main Adjustment Screw by turning to right (clockwise) until it is lightly seated, then back screw out exactly two complete turns. Close Idle Adjustment Screw by turning to right (clockwise) until it is lightly seated, then back screw out exactly one complete turn. Start engine and run until thoroughly warmed up.

Main (High Speed) Adjustment:—With engine warm and running, open throttle so that engine speed is 30-35 M.P.H. Turn Main Adjustment Screw in or clockwise slowly (¼ turn at a time) until engine slows down due to lack of fuel, then back screw out very slowly (⅛ turn at a time) until maximum speed is secured. Correct setting will be approximately 1½ turns open (first 1000 cars), 1¾-2 turns open (later cars) of screw from inner seated position.

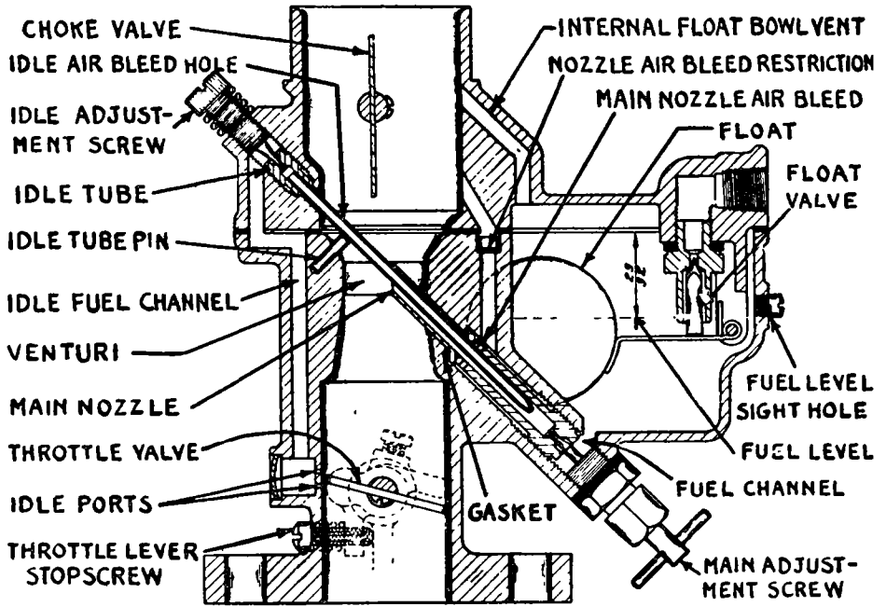
Idle (Low Speed) Adjustment:—Set throttle lever stopscrew so that engine runs at faster than normal idling speed. Close throttle. Turn Idle Adjustment Screw in or clockwise to lean mixture until engine begins to miss, then back screw out slowly until engine fires smoothly. Clear manifold by opening throttle momentarily, then recheck idle setting. Correct setting will be approximately ¾-1¼ turns of the screw from the inner seated position. Set throttle lever stopscrew for idling speed of 7 M.P.H. when pulling car in high gear.

PERFORMANCE:—Should be satisfactory for operation at altitudes less than 5000 feet if adjustments correctly made as directed above. If performance not satisfactory, check adjustments and tune up engine (see car model T&E page for tune up data). See Trouble Shooting Section below.

FLOAT LEVEL:—Fuel Level—Should be 23/32" below top edge of float bowl or just below lower edge of inspection hole on side of float bowl (remove inspection hole plug to check level).

Float Level—To check, invert upper body assembly (air horn and float bowl cover with complete float mechanism), measure from face of body gasket to top of raised seam on each float. Distance should be 1 27/64". To adjust, bend each float lever arm **using extreme care to secure equal setting for both floats.** DISASSEMBLY CAUTION—Before taking off Upper Body Assembly (to check or adjust float level), remove Idle Adjustment Screw, Spring and Idle Tube to avoid damage to tube and main nozzle when upper body assembly lifted off.

Inlet Needle Valve & Seat—Part No. 06287 (matched set).



CHOKE:—Plain butterfly type. Adjust choke linkage so that choke valve is wide open when dash control button is pushed all the way in.

TROUBLE SHOOTING:—Engine Stalls—Check idle speed setting, tighten throttle stop retaining screw, check idling or low speed adjustment, see that idle adjustment screw not ringed, clean idle tube and idle fuel channels with air, check float level (see Fuel Level Note below).

Flatness on Acceleration—Check Idle (Low Speed) and Main (High Speed) Adjustments, check float level (if engine loads up, see Fuel Level Note below), clean idle tube and idle fuel channels with air.

Performance Unsatisfactory—Tune up engine (see car model T&E page for tune up data), check all carburetor adjustments.

Fuel Level Note—If fuel level in float bowl rises above setting, dismantle needle valve, clean needle valve and seat with a soft clean cloth, reseat needle valve by tapping with finger several times while turning needle around. Reset float level. If level not maintained, install new needle valve and seat.

SERVICING:—Before removing Upper Body Assembly (air horn and float bowl cover), remove Idle Adjustment Screw and spring, unscrew and remove Idle Tube through adjusting screw hole—this is important to avoid damage to tube and nozzle when upper assembly lifted off. Idle tube positioning pin in main body casting is not removable. Main nozzle outlet and gasket are staked in main body casting and cannot be removed (nozzle base can be removed through main adjustment screw plug hole after adjustment screw assembly removed). Blow out all jets and channels with compressed air—do not use wires or drills to clean passages. See that float bowl vent to air horn is open and clean.

Reassembly—Replace all worn or damaged parts with genuine Tillotson service parts. Use all new gaskets and replace parts in same order as removed. See that nozzles and plugs are tight. Set float level and adjust carburetor.

MODEL U-1B

WILLYS, PICK UP MODEL 440, PANEL DELIVERY MODEL 440P (1940)

TYPE:—High velocity, triple flexible expanding or automatic venturi type with venturi and reed design similar to that used on Model U-1A (Willys). Main nozzle and metering jet design (fixed type—no high speed adjustment) is new and operates as follows:

Fuel System (Closed Throttle Idling & Low Speed):—Fuel for idling is taken through side holes in main metering jet and channel to mixing chamber at idle adjusting screw (fuel metered by restriction at top of channel) where is mixed with air admitted through two bleeder openings (upper hole has restriction and leads to air horn above venturi assembly, lower hole leads to mixing chamber below venturi—see illustration) and controlled by the idle adjusting screw. Fuel mixture is then taken down through vertical channel (with restriction at upper end) to idle discharge ports at the throttle edge. For closed throttle idling, fuel mixture is discharged through lower port only. As soon as throttle is cracked open, additional fuel is discharged through top port. Idle system supplies fuel for car speeds up to 18 M.P.H.

Driving Range (18-60 M.P.H.):—At speeds above approximately 18 M.P.H., air velocity at nozzle tip in small venturi is sufficient to bring this nozzle into action, the fuel discharged through this nozzle being metered by the fixed metering jet at the nozzle base. The flexible reed valves are calibrated to maintain maximum velocity at nozzle tip (closed at low speed, open automatically at higher speeds) and correct air-fuel ratio throughout the entire driving range. Whenever throttle is opened for acceleration, additional fuel is discharged through accelerating pump nozzle above venturi (see Accelerating Pump below).

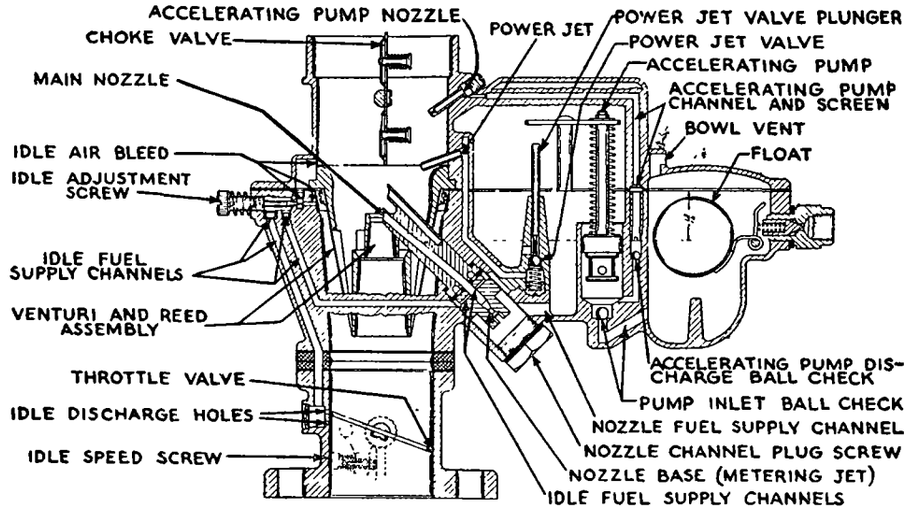
High Speed or Wide Open Throttle Operation:—At speeds above 60 M.P.H. or when throttle more than ¾ open, power jet valve plunger depressed by pump arm and opens power jet valve so that additional fuel is discharged through power jet in carburetor wall at top of venturi assembly. There is an air bleed at the top of the power jet fuel channel.

Main Nozzle Note—All fuel discharged by main nozzle through lower opening in nozzle tip. Upper opening in nozzle tip is not used. Use great care not to damage either opening in nozzle tip when servicing main nozzle as change in shape will alter air flow past nozzle and change discharge characteristics.

IDLE ADJUSTMENT:—With engine warmed up and choke valve wide open, set throttle lever stopscrew for slightly faster than normal idle speed, turn idle adjusting screw counter-clockwise (out) until engine begins to miss, then turn screw clockwise slowly until engine fires smoothly. Final setting should be approximately 1 turn open from inner seated position. Adjust throttle lever stopscrew for idle speed of 7 M.P.H. in high gear. See car model 'T&E' page for complete carburetor tune up instructions.

NOTE—If carburetor out of adjustment, turn idle screw in until it is seated, then back screw out exactly ¾ turn. Warm up engine and adjust as directed above.

PERFORMANCE:—Should be satisfactory if idle adjustment correctly made. Main metering jet is fixed type and no high speed adjustment provided. Standard metering jet should be satisfactory for operation at altitudes up to 3000 feet. For permanent operation at altitudes greater than 3000 ft., install high altitude metering jet (nozzle base) marked 'ALT'.



ACCELERATING PUMP:—Fuel is drawn into pump cylinder through intake ball check valve (in bottom of cylinder) when throttle is closed, and is discharged through outlet ball check valve, strainer (in plug at bowl cover flange) and pump jet in air horn when throttle is opened for acceleration. Upper section of pump piston is spring-loaded on stem to provide a prolonged pump discharge. **Adjustment**—On models where two holes provided in pump lever, engage link in hole nearest throttle shaft if flatness encountered on acceleration.

POWER JET:—Consists of a ball check valve controlling fuel discharge through power jet in carburetor wall above venturi and operated by accelerating pump arm (see Fuel System 'High Speed' above). No adjustment required.

FLOAT LEVEL:—Should be 13/16" below top edge (gasket seat) of bowl with engine running. To check float level, remove air horn and bowl cover assembly, remove gasket, use height gauge to measure actual fuel level below top edge of bowl. Do not press on float lever when checking (valve needle is spring-loaded which will permit some float movement with valve closed). To adjust, bend float lever slightly.
NOTE—When installing needle valve or float make certain that small spring is in place in hollow stem of valve needle. This spring is intended to minimize float movement and float level changes on rough roads.

CHOKE:—Manual control type, fitted with two poppet type relief valves. See that choke linkage properly adjusted to open and close choke valve fully.

SERVICING:—When servicing carburetor, blow out all channels and jets with compressed air (do not use wires or drills in jets or restrictions). Use extreme care not to bend valve reeds (if necessary to remove reeds, install short thick reed first and longer thin reed on outside). See that power jet valve ball seats tightly to prevent fuel discharge through power jet at intermediate speeds (check by

noting jet with engine running) and that plunger installed with small end down against valve ball. Make certain that pump plunger leather is good condition and contacts pump cylinder wall at all points (replace complete plunger assembly if leather worn or damaged). To remove nozzle, take out plug below metering jet, clean threads in casting thoroughly with compressed air, use socket wrench to remove metering jet, then remove nozzle from below taking great care not to damage threads in casting (if necessary, tap nozzle lightly on solid portion between upper and lower nozzle openings on upper end).

Reassembly—Replace all worn or damaged parts with genuine Tillotson service parts, use all new gaskets and re-install parts in same order as removed. Check gasoline level and idle adjustment as directed above.

TROUBLE SHOOTING:—**Motor stalls when idling**—Tighten throttle lever retaining screw and locknut, check idle adjustment. Remove idle adjusting screw, blow out all idling system channels and restrictions, clean metering jet with compressed air. Check fuel level. Tighten air horn and bowl cover retaining screws and carburetor mounting bolts, see that gaskets at these points are in good condition.

Flat Spots—Remove pump jet plug, clean pump jet and channels with compressed air. Remove air horn and bowl cover assembly, clean pump strainer (in pump outlet channel at air horn flange).

MODEL 61A5—Outline 9321
BANTAM, NEW SUPER FOUR SERIES 65 (1940)

TYPE:—Plain tube, updraft, 'balanced' type with float bowl vented through drilled hole in carburetor casting which opens into air horn. Fuel jets consist of a Low Speed or Idling System and a High Speed or Main Jet System in conjunction with a Compensating System which operate as follows:

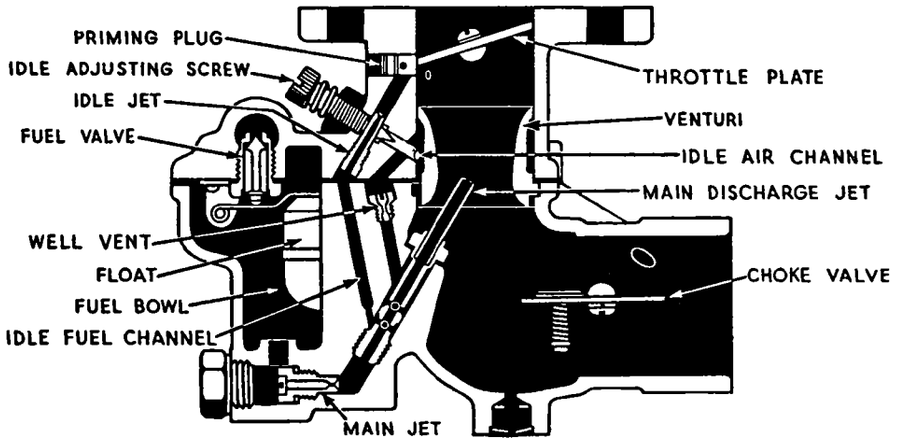
Idling System—Fuel for closed throttle idling and low speed operation is taken from the main discharge jet well through a cross-drilled passage in the lower end of the main discharge jet and up through the idle fuel channel to the Idle Jet which meters this fuel. As the fuel leaves the idle jet it is mixed with air admitted through the Idle Air Channel and controlled by the Idle Adjusting Screw. The fuel mixture is then discharged through the Priming Plug port into the air stream at the throttle edge.

Main Jet System—At higher engine speeds, fuel is discharged directly from the main discharge jet into the throat of the venturi and the idling system drops out. This fuel is metered by the Main Jet located in the fuel channel below the main discharge jet and the discharge jet is air bled by admitting air from the idle air channel through the Well Vent and drilled cross-channels in the lower end of the main discharge jet. This well vent and air bleed channel form the Compensating System. The main jet and compensating system are not adjustable but the main discharge jet delivery can be made richer or leaner by changing the main discharge jet or the well jet (see Performance data below).

IDLE ADJUSTMENT:—Idle adjusting screw controls air for the idle fuel mixture. Adjust only when engine thoroughly warmed up and choke valve wide open. Set throttle stopscrew so that engine idles at 6 MPH., turn idle adjusting screw in or clockwise for richer mixture, out or counter-clockwise for leaner mixture until engine fires smoothly. Final position of adjusting screw should be 1-1½ turns out from inner seated position. Check idle speed and readjust throttle stopscrew.

CAUTION—If idle adjusting screw must be turned in less than ¾ turn from inner seated position for good idling performance, check carburetor for clogged idle channels and jet or for air leaks at gasket between main body and throttle body gaskets (see Servicing below).

PERFORMANCE:—Performance should be satisfactory if Idle Adjustment correctly made as directed above. If necessary to change main discharge jet fuel delivery calibration for special operating conditions, this fuel mixture can be made richer by either increasing the size of the Main Discharge Jet or decreasing the size of the Well Vent. The fuel mixture can be made leaner by either decreasing the size of the Main Discharge Jet or increasing the size of the Well Vent. See Jet Calibration Table below.



FLOAT LEVEL:—Fuel Level—Fuel level in bowl should be 13/32-15/32" below top edge (gasket seat) of float bowl.

Float Level—Bottom of float at free end should be 1 5/32" (plus or minus 5/64") from the gasket seat of the throttle body (bowl cover) with the needle valve closed. Check by inverting throttle body.

Adjustment—Manufacturer recommends that no attempt be made to correct float level by bending float arm. Install new parts to correct level.

CHOKE:—Butterfly type with poppet type relief valve. When checking choke linkage, see that choke valve is wide open when choke control button on instrument panel is pushed in, and that valve is fully closed when button is pulled out.

SERVICING NOTES:—Always use new Body Gasket #C142-16 between main body casting and throttle body casting whenever carburetor is dismantled for cleaning. Carburetor is 'balanced' type and air leaks at this point will upset carburetor performance.

ZENITH JET SPECIFICATIONS
Bantam—Model 61A5—Outline 9321

Part	Size	Part Number
Venturi	#16	C38-35
Main Jet	#18	C52-6-1
Idling Jet	#15	C55-6
Main Discharge Jet	#60-1	C66-26-1
Well Vent	#20	C77-18
Fuel Valve & Seat	#25	C81-17

NOTE—Fuel valve and Fuel Valve Seat (Float Valve) are furnished in matched sets. Always replace both parts as a unit.

CARBURETION EQUIPMENT SECTION

'CE' PAGES

The CARBURETION EQUIPMENT SECTION contains the *Complete Separate Treatment* of the SPECIAL EQUIPMENT connected with the Fuel System, such as Anti-Percolators, Automatic Chokes, Carburetor Controls, Fast Idle and Throttle Cracking Devices, Fuel Pumps and Gas Gauges. The Illustrations, Adjustment, Performance, Testing and Trouble Shooting of Each Unit is fully treated.

CAPACITY AND PRESSURE TESTS FOR ALL TYPES

NOTE:—Manufacturer recommends that Fuel Pump Analyzer No. 1521551 be used in making these tests. All tests should be made with the fuel pump in place on the engine and the engine running to drive the pump. Engine speed should be 30-35 M.P.H. (for capacity test) or lowest possible idling speed (for pressure test).

TESTING:—Test equipment should be connected at pump outlet. Disconnect fuel line from pump to carburetor at pump, use special fitting and connect "T" connection, use rubber tubing to join gasoline line to end of "T", connect test equipment (bleeder line, pressure gauge and shut-off valve to open and close bleeder line) to side opening of "T" connection. Operate engine and make tests in following order.

CAPACITY TEST

Bleeder tube end must be at carburetor level or slightly higher. Shut-off valve should be open permitting fuel delivery through bleeder tube. Operate engine at 30-35 M.P.H. note quantity of fuel pumped in 45 seconds or 1 minute(see table below). Pressure gauge not used in making this test. If pump capacity in excess of 1 pint, check pump pressure (see test below), and if pressure not excessive pump need not be checked further. Delivery capacity of 1 pint is ample for all engine operation.

Fuel Pump Type	Minimum Capacity
A, B, E, G, J, L, N, O, P, R, S, T, V, W, X, Y	1 Pt. in 1 Minute.
C, D, F, I, AA, AB, AG, AH, AJ, AK, AU, AW	1 Pt. in 45 Seconds
AC, AD, AE, AF, AL, AM, AR, AS, AT	1 Pt. in 1 Minute.

PRESSURE TEST

Idle engine at lowest possible speed to secure static pressure reading. Close shut-off valve. Note pressure gauge reading. Pressure should not exceed figure in table below. If pressure does not exceed this figure and capacity is satisfactory, fuel pump operation is OK. Excessive pressure may cause rich fuel mixture and in extreme cases flooding of carburetor (if carburetor floods and pressure is not excessive, check carburetor float level setting and see that float needle valve shuts off tightly).

Fuel Pump Type	Maximum Pressure
A, B, E, G, J, L, N, O, P, R, S, T, V, W, X, Y	3½ pounds.
C, D	4¼ pounds.
F, I, AA, AB, AK, AU	4½ pounds.
AC, AF, AR	3 pounds.
AD, AE, AG, AL, AM	3½ pounds.
AH, AW	3¾ pounds.
AJ	4 pounds.
AS, AT	4¼ pounds.

TROUBLE SHOOTING

FUEL PUMP UNIT

TROUBLE SHOOTING:—If the pump action is not satisfactory, check in accordance with the following table:

No Fuel or Insufficient Fuel at Carburetor:

(1) Gasoline tank empty.
(2) Bent, kinked, leaky tubing or connections. Tighten all connections. Check condition of tubing. Replace if necessary.
(3) Dirty filter screen or loose sediment bowl. Take off glass sediment bowl, clean filter screen. Examine cork gasket and replace if necessary. Tighten bowl thumbnut securely.
(4) Loose valve plugs or caps. Examine gasket under head of plug, replace if necessary. Tighten plugs securely.
(5) Dirty or warped valves. Loose valve seat. Remove valve plugs and take out valves. Wash valves in gasoline. If warped or gummed, replace. Examine valve seat for smooth surface and see that seat is tight in pump body. Replace valves and assemble valve springs and plugs.
(6) Worn linkage, weak driving spring. Check for excessive play in linkage or worn rocker arm pin which will shorten pump stroke. Check driving spring (under diaphragm).
(7) Insufficient pump capacity. Check capacity (above).

Fuel Leakage through Vent in Pump Body:

(1) Worn or punctured diaphragm. Replace diaphragm.
(2) Loose diaphragm nut or defective gasket. See that nut on upper end of pull rod is tight and that gasket under nut is in good condition.

Fuel Leakage at edge of Diaphragm:

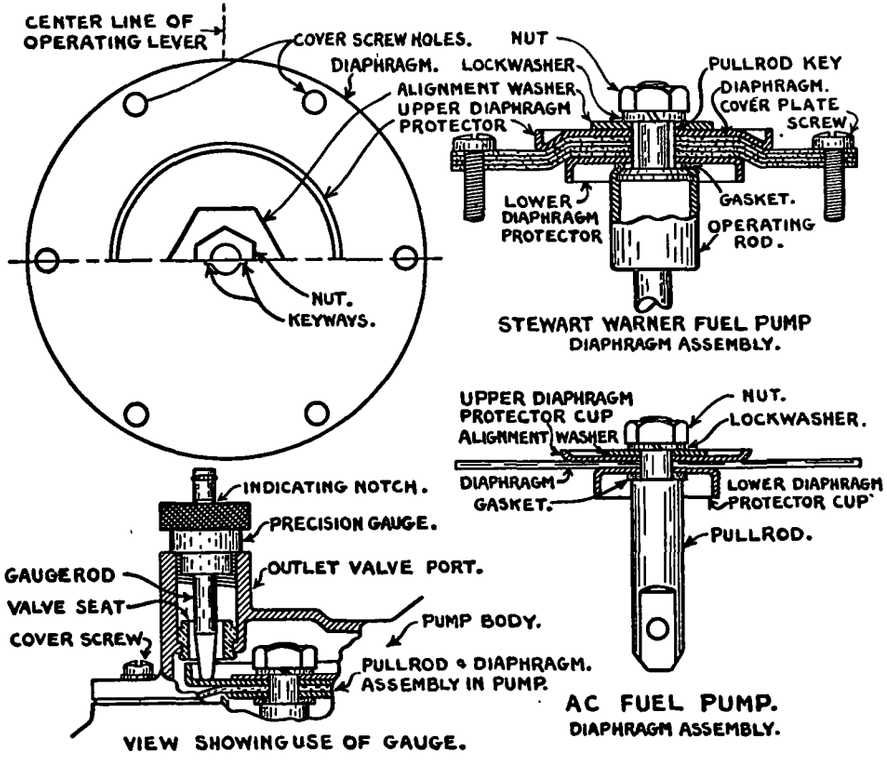
(1) Loose cover screws. Tighten cover screws securely (alternately around pump body).

Carburetor Flooding:

(1) Carburetor needle valve not seating. Check for worn valve or seat, sediment or other obstruction preventing seating of valve. Check float level.
(2) Excessive pump pressure. Check pressure (above).

VACUUM PUMP UNIT

TROUBLE SHOOTING:—If vacuum pump performance is not satisfactory as evidenced by faulty windshield wiper action, check as directed in following table:



Windshield Wiper operations slow at high speeds or when accelerating. Indicates that vacuum pump is not operating. Check windshield wiper lines and fittings. If no leaks are found, disassemble vacuum pump and check valves and diaphragm.

Oil Smoke in Engine Exhaust. Indicates punctured diaphragm. To check before disassembling pump, disconnect line between pump and manifold, operate pump, hold a piece of paper over pump outlet. Oil spray in exhaust from pump indicates a punctured diaphragm (if no oil spray noted at this point, oil smoke may indicate defective piston rings, etc.

TESTING:—When fuel pump fails to operate satisfactorily, check pump for minor defects as directed on individual system pages before any attempt is made to disassemble pump. Manufacturers recommend that pump be given an operating test after being removed from engine to conclusively determine that pump is defective. See directions below.

TO REPLACE DIAPHRAGM:—Special fixtures and gauges are necessary in replacing diaphragms on A.C. pumps. To replace diaphragm, mount pump body rigidly in vise or on a test stand, take off pump cover (first mark pump cover and pump body to insure correct reassembly), take off nut on end of pull-rod, remove lock washer, alignment washer, upper diaphragm protector cup and old diaphragm. To install new diaphragm, assemble pull-rod gasket and lower diaphragm protector cup (with cup portion pointing down) on pull-rod, taking care that gasket is seated against shoulder on pull-rod. Then place four layers of diaphragm material on pull-rod and carefully line up holes, using a special locating ring or several cover plate screws. Place upper diaphragm protector cup on pull-rod (with cup portion pointing up), place hexagonal alignment washer on diaphragm protector, and assemble lock washer and pull-rod nut. Use special wrench to hold the alignment washer from turning while the nut is being tightened and keep diaphragm holes lined up with the locating ring or several of the cover screws until the nut is tight. This is very important. Place pump cover in position and insert cover screws. Before cover screws are tightened, insert end of alignment wrench in hole in pump body and force pull-rod and diaphragm assembly to extreme upper position and hold in this position while cover screws are evenly tightened (tighten screws alternately to secure correct alignment of pump cover). Test diaphragm assembly by installing precision gauge in outlet valve port so that gauge rod rests on upper diaphragm protector cup. With the diaphragm correctly installed and in the extreme upper position the notch in the gauge rod should be visible at the top of the gauge.

Combination Fuel and Vacuum Pumps. Diaphragms should be installed in this type pump with the pull-rod assembly out of the pump. Clamp the flatted end of the pull-rod in a vise, assemble pull-rod gasket and lower diaphragm protector (cupped side down) on pull-rod, place five layers of diaphragm material on pull-rod, lining up the tabs on the layers and turning the diaphragm so that the tabs are 7/16 inch clockwise from the center line of the pull-rod flatted end. Assemble upper diaphragm protector (cupped side up), alignment washer, lock washer and nut. Hold alignment washer with special wrench and securely tighten nut. Test diaphragm position to make certain that diaphragm layers have not been twisted or moved from position. This is very important. Assemble leather oil seal and cap on pull-rod boss, install driving spring, place pull-rod assembly in pump with diaphragm tab pointing toward center of mounting flange on pump body. Invert pump and engage flatted end of pull-rod in notch in operating link, turn pull-rod assembly one quarter turn until tab points toward projection on diaphragm flange. This will lock pull-rod and operating link Then assemble pump cover as directed above.

HUDSON AND TERRAPLANE MODELS

1934-35-36 PUMP REPLACEMENT

NOTE:—Manufacturer recommends that 1937 Fuel Pump, Type AK #1523289, be used for replacement purposes on these earlier models. New pump has greater capacity and will supply fuel under conditions which may cause Vapor Lock in the smaller original pumps.

INSTALLATION:—Same gasket and spacer assembly must be used with this Type AK pump, when installing pump on earlier models, as is used on 1937 car models to secure correct pump stroke (original pump used single gasket only). See 1937 pump installation data (following).

1937-1938 PUMP INSTALLATION

TYPE AK FUEL PUMPS:—Special spacer (composed of five layers with total thickness of .275" which compresses to .250") must be installed between pump baffle and pump mounting flange. This spacer must not be confused with type used on combination fuel-and-vacuum pumps (see following section) which is same size. To install pump, place spacer assembly next to fuel pump mounting flange, then the baffle with the flat side toward the fuel pump, install gasket between baffle and crankcase. Make certain that insulating sleeves installed on mounting capscrews and insulating washers under capscrew heads.

NOTE—To correct pump noise on early 1937 models (similar to noisy tappet) caused by pump operating lever striking right side of crankcase, file back of lever near end slightly (bright spot on lever will show where it has been striking).

TYPE AB COMBINATION FUEL-AND-VACUUM PUMPS:—This pump cannot be installed on earlier models (cam too narrow and stroke insufficient). Special spacer (composed of six layers with total thickness of .312" compressing to .281" when installed) must be used between pump mounting flange and crankcase. Baffle is installed in recess in pump mounting flange (see Note on baffle gasket below). Install baffle with flat side toward pump and small tongue over oil return hole at bottom (if baffle reversed, flange at top will strike pump arm, and drain hole flapper will prevent oil returning to crankcase and cause oil leakage through breather hole in pump body). Spacer acts as gasket between pump and crankcase. Make certain that pump operating lever is placed between camshaft and right side of crankcase before installing mounting screws.

NOTE—On all 1937 and first 1938 combination fuel-and-vacuum pumps, vellumoid gasket, Part No. 156324, should be installed between oil baffle and pump body whenever pump removed for servicing. This gasket acts as oil seal. On later models, baffle recess is shallower and no gasket is needed.

TYPE B

Std. Equipment On:

AUBURN 6, MODELS 653 (1935), 654 (1936-37)

WILLYS-KNIGHT, MODEL 66-D, 66-E (1932-33)

DESCRIPTION:—**The AC Fuel Pump is a mechanically operated gasoline pump. The pump is mounted on the side of the engine block and is driven through a rocker arm by an eccentric cam on the camshaft. It supplies gasoline at a positive pressure directly to the float chamber of the carburetor. The gasoline flow is controlled entirely by the needle valve in the carburetor float chamber and by the speed of the car so that the operation of the pump is entirely automatic.**

OPERATION:—**The shaft (G) which supplies power to operate the pump is ordinarily the camshaft of the engine. When the camshaft is rotated, the eccentric cam (H) causes the rocker arm (D) to move backward and forward. The movement of the rocker arm which is pivoted at (E) pulls down the pull rod (F) together with the pump diaphragm (A) which is bolted on the upper end of the pull rod between the cup shaped metal discs (B). This creates a vacuum in the pump chamber (M) which causes gasoline from the fuel tank at the rear of the car to enter the pump through the inlet (J) into the sediment bowl (K) through the filter screens (L) and the inlet valve (N) and fill the pump chamber. As the eccentric completes a revolution the rocker arm ceases to pull on the pull rod and the driving spring (C) forces the pull rod and diaphragm upward. This closes the inlet valve and opens the pressure valve (O) causing the gasoline to flow through the outlet (P) to the carburetor float chamber. When the carburetor bowl is filled and the float needle valve closes, the pressure of the gasoline backed up in the pump chamber is sufficient to hold the driving spring (C) compressed, holding the pull rod and diaphragm in its lowest position. The movement of the rocker arm which continues as long as the engine is absorbed by linkage (T). Pump remains inoperative until sufficient gasoline has been used from the carburetor float chamber to allow the driving spring to force the pull rod upward again when the pump resumes operation. This spring (S) is used merely to keep the rocker arm in contact with the eccentric to eliminate noise and to take up the free motion of the linkage and rocker arm break.**

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pint in 1 minute. **Pressure**—3½ lbs. maximum.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyser to check performance before removing pump from car.

SERVICING:—See previous page on 'Servicing Fuel Pumps' for complete directions on servicing these pumps. Manufacturer recommends that pump not be disassembled further than is necessary to make tests and repairs outlined above. Special fixtures are necessary in reassembling the pump.

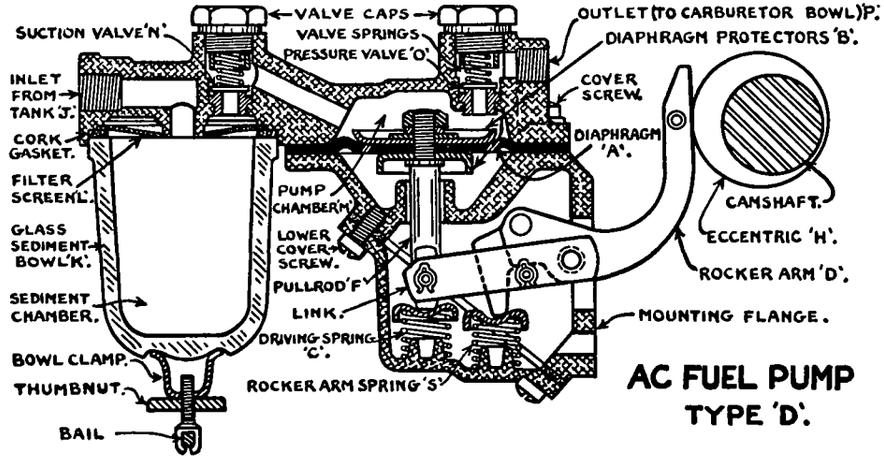
LA SALLE V8, ALL SERIES (1932-33)
LINCOLN, V8 & V12 MODELS (1932)
PIERCE ARROW, 8 & 12 CYLINDER MODELS (1936-37-38)

DESCRIPTION:—The Type D is a mechanically operated, diaphragm type pump and is similar in design and operation to the other A.C. types except that the driving spring (C) is located within the lower cover of the pump body and bears directly on the lower end of the pull rod instead of being located within the upper pump body and bearing on the lower diaphragm protector.

OPERATION:—As in previous pump designs, the down stroke of the diaphragm and pull rod is positively operated, the pull rod being pulled down through the movement of the rocker arm toward the pump body as the eccentric (H) is rotated by the rotation of the camshaft. The rocker arm (D) and pull rod (F) are connected by a linkage. The downward movement of the diaphragm (A) creates a vacuum in the pump chamber (M) and gasoline is drawn in through the inlet (J) into the glass sediment bowl (K) and then through the filter screen (L) and suction valve (N) into the pump chamber. When the down stroke is completed, the rocker arm is forced to follow the face of the eccentric by the rocker arm spring (S), releasing the pull rod linkage and allowing the driving spring (C) to force the diaphragm upward. This forces the gasoline in the pump chamber out through the pressure valve (O) and the outlet (P) to the carburetor.



Fuel delivery is controlled by the back pressure of gasoline in the delivery line, so that whenever the carburetor float valve closes the back pressure holds the diaphragm at the bottom of its stroke with the driving spring compressed. The rocker arm continues to move as long as the eccentric cam rotates but this movement is absorbed by the linkage. Whenever the carburetor float valve reopens the pumping action is resumed.

PERFORMANCE:—See article on Fuel Pump Testing.

Capacity—1 pint in 45 seconds. **Pressure**—4¼ lbs. maximum.

SERVICING:—For complete directions on dismantling pump for diaphragm replacement, assembly of new diaphragms and bench testing of pumps, see separate page on 'Servicing Fuel Pumps'. Manufacturer recommends that pump not be disassembled further than is necessary to complete the operations noted in table above as special fixtures are necessary to reassemble pump.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyser to check performance before removing pump from car.

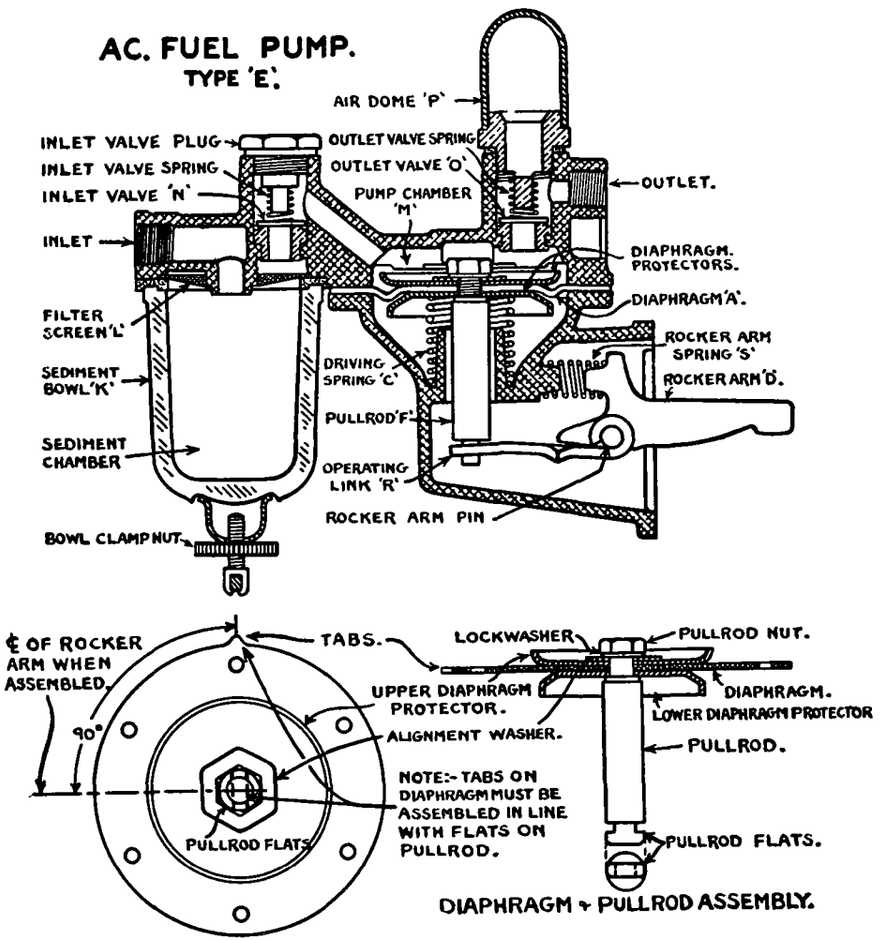
ROCKNE, 65, 75 ('32), 10, 31 ('33)

DESCRIPTION:—This fuel pump is of the mechanical, diaphragm type. It differs from previous designs in that the linkage has been simplified and the rocker arm spring relocated (see illustration). An air dome over the outlet valve is used. In servicing (replacing diaphragm), a preliminary assembly must be made with the pullrod out of the pump and the complete assembly then installed (see complete directions below).

OPERATION:—The down stroke of the diaphragm is positively actuated by the rocker arm 'D', which is connected to the pullrod 'F' through the link 'R'. The down stroke of the diaphragm causes a vacuum in the pump chamber and gasoline is drawn through inlet into the sediment chamber, through the filter screen 'L', and the inlet valve 'N' into the pump chamber 'M'. The rocker arm is forced to follow the eccentric driving cam by the rocker arm spring 'S', releasing the pullrod linkage, and the diaphragm is then forced up by the driving spring 'C', forcing the gasoline in the pump chamber through the outlet valve 'O' and the pump outlet to the carburetor. Fuel delivery is controlled by the back pressure of the gasoline in the carburetor float bowl so that when the carburetor float valve closes the back pressure will hold the diaphragm at the bottom of its stroke with the driving spring compressed. The rocker arm continues to move with the rotation of the eccentric cam but this action is absorbed by the pump linkage. Whenever the carburetor float valve reopens, the pumping action is resumed.



PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pt. in 1 min. Pressure—3½ lbs. maximum.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyser to check pump performance before removing pump from car.

SERVICING:—Servicing and testing of this type pump is similar to previous types (see page on 'Servicing Fuel Pumps') except for replacement of diaphragm. Complete directions for replacement of diaphragm are given below. Manufacturer recommends that pump not be disassembled further than is necessary to make tests and repairs indicated in Trouble Shooting table as special fixtures are necessary for reassembly.

Diaphragm Replacement:—With pump disassembled (pullrod out of pump body) and old diaphragm removed, clamp pullrod in vise, engaging flatted end of pullrod between vise jaws. Assembled pullrod gasket, lower diaphragm protector (cupped side down), four layers of diaphragm cloth, upper diaphragm protector (cupped side up), alignment washer, lock washer, pullrod nut, on pullrod in order given. Line up tabs on diaphragm and turn diaphragm layers so that tabs are in line with flatted end of pullrod (see illustration). Use special alignment washer wrench (#846291) and keep diaphragm from twisting or turning while pullrod nut is being tightened. Remove complete assembly from vise, clamp pump body in vise, place driving spring in position, insert diaphragm assembly, push down on diaphragm assembly (compressing driving spring), engage flatted end of pullrod in rocker arm link, turn diaphragm assembly 90° to right or left until holes in diaphragm line up with holes in pump body. Place pump cover in position, engage cover screws, flex diaphragm to extreme high position while tightening cover screws. Diaphragm gauge (#846295) used in testing assembly on previous pump designs should not be used on Type E pumps.

Rocker Arm Linkage. Whenever rocker arm or rocker link is removed from pump, make certain that link is replaced with loop upward (see illustration). Rocker arm pin must be secured with retaining rings.

TYPE G
MODELS B, BB FOUR CYLINDER CARS & TRUCKS (1932-33)

TYPE L
MODEL 18 V8 CARS & TRUCKS (1932)—EARLY PRODUCTION.

TYPE N
MODEL 18 (1932), 40 (1933) V8 CARS & TRUCKS.

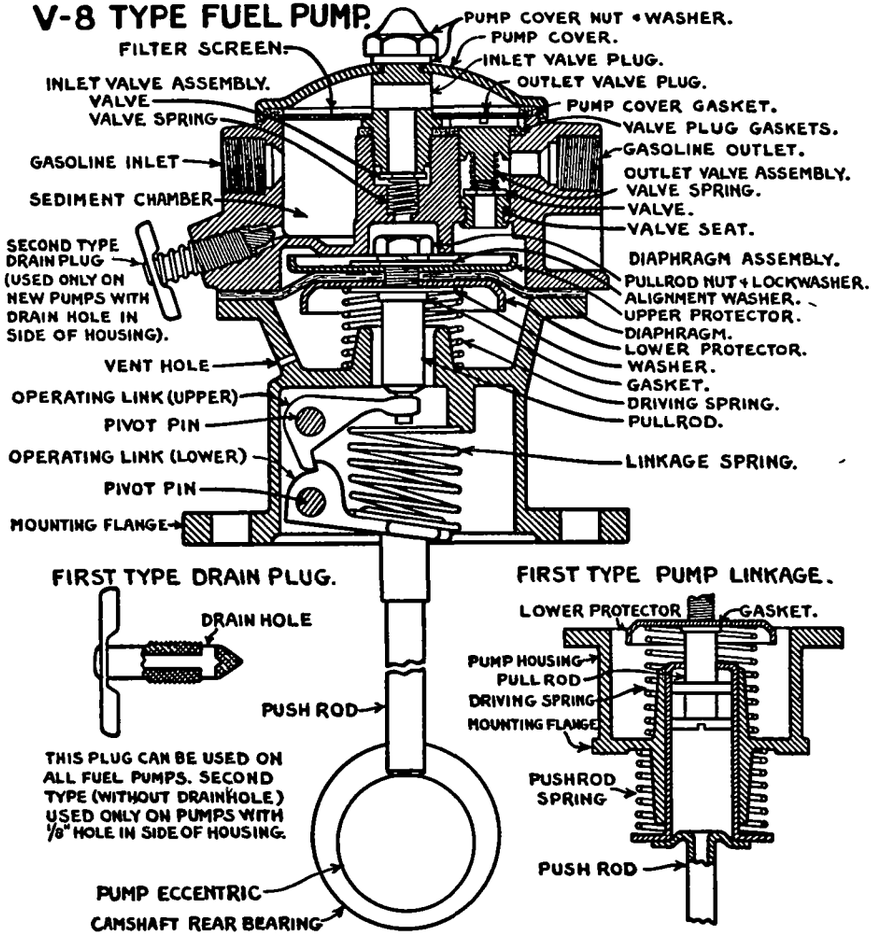
NOTE:—1934 and later Ford models equipped with AC Type R fuel pump. See article on Type R pump for data on these later models.

DESCRIPTION:—The Ford Fuel Pumps are mechanically operated diaphragm pumps mounted on the crankcase and driven by an eccentric on the camshaft. Two types of pump have been used on the V-8 models. The principal difference in these types is in the linkage (see illustration). On the first type pump, diaphragm and pullrod were pulled down by the pushrod spring when the pushrod was moving downward as the eccentric moved away from the pump (downward). On this type the pushrod merely compressed the pushrod spring on the upstroke. On the later type V-8 pump and the four cylinder model, the diaphragm and pullrod were pulled down positively by the pushrod linkage. Both pumps are similar in operation in that the downstroke of the diaphragm and pullrod are completed on the high point of the camshaft eccentric with the pushrod or operating lever moving toward the pump body.

OPERATION:—As the camshaft eccentric rotates and forces the pushrod (V-8) or operating lever (4 cyl.) toward the pump body, the operating linkage pulls the diaphragm and pullrod down creating a vacuum in the pump chamber. This causes gasoline to flow from the main tank through the inlet into the sediment chamber and then through the filter screen and down through the inlet valve into the pump chamber, filling it with gasoline. As the pushrod or lever moves away from the pump (being forced to follow the eccentric by the linkage or pushrod spring), the driving spring under the diaphragm forces the diaphragm upward, forcing the gasoline out through the outlet valve to the carburetor, the inlet valve being closed meanwhile by the inlet valve spring. When the pushrod reaches the bottom of the stroke, the cycle is repeated.

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pt. in 1 minute. **Pressure**—3½ lbs. maximum.

TROUBLE SHOOTING:—The following repairs may be performed on the pump without removing the pump from the engine. If the trouble cannot be located and repaired by these tests the pump should be removed and dis--assembled on the bench:



1. **Loss of Vacuum.** Pumping action is erratic or pump fails completely. Tighten all connections in gasoline line between tank and pump, tighten drain plug, examine gaskets under pump cover and pump cover nut, tighten pump cover nut.

2. **Filter Screen Clogged.** Filter screen is located under pump cover. Take off pump cover nut, remove pump cover and clean screen. If necessary, replace screen with new design incorporating reinforcing ribs to prevent distortion of the screen. See that cover gasket and cover nut gasket are in good condition before reassembling.

3. **Dirty or Warped Valves, Loose Valve Plugs or Seat.** Remove pump cover and valve plugs and inspect valves. Wash valves in gasoline. Replace if warped or damaged. Examine valve seats and see that outlet seat is tight in pump body. In replacing valves, see that springs are installed properly. Make certain that valve plug gaskets are in good condition and that plugs are tightened securely. Inlet valve plug should be examined whenever pump cover is removed as plug may be loosened by taking off pump cover nut.

4. **Leaks at Diaphragm.** Tighten upper pump body screws evenly and securely. Make certain that leakage is actually occurring at this point and not at the drain plug or pump cover.

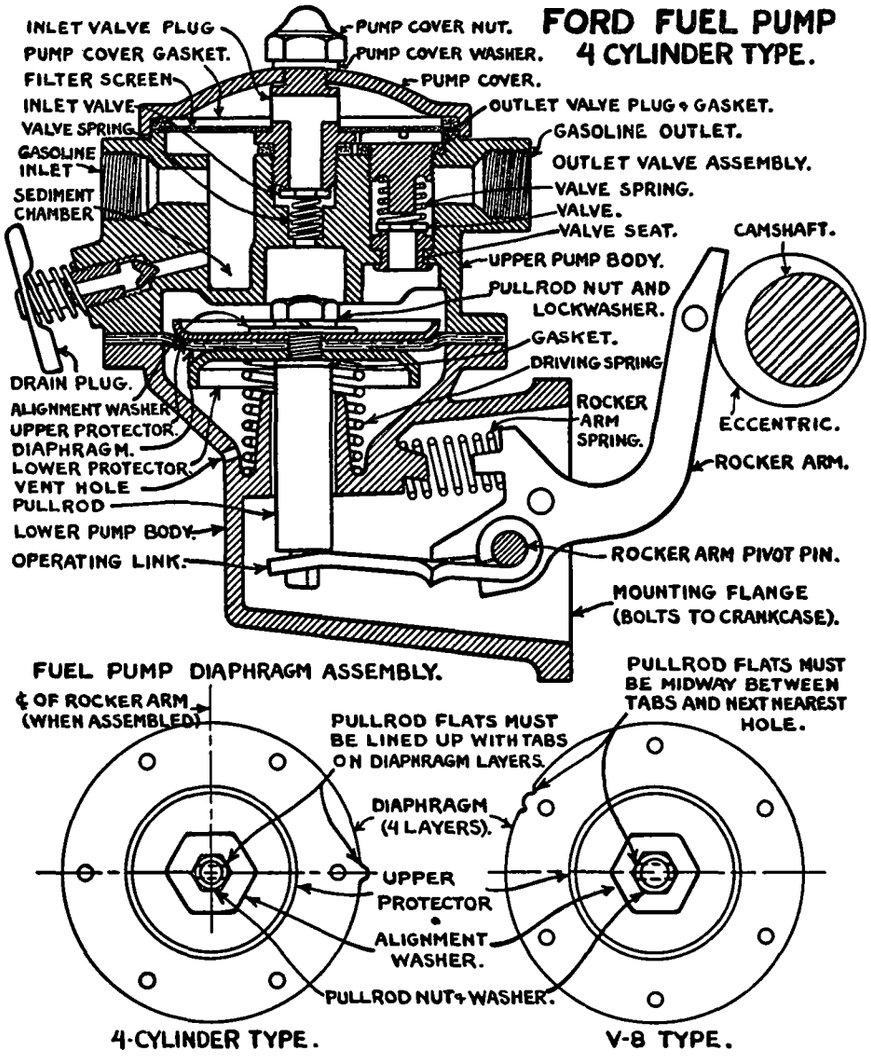
5. **Sediment and Water in Pump.** Fuel pumps are provided with a sediment chamber in the pump body and a drain plug on the side of the upper pump body. On the first type pumps the drain plug was hollow and sediment and water could be drained off by unscrewing the drain plug slightly. On later pumps a ⅛ inch hole was drilled through the side of the drain plug boss and a new Type B-9185-B solid drain plug used. Water is drained from this type pump by unscrewing the drain plug until this hole is connected to the sediment chamber. The first Type B-9185-AR drain

plug (which may be identified by the hole just back of the taper seat) can be used on either type pump but the new type drain plug without this hole should only be used on pumps with the ⅛ inch drain hole drilled in the pump housing. Water and sediment should be drained from the pump at approximately 1000 mile intervals.

6. **Leakage at Vent Hole.** This may indicate a punctured diaphragm or leakage around the pullrod. This will require disassembling of the pump, replacement of the diaphragm or replacement of the pullrod gasket and tightening of the pullrod nut (see instructions below).

7. **Sticking Pushrod (Type L Pump only).** Remove pump from engine and examine action of pushrod. Clean pushrod and spring or replace if necessary.

SERVICING:—If the above operations do not correct pump trrouble or if it is necessary to disassemble pump to replace diaphragm or correct leakage at pullrod, spot upper and lower pump bodies to assure correct reassembly, remove pump cover by taking off pump cover nut, remove upper pump body by taking out upper body screws. This will expose diaphragm assembly. In replacing diaphragms, diaphragm assembly must be completed off the pump on both the new V-8 and 4 cylinder pumps. This will require disengaging the pullrod from the operating link and mounting the pullrod in a vise.



Diaphragm Assembly. Clamp flatted end of pullrod in jaws of bench vise (Type B-9393 rod, 2⅛" long over all on 4 cyl. pump. Type 18-9405-B rod, 1 13/16" long over all on new type V-8 pump). Place pullrod gasket over threaded end of pullrod. Place lower diaphragm protector washer with dished side down on pullrod above gasket. Place four layers of diaphragm material on pullrod (these must all be new—never use some old layers), lining up tabs on circumference of diaphragm with center line of flats on pullrod (4 cyl. pump), or so that center line of flats is midway between tabs and next nearest hole (V-8 pump)—see illustration. Place upper diaphragm protector on pullrod above diaphragm with dished side up. Assemble alignment washer, pullrod lock washer, and pullrod nut in order and tighten nut loosely with the fingers. Then hold diaphragm alignment washer from turning with special wrench No. V-83 and tighten pullrod nut securely. It is very important that the diaphragm should not turn or become wrinkled while tightening the nut and the position of the tabs must be checked after the nut is tight.

Remove diaphragm assembly from vise, clamp pump body in vise, place diaphragm spring in position in pump body with lower end over boss, dip diaphragm assembly and pullrod in kerosene and install in pump. The tabs on the diaphragm should be in line with the pullrod on the 4 cylinder pump and 30° to one side of the center line of the rocker arm on the new type V-8 pump. Push downward on the diaphragm compressing the spring until the flatted end of the pullrod is engaged in link and turn diaphragm 90° to correct position. If holes in diaphragm do not line up with holes in mounting flange when diaphragm assembly is turned 90°, turn slightly so that holes line up and tabs are at point nearest 90° from original position (see illustration).

Important. In assembling upper pump body, place upper pump body over diaphragm, insert cover screws and turn down cover screws loosely or until they touch the lock washers. Then press in on pump lever (4 cyl. pump), or use a small rod to press up on lower pump link (V-8 pump) so that diaphragm is at the lowest possible position. Hold diaphragm in this position and tighten the cover screws evenly and securely. This is necessary in order to secure the correct pump stroke.

Rocker Arm and Link Assembly. Whenever rocker arm and link have been disassembled, the link should be installed in the pump body with the flange upward (see 4 cylinder Type G illustration) and the rocker arm inserted so that it engages one side of the link. Rocker arm pin should then be inserted through hole in pump body so that it engages one side of the rocker arm. Then place rocker arm spring in position, making certain that spring engages projection on rocker arm. Then hold rocker arm in operating position and force pin through rocker arm and link so that it enters the second hole in the pump body, assemble retaining rings on pin. See that rocker arm operates freely.

OPERATING TEST:—The pump may be tested by connecting a piece of rubber tubing approximately 30 inches long to inlet opening, immersing the end of the tubing in a pail of gasoline and operating the pump by hand. The pump should raise gasoline 30 inches and should deliver fuel at the outlet after not more than forty strokes. If fuel does not flow from the outlet after forty strokes, the pump will not perform satisfactorily on the car. The pump suction and pressure may be tested by holding the finger alternately over the inlet and outlet openings while the pump is operated. When

installed on the car, the pump should prime itself and deliver fuel to the outlet in twenty seconds or less with the engine being turned over by the starter.

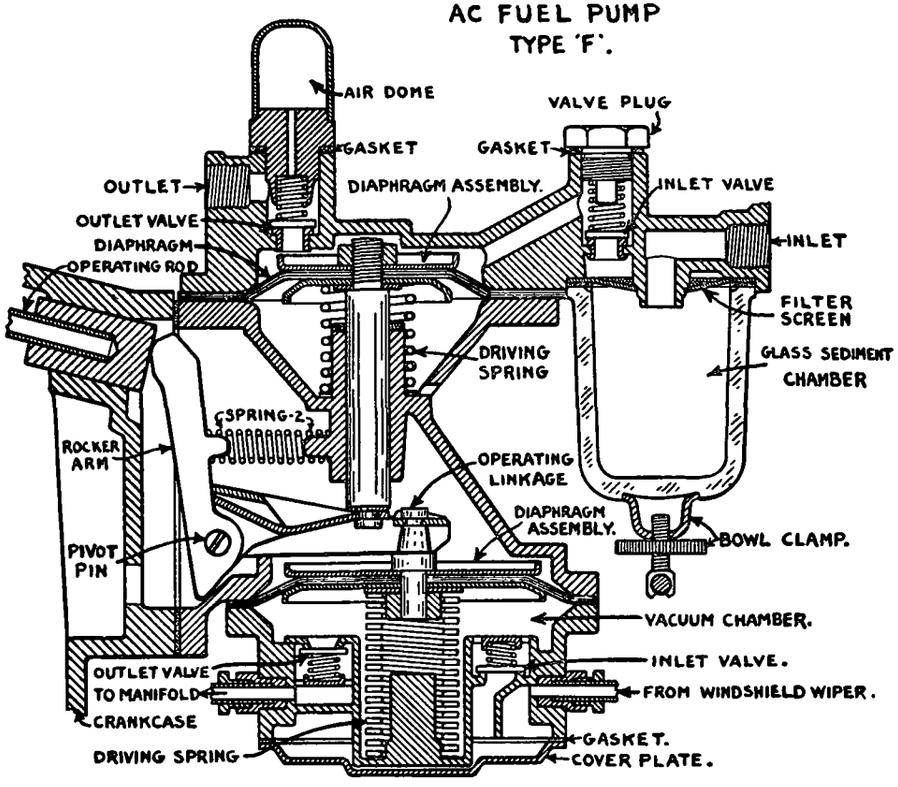
STUDEBAKER, 73, 82, 92 ('33), C ('34), 1C ('35), 2C ('36), 3C ('37), 4C ('38), 5C ('39).

DESCRIPTION:—These types fuel pumps consist of two distinctly separate units, a fuel pump (upper section of the unit) and a vacuum pump (lower section of the unit) which are entirely separate except that the same operating linkage is used for both units. The Fuel Pump is similar in design and operation to the Type E (see separate article for complete data on servicing of fuel pump section).

The Vacuum Pump unit is designed for windshield wiper operation and acts as a booster pump to ensure continuous windshield wiper operation even when the car is operated with wide open throtttle and consequently low manifold vacuum.

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pt. in 45 sec. (F, I), 1 min. (J).
Pressure—4½ lbs. (F, I), 3½ lbs. (J), maximum.



OPERATION OF VACUUM PUMP:—The vacuum pump consists of a vacuum chamber containing the inlet and outlet valves and closed at the upper end by the pump diaphragm. A spring is assembled in the center of the pump under the diaphragm. The operating shaft on the upper surface of the diaphragm assembly is connected to the pump rocker arm through the linkage. In operation when the rocker arm is actuated by the eccentric on the camshaft the vacuum pump diaphragm is forced down, expelling any air in the pump chamber through the outlet valve into the manifold. When the rocker arm moves back (freeing the pump linkage), the driving spring under the diaphragm forces the diaphragm upward creating a vacuum in the chamber, opening the inlet valve and causing the windshield wiper to operate.

Whenever the engine is operated with the windshield wiper turned off the vacuum in the vacuum chamber will hold the diaphragm at its lowest position (with the driving spring compressed) and the vacuum pump will not operate. Whenever the manifold vacuum is higher than the pump vacuum the pump will likewise be inoperative and the windshield wiper will be operated by the manifold vacuum straight through the pump with both valves open. At all other times the pump operates as a booster in operating the windshield wiper.

SERVICING (VACUUM PUMP SECTION):—To replace vacuum pump diaphragm, assemble in order, pull rod gasket, protector washer, five layers of diaphragm cloth, protector washer, alignment washer, lock washer, pull rod nut. Line up holes in diaphragm layers and see that center line of flats on pull rod is exactly midway between adjacent holes on diaphragm. Hold diaphragm alignment washer from turning while pull rod nut is being tightened. Follow directions below for assembly of pump.

Assembly of Vacuum Pump Section. Place fibre inlet valve in position on brass valve seat in body. Place inlet valve spring in position on valve. Place valve stop plate (spider-shaped die-cast piece) on top of valve spring with top coil of spring seated in stop plate. Check assembly of inlet valve by pressing down on inlet valve stop, see that valve spring is properly centered in stop and that legs of stop plate fit in recess in body. Place outlet valve spring in position, see that spring is centered in recess. Place outlet valve on spring. Hold down on inlet valve spring stop plate, slide valve retainer gasket in place, place valve retainer on top of gasket (without releasing inlet valve spring). Mount valve retainer in place, using flat-head screws (tighten center screws first), make certain that valve retainer is correctly installed with countersunk holes facing upward. Invert vacuum pump body, place screen in position, see that screen is flat and fits around shoulders of body screw holes. Assemble bottom cover.

Installing Vacuum Pump Section. Invert fuel pump and mount in a vise on the bench. Install vacuum pump diaphragm assembly, making certain that flatted end of pull rod is engaged in operating link and turned 90° to position for correct engagement. Place diaphragm spring in position on diaphragm. Place assembled vacuum pump unit in position on fuel pump, make certain that diaphragm spring is centered on boss in vacuum pump body. Push in on the pump rocker arm until the diaphragm is flat, wedge a small piece of metal between body and shoulder on rocker arm to hold rocker arm in this position while assembly is being completed. Line up marks on body flanges (these marks should be made before pump is disassembled), press down on pump, install screws and lock washers loosely, threading screws through holes in diaphragm layers. Then remove metal wedge, allowing diaphragm to assume highest position, tighten screws alternately and securely.

TESTING:—The strength of the vacuum pump spring will make it impractical to bench-test the pump before it is installed on the car. In installing the pump, see that the rocker arm is in the innermost position to avoid possibility of distorting the pump mountng flange while mounting nuts are being tightened.

To check vacuum pump operation, note windshield wiper performance while engine is alternately idling and accelerating. Windshield wiper action should be constant. Do not operate the pump with the outlet closed or blocked as the downward stroke is positively driven by the linkage.

TROUBLE SHOOTING:—See separate article for complete trouble shooting directions for both Fuel Pump and Vacuum Pump sections.

NOTE:—Type R is similar in design to Type T. See following article on Type T for complete description and servicing data for Type R pumps without oil seal. Data on pumps with oil seals are given below.

OIL SEAL NOTE:—Pump differs from other Type R pumps only in that an Oil Seal is assembled on the lower end of the pull rod below the diaphragm. The Oil Seal assembly consists of an upper retainer (with a flange at its lower end serving as lower seat for the driving spring), two leather oil seal washers, and a lower retainer. The entire assembly is locked in place on the pull rod stem by the shoulder on the lower end of the pull rod and rests on the pump boss in the pump body (see illustration). The operation of the pump is entirely similar to other Type R pumps.

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pint in 1 minute. **Pressure**—3½ lbs. maximum.

SERVICING:—Trouble Shooting and servicing for this pump are the same as for other Type R pumps except for the special directions given below for the removal of the diaphragm assembly, assembling of oil seal on the pull rod, and replacing of diaphragm assembly in the pump.

To Remove Diaphragm Assembly from Pump:—Use special tool #1521556, which is designed to free lower retainer from boss on pump body (if this tool is not used, it will be necessary to remove rocker arm pin in order to free pull rod from rocker arm linkage). To remove diaphragm assembly (with pump cover or upper body removed), invert pump body, force edge of special tool under edge or flange of upper oil seal retainer, pry on tool to move flange on retainer up onto top edge of pump boss. Hold pump link against upper stop by wedging a screwdriver between the link and the bottom of the pump body, push down on diaphragm and away from end of link. This will unhook the pull rod from the link and diaphragm assembly can then be removed. Diaphragm assembly should be replaced as a unit (see directions below for assembly of oil seal on pull rod).

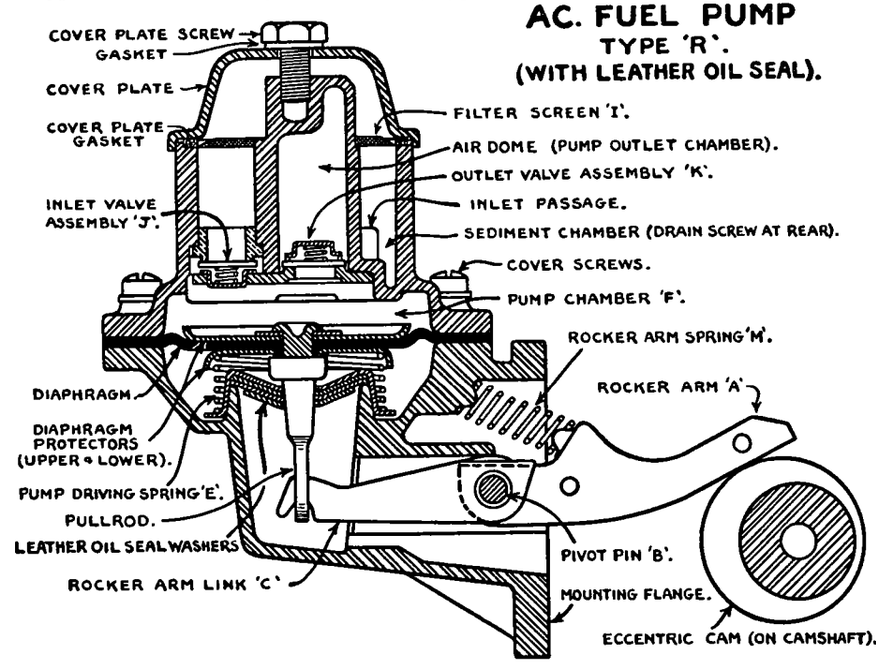
To Assemble Oil Seal on Diaphragm Assembly:—Place driving spring (E) in position on pull rod against lower diaphragm protector, place upper oil seal retainer in position on lower end of driving spring with cupped portion within spring, compress spring by pressing on oil seal retainer until retainer is below shoulder on pull rod, then rotate retainer ¼ turn so that it is locked in place. Force two leather oil seal washers down on pull rod stem until they rest against upper retainer, assemble lower retainer below washers and lock in place by rotating ¼ turn. The complete assembly is then ready to be installed in the pump.

To Install Diaphragm Assembly in Pump:—Invert the pump body, hold link against upper stop by wedging screwdriver between link and bottom of pump body, insert diaphragm assembly in pump body, tilting assembly so that flange on upper oil seal retainer rests on top edge of pump boss and pull rod clears end of link (see illustration). Press down on diaphragm assembly and hook pull rod over end of link, then push diaphragm back into vertical position and center in pump body so that oil seal retainer snaps into place around pump boss. The upper pump body can then be put in place and the screws installed.

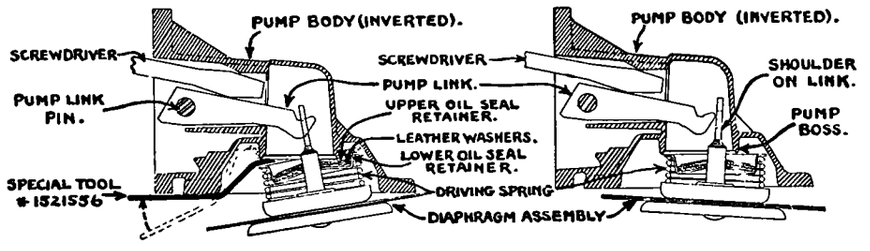
TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyser to check pump performance before removing pump from car.

TYPE W

Std. Equipment On:



BUICK, MODEL 40 (1936-37) & FIRST CARS ONLY (1938)
CHEVROLET, ALL MODELS (1935-36)
NASH 6, 3620, 3640 ('36), 3720 ('37), 3820 ('38), 3920 ('39)
NASH 8, MODEL 3680 (1936)
NASH-LAFAYETTE, 3710 ('37), 3810 ('38), 3910 ('39)
STUDEBAKER DICT., 3A, 4A ('36), 5A, 6A ('37), 7A, 8A ('38), 9A ('39)



NOTE:—The Type W pumps are assembled from parts as listed below:
Body (including linkage) ..... **Type R.** Top Cover Assembly.....**Type B.**

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pt. in 1 minute. **Pressure**—3½ lbs. maximum.

OIL SEALS:—Both leather and rubber oil seal washers have been used on these pumps. On pumps with leather oil seal washers, the upper oil seal washer retainer is held in place by a separate spring assembled above the retainer and below the lower diaphragm protector. Assemble the oil seal as follows: With the diaphragm assembly inverted, place the retainer spring over the pullrod so that it rests on the lower diaphragm protector, then assemble following parts in order: (1) upper oil seal washer retainer with concave side toward spring (cupped portion away from spring), (2) two leather oil seal washers, (3) lower retainer with concave side toward leather seals. Install diaphragm and oil seal assembly in pump as directed for Type R

SERVICING:—For all other servicing data than oil seals (above), see article on Type R (for lower body and linkage), Type B (top cover).

TYPE T

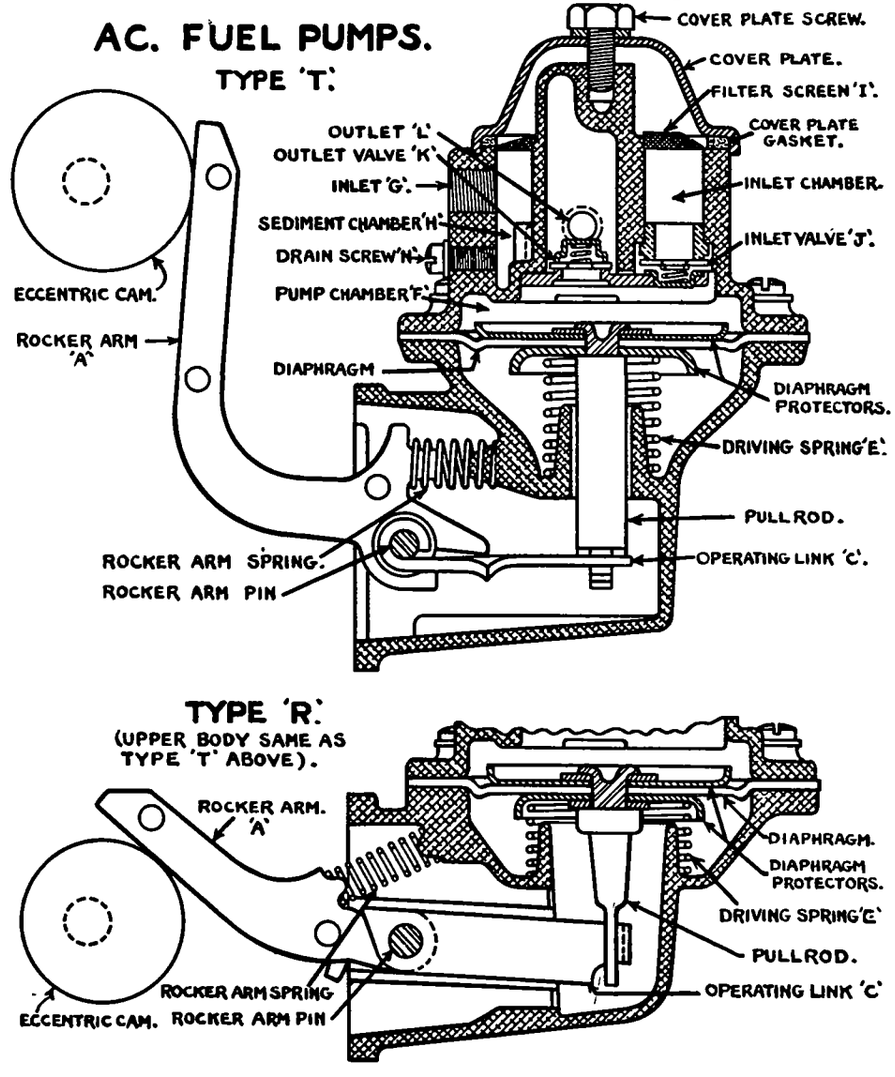
Std. Equipment On:

HUPMOBILE, 518-D, 521-J, 527-T ('35), 618-G ('36), 822-E ('38), 922-E, SKYLARK R ('39)
OLDSMOBILE SIX, F-34 ('34), F-35 ('35), F-36 ('36)
OLDSMOBILE EIGHT, L-34 ('34), L-35 ('35), L-36 ('36)
STUDEBAKER, COMM. B ('34), 1B ('35); PRES. C RHD ('34)

DESCRIPTION:—These pumps are mechanically operated, diaphragm type pumps and are similar in operation to previous pump types. The pump design is not similar to previous designs (see illustration). The sediment chamber (H) is located in the pump body and the external glass sediment bowl is not used. The sediment chamber can be drained by removing the screw (N). The pull rod is assembled as a unit with the diaphragm and diaphragm protectors (upper end of pull rod is riveted) and it is necessary to replace this entire assembly as a unit whenever the diaphragm is found defective.

OPERATION:—As in previous pump designs, the down stroke of the diaphragm is positive, the diaphragm being pulled down by the action of the rocker arm (A), which is connected to the pull rod by the linkage (C). This creates a vacuum in the pump chamber and gasoline is drawn in through inlet (G), sediment chamber (H), filter screen (I), and inlet valve (J) into pump chamber (F). The rocker arm is forced to follow the face of the eccentric cam by the rocker arm spring (M), releasing the pull rod linkage and the diaphragm is then pushed upward by the driving spring (E). This forces the gasoline out through the outlet valve (K) and the pump outlet (L) to the carburetor. Fuel delivery is controlled by the back pressure of the gasoline in the carburetor float bowl so that when the carburetor float valve closes, this back pressure holds the diaphragm at the bottom of its stroke with the driving spring compressed. The rocker arm continues to move with the rotation of the eccentric cam but this motion is absorbed by the linkage. Whenever the carburetor float valve opens, the pumping action is resumed.

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pt. in 1 minute. **Pressure**—3½ lbs. maximum.



TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyser to check pump performance before removing pump from car.

SERVICING:—Diaphragm and pullrod are riveted together and must be replaced as a unit. To assemble pump, follow directions as given below.

Diaphragm and Pullrod Assembly. Place diaphragm (driving) spring in place in pump body, position diaphragm assembly on driving spring so that spring is centered in lower diaphragm protector, press downward on diaphragm and turn to left at same time so that pullrod engages end of rocker link, turn diaphragm assembly one-quarter turn to left so that holes in diaphragm and pump body line up. Push in on rocker arm until diaphragm is flush with pump body flange, place top assembly in position (as designated by marks on pump and cover made before disassembly), install cover screws and lock washers, turn screws down loosely. Release rocker arm, which will flex diaphragm in extreme upper position, tighten cover screws alternately and securely.

Valve and Cover Assembly. To assemble valves and cover before installing on pump, place outlet valve spring retainer in cover, being careful not to distort legs of retainer, place valve plate gasket in position, install outlet valve spring in retainer, place outlet valve on spring. Place inlet valve on its seat, position valve spring on center of inlet valve, install inlet valve retainer in valve plate and see that shoulder of retainer fits flush in depression in plate. Install valve plate in position in cover and insert three mounting screws. See that inlet valve is centered in spring seat and outlet valve centered on valve seat in valve plate. Install strainer screen on top of cover, see that screen fits properly around inlet and at edges of cover. Place cork gasket in cover, install cover plate. Install fibre gasket on cover plate capscrew, tighten capscrew so that cover plate is secure and tight. See that gasket seats properly and that filter screen is not distorted. Cover assembly is then ready to install on pump body.

Rocker Arm and Linkage. If rocker arm has been removed, assemble link, rocker arm, and rocker arm spring in pump body in proper position (see illustration), insert rocker arm pin through hole in body so that it engages rocker arm and link. Stake pin in place by using punch to turn body metal over pin at each end. See that rocker arm operates freely after assembly (if arm binds, drive pin back slightly). Rocker arm linkage will ordinarily not require disassembly when servicing pump.

TYPE V

Std. Equipment On:

1521544—OLDSMOBILE SIX, MODEL F-34 (1934)
1521681—OLDSMOBILE SIX, MODEL F-34 RHD CARS (1934)
1521545—OLDSMOBILE EIGHT, MODEL L-34 (1934)

DESCRIPTION:—This combination fuel-and-vacuum pump is same design as Type J except that fuel pump top cover assembly is same as Type R.

PERFORMANCE:—See article on Fuel Pump Testing for complete testing data. **Capacity**—1 pint in 1 minute. **Pressure**—3½ lbs. maximum.

SERVICING:—**Fuel Pump Section**—See article on Type R Fuel Pump for data. **Vacuum Pump Section**—See article on Type J fuel-and-vacuum pump.

Optl. Equipment On:

OLDSMOBILE SIX, MODEL F-36 (1936)

OLDSMOBILE EIGHT, MODEL L-36 (1936)

DESCRIPTION:—This type fuel pump is similar in design and operation to previous combination fuel and vacuum pumps except that the sediment chamber is located at the top of the fuel pump section within an inverted glass sediment bowl and the location of fuel pump inlet valve assembly (J) and outlet valve assembly (K) is somewhat changed. As in previous designs, the fuel pump and vacuum pump are two distinct units although the same linkage is used for the operation of both units.

OPERATION:—Fuel Pump. Fuel pump operation is similar to previous types and down stroke or suction stroke of diaphragm is positively actuated. The diaphragm is forced upward on the delivery stroke by the driving spring below the diaphragm. Fuel flow through the pump after entry through the inlet is through the inlet passage or riser into the glass sediment bowl. From near the top of the sediment bowl, fuel passes through filter screen (I) and inlet passage to inlet valve (J) and into the pump chamber. From the pump chamber the fuel is forced through outlet valve (K) to the pump outlet. An air chamber is formed in the upper body casting above the outlet valve. The lower portion of the glass bowl below the top of the inlet passage to the pump chamber forms the sediment chamber (H).

Vacuum Pump. The down stroke of the vacuum pump diaphragm by which air is displaced from the pump chamber is positively actuated by the pump linkage. The diaphragm is forced upward by the heavy driving spring below the diaphragm, creating a vacuum within the pump chamber. This opens the inlet valve and operates the windshield wiper. The pump acts as a booster to insure continuous wiper operation and will be inoperative whenever pump vacuum is exceeded by manifold vacuum (both valves will be open), or whenever the wiper is not being used (diaphragm held at lower end of stroke by vacuum in pump chamber).

PERFORMANCE:—See article on fuel pump testing.
Capacity—1 pt. in 45 seconds. Pressure—4½ lbs. maximum.

TROUBLE SHOOTING:—If fuel pump or vacuum pump operation is not satisfactory, check in accordance with the following tables:

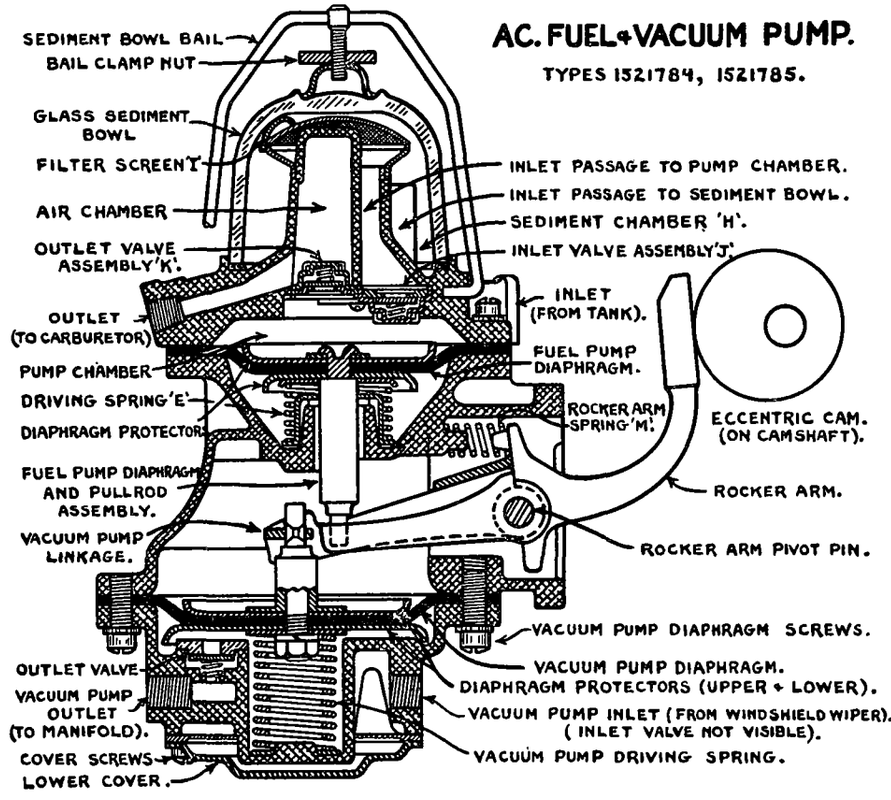
Fuel Pump Unit

No fuel or insufficient fuel at carburetor—Check fuel line for bent, kinked, leaky tubing or connections. Tighten all connections. Clean filter screen, examine sediment bowl gasket, tighten bowl thumbnut securely (loose bowl on this type will cause leaks around lower edge of bowl if any gasoline is in sediment chamber). Check valves and valve seats for dirty or warped valves, loose valve assemblies. Check diaphragm driving spring.

Fuel Leakage through vent in pump body—Diaphragm is worn or punctured and should be replaced.

Fuel Leakage at edge of diaphragm—Loose cover screws. Tighten cover screws evenly around pump body.

Carburetor flooding—Check carburetor float level. See that float valve seats properly. Replace float valve assembly if seat or valve is worn.



Vacuum Pump Unit

Not operating (no vacuum except as supplied by manifold). This will be evidenced by slow windshield wiper action at high speeds or with wide open throttle. Check vacuum lines and tighten connections. Examine vacuum pump valves and diaphragm.

Oil smoke in engine exhaust—Punctured vacuum pump diaphragm. Check before disassembling pump by disconnecting pump outlet line to manifold, operate vacuum pump and note oil spray in pump exhaust. Oil spray at this point indicates punctured diaphragm which should be replaced. If no oil spray is noted, oil smoke may be caused by worn rings, etc.

SERVICING:—Fuel Pump. Diaphragm assembly should be replaced as a unit (pullrod upper end is riveted). To install new diaphragm assembly, place oil seal gasket and oil seal gasket retainer over pullrod boss in pump body, place driving spring (E) on oil seal gasket retainer, place spring retainer on spring with cupped side downward, insert diaphragm and pullrod assembly in body, invert pump body so that fuel pump link falls toward pullrod, push diaphragm down in body to compress driving spring, engage flatted end of pullrod in slot in end of link, turn diaphragm assembly 90° to lock pullrod in link. If cover assembly has not been disassembled (see directions below for installation of valves in cover assembly), push upward on pump rocker arm until diaphragm is even with top edge of body, place cover assembly in position on body, lining up marks made before disassembly, install cover screws and lockwashers, turn screws down loosely. Release rocker arm, which will flex diaphragm in extreme upper position, and tighten cover screws alternately around pump body evenly and securely.

To assemble valves in cover assembly, place valve cage gaskets in position in cover, place inlet and outlet valve cage assemblies on cage seats in cover, making certain that the large diameter is placed downward against the gasket on the inlet side and that the small diameter is assembled in outlet

hole in the cover so that the shoulder of the cage fits properly against the gasket. This is very important. Place valve cage retainer in position, making certain that the curved end of two legs fits snugly against each valve cage, insert two mounting screws, tighten screws securely. Place cork bowl gasket in position on cover, assemble glass sediment bowl, bowl seat, thumbnut and bail above bowl, tighten thumbnut securely. This completes the top cover assembly.

Vacuum Pump. Vacuum pump servicing and assembly is exactly the same as for other types except that tabs are provided on the diaphragm and these tabs should be lined up with the center line of the flatted end of the pullrod when new diaphragms are being installed. See complete article on Types F, I, J pumps.

Std. of Optl. Equipment On:
TYPE AB
BUICK, MODELS 60, 80, 90 (1936 to 39)
CADILLAC V8, ALL SERIES (1936 to 39)
HUDSON & TERRAPLANE, ALL MODELS (1937-38)
LA SALLE V8, SERIES 50 (1937-38-39)

TYPE X
PACKARD, MODEL 120-B (1936)

NOTE:—The Type X pump is equipped with a Type R top cover assembly (fuel pump section). See article on Type R pumps with oil seal for illustration and fuel pump servicing instructions on this model.

DESCRIPTION:—These types similar in design to previous types (combination fuel and vacuum pumps) in that fuel pump and vacuum pump units are entirely separate although both units mounted on the same body casting and operated by the same linkage. New features include fuel pump oil seal, mounting flange baffle, silencer unit in body vent, and assembled diaphragm units (pull rod riveted on top protector washer forming assembly of pull rod, diaphragm, and protector washers).

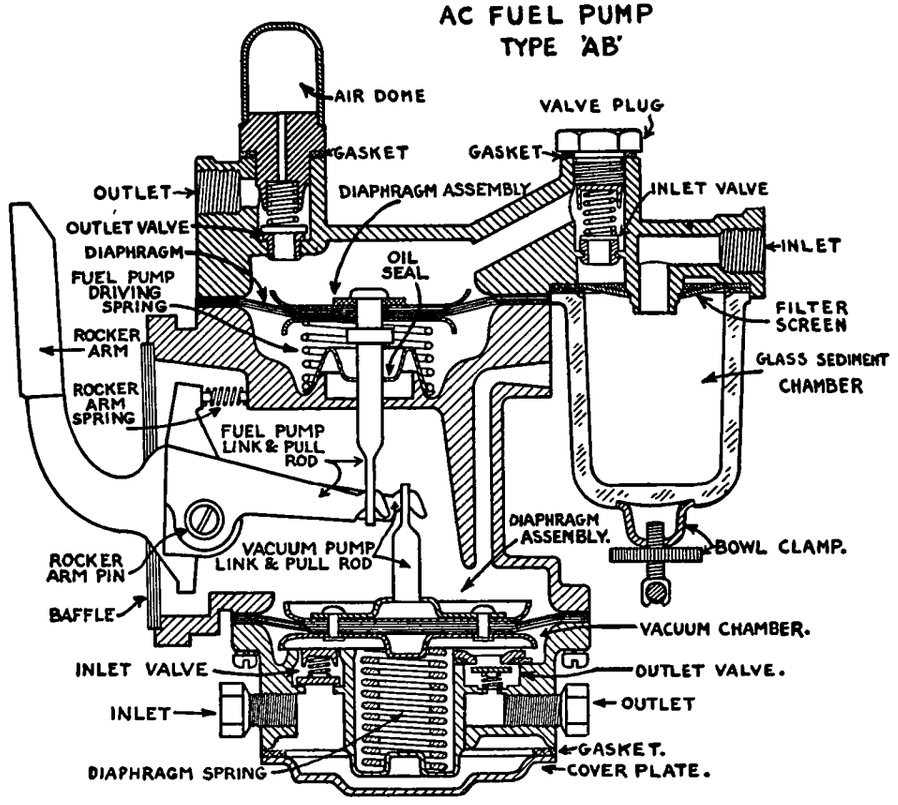
OPERATION:—Fuel Pump—Same as for previous types. Downstroke or suction stroke of diaphragm positively actuated by linkage. Upstroke or delivery stroke actuated by driving spring under diaphragm. Rocker arm motion absorbed by linkage when delivery line closed by seating of carburetor float needle valve (pressure in line balances driving spring tension so that diaphragm held in lower position with spring compressed).

Vacuum Pump:—Same as for Type F. Downstroke of diaphragm in which air displaced from pump chamber positively actuated by linkage. Upstroke in which vacuum created in pump chamber actuated by heavy driving spring under diaphragm. Rocker arm motion absorbed by linkage when pump not in use (windshield wiper turned off) with diaphragm at lower end of stroke and driving spring compressed.

PERFORMANCE:—See article on Fuel Pump Testing.
Capacity—1 pt. in 45 seconds (AB), 1 minute (X).
Pressure—4½ lbs (AB), 3½ lbs. (X), maximum.

SERVICING:—Both fuel pump diaphragm and vacuum pump diaphragm replacements furnished as assemblies with pull rod and diaphragm protectors (pull rod riveted on upper protector washer). Instruction below for installation of these units.

Rocker Arm & Link Assembly in Body:—Assemble rocker arm, fuel pump link, link spacer and vacuum pump links on rocker arm pin bushing in same position as when removed from pump. Place hooked end of one vacuum link on top of other vacuum link while assembling. Insert assembly in pump body making certain that rocker arm spring is seated on ear of link spacer. Insert rocker arm pin, place washer on end of pin, peen counter-bored end of pin securely over washer.



Fuel Pump Diaphragm Assembly (Type AB):—Invert pump body allowing link to fall against stop, insert small tool or screwdriver to hold link in this position. Place diaphragm driving spring in position on lower diaphragm protector, place oil seal (when used) on spring so that spring seats on lower flange with cupped portion of seal within spring, insert diaphragm assembly in pump body, compress diaphragm spring and hook pull rod over end of link. See that spring is seated in lower protector and on oil seal.

Fuel Pump Valve and Cover Assembly (Type AB):—See that valve chamber thoroughly cleaned, valve seat inserts tight in cover, and that seats are smooth and flat. Place a drop if Finol on each fibre valve (do not substitute other types of valves), place valves flat on valve seat, insert valve spring on top of valves, see that fibre gaskets on valve plugs in place and in good condition, install plugs making certain that valve spring enters spring cup in plug, tighten plugs securely. Examine sediment bowl gasket and filter screen, replace if necessary, install sediment bowl and tighten bail nut securely.

Fuel Pump Cover Assembly:—To install cover assembly on pump, clamp pump body in vise, place cover in position on body lining up marks made before disassembly, insert cover screws through holes in cover and diaphragm, turn screws down until heads within ⅛" of cover flange. Flex diaphragm in extreme upward position by pushing up on pull rod, hold in this position, tighten cover screws evenly and securely.

VACUUM PUMP SECTION

Vacuum Pump Unit Assembly:—Inlet Valve seat is part of vacuum pump body assembly. To assemble pump, place fibre inlet valve on valve seat, position valve spring on valve, place spider-shaped inlet valve stop plate on top of spring with top coil of spring seated in recess in bottom of spider. Insert outlet valve spring, centering spring coils in recess, place outlet valve in position on top of spring. Press inlet valve stop plate down until legs fit into recess in body making certain that valve spring is properly centered on stop, hold in this position and slide valve retainer gasket in position, place valve retainer in position on top of gasket making certain that retainer installed with countersunk holes upward. Insert valve retainer screws tightening center screws first and end screw last. Turn pump body over, install screen, see that screen lies flat and fits closely around screw holes in body. Install cover gasket on screen lining up screw holes, place cover on gasket, insert cover screws and tighten securely.

Vacuum Pump Installation:—Clamp completed fuel pump and body assembly in vise in inverted position. Install vacuum pump diaphragm assembly, see that pull rod hooked on both links properly and that diaphragm holes line up with holes in body. Place diaphragm spring in position on diaphragm, centering spring in lower protector washer, place assembled vacuum pump unit in position on diaphragm lining up marks made before disassembly and seeing that spring is centered on boss in vacuum pump body. Press in on rocker arm until diaphragm is flat and even with body flange, insert screws through holes in vacuum pump body and diaphragm, turn screws in until ⅛" from flange. Release rocker arm so that diaphragm spring flexes diaphragm to extreme upper position, tighten screws evenly and securely.

TESTING:—Vacuum pump spring strength makes it impractical to test combination units on the bench. Pump should be installed on engine and tested with No. 1521551 analyzer (fuel pump section). To test vacuum pump operation, open windshield wiper valve and note performance when engine is alternately idled and accelerated. Wiper action should be practically constant and independent of engine speed variations.
NOTE—Pump should never be operated with outlet passage of vacuum pump blocked. The exhaust stroke of the pump is positive and damage will result to the vacuum pump linkage.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting.

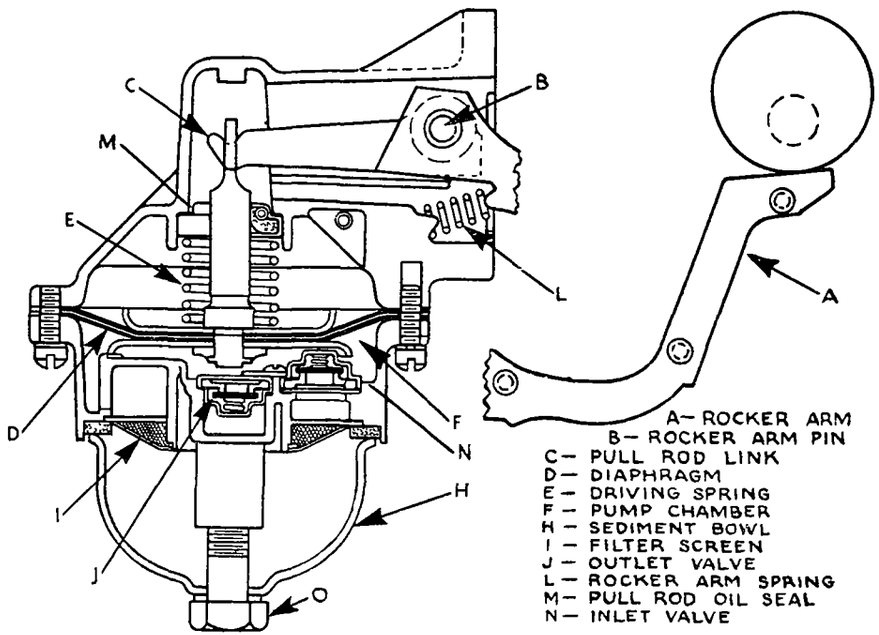
TYPE AH

USED ON:

1523228—OLDSMOBILE SIX, F-37 (1937), F-38 (1938)
OLDSMOBILE EIGHT, L-37 (1937), L-38 (1938)
1523844—OLDSMOBILE SIX, '60' F-39, '70' G-39 ('39)
OLDSMOBILE EIGHT, '80' MODEL L-39 (1939)
1523109—PONTIAC SIX, 37-26CA (1937), 38-26DA (1938)
PONTIAC EIGHT, 37-28CA (1937), 37-28DA (1938)
1523844—PONTIAC SIX, MODELS 39-25, 39-26 (1939)
PONTIAC EIGHT, MODEL 39-28 (1939)

TYPE:—New design, inverted, mechanically operated, diaphragm type pump with improve oil seal on pull rod which necessitates removal of rocker arm pin to engage or disengage pull rod when servicing diaphragm assembly. Operation similar to previous types.

OPERATION:—As in previous designs, suction stroke of diaphragm positively actuated by pump linkage, delivery stroke actuated by driving spring 'E'. On suction stroke when diaphragm 'D' is pulled up by rocker arm 'A' and link which engages pull rod at 'C', fuel is drawn through inlet into sediment bowl 'H' and then through filter screen 'I' and inlet valve 'N' into pump chamber 'F'. Rocker arm is forced to follow face of eccentric driving cam by spring 'L', allowing driving spring 'E' to force diaphragm down on delivery stroke, and forcing the fuel out through the outlet valve 'J' to the carburetor. Fuel delivery is controlled by back pressure in line so that whenever carburetor float valve is closed, diaphragm remains at top of stroke with spring 'E' compressed, and rocker arm motion is absorbed by the linkage. When pressure is relieved by opening of carburetor float valve, pumping is resumed.



PERFORMANCE:—See article on Fuel Pump Testing and use of Analyzer.
Capacity—1 pt. minimum in 45 seconds. **Pressure**—3¾ lbs. maximum.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyzer No. 1521551 and check performance before removing fuel pump from car.

SERVICING:—Disassembly. Drill out counterbored (small end) of rocker arm pin with ⅜" drill. Use special tool No. 1521581 and drive pin out of arm and pump body. Invert pump and clamp in vise. Mark cover and body flange to insure replacing in same position. Take out ten capscrews in flange and lift off cover assembly. Lift out diaphragm and link assembly.

Valve & Cover Sub-assembly. Place gasket in position in cover casting, install valve and cage assemblies making certain that large diameter of inlet valve cage is against gasket and that small diameter of outlet valve cage is installed in hole in cover so that shoulder of cage fits against gasket. Pump will not operate satisfactorily if valves installed in any other manner. Place valve cage retainer in position on valves making certain that curved ends of two lugs fit snugly against each valve cage, insert two retainer screws and tighten securely. See that retainer has not shifted after screws are tightened. Install cork bowl gasket in cover, place metal sediment bowl cover on gasket, assemble cover screw gasket on cover, insert cover screw and tighten securely. Cover gasket and cover screw gasket must be in good condition and must contact seat at all points to insure tightness and prevent gasoline leaks at these points.

Pump Assembly. Assemble link, rocker arm bushing, link spacer washers and rocker arm spring in position in pump body, insert small end of special assembling tool No. 1521581 through rocker pin hole in body to hold these parts in position loosely. Install oil seal and diaphragm driving spring in position, install diaphragm assembly inserting pull rod through spring and oil seal and engaging pull rod end with hook on link. Then press assembling tool on through pump body until linkage is held in position by larger section of tool. Use regular rocker arm pin to drive assembling tool out. This will leave linkage correctly assembled on pin. Install steel washer on counterbored small end of pin and swedge end of pin out against washer. Push upward on rocker arm until diaphragm is level with top surface of body flange, install cover assembly, lining up marks on flanges made before disassembling pump, insert cover screws (see that lockwasher in place on each screw) and turn down screws until flanges are ⅛" apart. Release rocker arm which will allow diaphragm to move to highest position, tighten cover screws alternately and securely. Cover must be tightened only with diaphragm flexed in extreme upward position to insure pump having full stroke in service.

TYPE AS

Number **Used On:**
1523648—CHRYSLER ROYAL, MODEL C18 (1938)—OPTIONAL
DE SOTO, MODEL S5 (1938)—OPTIONAL
DODGE, MODEL D8 (1938)—OPTIONAL
PLYMOUTH, MODELS P5,6 ('38), P7,8 ('39)—OPTL.

DESCRIPTION:—This combination Fuel-and-Vacuum pump is an 'inverted' type (vacuum pump section on top) with same design body and mounting flange as Type AT pumps. Vacuum pump section is same design as other AC Vacuum pumps. Fuel pump section is same design as Type AH except that glass bowl type sediment chamber retained by bail and thumbscrew is used.

PERFORMANCE:—See article on 'Fuel Pump Testing' for complete testing data.
Capacity—1 Pint in 1 Minute. **Pressure**—4¼ pounds maximum.

SERVICING:—Fuel Pump Section—See article on Type AH Fuel Pump for data.
Vacuum Pump Section—See article on Type AJ combination fuel-and-vacuum pump for data.

TYPE AT

Number **Used On:**
1523647—CHRYSLER ROYAL, MODEL C18 (1938)

PONTIAC EIGHT, 37-28CA ('37), 38-28DA ('38)—OPTIONAL
1523825—PONTIAC SIX & EIGHT, ALL MODELS (1939)—OPTL.

TYPE:—Combination fuel-and-vacuum pump. New design, inverted, mechanically operated, diaphragm type pump. Vacuum section mounted on top of pump body with fuel pump section below which is reversed from previous designs. Improved type oil seal used on fuel pump pull rod which necessitates removal of rocker arm pin to engage or disengage pull rod when servicing diaphragm assembly. Operation is similar to previous types.

FUEL PUMP SECTION

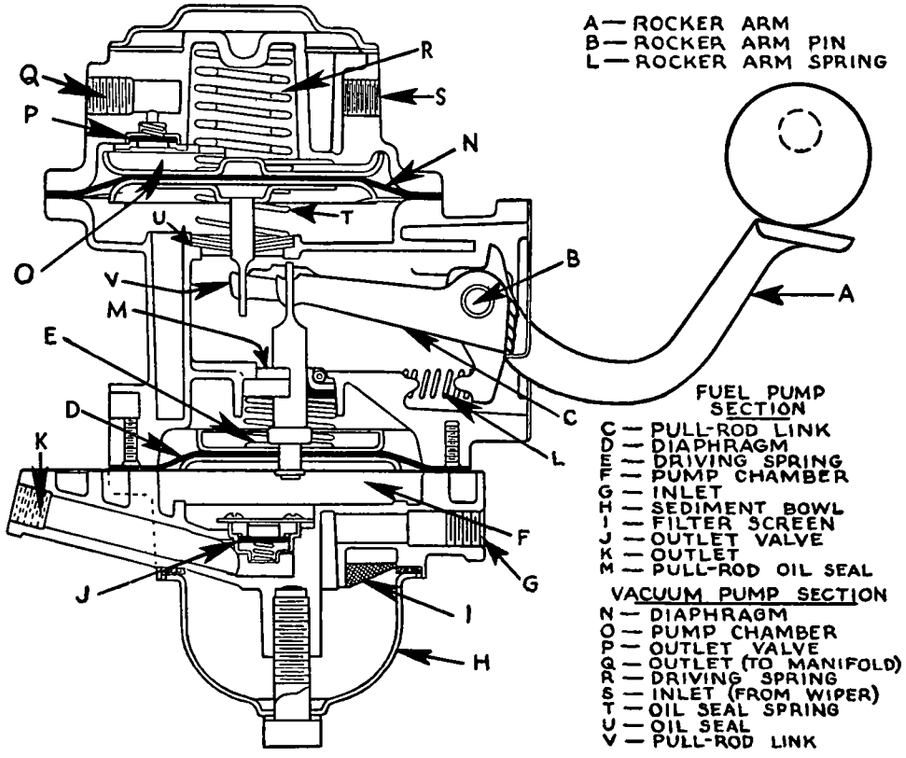
NOTE:—Design of fuel pump section identical with Type AH fuel pumps. See preceding article on Type AH for description of operation and complete servicing directions. Fuel pump section should be removed first and installed first when servicing these pumps.

PERFORMANCE:—See article on Fuel Pump Testing and use of Analyzer. **Capacity**—1 pt. minimum in 45 seconds. **Pressure**—4 lbs. maximum.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting. Use Fuel Pump Analyzer No. 1521551 and check performance before removing pump from car.

VACUUM PUMP SECTION

OPERATION:—Exhaust stroke positively actuated by pump linkage and suction stroke actuated by large driving spring 'R'. When the diaphragm 'N' is forced up by the long rocker arm link 'M', air in the pump chamber 'O' is forced out through outlet valve 'P' and outlet 'Q' to the intake manifold. Driving spring 'R' then forces diaphragm down, creating a vacuum in the pump chamber and placing a suction on the windshield wiper line which is connected at inlet 'S' (inlet valve not shown).



Whenever the windshield wiper is not in use (inlet line shut off), manifold vacuum holds the diaphragm at the upper end of its stroke with the driving spring compressed and the rocker arm motion is absorbed by the linkage. Likewise whenever the manifold vacuum is higher than that of the pump with the windshield wiper in operation, both the inlet and outlet valves will remain open and air flow from the wiper will be straight through the pump.

TROUBLE SHOOTING:—See article on Vacuum Pump Trouble Shooting.

SERVICING:—**Disassembly.** With pump clamped in vise, take out two opposite flange screws and install special guide pins as pilots when cover removed (guides may be made up of 3/16" cold-rolled stock, 2" long, with ¼" of 10-32 thread on one end). Mark cover and body flanges to insure correct reassembly, take out remaining flange screws, lift off cover assembly. Press down on rocker arm, unhook diaphragm assembly from inner pump link, lift diaphragm assembly out.

Vacuum Pump Body Assembly. Place fibre inlet valve on brass valve seat (body furnished with valve seat installed), and position inlet valve spring on valve. Install spider-shaped valve stop plate on valve spring making certain that top coil of spring is seated in recess in stop plate. Install outlet valve spring and see that spring is centered in recess in body. Press down on inlet valve stop plate, install fibre outlet valve on valve spring, see that legs on stop plate fit into recess in body. Without releasing stop plate, slide retainer gasket into position, place retainer on top of gasket (countersunk holes must face up), insert flat-headed retainer screws and tighten securely (tighten center screws first, end screw last). Turn pump body over and install screen making certain that screen is flat and fits snugly around screw holes in body, install gasket on screen, place bottom cover on gasket and install four cover screws. See that gasket fits properly and cover screws tightened evenly to prevent leaks at this point.

Diaphragm & Pull Rod Assembly. Diaphragm and pull rod furnished as an assembly (riveted together). Place small lower oil seal retainer, leather oil seal washer, large upper oil seal retainer, and oil seal retainer spring in position in pump body in that order. See that the asssembly fits snugly in the recess around the pull rod hole. Install diaphragm on top of retainer spring, threading pull rod through oil seal and engaging hooked end of longer pump link in pull rod slot.

Vacuum Pump Assembly. Clamp pump body (with fuel pump installed) in vise with vacuum diaphragm up. Press down on rocker arm until diaphragm is flat on flange, install small metal wedge between body and shoulder on arm to hold it in this position while completing assembly. Place heavy driving spring on diaphragm, place vacuum pump body assembly in position on spring making certain flange marks line up and that spring is centered on diaphragm and around boss in pump body. Press down on vacuum pump body, insert flange screws (lockwasher on each screw), turn screws down loosely. Remove rocker arm wedge, tighten screws evenly. Check vacuum pump operation after pump re-installed on engine.

TYPE:—These pumps are assembled of Body and Top Cover assemblies used on other fuel pump types as follows:

Pump Type	Body Assembly	Top Cover Assembly
AC	Type B	Type R
AF	Type R	Type AA
AG	Type D (Riveted Diaphragm)	Type AA
AK	Type R (Larger)	Type D

PERFORMANCE:—See article on Fuel Pump Testing for testing procedure.

Pump Type	Capacity (1 Pt. Min.)	Pressure (Maximum)
AC	1 minute Max.	3 lbs.
AF	1 minute Max.	3½ lbs.
AG	45 seconds Max.	3½ lbs.
AK	45 seconds Max.	4½ lbs.

SERVICING:—See previous articles on the Fuel Pump Types from which these pumps are assembled for complete servicing instructions.

TYPE AD

USED ON:

1523234—NASH-LAFAYETTE, MODEL 3710 (1937)—OPTIONAL EQUIP.
1523641—NASH-LAFAYETTE, 3810 (1938), 3910 (1939)—OPTL.
1523238—NASH AMBASSADOR SIX, MODEL 3720 (1937)—OPTIONAL.
1523643—NASH AMBASSADOR SIX, 3820 ('38), 3920 ('39)—OPTL.
1523236—NASH AMBASSADOR EIGHT, MODEL 3780 (1937)—OPTIONAL.
1523644—NASH AMBASSADOR EIGHT, 3880 ('38), 3980 ('39)
1522228—STUDEBAKER, MODELS 7A, 8A (1938)—OPTIONAL

TYPE:—This pump similar to Type X fuel and vacuum pump except that Top Cover for fuel pump section is Type B.

PERFORMANCE:—See article on Fuel Pump Testing for test procedure. **Capacity**—1 Pt. in 1 minute. (Min.). **Pressure**—3½ lbs. maximum.

SERVICING:—Follow instructions given for Type X except for top cover assembly (see Type B for valve and cover section of fuel pump).

TYPE AL

Number	Used On:
1523137	CHRYSLER ROYAL, C16 ('37), C18 ('38)—OPTL.
	DE SOTO, MODELS S3 ('37), S5 ('38)—OPTL.
	DODGE, MODELS D5 (1937), D8 (1938)—OPTL.
	PLYMOUTH, MODELS P3,4 ('37), P5,6 ('38)—OPTL.
1523915	CHRYSLER ROYAL, C22 (1939)—SWINGING WINDSHIELD.
	DE SOTO, MODEL S6 (1939)—SWINGING WINDSHIELD.
	DODGE, MODEL D11 (1939)—SWINGING WINDSHIELD.
1523885	PLYMOUTH, MODELS P7,8 (1939)—RHD CARS.

DESCRIPTION:—This combination Fuel-and-Vacuum Pump is same design as Type I except that fuel pump top cover assembly is same as Type B.

PERFORMANCE:—See article on 'Fuel Pump Testing' for complete testing data. **Capacity**—1 Pint in 1 Minute or less. **Pressure**—3½ pounds maximum.

SERVICING:—See article on Type I combination Fuel-and-Vacuum Pump for all servicing data (except fuel pump top cover and valve assembly for which refer to article on Type B pump).

TYPE AM

Number	Used On:
1523271	CHEVROLET, ALL MODELS (1938-39)—OPTL.

DESCRIPTION:—This combination fuel-and-vacuum pump is same design as Type 'X' except that mounting flange and fuel pump section Top Cover is same as used on Type 'AF' fuel pumps.

PERFORMANCE:—See article on 'Fuel Pump Testing' for complete testing data. **Capacity**—1 Pint in 1 Minute or less. **Pressure**—3½ pounds maximum.

SERVICING:—Fuel Pump Section. See article on Type AF Fuel Pump for data. **Vacuum Pump Section**—See article on Type X fuel-and-vacuum pump for data.

TYPE AN VACUUM PUMP

USED ON:

1523188—CHRYSLER CUSTOM IMPERIAL, C15 (1937), C20 (1938)
CHRYSLER IMPERIAL C23, CUST. IMP. C24 (1939)

NOTE:—This pump consists of the vacuum pump section of a Type 'I' pump. The fuel pump section is omitted and a special cover plate installed on the fuel pump mounting flange. See article on Type I for servicing instructions.

TYPE AR

DESCRIPTION:—This pump is assembled from parts which are also used on other pump models as follows:
Top Cover Assembly—Type 'AF'. Body and Linkage Assembly—Type 'B'. Pump has inverted glass bowl type sediment chamber. Diaphragm is riveted to pull rod and should be serviced as an assembly.

PERFORMANCE:—See article on 'Fuel Pump Testing' for complete testing data. **Capacity**—1 Pint in 1 Minute or less. **Pressure**—3 pounds maximum.

SERVICING:—See articles on Type B Fuel Pump (for body and linkage servicing including Diaphragm replacement) and Type AF Fuel Pump (for top cover and Valve Assembly servicing).

TYPE AU

Number	Used On:
1523695	CADILLAC V16, SERIES 90 (1938-39)—RIGHT HAND
1523696	CADILLAC V16, SERIES 90 (1938-39)—LEFT HAND

NOTE:—On this model, one pump mounted at forward end of each cylinder bank and supplies fuel to carburetor for that bank. Fuel lines to carburetors are inter-connected so that either pump can supply fuel for both carburetors, and one pump only will normally operate when engine is idling. When engine operated under load, both pumps operate.

DESCRIPTION:—These pumps assembled from parts which are also used on other pump models as follows:
Top Cover Assembly—Type 'AA'. Body and Linkage Assembly—Type 'AK'. NOTE—Type AK Body and Linkage Assembly is similar to Type R except that is larger size.

PERFORMANCE:—See article on 'Fuel Pump Testing' for complete testing data. **Capacity**—1 Pint in 45 Seconds or less. **Pressure**—4½ pounds maximum.

SERVICING:—See articles on Type R Fuel Pump (for body and linkage servicing including Diaphragm replacement) and on Type AA Fuel-and-Vacuum Pump (for top cover and Valve Assembly servicing).

TYPE AW

Std. Equipment On:

1523969—CHRYSLER IMPERIAL, SARATOGA, NEW YORKER, C23 (1939)
CHRYSLER CUSTOM IMPERIAL, MODEL C24 (1939)

DESCRIPTION:—This fuel pump same design as Type AH except for different mounting studs, air dome, and curled hair air cleaner.

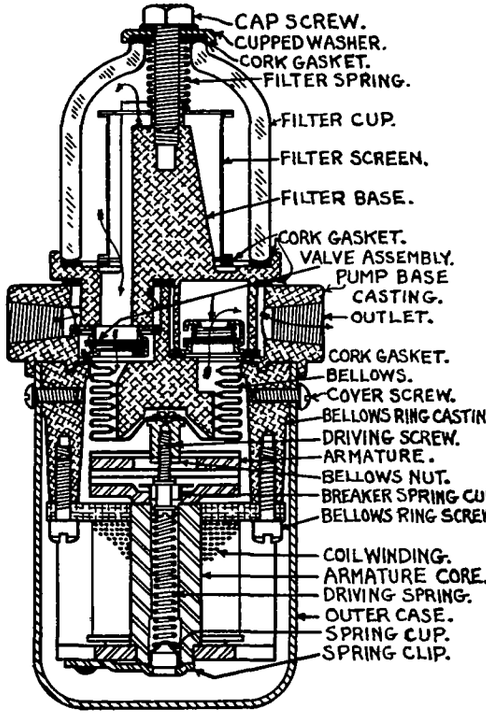
PERFORMANCE:—See article on Fuel Pump Testing for complete testing data. **Capacity**—1 pint in 45 seconds. **Pressure**—3¾ lbs. maximum.

SERVICING:—See article on Type AH fuel pump for data.

DESCRIPTION:—The new type Autopulse has been considerably modified in construction and can be completely disassembled for inspection and service although the principle of operation remains the same as in the earlier types. The two valves are assembled in the pump base casting and are accessible after removing the filter and filter base casting and taking out the two brass screws under the filter screen. The driving motor is accessible by taking out the two screws on the side of the base cover.

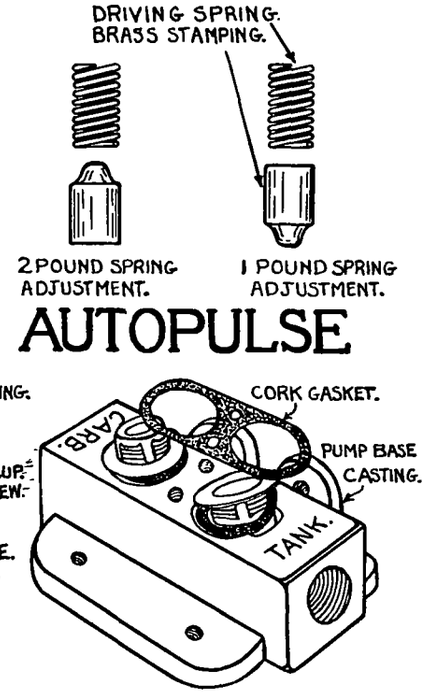
OPERATION:—The operation of the pump is entirely automatic and is controlled by the back-pressure of the gasoline in the float chamber of the carburetor. The Autopulse feed wire should be connected to the coil side of the ignition switch or to the switch side of the ignition coil. In special cases where neither of these terminals is available the Autopulse can be connected to the ammeter through a special switch. This switch must be turned on when the engine is started.

INSTALLATION:—The Autopulse should be mounted near the carburetor and preferably at a slightly lower level than the carburetor bowl. If possible it should be mounted on the chassis frame under the front floor boards so that the filter may be easily reached for cleaning. The suction line should be shielded from the engine exhaust pipe if it is necessary to run them together, to prevent vaporizing of the gasoline in the line. Likewise the pump should not be mounted above the carburetor as this will allow air to be trapped in the delivery line which will cause the pump to flutter. The Autopulse should not be mounted on the dash.



CAPACITY:—The Autopulse will pump approximately 12 gallons per hour. The standard unit is fitted with ⅛ inch openings which will take either ¼ or 5/16 inch tubing. The ¼ inch tubing will be sufficient for engines requiring up to ten gallons per hour. The pump is also furnished with ¼ inch pipe thread couplings which will accommodate ⅜ inch tubing. On multiple units inlet and suction manifolds are used. One end of the manifold can be closed with a pipe plug or if greater capacity is desired, two suction and delivery lines can be used connected to each end of the manifold. Additional pressure can be secured by reversing the small brass stamping on the lower end of the driving spring in the coil core which provides two pounds pressure instead of the standard one pound pressure. To make this change, first remove the motor cover. Then insert a small screwdriver in the slot in the spring support on the base of the motor, compress the spring and slip the support to one side. This will allow the spring and stamping to be removed. Reverse the stamping so that the small knob is against the spring and replace. Make certain that the support is snapped in place (see illustration).

SERVICING:—**Check for Correct Installation:**—After installing pump, turn on ignition but do not start engine. The pump should start at once and pump rapidly until the carburetor bowl is fulll. The pump should then stop. If the pump strokes rapidly and air bubbles are noticeable in the filter chamber, there is a leak in the suction line. If the pump does not stop and continues to pump slowly, there is a leak in the delivery line or the carburetor float valve is not properly seated.



Cleaning Filter:—The filter is designed to trap all foreign matter and water in the filter chamber. To clean filter, take out the cap screw at the top, lift off the filter bowl and remove screen. In replacing the filter, carefully check the gaskets and replace if they are worn or damaged.

Valves:—To check valves, remove the filter and screen and take out the two screws in the filter base casting. Remove the filter base. The valves can then be taken out. Carefully examine the gaskets and replace if necessary. The valve on the 'Tank' side of the base should be inserted with the flange at the top and the valve on the 'Carb' side should be inserted with the flange at the bottom.

Pump Bellows:—To replace bellows, remove motor cover, take out driving spring by slipping spring clip at lower end to one side. Then loosen the nut on the driving screw directly below the bellows stud and loosen the driving screw by inserting a thin screwdriver in the spring hole. Then take out two screws in bellows ring casting and remove coil and armature. Take out the four screws in the bellows ring. The bellows ring and bellows can then be removed. After replacing the bellows, be careful to leave a clearance of .040 inch between the armature and the top of the magnet. The lock nut on the driving screw should be tightened to hold this adjustmet.

SECTIONAL VIEW.

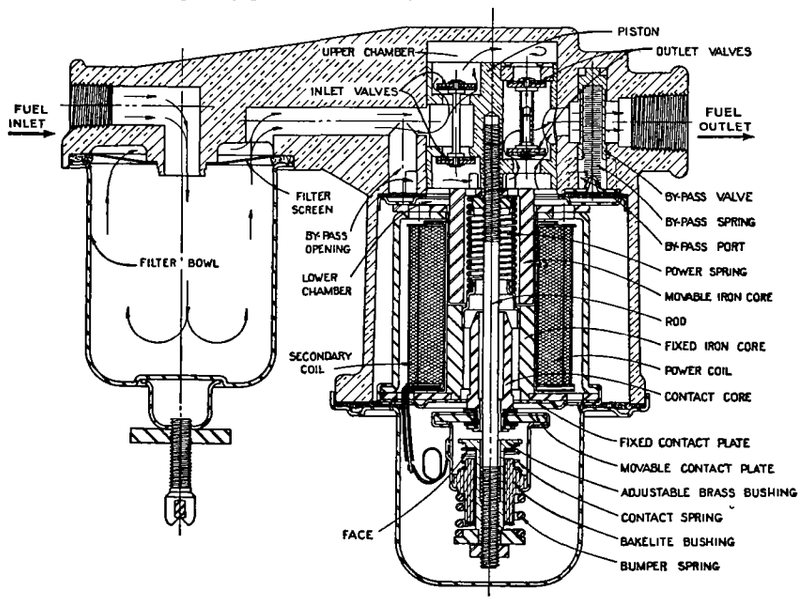
VALVE ASSEMBLY.

Armature and Magnet:—When the lower contacts become worn it will be necessary to replace the armature. This operation requires the use of a special tool, a plain sleeve .341 inch outside diameter and .316 inch inside diameter, to align the breaker spring cup on which the lower contacts are mounted to insure proper clearance. To replace armature, disassemble as directed in above paragraph. Then remove armature by taking out two bolts. In reassembling, insert the special tool in the hole in the magnet to hold cup in alignment while the bolts are being tightened. Be careful to leave .040 inch clearance between the armature and the magnet. The magnet is installed in the same manner. If the upper contacts are worn they may be replaced by riveting a new upper contact bridge in place.

KING-SEELEY ELECTRIC FUEL PUMP

DESCRIPTION:—This pump is an electric, double-acting, piston type and is assembled as follows:

Piston & Valves—Valves are located in piston and are inertia type (valve mounted directly on each end of valve stem and operated by fuel flow without springs—light spring located on outlet valve stem used to facilitate priming when pump is dry). Piston is diamond-turned, die-cast aluminum and is screwed on upper end of piston rod directly above movable core. Fuel flows through channels in piston and ports in cylinder wall (see illustration).



Coil & Power Spring—Coil is wound on form around stationary core and consists of a primary (connected in series between terminal on side of case and contacts) and a short-circuited secondary (which minimizes arcing at the contacts). Downstroke of piston, with coil energized, is caused by attraction between stationary core and movable core (mounted on piston rod below piston) and compresses the power spring located within the movable core. Upstroke of piston, with contacts open and coil not energized, is caused by power spring expansion.

Contact Mechanism—Contacts are stainless steel and are submerged in fuel which prevents arcing. Upper (stationary) contact is mounted on lower face of coil stationary core. Lower (movable) contact is mounted on the lower end of the contact core on the piston rod and is insulated from the rod by a bakelite bushing. Bakelite bushing is free on an adjustable brass bushing on the piston rod and is positioned by a bumper spring below and a contact spring above. This design results in a firm contact (contacts held together by attraction of coil core for contact core when coil energized so that contact spring compressed by piston movement) and a quick break (when contact spring reaches limit of compression).

OPERATION:—When coil is energized, movable core and piston are drawn down opening inlet valve and closing outlet valve of upper pump chamber so that fuel is drawn from tank through filter bowl and screen and channel in piston into this pump chamber. At the same time, inlet valve closes and outlet valve opens for lower pump chamber and fuel is forced out of this chamber through pump outlet to carburetor. During this stroke of the piston the contacts are held firmly closed (by attraction between stationary core and contact core) and the movement of the piston rod and brass bushing (which is rigidly mounted on rod) compresses the contact spring. When the spring is compressed sufficiently so that the brass bushing strikes the face of the bakelite bushing (which is part of the movable contact assembly), the subsequent movement of the bakelite bushing opens the contacts (contact spring snaps contacts wide open and prevents arcing as soon as coil is de-energized). Power spring (which is compressed during downstroke of piston) then forces piston up and valve action is reversed so that fuel is drawn into lower pump chamber and forced out of upper chamber. At the top of the stroke, the contacts close and the pumping cycle is then repeated.

Delivery Pressure Regulation—A spring-loaded, piston type, by-pass valve located in the outlet channel of the pump opens when the pressure exceeds the valve spring calibration and by-passes fuel through a channel in the pump housing back to the inlet side of the pump. Fuel is re-circulated through the pump in this manner until the carburetor float needle valve opens and the pressure decreases. When this occurs by-pass valve closes and fuel delivery resumes. By-pass valve springs are calibrated and standard spring limits delivery pressure to 2¼-2½ lbs. Special springs are available for pressures up to 4½ lbs.

SERVICING:—Units which do not operate satisfactorily should be replaced. Manufacturers service policy provides for replacement exchange.

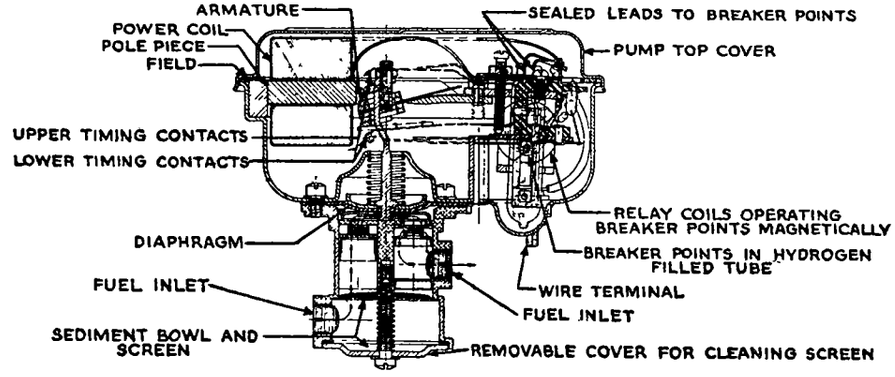
STEWART-WARNER ELECTRIC FUEL PUMP

MODEL 110-A

DESCRIPTION:—Electrically driven, diaphragm type pump with new design magnetic motor consisting of an oscillating armature mounted in front of the power coil and linked to the pump diaphragm assembly. Contacts with control power coil circuit are sealed in a hydrogen filled tube and operated remotely by two relay coils (small contacts for relay coil operation are mounted on armature). Entire motor mechanism (power coil, armature, contact points, and contact operating relay coils) are located in upper pump housing and entirely removed from pumping chamber and fuel. Pumping mechanism (sediment bowl, filter screen, inlet and outlet valves, diaphragm assembly and delivery spring) are located in lower die-cast pump housing so that all fuel is below the diaphragm which is clamped between the two pump housing parts. Pump is pusher type and is designed to be mounted near the fuel tank (not more than 3' of suction line) and it is claimed that with this type of mounting vapor lock cannot occur.

Capacity & Performance—Pump will maintain delivery rate of 15 gallons of fuel per hour to the carburetor bowl (two pumps can be mounted in parallel for greater capacity) and operates at rate of 250 strokes per minute for maximum delivery. Current consumption is 1 ampere (maximum) or ½ ampere (average). NOTE—While pump is intended for liquid fuel pumping, all liquids including water may be handled. Pump is not affected by freezing.

OPERATION:—Pump switch contacts (in hydrogen filled tube) are normally held closed by spring tension so that power coil is energized immediately when the ignition switch is turned on. This causes armature to be drawn up toward coil core, compressing delivery spring, and raising pump diaphragm so that fuel is drawn into pump chamber from tank. When the armature reaches the upper position at the end of its stroke, the upper relay contacts close and upper relay coil is energized which attracts the movable contact of the main switch contact assembly, opening the contacts and breaking the power coil circuit. Delivery spring then pushes armature and pump diaphragm down and forces the fuel in the pump chamber out through the outlet valve and line to the carburetor bowl. When the armature reaches the lower end of its stroke, the lower relay contacts close and the lower relay coil is energized. This coil opposes the upper coil and counteracts the magnetic attraction holding the switch contacts open so that these contacts close. The pump cycle is then repeated.



INSTALLATION:—Install pump upright (mark 'TOP' up) on frame side rail, cross-member, or bracket at tank level near tank so that suction line is not more than 3 feet in length. Tubing used to connect pump and tank should not be smaller than 5/16" outside diameter, tubing between pump and carburetor should be ¼" (small engines), 5/16" or ⅜" (large engines). Pump inlet and outlet are ⅛" P.T. Wire connecting terminal on fuel pump to ignition switch should be #16 or heavier. Connect pump to 'Gauge' terminal on switch so that pump controlled by switch. Make certain that pump well grounded through mounting bolts (use separate ground wire if necessary).

Dual Pump Installations—Use 'Tee' fitting in suction line and delivery line and connect each pump to this Tee. Wire pumps in parallel or install separate switches so that each pump can be cut in or out independently.

SERVICING:—**Sediment Bowl & Filter Screen**—To drain sediment bowl and clean filter screen, remove attaching screw on cover at bottom of pump casting, remove cover. Screen located within bowl and can be removed after cover has been taken off.

Switch Contacts—No servicing required. Contacts are sealed in hydrogen filled tube and are designed to outlast the life of the engine. Serviced by replacement only.

Diaphragm & Motor Servicing—Motor and diaphragm attaching screws are accessible by removing two screws in top cover. Diaphragm and diaphragm protectors are a unit with the pullrod (riveted assembly).

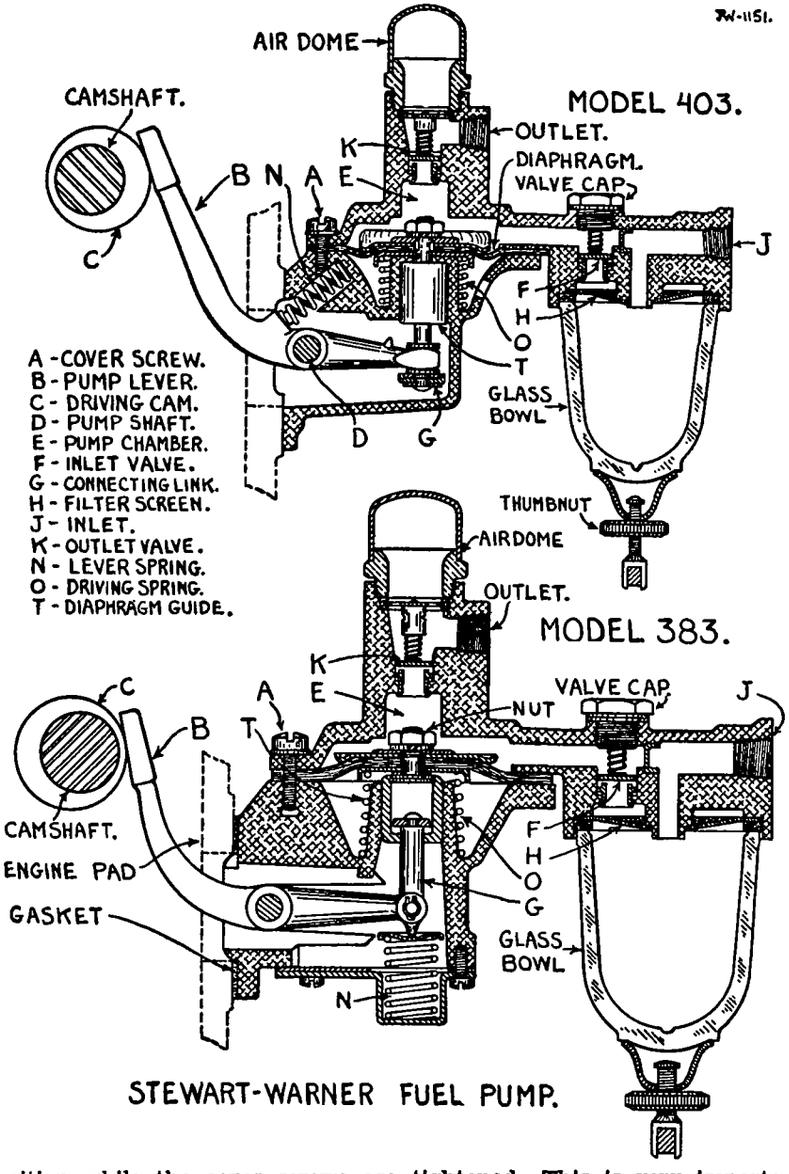
SERVICING STEWART-WARNER FUEL PUMPS

ALL MECHANICAL TYPES

Stewart Warner Pumps. Special tools and gauges are not necessary to replace diaphragms on these pumps. To install diaphragms, mount pump in bench vise, take off pump cover, nut, lock washer, alignment washer, diaphragm washer, and remove old diaphragm. See that spring retainer or lower diaphragm washer is properly installed with the cupped portion pointing down. Place four layers of diaphragm material (P-60637) in position on pull-rod, assemble upper diaphragm washer and alignment washer in place. Each of these parts has a keyway on the mounting hole. Line up keyways and compress driving spring so that the key on the pull-rod is engaged in these keyways. Hold the assembly in position and turn down nut and lock washer loosely. Hold the alignment washer from turning with a second wrench and tighten pull-rod nut securely. Be careful not to change relative position of diaphragm while this is being done. This is important. Then place pump cover in position, insert cover screws and turn screws down until about three threads on the end of each screw is engaged. Then flex diaphragm by pushing pump operating lever in toward pump as far as possible and hold it in this position while the cover screws are tightened evenly and alternately. This is important to secure the correct pump stroke. Test pump as directed above before installing in the car.

STEWART-WARNER FUEL PUMP

NOTE:—All models are similar to Model 403 (see illustration) except for minor details of mounting and construction of air dome and filter screen. The letter following the model number designates a particular installation. Model 407 is equipped with a large type diaphragm.



DESCRIPTION:—The Stewart Warner Fuel Pump is a mechanical diaphragm pump driven from the cam shaft of the engine and designed to deliver gasoline from the fuel tank at he rear of the car to the float chamber of the carburetor. A filter and glass sediment bowl are incorporated in the supply line of the pump so that all fuel passes through the glass bowl and then through a fine mesh strainer before it enters the pump chamber. From the pump chamber it is forced to the carburetor bowl, maintaining a constant supply which is designed to be in excess of the actual requirements of the engine. There is an air dome on the pump directly over the outlet valve which relieves the carburetor float valve of excessive pressure on the delivery stroke of the pump by allowing the air in the dome to be compressed.

OPERATION:—On the suction stroke of the pump the special cam on the camshaft forces the lever 'B' down, drawing the pump shaft and diaphragm downward. This creates a vacuum in the pump chamber 'E' which opens the inlet valve 'F' and causes gasoline from the fuel tank at the rear of the car to flow through the inlet 'J' into the glass reserve bowl or sediment chamber and then through the filter screen 'H' and the inlet valve to the pump chamber. As the camshaft rotates the pump lever moves upward through the action of the spring 'N'. This allows the driving spring 'O' to force the diaphragm upward closing the inlet valve, opening the outlet valve 'K' and forcing the gasoline out through the outlet to the carburetor. Air and gasoline vapor are compressed in the air dome during this delivery stroke and expand during the subsequent suction stroke so that the flow of gasoline in the line is kept more uniform and the rate is increased about twenty five per cent. When the back-pressure of gasoline in the line reaches 2.5 lbs. (carburetor float valve closed), the diaphragm is held in the lower position while the pump lever motion is absorbed by the linkage so that the pump remains inoperative until the float valve opens, when the pumping is resumed.

TROUBLE SHOOTING:—If the pump fails to deliver gasoline to the carburetor, disconnect delivery line and watch pump action while turning the engine over with the starter. If gasoline spurts from the delivery tube, the line to the carburetor is clogged or the carburetor needle valve is clogged. Observe breather hole in pump housing. If gasoline flows from this hole, the pump diaphragm is cracked and must be replaced. Disconnect supply line to gasoline tank and check for stoppage by blowing through the line. Then examine inlet and outlet valves, clean valves and valve seats and check valve springs. If the valves are warped or gummed, replace valves using new gaskets under the valve retaining nuts. Draw nuts down tight and tighten diaphragm screws. Clean out vent hole in pump housing to prevent back pressure in pump. If this does not correct trouble, remove pump from engine and test by connecting short pieces of rubber tubing to the inlet and outlet. Immerse the inlet tube in a glass of gasoline and operate pump by hand. Gasoline should spurt out of the outlet tube. If the pump does not operate it will be necessary to disassemble and examine the diaphragm and diaphragm spring. Replace weak springs, cracked or leaky diaphragm.

SERVICING:—See article on 'Servicing Fuel Pumps' on previous page for complete instructions on servicing and testing pumps. Diaphragms are installed as directed below.

To Replace Diaphragm:—Remove the pump cover by taking out cap screws. Unscrew the nut holding diaphragm on pump plunger using a second wrench to hold the large hexagonal nut from turning (this is very important to prevent tearing diaphragm and injuring pump). Remove old diaphragm and lay four pieces of diaphragm material in position on the spring retainer. Insert two cover screws to line up holes. Then place the two washers on the diaphragm, lining up the keyways in the washers and diaphragm with the key on the pump plunger stud. Compress driving spring by forcing these parts down on the stud until they seat properly with the key engaged in the keyway and screw the retaining nut down (holding the large hexagonal nut with a second wrench to prevent turning). Then place the pump cover on the diaphragm and engage the cover screws. Turn these screws down about three threads and then flex diaphragm by pushing the pump lever toward the pump as far as possible. Hold it in this

STEWART-WARNER FUEL PUMP.

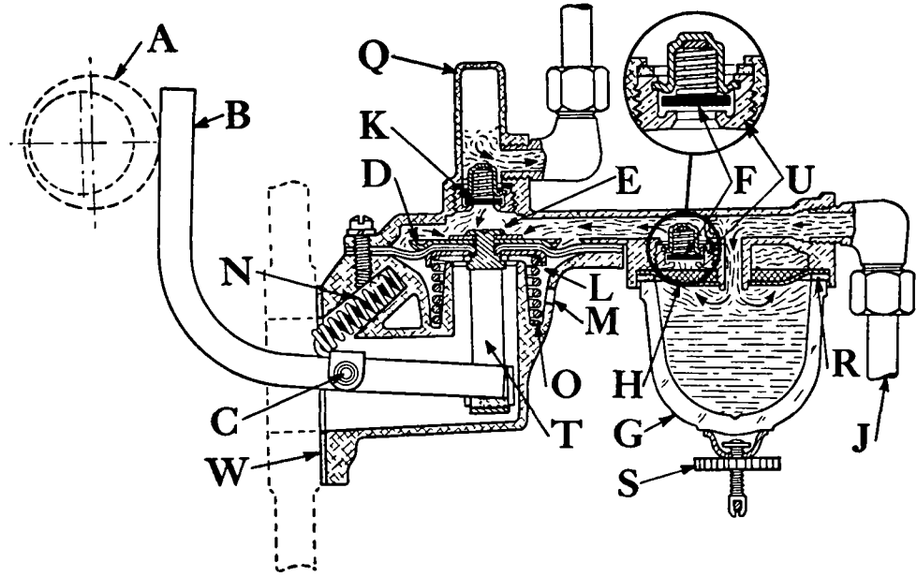
position while the cover screws are tightened. This is very important to allow the proper pump action. In replacing the pump on the engine make certain that he gasket is in place between the pump and the engine pad. The pump will prime itself in approximately 20 strokes or 40 R.P.M. of the engine.

NOTE:—These fuel pumps are similar except that valve construction on Models 807, 814 is similar to Model 403 (see previous page). All models have the integral pullrod and diaphragm assembly. Letter following model number designates a particular installation. The Model 807 is equipped with a large diaphragm assembly.

DESCRIPTION:—The Model 706 Fuel Pump embodies many of the features found on previous models and is particularly small and compact. The maximum fuel delivery of the pump is 22 gallons per hour when operating at 2000 R.P.M. but pump delivers 18 gallons per hour operating at 100 R.P.M.

OPERATION:—Suction Stroke. The relative position of the moving parts and the flow of gasoline on the suction stroke is shown in the illustration. As the motor cam pushes lever 'B' toward the pump, the lever fulcrums at 'C', thereby pulling the pump diaphragm 'D' down. This creates a vacuum in chamber 'E'. Inlet valve 'F' opens, pressed down by a spring, and gasoline is drawn from glass reserve bowl 'G' through screen 'H'. The glass bowl is connected to the rear tank by inlet line 'J'. In operation the glass bowl will always be full of gasoline. The outlet valve 'K' is also pressed downward by a spring and will be closed during the suction stroke.

Delivery Stroke. When the low point on cam 'A' is on the side nearest the pump, pressure is exerted on lever 'B' by the lever spring 'N' causing the lever to follow the cam. The other end of the lever is engaged with the diaphragm but is free to slide in the diaphragm piston rod 'T'. On the end of the delivery stroke the lever is up as high as it will go, permitting the diaphragm spring 'O' to push the diaphragm up, forcing gasoline from chamber 'E' out through the outlet valve 'K' to the carburetor. The inlet valve 'F' is held closed by the spring during the delivery stroke. The air dome 'Q' relieves the excess pressure when the valve is closed and utilizes this pressure to increase the delivery rate by about 25 per cent. Maximum delivery pressure is 2½ pounds per square inch.



Control of Delivery. Maximum delivery rate of the pump is in excess of the motor requirements and the actual delivery of gasoline is controlled by the carburetor float valve which shuts off the flow of gasoline when the float bowl is full. When this occurs and the air dome pressure builds up to 2½ pounds, the pump diaphragm stops pumping and remains in the down position since the pressure of the gasoline in the pump chamber and carburetor line balances the pressure of the diaphragm spring. The pump lever continues to move with the rotation of the motor cam and slides on the piston rod 'T'.

TROUBLE SHOOTING:—On the Car. Do not remove pump from engine until the following points have been checked:

1. See that gasoline tank on car is not empty.
2. Note if gasoline has been coming out of breather hole 'M'. This will indicate a leak due to punctured diaphragm or at the piston rod.
3. Examine sediment bowl 'G' and screen 'H'. Empty water in bowl, clean screen. In replacing bowl be sure that gasket is intact, that bowl is flat on its seat when nut 'S' is drawn up. A leak at this point will cause erratic pump action and retard delivery. Soak new gasket in lubricating oil.
4. Check for loose connection or broken lines. Disconnect gasoline supply line at both ends and blow through it to be sure that it is not clogged.
5. Disconnect delivery line at pump, observe whether gasoline spurts out of pump outlet when engine is cranked with the starter. If gasoline delivery is satisfactory at pump and carburetor bowl is empty, see that delivery line is not clogged, and check carburetor float valve.

Testing Pump off the Engine. If tests on car indicate that pump is not operating satisfactorily, remove pump for bench testing. Attach a short piece of rubber tubing to inlet and delivery connections of pump, immerse inlet tube in pail of gasoline, operate pump by hand. Gasoline should spurt out of delivery tubing in approximately fifteen strokes of the lever. If pump does not operate, check as follows:

1. Examine check valves 'F' and 'K'. Some gasolines form gummy deposits on the valves and springs, preventing spring action and proper seating of valves. Clean valve seats and springs, replace valves with glossy side down. Be careful not to stratch valve seats. In replacing valve nut or cage 'U' always use a new gasket and be sure to draw nuts up tight.
2. Examine vent hole 'M' and clean out if necessary. It must be kept open.
3. Repeat test as given above for hand operation of the pump.

SERVICING PUMP:—Diaphragm. If pump cannot be made to operate, disassemble and examine diaphragm 'D' and diaphragm spring 'O'. A punctured diaphragm or weak diaphragm spring should be replaced. To remove diaphragm, drive out fulcrum shaft pin 'C'. Replace diaphragm and stem assembly as a unit. In reassembling pump be sure to stake ends of fulcrum pin hole after pin has been replaced in order to prevent pin working out in service. If it is not possible to stake pin in place, use Part No. 65043 snap ring and No. 65044 fulcrum shaft. The diaphragm is held in place on the piston rod by a spinning operation. Assembly must be replaced as a unit.

Assembling Pump. In replacing the diaphragm, clamp pump body in a vise, line up holes in diaphragm and pump body, set the pump cover on top of the diaphragm, push in far enough so that cover screws can be turned down not more than three threads. Then pull diaphragm down by pushing lever in toward pump as far as it will go, hold lever in this position and tighten cover screws. This is important for correct operation of pump.

Air Dome. The air dome is cast integrally with the pump cover and can not be removed. This eliminates possibility of leakage at air dome threads.

Valve Assemblies. Inlet and outlet valves are the same and are constructed as assemblies in a retaining nut or valve cage which is screwed in place in the pump castings. In servicing valves the entire valve assembly should be replaced although if the seat is satisfactory it is possible to replace only the valve or spring. In assembling the valve cage always use a new gasket and see that the cage is screwed tightly into the casting.

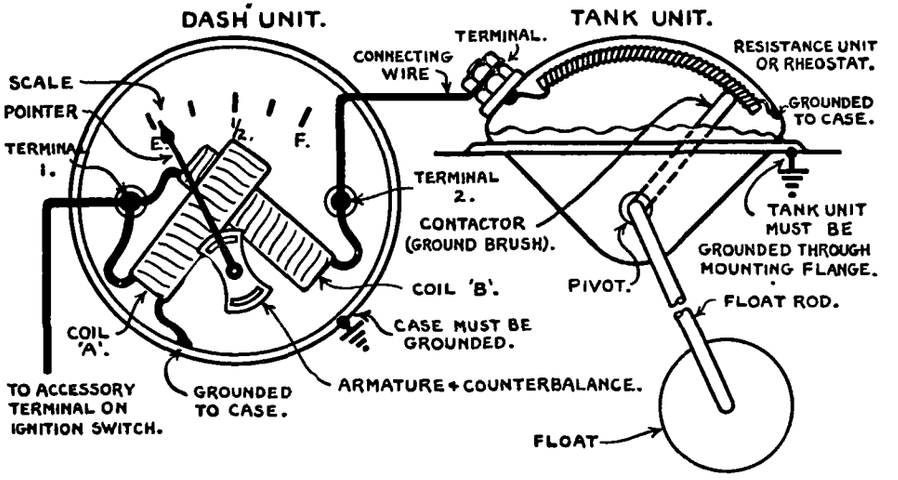
DESCRIPTION:—This is an electric gauge of the 'balanced' coil type and consists of a dash unit or recording device and a tank unit or measuring device. The two units are connected by an insulated wire and each unit is grounded. The feed wire on the dash unit is connected to the accessory terminal of the ignition switch (or coil side of switch) so that the gauge is operative only with the ignition turned 'on'.

OPERATION:—The two coils in the dash unit are connected in parallel to the switch terminal (1) on the gauge case. Coil (A) is grounded to the gauge case so that the current flow through this coil is constant. The other end of coil (B) is connected to the tank terminal on the gauge case so that the coil is in series with the resistance unit in the tank unit. The resistance unit is grounded through the contactor on the upper end of the gasoline tank float rod so that the resistance is cut in or out of the coil (B) circuit as the float rises and falls.

When the gasoline tank is empty (float in lowest position) all of the resistance coil in the tank unit will be in coil (B) circuit so that the current flow through coil (B) will be less than that through coil (A). This causes the dash unit armature to swing toward coil (A) so that the pointer (mounted on the armature) will be opposite the 'E' or empty end of the dial. As the float rises, the contactor cuts the resistance out of the coil (B) circuit so that when the tank is full, the resistance is entirely cut out and coil (B) is grounded directly. This attracts the armature so that the pointer swings over to the 'F' or full end of the dial. Variations in battery voltage have no effect on the operation of the gauge and the current consumption is negligible.

MOUNTING:—Both the dash unit and tank unit are grounded through the case and a good ground must be provided when they are mounted on the car. Remove all paint and grease from under the mounting flange and see that the two metal surfaces are in contact. When dash units are mounted on a wooden dash or other insulated support, a separate ground lead should be run from the mounting screw to the car frame or engine block.

TANK UNIT NOTE:—Tank units are furnished in both Gear Type (for tanks greater than 12" in depth or where baffles prevent installation of lever type) and Lever Type (for tanks of 12" depth or less). Tank units furnished with floats not attached to arm and should be installed as follows:



Gear Type—Travel limited to 52½° above and below horizontal position of arm. When installing, cut off float arm to correct length required for depth of tank and solder float on arm in horizontal position.

Lever Type—Furnished with float arm 12" long. Cut off float arm to correct length and solder float on arm at right angles to arm and with long diameter of float horizontal.

TROUBLE SHOOTING:—If gauge operation is not satisfactory, check in accordance with the following table:

Gauge Reads 'Full' at all times

1. Lead between dash unit and tank unit is grounded. Check by disconnecting lead at each end and substituting a test jumper wire. If gauge operates correctly, replace lead.
2. Connections on dash unit reversed. Reverse wires on dash unit and note performance.
3. Coil (A) in dash unit open-circuited. To check, disconnect tank unit lead on dash unit momentarily. Pointer should move to 'Empty' end of scale. This coil should draw .13 ampere at 6.0 volts (between switch terminal on dash unit and ground on case with tank unit lead disconnected).
4. Resistance unit in tank unit short-circuited. Check with voltmeter and battery between tank unit terminal and ground on case with dash unit lead disconnected. Resistance of unit should be 110 ohms.

Gauge Reads 'Empty' at all times

1. Dash unit not grounded. Examine ground contact or run extra ground lead from case to car frame.
2. Open-circuit between dash unit and tank unit. Check by connecting jumper wire between terminals on units and noting gauge performance.

Gauge Reading Inaccurate

Mechanical defect in dash unit or tank such as tight pivot bearings, armature counterbalance binding or incorrectly positioned, bent dial pointer, or bent float rod.

SERVICING:—Dash units or tank units which are found to be defective should be replaced.

AC GASOLINE GAUGE TESTING

NOTE:—Manufacturer recommends that AC Gas Gauge Tester, Part No. 1516000, be used in making these tests. Tester is similar to a gas gauge Tank Unit equipped with test leads and an operating handle by which the resistance can be cut in and out of the gauge circuit in a similar manner to the operation of the tank unit on the car.

TESTING:—Make the following tests in the order given which will completely check all gas gauge units and wiring.

DASH UNIT

With ignition switch 'off', disconnect tank wire at terminal on back of dash unit, connect RED tester lead to this terminal, ground BLACK tester lead to frame. Turn ignition switch 'on', move Tester arm up and down. Gas gauge dash unit should register 'Full' and 'Empty'. If operation is O.K., disconnect tester and reconnect tank wire. If dash unit pointer does not register correctly, check feed wire by connecting 6 volt test lamp between dash unit Ignition Terminal (second terminal on back of dash unit) and ground. If test lamp does not light, circuit from ignition switch is defective and ignition switch and connecting wire should be checked or replaced. If lamp lights (gauge circuit O.K.) and dash unit does not operate, replace dash unit and reconnect wires.

GAUGE WIRING

Disconnect tank unit wire at nearest point to tank unit (bayonet type snap connector or junction block). Attach Red tester lead to wire running back to dash unit, ground BLACK tester lead to car frame. Turn ignition 'on'. Move tseter arm up and down and watch dash unit pointer which should move from 'Empty' to 'Full'. If dash unit reads 'Empty' at all times, or if reading is lower than when dash unit tested alone (dash unit test above), check wire for shorts or leaks (broken insulation, short junction block terminals, un-insulated connectors touching body or frame, etc.). If dash unit reads above 'Full' at all times, or if reading is higher than when dash unit tested alone, check wire for open-circuits (break in wire, loose connections, corroded terminals, etc.). If dash unit and wire tests O.K., check tank unit.

TANK UNIT

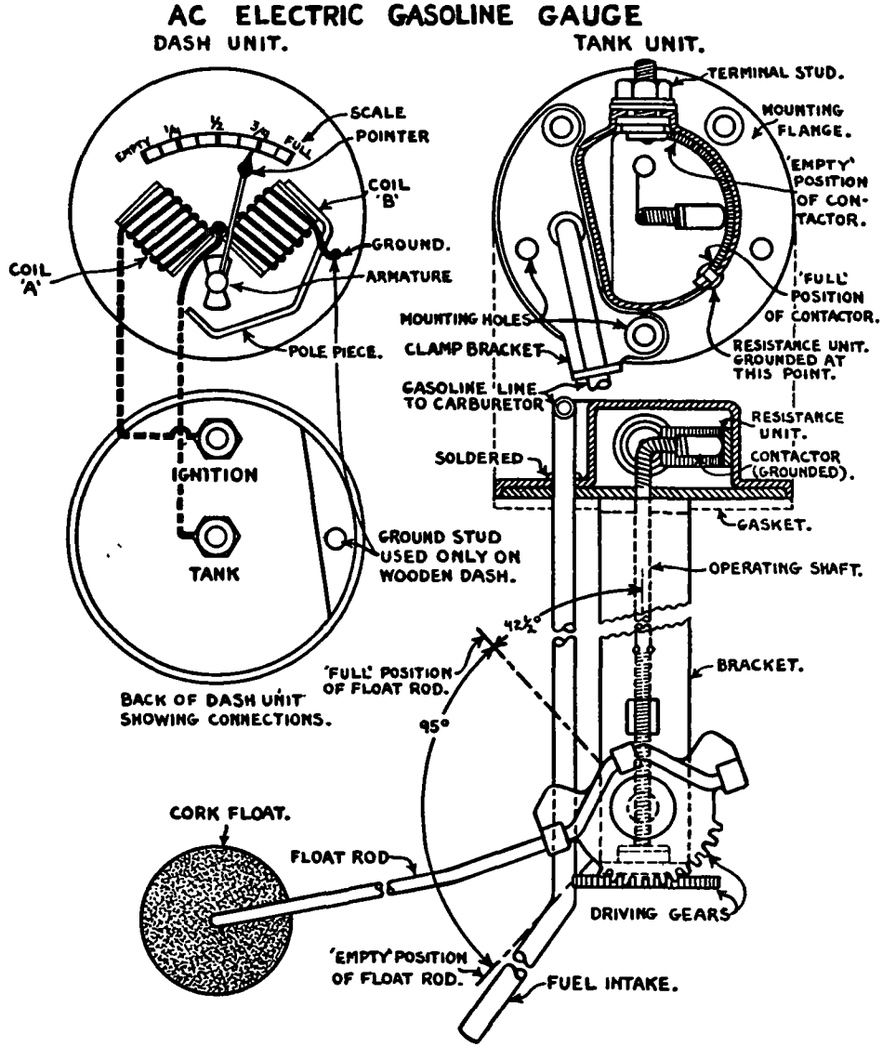
Remove tank unit, clean tank unit terminal and mounting flange thoroughly, connect tank unit to wire running to dash unit, ground tank unit by connecting jumper wire from tank unit mounting flange to car frame. Turn ignition 'on'. Move tank unit float arm up and down. Dash unit pointer should move from 'Empty' to 'Full'. If dash unit reading indicates tank unit defective, replace tank unit. Always check tank units before installing in tank and make certain that float arm is free (check for freedom of movement by noting that float arm falls back to empty position when released in various positions). See that gasoline tank and tank unit mounting flange are clean (tank unit grounded to frame through tank) and that a good ground contact exists between tank and frame.

DESCRIPTION:—The A.C. Electric Gasoline Gauge is of the balanced coil type and consists of two units, a dash unit or recording gauge and a tank unit or measuring device mounted on top of the gasoline tank. The dash unit mounted on the instrument panel consists of two coils mounted at an angle of 90 degrees. The gauge pointer is attached to an armature which is pivoted at the intersection of the coil axes. The dash unit is connected to the coil side of the ignition switch and to the tank unit through insulated wires. The dash unit is grounded through the mounting screws to the instrument board and car frame.

The tank unit consists of a fixed resistance connected to the dash unit. A movable contact arm geared to a float in the gasoline tank cuts this resistance in or out of the dash unit coil circuit. The float rests on top of the gasoline in the tank and rises and falls with the gasoline level. A friction brake is built in the tank unit to prevent wave motion caused by road shocks affecting the gauge reading. The dash unit is also provided with an inertia dampener to prevent road shocks being transmitted to the gauge pointer. Both dash units and tank units are standardized so units are interchangeable.

OPERATION:—The upper terminal of the dash unit marked 'Ignition' is connected to the coil side of the ignition switch (or to the 'auxiliary' terminal of lock switch coils) so that the gauge is operative whenever the ignition switch is turned on. Current flows through coil 'A' of the dash unit to the center terminal marked 'Tank'. The second coil 'B' is connected to this terminal. The other end of this coil winding is grounded to the gauge case. The 'Tank' terminal of the gauge is connected to the terminal on the tank unit and circuit is completed to ground through the tank unit resistance winding. This resistance winding in the tank unit is grounded through the movable contactor so that the resistance is cut in or out of the dash unit coil circuits as the float rises and falls with the gasoline level in the tank.

When the gasoline tank is empty with the float at its lowest position, the contactor will be at the terminal end of the resistance unit so that the resistance is entirely cut out of the coil 'A' circuit and coil 'B' is practically short-circuited. Current in coil 'A' will be at maximum and in coil 'B' at minimum. The resulting magnetic field will cause the pointer armature to swing over so that the pointer will be opposite the 'Empty' end of the gauge scale. As gasoline is added in the tank and the float rises, the contactor moves along the resistance unit adding resistance in the coil 'A' circuit and causing more current to flow through coil 'B'. The pointer armature is attracted toward coil 'B' and the pointer passes over the gauge scale toward the 'Full' position. With the tank full the resistance will be entirely in the coil 'A' circuit and entirely out of the coil 'B' circuit.



Since the gauge is of the balanced coil type, differences in the voltage of the car battery will have no effect on the accuracy of the gauge reading. Current consumption of the gauge is between 1/6 and 1/10 ampere and can be disregarded.

INSTALLATION:—Both the tank unit and dash unit are grounded and care must be taken whenever the units are installed or replaced that a ground is provided. On the tank unit it will be sufficient to remove paint and carefully clean the tank under the tank unit flange. Dash units designed to be mounted on a wooden dash or instrument board are provided with a ground stud which should be connected to the car frame.

TANK UNIT (NEW TYPE):—Gearless type with integral float arm and contactor arm (rheostat ground brush). Float arm is pivoted in lower end of tank unit case so that movement of the arm (with the rise and fall of the float in the tank) causes the upper end of the arm to sweep across the tank unit resistance coil. Except for this new type float arm construction and separately mounted fuel outlet pipe (some models), gasoline gauge is similar to type used on previous car models.

TROUBLE SHOOTING:—Defective units should be replaced and servicing operations will be confined to locating trouble in dash unit or tank unit. Check gauge operation from following table:

1. Pointer does not move when ignition is turned 'on'.
   The line from the ignition switch to the dash unit is open. Check connections and supply new lead from switch to 'IGN' terminal on gauge.
2. Gauge indicates 'Full' at all times.
   The line between dash unit and tank unit is open. Check connections and replace line with insulated wire.
   Tank unit burned out. Replace tank unit.
   Tank unit not grounded. Check by supplying new ground from tank unit to car frame.

3. Gauge indicates 'Empty' at all times.
   Wires reversed on dash unit. See that connections are made as indicated above on diagram.
   Dash unit is not grounded. See that dash unit is properly grounded. Check by supplying special test ground to car frame. If dash unit does not register correctly, it must be replaced.

AUTO-LITE ELECTRIC GASOLINE GAUGE

This type gauge standard equipment on the following car models:

Car Model	Model (Dash Unit).
Chrysler, Royal C22 (1939)	NG-9064D
Chrysler, Imperial C23 (1939)	NG-9064D
Chrysler, Cust. Imp. C24 (1939)	NG-9064D
DeSoto, Model S6 (1939)	NG-9040D
Dodge, Model D11 (1939)	NG-9023D
Plymouth, Models P7, P8 (1939)	NG-9009D
Studebaker Champion, Model G (1939)	NG-9211D

IMPORTANT SERVICE NOTE:—Three types of dash units have been used as described below and special precautions must be observed when tightening connections at dash unit terminals on each model. Excessive tightening will loosen terminal stud and destroy the accuracy of the gauge requiring replacement of the dash unit (see also Calibration Adjustment below).

First Type Dash Unit—No identification marks. No terminals staked to prevent turning. Use great care when tightening connections, particularly at 'IGN.SW.' terminal.

Second Type—May be identified by radio resistor terminal at top of gauge between '1' and '2' terminals and use of round insulating washers on each of these terminals. The 'IGN.SW.' terminal is staked to prevent turning. Other terminals are not staked.

Latest Type—May be identified by radio resistor terminal and insulating strip extending across between '1' and '2' terminals (replaces individual insulating washers used on other types). All three terminals staked to prevent turning.

DESCRIPTION:—Gauge consists of a bimetal or thermostatic arm type dash unit and a rheostat type tank unit connected together by two wires.

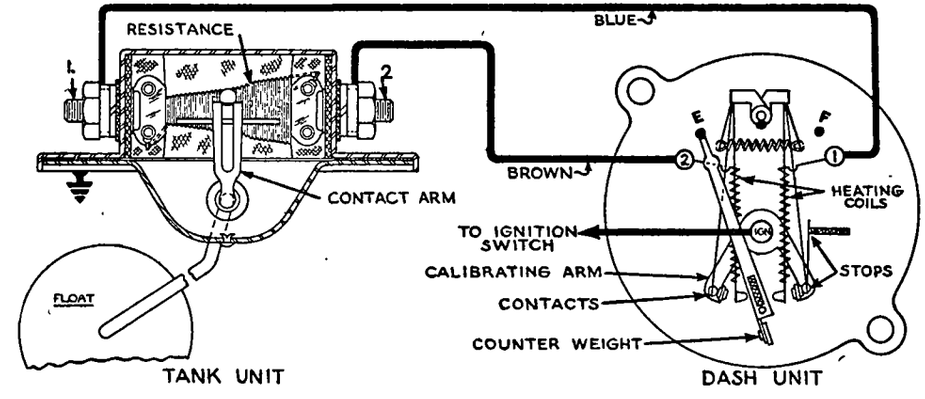
Dash Unit—Pointer actuated by the two bimetal arms on which heating coils are wound (these arms hinged at upper end with lugs to engage pointer at lower end). The two outer bimetal arms (without heating coils) compensate the dash unit for temperature changes (left hand arm controls dash unit contacts, right hand arm has insulated stop at each side to limit motion in each direction) and the contacts compensate for battery voltage variations (remain closed at 5 volts or less, open and close at voltages above 5 volts to maintain constant gauge input). The circuit through the dash unit is from the 'IGN.SW' terminal through the contacts and then through each heating coil to terminals '1' and '2'.

Tank Unit—Consists of a resistance coil wound on a flat form and connected between the two tank unit terminals. Contact arm is grounded and circuit from each terminal is through the resistance to ground at the contact arm. Contact arm is mounted on the float lever and moves across the resistance as the float rises and falls so that resistance is cut out of one dash unit heating coil circuit and in on the other heating coil circuit with this movement.

OPERATION:—When the ignition switch is turned on, current flow through heating coil on each bimetal arm in the dash unit depends on contact arm position in tank unit (contact arm controls amount of resistance in each heater coil circuit) and the unequal current flow through each coil causes an unequal deflection of the bimetal arms so that the pointer is moved on the scale. Any change in the position of the tank unit contact arm (caused by float movement) causes a like change in the bimetal arm deflection and pointer reading of the dash unit. When voltage at gauge exceeds 5 volts, or if bimetal arms become overheated, contacts open and close to maintain constant input so that readings are accurate regardless of voltage fluctuations (pointer position entirely dependent on division of current between heating coils on bimetal arms as controlled by tank unit. Contact opening and closing is sufficiently rapid so that pointer does not change). External temperature changes (affecting outer unwound bimetal arms) cause a slight rotation of the hinge so that position of inner bimetal arms and pointer remains unchanged. Gauge design results in a lag or damping action so that pointer fluctuations due to fuel tank surges are minimized. When ignition switch is turned off, bimetal arms flex away from pointer which is then returned to the empty position by the counterweight at the lower end.

TESTING:—Use spare tank unit, which is known to be in good order, to test gauge units. Disconnect wires on terminals '1' and '2' of dash unit, connect these terminals to same numbered terminals of test tank unit, ground test unit to car. Turn ignition switch on and operate test unit by hand, moving float from empty to full position, and noting dash unit pointer reading. NOTE—Allow one minute for dash unit to indicate true reading. If dash unit reads correctly when operated with test tank unit, trouble is in wiring or tank unit (see Trouble Shooting Table and test directions below). If dash unit does not read correctly, replace unit (see Calibration Adjustment below).

Checking Wiring—Connect 6 volt test lamp in series with wire to tank unit at connector accessible through hole in trunk floor. With ignition turned on, lamp should go on and off at regular intervals. If lamp does not light, wire is grounded or open-circuited (see Trouble Shooting table). Test both Brown and Blue wires in this manner. NOTE—Open-circuits are usually found at wire connectors in rear compartment. Clean contact surfaces thoroughly to remove all grease, dirt, insulating varnish. Grounds may occur at left windshield post where wires enter post or at left rear quarter window (make certain that moulding screws do not pinch or pierce wiring insulation).



TROUBLE SHOOTING:—If wires open-circuited, grounded or reversed, gauge will read inaccurately as follows:

	Gauge Reading With		
	Tank Empty	Tank ½ Full	Tank Full
Blue Wire Grounded	Empty	¼ Full	½ Full
Blue Wire Open	½ Full	Full plus	Full plus
Brown Wire Grounded	½ Full	¾ Full	Full
Brown Wire Open	Empty	Empty	Empty
Wires Reversed	Full	½ Full	Empty

Gauge Reading Inaccurate—See table above. May also be caused by excessive tightening which has loosened terminal studs requiring replacement of dash unit (see Service Note and Calibration Adjustment).

Pointer Sticks or Binds—See that pointer does not bind on panel at lower end (if necessary, shim gauge out from panel by installing gasket cut to size of dash unit mounting face. Check pointer bearing alignment and endplay (adjust by bending bearing supports).

Fluctuating Pointer—Examine contact points and clean by drawing piece of bond paper between them.

CALIBRATION ADJUSTMENT:—If pointer position not correct at Empty or Full, or if gauge reads inaccurately, dash unit should be calibrated as follows: Remove dash unit from car, connect to tank unit known to be in good condition and to a battery (see illustration for connections). Loosen both nuts on 'IGN.SW' terminal (inner nut is staked on later type units) to release calibrating arms. Set tank unit float in Empty position, move left hand calibrating arm (on which stationary contact is mounted) to right to raise pointer reading, or to left to lower pointer reading. Move tank unit float arm to Full position, move right hand calibrating arm to right to raise pointer reading, or to left to lower pointer reading. Recheck gauge at Empty position (setting may be changed by the Full adjustment). Tighten nuts on 'IGN.SW' terminal to lock calibrating arms in position using extreme care not to shift arms while tightening inner nut. NOTE—When making this adjustment, or when testing dash unit on the bench, unit must be shielded from air currents which might cause unequal cooling of the bimetal arms and affect the gauge reading. Allow 1 minute for bimetal arm heating coils to heat up, after moving tank unit float, before checking dash unit pointer position.

K-S 'TELEGAUGE' FUEL GAUGE

DESCRIPTION:—The K-S Telegauge is a hydrostatic gasoline gauge. The gauge actually measures the pressure due to the weight of the gasoline in the tank on a column of trapped air in the tank unit of the gauge. This is recorded by the height of the liquid column in the dash unit of the gauge. Since the height of the column depends upon the height of the gasoline in the tank the dash unit is calibrated to read directly in gallons. It should be remembered that there are three distinct units to the gauge; the dash unit or recording unit, the tank unit or pressure unit, and the air line which connects them. These will be taken up individually.

Tank Unit:—The tank unit consists essentially of an inverted cup mounted in the bottom of the gasoline tank and connected through an air-tight tube to the gauge connection on the top of the tank. The cup is closed by a plate at the bottom to prevent fuel surges affecting the operation but gasoline is free to enter the cup through a hole in the plate. A vent pipe to protect the gauge against high pressure extends down through the cup with the lower end (which is open) at the lowest portion of the cupped lower plate. The upper end is open to the air. It is purely a safety measure and since the lower end is normally covered by gasoline it has no part in the operation of the gauge. There is, however, an air supply tube which terminates in a cup at the upper end in the tank while the lower end is curved up under the bottom of the cup. This acts to renew the air supply in the cup by trapping gasoline in the upper air cup from which it runs down through the tube, drawing with it small bubbles of air. These bubbles find their way into the cup of the tank unit and maintain the air supply. When the cup is completely filled they escape around the edge and through the gasoline in the tank.

Air Line:—This consists of an air-tight copper tube connecting the terminals of the tank unit and the dash unit. It transmits the air pressure in the tank unit to the dash or recording unit where it displaces the red liquid in the gauge.

Dash Unit:—The dash unit consists of a glass tube open at the top and mounted directly behind the face of the gauge so that the height of the liquid can be seen. The lower end of the tube is connected to a brass supply tube which is connected at its upper end to the air line from the tank unit. The whole assembly is thus a 'U' tube filled with a red liquid and open to the air at one end and connected to the tank unit or pressure source at the other end. When the pressure at both ends of the 'U' are equal, as they will be when the gasoline tank is empty, the liquid will be of the same height in the two sections of the 'U'. This corresponds to the 'Empty' position of the gauge and the top of the column in the gauge glass should be opposite the 'Empty' figure on the gauge face. Most of the gauges do not show a '0' or empty position and the gauge will read 'R' indicating the reserve supply at the lowest position of the liquid. A calibrating wire is installed in the brass tube at the factory. This wire must not be removed or the accuracy of the gauge will be affected.

OPERATION:—As the tank is filled with gasoline, the pressure of the gasoline tends to displace the air in the tank unit cup, driving it through the air line to the dash unit. Here it unbalances the two liquid columns, driving the liquid down in the supply tube and up in the gauge glass. The gauge is calibrated to read directly in gallons.

TROUBLE SHOOTING:—If performance of the gauge is not satisfactory, check trouble from following table:

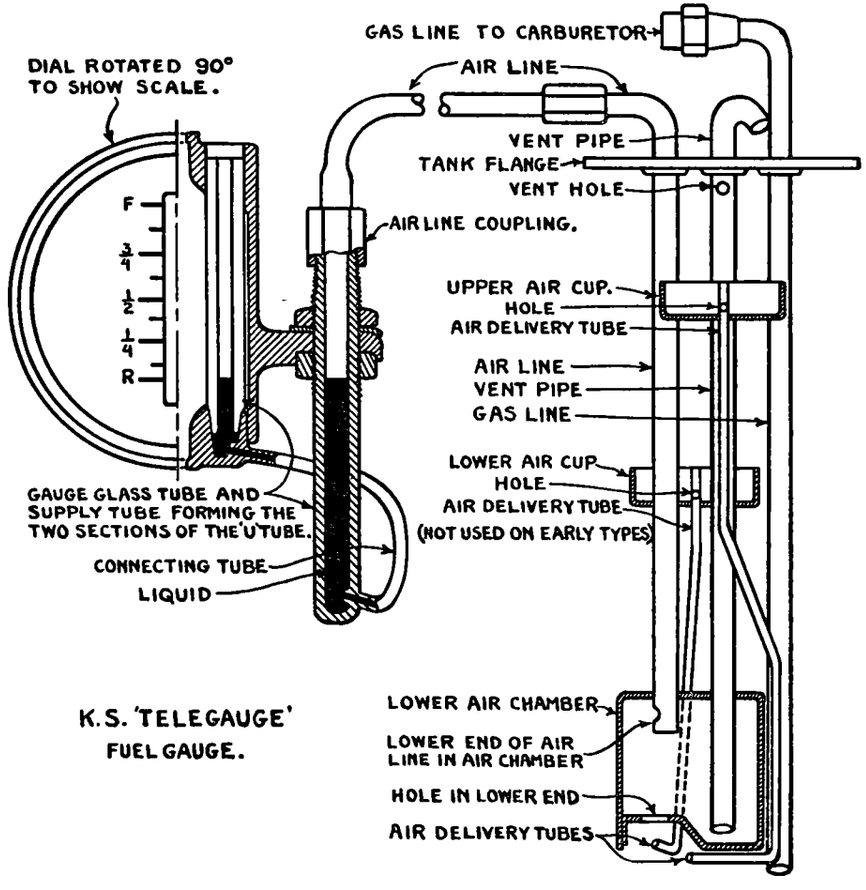
Gauge Does Not Register. If gauge reading goes up slowly when motor is operated with car standing still, this may mean that air line is plugged and air in line is expanding from motor heat.

(1) Air line leaks. Dry out air line and test for tightness (vacuum).
(2) Broken Dash Unit. Inspect and replace if necessary.
(3) Plugged Air Line. Blow out air line with hand pump. See that air actually passes through line.
(4) Plugged or Broken Tank Unit. Inspect tank unit and replace if necessary.

Gauge Reading Erratic. Noticed as increase in reading when car is decelerated, and drop in reading when car is accelerated. Small variations when turning corners, etc., are normal.

(1) Moisture in air line. This takes the form of small plugs or drops of gasoline in the line. Dry out air line with hand tire pump.

Gauge Reading Drops When Car is Parked. A small drop over long periods, as when car is parked overnight, is normal at certain times.



(1) Small leak in air line. Check air line for tightness (vacuum).

Gauge Reads High. Gauge will read full before tank is completely filled and will indicate gasoline in tank when tank is empty.

(1) Too much liquid in dash unit. Disconnect air line. Absorb excess liquid with match or toothpick until liquid level is at '0'. Dry out air line before reassembling.

Gauge Reads Low. Gauge does not read full with gasoline tank completely filled.

(1) Not enough liquid in dash unit. Disconnect air line. Add liquid until level is at '0' mark. Dry out air line before reassembling.
(2) See that calibrating wire is in place in brass tube of dash unit.

K.S. 'TELEGAUGE' FUEL GAUGE.

SERVICING:—Dash Unit. The level of the red liquid should be opposite the lowest mark on the gauge with the air line disconnected at top of the supply tube. To check, disconnect the air line and note the reading. The level of the liquid can be adjusted by using a toothpick to absorb excess or by adding additional liquid. This can be secured from the manufacturer and only genuine King-Seeley Telegauge liquid should be used. Make certain that the calibrating wire is in place in the brass tube. Inspect dash unit for evidence of breakage or mutilation.

To Test Dash Unit. Pump air into brass tube by moving thumb up and down rapidly at top of tube until reading is secured, then hold thumb tightly over brass tube and note whether reading is held. If liquid level in glass tube is maintained, dash unit is OK.

Air Line:—Air line should be dried out whenever it is disconnected. To do this, connect a hand tire pump to the dash unit end of the air line (special pump connection K-S No. 1502 may be used), remove gasoline tank filler cap, pump at least 50 full strokes through the line. Make certain that line is not plugged and that air passes through. Examine air line connections, see that cones are smooth, true and clean so that connections will be tight.

To Test Air Line. Plug tank end of air line. Suck on dash unit end. Vacuum should be sufficient to hold tongue against end of tube for one minute. If line leaks (no vacuum) or is plugged (air cannot be driven through), it should be replaced. Do not use air compressor line to blow out air line as pressure will be excessive.

Tank Unit:—Tank unit will ordinarily not require attention. Examine connector at top of air line tube. If tank unit is removed from gasoline tank, examine hole in air delivery tube in air cup, and see that hole in plate at lower end of chamber is open. Air chamber and line must be tight.

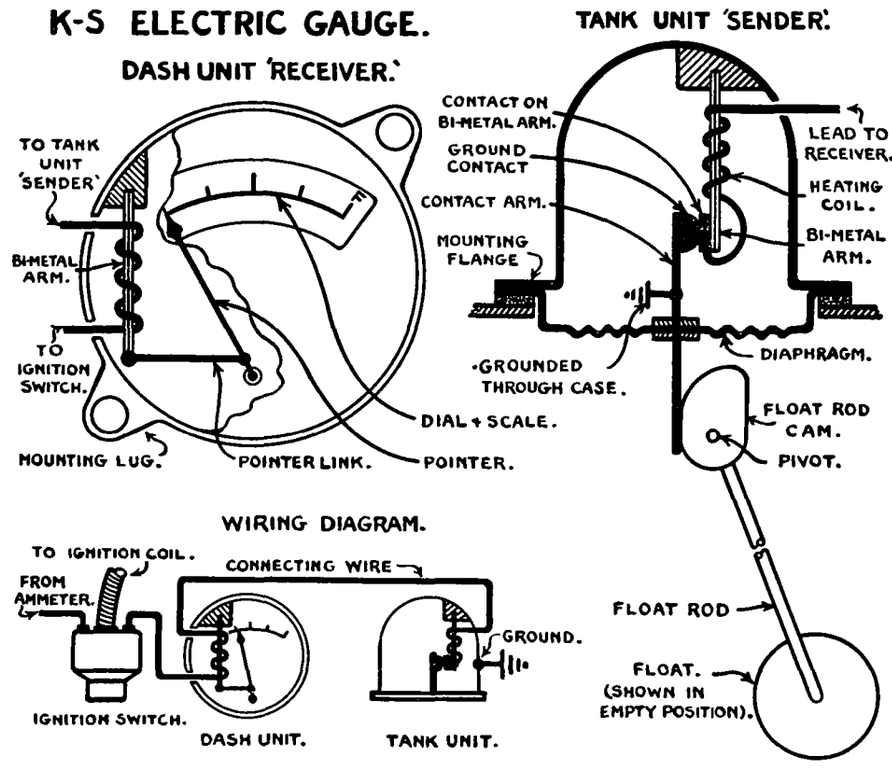
Final Check:—After reassembling air line, disconnect fuel line at pump and blow back through fuel line (when fuel tube is part of tank unit), or drive the car in such a manner as will cause fuel to splash in tank (where fuel tube is separate). This will build up the air supply in the air chamber so that the gauge will register. If the gauge reading is held for one-half hour, gauge is operating satisfactorily.

KING-SEELEY ELECTRIC TYPE GAUGES

DESCRIPTION:—This is an electric type gauge of a new type using bi-metal arms on which heating coils are wound in both the tank or engine unit 'Sender' and the dash unit 'Receiver'. The two heating coils are connected in series and the gauge circuit is completed to ground through a set of contacts in the Sender unit (one of which is mounted on the bi-metal arm). The feed wire on the Receiver unit is connected to the accessory terminal of the ignition switch so that the gauge registers only with the ignition on.

Gasoline, Oil, Water Level—For this purpose the ground contact in the Sender is mounted on a movable arm (arm mounted through diaphragm forming lower cover of Sender unit and flexes diaphragm as it is moved). The lower end of the ground contact arm is actuated by a cam on the upper end of the float rod pivot. When the float moves up to follow the gasoline, oil, or water level, the cam moves the arm so that contact pressure and length of time contacts remain closed is increased.

OPERATION:—When the Sender contacts are closed a current flows through the heating coils of both the Sender and Receiver units. This causes the bi-metal arm in the Receiver to bend, moving the pointer, and indicating a reading on the gauge dial. At the same time the heating coil in the Sender unit causes its bi-metal arm to bend, opening the contacts and interrupting the current flow. When this occurs the heating action stops and the cooling of the bi-metal arm causes it to flex in the opposite direction and again close the contacts. In operation, this cycle takes place very rapidly (approximately once each second for the gasoline gauge with tank empty), and a steady reading is obtained on the Receiver dial.



TROUBLE SHOOTING:—Gasoline, Oil, Water Level Gauges—Manufacturer recommends use of extra or test Sender and Receiver to check operation of units which do not perform satisfactorily. Make tests as directed below:

Testing Sender:—Disconnect lead of Sender unit on car, connect this lead to test Sender and ground this Sender to the car frame. Turn on ignition, move Sender float up to 'full' position and note reading on Receiver. Receiver should read full or 'F' after 10-15 seconds time. If Receiver reading is correct, check following points before replacing Sender unit.

1. Ground. Sender is grounded through case. See that all paint and grease are removed under flange and both surfaces make good contact.

2. Radio By-pass Condenser Shorted. If by-pass condenser is connected at Sender on cars with radio, test for short-circuit by disconnecting condenser and noting gauge operation. If gauge is satisfactory, replace condenser. Use only condenser of .05 microfarad capacity (manufacturer recommends Cornell Dubilier Corp. Condenser No. 22-259).

If reading is secured with test Sender is same as that with Sender on car, check wire connecting Sender and Receiver and replace if found to be open-circuited or grounded.

Testing Receiver—Disconnect wires on Receiver on car and connect to same terminals on test Receiver. Turn on ignition switch and note reading on gauge. If test Receiver reading is correct, replace Receiver on car. If test Receiver reading is same as car Receiver, repeat tests on Sender and wiring.

SERVICING:—No service operations are required other than to see that wires are properly connected and terminals are tight. No repair operations are possible and defective Senders and Receivers should be replaced.

ELECTRIC TYPE

FUEL-AND-OIL LEVEL GAUGE NOTE:—These installations consist of a regular gasoline gauge dash unit and tank unit and an additional tank unit placed in the crankcase oil pan to indicate the oil level. A two-way selector switch is used so that the dash unit may be connected to the fuel tank unit (for gasoline reading), or to the oil pan unit (for oil level reading). Dash unit and tank units used for this type installation are the same as used for regular gasoline gauges and these units are tested in the same manner as fuel gauges listed below.

DESCRIPTION:—The electric gasoline gauge is of the balanced coil type and consists of a dash recording unit and a tank resistance or variable resistance connected to a float in the gasoline tank. The gauge operates only when the ignition switch is on and indicates 'Empty' with the switch off. With engine stopped it will be necessary to turn the switch on to secure a correct reading. The gauge is not affected by changes in battery voltage and will give a correct reading with a discharged battery.

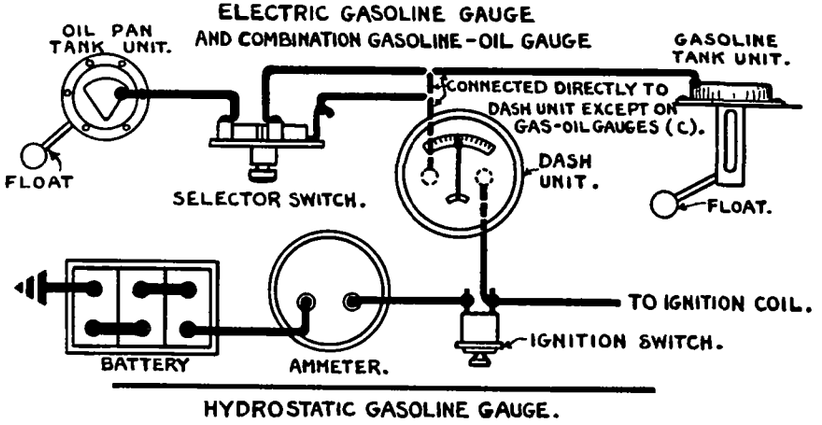
MOUNTING:—Both the dash unit and the tank unit should be grounded. If the gauge is mounted on a wooden dash it will be necessary to run a wire from the gauge case to the engine block or car frame. The tank unit is grounded through the mounting screws. One wire from the 'Ga' terminal on the dash unit runs to the terminal on the tank unit. A second wire from the dash unit terminal 'IGN SW' should be connected to the coil terminal of the ignition switch. Make certain that all connections are tight.

TROUBLE SHOOTING:—If gauge does not register correctly in service, first check for loose connections at switch, dash unit, or tank unit and check lines for broken wires. Make certain that both dash unit and tank unit are properly grounded. Then make the following tests:

Defective Dash Unit. Turn on ignition switch. Remove wire at tank unit. Gauge should register 'Empty'. Ground wire to car frame. Gauge should register 'Full'. If it does not, the dash unit is defective.

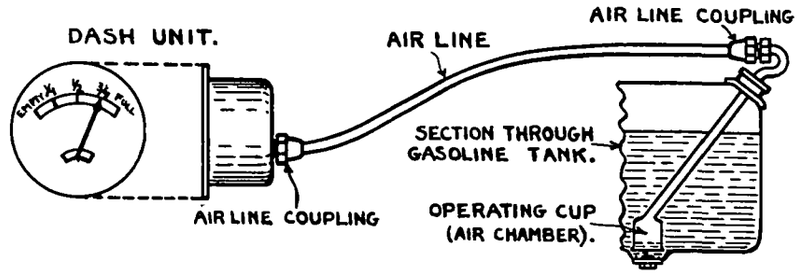
Defective Tank Unit. If the above tests indicate that the dash unit is operating correctly and the gauge will not operate in service, the tank unit is probably defective.

Do not attempt to make repairs to either the dash unit or tank unit. The manufacturer will replace all defective instruments.



HYDROSTATIC TYPE

DESCRIPTION:—The hydrostatic type gasoline gauge consists of a pressure gauge on the dash calibrated to read in gallons of gasoline, an operating cup or air chamber in the gasoline tank, and a tube connecting the two units. This tube has a coupling at the dash unit and at the top of the gasoline tank and these couplings must be tight to prevent any leakage of air pressure from the system. The gauge line is also connected to the vacuum tank so that the air is removed whenever the tank operates. This has the effect of removing any gasoline vapor from the air line, which would interfere with the correct reading of the gauge. For this reason the gauge reading will drop back to zero or 'Empty' whenever the vacuum tank operates but the gauge will shortly afterward indicate a correct reading.



OPERATION:—The gauge, air line and operating cup are normally filled with air. The operating cup is open only at the bottom and the air will be trapped in the cup by the gasoline in the tank. The weight of the gasoline will exert a pressure on the air, compressing it slightly. This pressure is transmitted to the dash unit, which is a pressure gauge, and will be indicated on the scale in terms of gallons of gasoline. The pressure depends entirely on the height of the gasoline in the tank, increasing from no pressure when the gasoline level is below the bottom of the operating cup to a greater pressure when the tank is full. Naturally any leak in the air line will permit the escape of air and the pressure will be lost, causing the dash unit to register a lower reading than it should.

TROUBLE SHOOTING:—If the gauge fails to register, the trouble may be in the gauge or dash unit, the air line may be clogged, or the coupling may be loose. Check as follows:

Testing Dash Unit. Disconnect the air line at the back of the dash unit and slip a short piece of rubber tubing over the gauge socket and then blow through the tubing until the gauge reading is approximately ¾ 'Full'. Any excessive pressure will destroy the gauge. Seal the rubber tube and watch to see if the gauge holds the reading. Tap the gauge glass slightly. If the pointer remains at the ¾ mark, the dash unit is operating satisfactorily. If the pointer drops back to '0', indicating that the pressure is being lost, the dash unit is defective and must be replaced. No repairs are possible.

HYDROSTATIC GASOLINE GAUGE.

To Free Air Line. Disconnect the air line at the dash unit. Remove the gasoline tank filler cap. Then blow out the lines with a hand tire pump or tire air line. Any pressure may be used but the hand air pump is preferable. When the air bubbles through the gasoline in the tank, showing the air line is open, connect the air line to the dash unit. Use two wrenches to prevent damage to the dash unit. It will be necessary to run the engine to free the operating cup from gasoline which fills it whenever the air line is disconnected.

If the gauge registers less than the actual contents of the tank, it is an indication that the air line is not tight. Blow out the line and tighten the couplings, using two wrenches to avoid twisting the dash unit and tank unit.

If the gauge registers more than the actual contents of the gasoline tank, it is an indication that the dash unit has been subjected to excessive pressure. The dash unit must be replaced.

FAST IDLE & THROTTLE CRACKING ADJUSTMENTS

IMPORTANT NOTE:—The Fast Idle and Throttle Cracking Adjustments listed below are important for easy starting and good engine performance when cold. If engine is hard to start when cold, Automatic Choke should be examined to make certain that choke valve is closed, and Throttle Cracking linkage examined to see that throttle valve is being opened the correct amount. If engine does not idle smoothly or dies when cold, Fast Idle mechanism should be examined to make certain that throttle valve is held open in 'fast idle' position. If engine speed is excessive when started (this may cause damage to starter or pinion by too violent disengagement), examine Throttle Cracking setting for too large throttle opening. See settings below and special articles on all types of Automatic Chokes and Fast Idles. It should be kept in mind that engines fitted with Fast Idles run at a faster speed (Cold Idle Speed) when engine is cold and that this decreases to the normal speed (Hot or Slow Idle Speed) when the engine reaches normal running temperature.

DESCRIPTION:—Fast idle and throttle cracking devices are used on a number of the car models. Fast Idles consist of attachments on the carburetor which hold the throttle valve open slightly so that the engine operates at a higher or 'cold idle' speed during the warming up period, and decreases to the slow or 'hot idle' speed when the engine warms up, or when the choke valve is opened. Throttle Cracking devices consist of a linkage between the carburetor throttle valve and choke valve so that the throttle is opened when the carburetor is choked for starting, or a linkage between the throttle valve and the starting pedal so that the throttle is opened while the starter is being operated to crank the engine.

SERVICING:—For cars after 1935 see Car Model Page in Tune Up and Electrical Section. See car listing below for adjustments on previous car models.

Auburn Model 8-100 '32, 8-101 '33. Throttle Cracking—Choke valve and throttle interconnected by 'Throttle-Cracking' device so that throttle is opened .046" with choke valve fully closed. See article on Stromberg URO-2 carburetors for adjustment.

Auburn Model 8-50Y '34, 851 '35. Fast Idle—Stromberg lever type. See separate article. No adjustment required.

Auburn Model 653 '34-35, Carter Carburetor. Throttle Cracking—Throttle and choke valves interconnected so that throttle is opened .031-.035" when carburetor is choked for starting. No adjustment required.

Auburn Model 653 '35, Stromberg Carburetor. Throttle Cracking—Throttle stopscrew stop cam linked to choke valve so that throttle is opened slightly when carburetor is choked for starting. Throttle stopscrew should rest on high point of cam with choke valve fully closed.

Buick Models 40, 50, 60, 90, '34-35. Fast Idle—Buick Cold Idle Control (thermostatically controlled cam which serves as throttle stopscrew stop). See separate article for description and setting.

Throttle Cracking—Accelerator pedal control of starting switch. Vacuum switch or accelerator linkage adjustment as follows:

Buick Model 40. Warm up engine (water temperature should be 140°F.). Close hand throttle (push button in), check idling speed, adjust to correct 'hot' or slow idling speed of 8 M.P.H. Check accelerator pedal position (distance from top of pedal to floor should be 2 29/32"—adjust by changing length of pedal rod). Rotate 'fast' or cold idle control cam on carburetor counterclockwise until it is against the stop, see that cam remains in this position while vacuum switch adjustment is being made. Disconnect vacuum switch operating rod at vacuum switch, rotate switch lever until pointer lines up with line on case marked 'Fast Idle', adjust rod length so that it can be connected to switch lever without disturbing position of lever. Check operation of starter and see that gap between idle adjustment screw and throttle opening cam on carburetor is at least 7/32" at the instant when vacuum switch makes contact and operates starting motor.

Buick Models 50, 60, 90. Warm up engine (water temperature should be 140°F.). Check idling speed, adjust to correct 'hot' or slow idling speed of 8 M.P.H. See that throttle rod shoulder is screwed up as close as possible to the trunnion on the throttle valve lever, check accelerator pedal position. Distance from top of accelerator pedal to floor should be 4⅛" (50), 4⅜" (60), 4⅝" (90). Adjust by disconnecting accelerator pedal rod and changing position of trunnion on lower end. Rotate cold idle control cam clockwise by hand until it is against the stop, see that cam remains in this position while vacuum switch adjustment is being made. Take out cotter pin in lower end of vacuum switch lever operating rod, turn switch lever so that pointer lines up with line marked 'Fast Idle' on switch case, adjust rod length by turning rod in or out of switch lever trunnion until lower end of rod can be inserted in hole in lower bell crank without disturbing position of switch lever. Check operation of starter and see that gap between idler adjustment screw and throttle opening cam is at least 3/32" at the instant when vacuum switch makes contact and operates starting motor.

Cadillac V-8 355-D '34-35, V-12 370-B, C, D '32-35, V-16 452-B, C, D '32-35. Throttle Cracking—Kicker screw on carburetor opens throttle correct amount for starting. See article on Detroit Carburetors for adjustment of kicker screw.

Chrysler Model CO '33. Fast Idle—Thermostatic spring end serves as stop for throttle stopscrew when engine is cold, holding throttle open in fast idle position. If thermostatic spring is disturbed, adjust so that end of spring is even with mark on stop lug with engine at 70°F.

Throttle Cracking—Accelerator pedal control of starting switch. Throttle is opened when accelerator pedal is depressed to operate starter. See article on Delco-Remy Starter Controls for adjustment of vacuum switch which determines throttle opening when starter is cranking engine.

Chrysler Royal CT, Imperial CQ '33. Throttle Cracking—Accelerator pedal control of starting switch. Adjustment same as for Chrysler CO above.

Chrysler CA, CB '34. Fast Idle—Throttle stopscrew dog (stop cam pivoted below throttle shaft) linked to choke valve so that throttle is opened to fast idle position with choke valve more than half closed. No adjustment required.

Throttle Cracking—To adjust, loosen nut on movable plate on starting pedal, shift plate until gap between edge of plate and throttle cross shaft is 3/16" with throttle valve at idling or closed position and starting pedal released. With this setting throttle is opened ½-⅓ while engine is being cranked. A gap smaller han 3/16" will cause excessive engine speed when engine begins to fire.

Chrysler CU '34 (Stromberg EX-32 Carburetor). Fast Idle—Throttle stopscrew stop cam linked to choke valve so that throttle is opened to fast idle position when carburetor is choked for starting. Throttle stopscrew should rest on high point of cam with choke valve fully closed.

Throttle Cracking—Accelerator pedal control of starting switch. Throttle is opened when accelerator pedal is depressed to operate starter. To adjust linkage, see that accelerator pedal is in idle posiion, disconnect vacuum switch operating rod at switch, turn switch lever so that pointer lines up with line marked 'Idle' on switch case, vary length of rod by turning adjustable link on switch end of rod until rod can be coupled to switch without disturbing position of switch lever. Hold fast idle on carburetor in 'Off' position, adjust screw on throttle bell crank directly to rear of vacuum switch so that there is 3/16" play or lost motion in throttle linkage. This setting will provide ¼-⅓ throttle opening at point where vacuum switch makes contact and starter cranks engine.

FAST IDLE & THROTTLE CRACKING ADJUSTMENTS FOR 1933-34-35 CAR MODELS CONT.

Chrysler CU, CV '34, C2, C3 '35 (Stromberg EE-22 Carburetor). Fast Idle—Throttle stopscrew stop cam linked to choke valve so that throttle is opened to fast idle position when carburetor is choked for starting. Throttle stop screw should rest on high point of cam with choke valve fully closed, providing throttle opening of .016-.020".

Throttle Cracking (CU, CV '34 only). Same type as on Model CU with EX-32 carburetor. See adjustment instructions above.

Chrysler CH, CL '32, CL* '33, CW '34, CW* '35. Fast Idle—Stromberg type (see separate article). Setting should be 1½ turns of the fast idle screw beyond the point of contact with the throttle valve closed and the slow idle screw backed off so as to be inoperative. Slow or hot idling speed must be reset at 6 M.P.H. after adjustment is completed.

Chrysler Airstream Model C6. Fast Idle—Throttle stopscrew dog (stop cam which is pivoted below throttle valve) linked to choke valve so that throttle is opened to fast idle position with choke valve more than half closed. No adjustment required.

Throttle Cracking—Adjusted by shortening or lengthening rod connecting starting pedal and throttle cross shaft so that throttle valve is opened 1/4-1/3 with starter cranking engine.

Chrysler CZ, C1 '35. Fast Idle—Throttle stopscrew dog (stop cam pivoted below throttle shaft) linked to choke lever so that throttle is opened to fast idle position with choke valve closed. See that throttle stopscrew rests on high point of fast idle cam when choke valve is fully closed.

Throttle Cracking (CZ)—Design and adjustment same as Chrysler C6.

Continental Beacon '33, 41 '34. Throttle Cracking—Throttle stopscrew stop plate located on connector link between choke valve and throttle valve so that throttle is opened slightly when carburetor is choked for starting. Should not require adjustment.

Continental Flyer, Ace '33. Throttle Cracking—Throttle and choke valves interconnected so that throttle is opened slightly when carburetor is choked for starting. Should not require adjustment.

De Soto SD (1933). Throttle Cracking—Accelerator pedal control of starting switch. Throttle is opened when accelerator pedal is depressed to operate starter. See article on Delco-Remy Starter Controls for description and adjustment of control linkage.

De Soto SE '34, SF, SG '35. Fast Idle—Throttle stopscrew dog (stop cam pivoted below throttle shaft) linked to choke valve so that throttle is opened to fast idle position with choke valve more than one-half closed. No adjustment required.

Throttle Cracking (Model SD '34).—Throttle valve interconnected with starting switch pedal. For adjustment see Chrysler Model CA, CB '34 above.

Throttle Cracking (Model SF '35).—Throttle valve interconnected with starting switch pedal. For adjustment see Chrysler Model C6 '35 above.

Dodge DR, DS '34, DU '35. Fast Idle—Throttle stopscrew dog (stop cam pivoted below throttle shaft) linked to choke lever so that throttle is opened to fast idle position with choke valve closed. See that throttle stopscrew rests on high point of fast idle cam when choke valve is fully closed.

Throttle Cracking (Model DR, DS '34). Throttle valve interconnected with starting switch pedal. For adjustment see Chrysler CA, CB '34 above.

Throttle Cracking (Model DU '35). Throttle valve interconnected with starting switch pedal. For adjustment see Chrysler C6 '35 above.

Essex-Terraplane K '32, K, KT '33, KS '34, G '35. Throttle Cracking—Throttle and choke valves interconnected so that throttle valve is opened .022-.026" (K '32), .036-.040" (K '33, KS '34, G '35), .038-.042" (KT '33) when choke valve is closed for starting. Should not require adjustment.

Essex-Terraplane K, KU '34, GU '35. Fast Idle—Carter drop-bar type operated by Carter Climatic Control (Automatic Choke). See special article on Carter Fast Idles.

Ford V-8 1932-33. Throttle Cracking—Kicker screw on carburetor opens throttle correct amount for starting. See article on Detroit Carburetors (Ford) for adjustment of kicker screw.

Ford V-8 '34-35. Fast Idle—Stromberg. Special design with throttle stopscrew mounted on pivoted lever connected to choke valve lever. No adjustment required other than regular idling speed adjustment.

Franklin V-12 17, 17B '32-34. Throttle Cracking—Delco-Remy No. 1370 solenoid connected to starter terminal and linked to throttle valve so that throttle is opened ⅓ while starter is operating.

Graham all Models '31-33. Throttle Cracking—Kicker screw on carburetor opens throttle correct amount for starting. See article on Detroit Carburetors for adjustment of kicker screw.

Graham 67 '34. Throttle Cracking—Choke valve and throttle valve interconnected by 'Throttle Cracking' device so that throttle is opened .040" when carburetor is choked for starting. For adjustment see article on Stromberg URO-2 Carburetors.

Graham 68 '34, 74 '35. Throttle Cracking—Consists of lever and adjusting screw (kicker screw) pivoted on throttle valve shaft and linked to choke valve lever. Adjusting screw contacts ear on throttle valve lever and holds throttle open with choke valve closed. To adjust, hold choke valve closed, turn adjusting screw in or out until throttle opening is .060" (68), .073" (74) (check by passing #53 (68), #49 (74) drill between edge of throttle valve and carburetor wall).

Graham Special Six Model 73. Fast Idle—Integral with automatic choke. See article on Automatic Choke and Fast Idle on Model EX-23 Carburetor.

Graham Eight Model 72. Fast Idle—Integral with automatic choke. See article on Automatic Choke and Fast Idle on Model EE-14 Carburetor. Starting motor (solenoid pinion shift type) is controlled by accelerator pedal so that throttle is opened while starter is cranking engine.

Graham Supercharged 69 '34, 75 '35. Throttle Cracking—design and adjustment same as for Model 74 except that throttle opening should be checked with #52 drill (go) and #48 drill (no go). Throttle opening while cranking is same as for Model 72 (accelerator pedal operation of starting control).

Hudson Challenger Model LTS '34. Throttle Cracking—Throttle and choke valves interconnected so that throttle is opened .036-.040" when carburetor is choked for starting. Should not require adjustment.

Hudson LL, LT '34, GH, HT, HU, HHU '35. Fast Idle—Carter drop-bar operated by Carter Climatic Control (Automatic Choke). See special article on Carter Fast Idles.

Hupmobile 521-O (1935. Carter Fast Idle operated by Carter Climatic Control (Automatic Choke). See article on Carter Model 317-S Dual Carburetor.

La Salle 350 Series 50 '34-35. Fast Idle—Integral with Automatic Choke. See article on Automatic Choke and Fast Idle on Model EE-23 Carburetor.

La Salle Model 35-50 (Late 1935). Fast Idle—Integral with Automatic Choke. See article on Automatic Choke and Fast Idle on Model EE-15 Carburetor.

Oldsmobile F-33, L-33 '33. Fast Idle—Stromberg type (see separate article). Setting should be made by inserting #55 drill (F-33), .090" feeler (L-33) below throttle stopscrew and lug on carburetor, after setting hot or slow idling speed correctly, and turning up fast idle screw until it just makes contact.

Oldsmobile F-34 '34. Fast Idle—Integral with automatic choke. See article on Stromberg Model EX-23 Automatic Choke and Fast Idle (1934 Type).

Oldsmobile L-34 '34. Fast Idle—Stromberg Lever Type. See separate article. No adjustment required.

Throttle Cracking—Accelerator pedal control of starting switch. Throttle is opened when accelerator pedal is depressed to operate starter. See article on Delco-Remy Stater Controls.

Oldsmobile Six F-35, Eight L-35. Fast Idle—Stromberg type. See special article. Linkage should be adjusted so that clearance between top edge of throttle stopscrew and notch on intermediate step of fast idle cam should be 1/16" with choke valve wide open.

Throttle Cracking—Starting pedal lever and throttle cross shaft interconnected so that throttle is opened to provide 1/16" clearance between throttle stopscrew and high lobe of fast idle cam. This clearance is nectssary to allow automatic choke mechanism to close choke valve and revolve fast idle cam to fast idle position. To adjust, loosen capscrew on throttle cross shaft lever, shift lever until clearance between lever and pin on starting pedal lever is ¼", tighten capscrew. Check to see that this setting provides 1/16" clearance between throttle stopscrew and high lobe of fast idle cam.

Packard Eights 1931-32. Throttle Cracking—Kicker screw on carburetor opens throttle correct amount for starting. See article on Detroit Carburetors for kicker screw adjustment.

Packard 1001, 2, 3, 4 '33, 1100, 1, 2, 3, 4, 5 '34. Stromberg Type (see separate article). Setting should be 1¾ turns of the fast idle screw past the point where it contacts the fast idle lug with the throttle completely closed and throttle stopscrew backed off so as to be inoperative. Slow idle screw should be reset at 1¾ turns from closed position of throttle valve.

Packard Twelves '33-34-35. Stromberg Type (see separate article). Setting made as for Packard Eights above except that fast idle screw should be turned 6¾ turns.

Packard Model 120. Fast Idle—Integral with Automatic Choke. See article on Automatic Choke and Fast Idle on Model EE-14 Carburetor.

Packard Eight 1200, 1201, 1202; Super Eight 1203, 1204, 1205. Fast Idle—Integral with Automatic Choke. See article on Automatic Choke and Fast Idle used on Model EE-23 Carburetor.

Pierce Arrow Eight '34-35, Twelve '33-34-35. Fast Idle—Stromberg type (see separate article). Setting should be 1⅛ turns (8's), ¾ turn (12's) of the fast idling screw from throttle closed position with throttle stopscrew (hot or slow idling speed adjusting screw) backed off so as to be inoperative. Throttle stopscrew must be set for hot idling speed of 38 (37-39) explosions per 15 seconds after adjustment is completed.

Plymouth PF, PE '34, PJ '35. Fast Idle—Throttle stopscrew dog (stop cam pivoted below throttle shaft) linked to choke valve so that throttle is opened to fast idle position with choke valve more than one-half closed. No adjustment required.

Throttle Cracking '34. Throttle linkage connected to starting pedal. To adjust, loosen nut on movable plate on starting pedal, shift plate until gap between edge of plate and throttle cross shaft is 3/16" with throttle valve at idling or closed position, and starting pedal released. With this setting, throttle will be opened ½-⅓ while starter is cranking engine. A gap smaller than 3/16" will cause excessive engine speed when engine begins to fire.

Throttle Cracking '35. Adjusted by shortening or lengthening rod connecting starter pedal and throttle cross shaft. With correct setting, throttle should be opened ¼-⅓ while starter is cranking engine.

Pontiac 601 '33, 603 '34. Fast Idle—Throttle and choke valves interconnected so that throttle is opened .031-.035" when carburetor is choked for starting. Should not require adjustment.

Throttle Cracking '34. Accelerator pedal control of starting switch. Throttle is opened when accelerator pedal is depressed to operate starter. Adjustment same as for Model 605 '35 below. See also article in Equipment Section on Delco-Remy Starter Controls.

Pontiac Six 701A, 701B. Throttle and choke valve interconnected so that throttle is opened .031-.035" when carburetor is choked for starting. No adjustment required.

Pontiac Eight 605. Fast Idle—Carter drop-bar type. No adjustment.

Throttle Cracking—Accelerator pedal control of starting switch (solenoid pinion shift type starter). Vacuum switch or accelerator linkage adjustment as follows:

Pontiac Eight. Adjust rod connecting bell cranks on side of engine block so that accelerator pedal just touches floor board with carburetor throttle valve wide open. Release accelerator pedal and with throttle valve in closed position, set adjusting screw in lever at forward end of this connecting rod so that clearance between this lever and lever which operates carburetor throttle valve rod is .235-.265" (use gauge #J-635-1). Disconnect vacuum switch operating rod at switch lever, turn switch lever so that pointer lines up with line on switch body, adjust length of rod by turning trunnion on rod until rod can be connected to switch lever without disturbing position of lever. See that hand throttle is fully closed, loosen set screw in throttle cable trunnion (at lower end of cable), adjust cable length so that clearance between lever at forward end of hand throttle operating rod and carburetor throttle valve rod lever is 1/32" minimum (use gauge #J-635-2). Check setting after opening and closing hand throttle. These clearances are important.

Reo 'S' '33-34-35. Fast Idle—Stromberg type (see separate article). Setting should be .040" throttle opening (check by passing #60 drill between edge of throttle valve and carburetor wall) with choke valve fully closed and fast idle adjusting screw turned down so that it just contacts the cam.

Reo Flying Cloud 6-A '35. Fast Idle—Throttle stopscrew dog (stop cam pivoted below throttle shaft) linked to choke valve so that throttle is opened to fast idle position with choke valve more than one-half closed. No adjustment required.

Reo Royale N-2 '34. Fast Idle—Integral with Automatic Choke. See article on Stromberg Auomatic Choke and Fast Idle on Model EE-23 Carburetors (1934 Type).

Studebaker 56, 73, 82, 92 '33. Fast Idle—Stromberg Type (see separate article). Setting should be 1¼ turns (56), 1¾ turns (73, 82, 92) of the fast idle screw beyond the point where it contacts the fast idle lug with the throttle closed and the slow idle screw backed off so as to be inoperative.

Studebaker Dict. A, Comm. B '34. Fast Idle—Integral with Automatic Choke. See article on Stromberg Automatic Choke and Fast Idle on Models UR-23 (Dict. A), E-33 (Comm. B) Carburetors (1934 Type).

Studebaker Pres. C '34. Fast Idle—Stromberg Type (see separate article). Setting is same as for 1933 Models above (1¾ turns of the fast idle screw).

Studebaker Dictator 1-A, 2-A. Fast Idle—Integral with Automatic Choke. See article on Automatic Choke and Fast Idle on Model EX-23 Carburetor.

Studebaker Commander 1-B, President 1-C. Stromberg lever type (throttle stopscrew stop plate linked to choke valve). No adjustment required.

Terraplane Standard G. Throttle and choke valve interconnected so that throttle is opened .036-040" when carburetor is choked for starting No adjustment required.

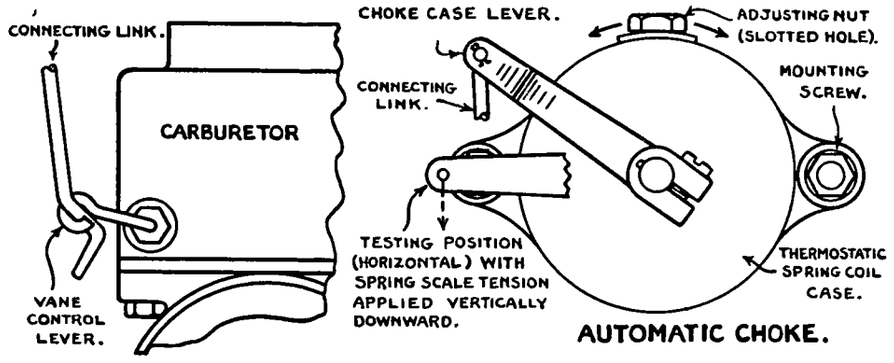
Terraplane, all Models—See Essex-Terraplane above.

This type control used as standard equipment on the following Cadillac models:

Car Model	Carburetor.
V8, Model 355-D, Series 10, 20, 30 (1934-35)	Detroit X-8244
V12, 370-D, Series 40 ('34-35), 80, 85 ('36), 85 ('37)	Detroit 51
V16, 452-D, Series 60 ('34-35), 90 ('36-37)	Detroit 51

NOTE—It is necessary to block automatic choke in 'off' position when adjusting carburetor as raising the engine hood will lower temperature under hood sufficiently to cause slight choke action. This will lead to incorrect carburetor setting to offset this condition.

DESCRIPTION:—The Detroit carburetor used on Cadillac models is provided with two distinct choke operations (1), the starting sleeve which is rotated by the choke button on the instrument panel to open the priming port in the auxiliary unit for starting, and (2), the vane control lever operated by the automatic thermostatic spring coil to provide a richer mixture during the warming up period. See complete article on Detroit Carburetors.



OPERATION:—**Choke Button**—The choke button is operated in the usual manner when the car is started. However, as soon as the engine begins to fire, the choke button should be returned to the 'off' position as the carburetor is controlled entirely by the automatic control during the warming up period. See Carburetor article for adjustment.

Automatic Choke Coil—The thermostatic spring coil is mounted on the carburetor riser and is linked to the vane control lever on the carburetor. The coil tends to wind and unwind in accordance with change in engine temperature, rotating the shaft and lever and increasing or decreasing the control lever pressure on the carburetor air vanes. This pressure is at a maximum when the engine is cold and is decreased as the engine warms up so that at regular operating temperatures the vanes are free and are controlled entirely by the air velocity within the carburetor.

ADJUSTMENT:—The operation of the choke control is entirely automatic. The choke setting is adjustable and should be checked if performance is not satisfactory during the warming up period. To check setting, disconnect connecting link at choke case lever, attach sensitive spring balance at this point and pull straight down until lever is horizontal. Note scale reading with lever horizontal and spring scale vertical.

Car Model	Scale Reading
Cadillac V8 (all models)	12.9 ounces
Cadillac V12, V16 (all models)	5.2 ounces

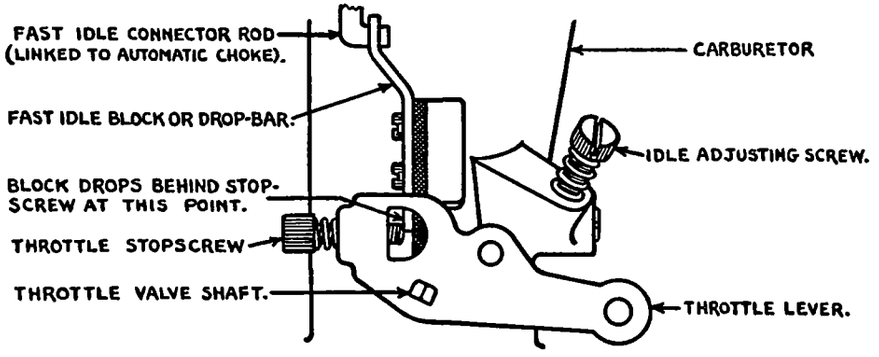
To adjust, loosen adjusting nut on top of choke case, slide nut to right or left along slot until pull required to hold arm horizontal is correct, tighten adjusting nut.

AUTOMATIC CHOKE.

CARTER FAST IDLE

DROP BAR TYPE

This type Fast Idle used with Carter Climatic Control on Carter Carburetors as standard equipment on the following car models:



Car Model	Carburetor
Hudson Six, Models GH ('35), 63 ('36)	309-S, 329-S
Hudson Eight, Models LL, LT, LTS (1934)	282-S, 299-S
Hudson Eight, HH, HU, HHU ('35), 64, 65, 66, 67 ('36)	310-S, 330-S
Oldsmobile Six, Model F-36 (1936)	327-S, 39-S, 42-S
Pontiac Six, Model 36-26A, B (1936)	324-S, 340-S
Pontiac Eight, Model 605 (1935)	298-S, 315-S
Pontiac Eight, Model 36-28 (1936)	322-S
Reo, Model 6D (1936)	336-S
Studebaker Dictator, Models 5A, 6A (1937)	371-S
Terraplane, Models K, KU (1934)	281-S
Terraplane, Models GU ('35), 62 ('36)	309-S, 329-S

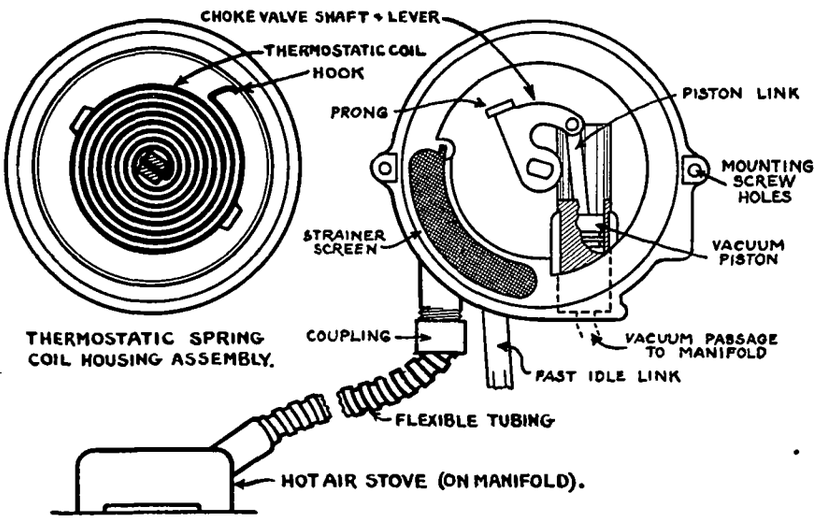
NOTE—All 1936 and later models are fitted with an 'Unloader' and Choke valve lock. See Climatic Control for settings and adjustment directions for these devices.

FAST IDLE MECHANISM:—The fast idle consists of a bar or arm linked to the choke valve shaft which drops down behind the throttle valve stop screw when the choke valve is closed. This prevents the throttle valve closing to its normal or 'hot idle' position. The fast idle bar will drop in place only when the throttle is opened and the accelerator pedal must be depressed to place the fast idle in operation. Carburetor adjustments should be made only with the fast idle inoperative (engine warmed up with the bar raised sufficiently so that it does not engage the stop screw).

SERVICING:—Fast idle linkage should not require attention. See that fast idle bar drops down behind throttle stopscrew when throttle valve is opened with engine cold (70°F). Automatic choke does not close choke valve when engine is hot. All adjustments on automatic choke and fast idle should be made with engine cold.

1936 and Later Models. On these models (With Unloader), fast idle connector rod or link cannot be disconnected from the fast idle block, and the two screws mounting the fast idle block on the carburetor body casting must be removed to allow the fast idle block to be removed with the Climatic Control whenever it is taken off the carburetor. When replacing fast idle block see that it slides freely with the mounting screws tight (replace screws if block binds).

This type automatic choke used as standard equipment on Carter carburetors on the following car models:



Car Model	Carburetor
Hudson Eight, Models LL, LT, LTS (1934)	282-S, 299-S
Hudson Six, Model GH (1935)	309-S
Hudson Eight, Models HT, HU, HHU (1935)	310-S
Hudson Six, Model 63 (1936)	329-S
Hudson Eight, Models 64, 65, 66, 67 (1936)	330-S
Hupmobile Six, 822-E ('38), 922-E, Skylark R ('39)	398-S
Nash Ambass. Six, 3920 (1939)	435-S
Oldsmobile Six, Model F-36 (1936)	327-S, 39-S, 42-S
Oldsmobile Six, Model F-37 (1937)	351-S
Oldsmobile Six, Model F-37 (Late '37), F-38 (1938)	385-S, 388-S
Oldsmobile Six, F & G-39 ('39) First Cars	385-S
Oldsmobile Six, F & G-39 ('39) Later Cars	425-S, 426-S
Pontiac Eight, Model 605 (1935)	298-S, 315-S
Pontiac Six, Models 36-26A, B (1936)	324-S, 340-S
Pontiac Eight, Model 36-28 (1936)	322-S
Pontiac Six, Model 37-26CA (1937)	352-S, 364-S
Pontiac Eight, Model 37-28 (1937)	350-S
Pontiac Six, Model 38-26DA (1938)	401-S
Pontiac Eight, Model 38-28DA (1938)	400-S
Pontiac Six, 39-25, 39-26 (1939)	433-S
Pontiac Eight, 39-28 (1939)	432-S
Reo, Model 6D (1936)	338-S
Studebaker Dict., Model 5A, 6A (1937)	371-S
Terraplane, Models K, KU (1934)	281-S
Terraplane, Model GU (1935)	309-S
Terraplane, Model 62 (1936)	329-S

DESCRIPTION:—The Carter Climatic Control is an automatic choke designed to choke the carburetor for cold starting and to control the choking action during the warming up period. It employs a combination of engine temperature (hot air from hot air stove on manifold is delivered to control unit case by a flexible connecting tube) and manifold vacuum (vacuum passage in carburetor casting connects port below throttle valve and port in control case) to actuate a thermostatic spring linked to the choke valve shaft lever and a vacuum piston assembly built around the shaft lever (bakalite piston is mounted directly on end of lever). The control is adjusted to close the choke valve completely at 70°F. and the choke valve is opened progressively by the thermostatic spring as the engine warms up. The piston assembly, actuated by manifold vacuum, tends to open the choke when the engine begins to fire and prevents over-choking. A 'fast-idle' control is linked on the choke valve shaft (see below).

1936-39 Type—Design changed slightly so that piston housing plate mounted on air horn by single rivet or screw. Lower edge of plate is flat and rests on ledge on main body casting (vacuum passage in carburetor body terminates at this point and connects with vacuum passage to vacuum cylinder in plate). Vacuum cylinder now located vertically with conventional piston linked to choke valve shaft.

SERVICING (1934-35):—Disassembly. To disassemble, loosen the lock screw holding the flexible tubing in place in the control case, take out two screws and lock screws in edge of case (cover holding screws), lift off housing assembly containing thermostatic spring (assembly consists of cover, cork insulator, thermostatic coil, and bracket). Do not attempt to remove thermostatic spring or alter its position. Clean out this assembly with air. To disassemble remainder of control unit, remove dust cover on carburetor, remove screw in choke trip lever assembly, taking care that small hand trip lever is not lost, remove two screws holding choke valve in place on choke valve shaft, revolve choke piston lever and shaft assembly until bakalite choke piston on end of lever can be removed, remove piston, pull choke shaft out. Remove two attaching screws holding case on carburetor casting, take out piston plate, port plate, and strainer. Clean these three parts with gasoline, dry with air. Clean remainder of control unit with air, blow out vacuum passage in carburetor (apply air pressure to port in piston plate housing). If the piston plate housing is removed from the air horn of the carburetor, use a new gasket to insure a tight connection at this point. Any air leak will interfere with correct choke action.

Reassembly. In reassembling control unit, see that cork gasket is placed on piston plate housing so that the small hole fits over the raised boss of the vacuum port. Place port plate in grooved recess in piston plate, place strainer in position covering slot in piston plate, assemble on cork gasket and piston plate housing, making certain that slot in piston plate and cork gasket coincide, install two attaching screws. Any misalignment in assembly will interfere with correct choke action. Slide choke valve shaft in until it engages first half of trip lever assembly, place bakelite piston in position in piston plate, line up piston with piston arm, slide choke valve shaft in until it fully engages trip lever. Mount choke valve on shaft, making certain it is perfectly lined up with the air horn bore (see that choke valve does not drag or stick in closed position). When mounting carburetor on engine, see that flexible tubing is entered to full depth of hole and tighten lock screw securely. Any air leak at this point will interfere with correct choke action. Place thermostatic spring housing assembly in position with calibration marking down, install retaining screws and lock washers (do not tighten screws), revolve housing assembly counter-clockwise until spring tension is felt on choke valve, tighten screws with center line of calibration in line with pointer. This is the standard setting.

SERVICING (1936-39):—Disassembly. Take out attaching screws, remove retainers on rim of piston housing plate which holds thermostatic coil housing in place. Turn thermostatic coil to right or clockwise to disengage coil hook from prong, lift coil and housing assembly off. Remove strainer screen. Take out choke valve screws, lift choke valve out. Loosen clamp screw on fast idle link and lever assembly, bend lip under screw with screwdriver (see Unloader adjustment when reassembling) so that it will clear portion of choke valve shaft which is not flat, revolve the choke shaft so that piston clears cylinder edge, remove choke shaft, piston, piston lever and link as an assembly. Remove suction passage gasket from air horn. Do not remove piston housing plate from air horn.

Servicing—Wash all parts in gasoline except thermostatic coil and housing assembly and cork gaskets. Clean thermostatic coil assembly with air. Blow out all passages with air. Replace all worn or damaged parts. Use all new gaskets when reassembling.

Reassembly. Install the choke piston lever, piston and link, and shaft assembly in air horn and see that choke lever pin and screw assembly correctly located on shaft. Tighten screw on choke lever and see that these parts work freely. Install choke valve using new valve screws. Turn screws down loosely, then close choke valve and tap lightly to centralize valve in air horn, tighten screws securely, see that choke valve operates freely without binding in air horn. Install strainer in piston plate housing. Install new suction passage gasket in air horn (do not use old gasket). Install air horn assembly on carburetor, tightening screws securely. Install attaching screw and lockwasher under piston housing plate. See that the cork insulating strip on thermostatic coil housing is in good condition and has not shrunk, turn housing so that word 'Climatic' is at bottom, install in this position, turn counter-clockwise until center mark on piston plate housing is in line with reference mark on housing, install retainers and tighten attaching screws which hold housing in place.

Installing Carburetor on Engine—See that flexible tubing connection at housing is tight. This is important as any air leak at this point will interfere with correct performance. See that choke valve operates freely throughout range without any binding at any point in the mechanism.

Choke Valve Installation—When installing choke valve, make certain that it is correctly aligned in air horn so that it does not drag or stick in closed position which will interfere with correct Climatic Control operation. Centralize valve by tapping lightly in closed position (attaching screws loose), tighten screws.

SETTING & ADJUSTMENT:—Setting indicated above (thermostatic coil case revolved so that reference mark lined up with center line of calibrations on piston housing plate) is standard for all models except those noted in the table below. For these special car models, rotate coil housing counter-clockwise (for Richer setting), clockwise (for Leaner setting) the correct number of graduations or 'points' before tightening the housing mounting screws. Check car performance as directed below and make any necessary readjustments for special fuel and operating conditions.

Car Model	Carburetor	Thermostat Setting
Nash 3920 (1939)	435-S	2 points Rich
Oldsmobile F-36 ('36)	327-S, 39-S, 42-S	1 point Rich
Oldsmobile F & G-39 ('39)	425-S, 426-S	2 points Rich
Pontiac Six (1937-38)	352-S, 401-S	1 point Rich
Pontiac Taxi (1937)	364-S	1 point Rich
Pontiac Eight (1937)	350-S	2 points Rich
Pontiac Eight (1938)	400-S	1 point Rich
Pontiac Six & Eight (1939)	432-S, 433-S①	2 points Rich
Pontiac Six & Eight (1939)	432-S, 433-S②	1 point Rich
Reo 6D (1936)	338-S	1 point Rich
Studebaker Dict. 5A, 6A ('37)	371-S	1 point Lean
All Others		Centered

①—First carburetors with #42 choke heat suction hole.

②—Later carburetors with #36 choke heat suction hole.

To Check Setting—Note engine performance during warming up period after engine has been started cold. Engine must be cold so that choke is operating (if engine is warm when started choke valve will not close). If engine has a tendency to run lean, thermostatic coil housing should be turned counter-clockwise one graduation. If engine runs rich or has a tendency to load up, coil housing should be turned one graduation clockwise.

To Adjust—Loosen retainer screws on rim of thermostatic coil case, rotate one graduation, tighten screws. Adjustments should always be made with engine cold (allow four hours for engine to cool off after it has been running) and setting should again be checked as directed above.

CARTER UNLOADER

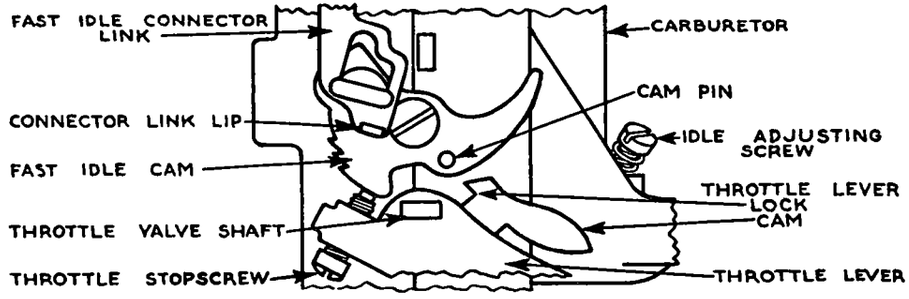
NOTE:—No unloader used on 1934-35 type carburetors.

1936 TYPE

DESCRIPTION:—Consists of an ear on the fast idle block which strikes the throttle lever when throttle is opened (fast idle block down in fast idle position). When this contact is made, further movement of the throttle lever pushes the fast idle block up opening the choke valve so that a flooded condition can be corrected.

Adjustment—With throttle valve held wide open, adjust curved lip on fast idle block so that lower edge of choke valve is held away from inner wall of air horn by amount shown in table below. Then hold choke valve and throttle valve wide open, adjust lip on choke lever so that choke valve locked open. See that choke valve released when throttle valve closed.

NOTE—Clearance between lip on choke lever and top end of fast idle link should be 1/16" with choke valve and throttle valve held wide open. Adjust by removing fast idle block and link assembly from carburetor and filing not more than 1/32" from top of link. Do not change original shape of link. See that all burrs removed. See that entire choke mechanism operates freely without binding.



Car Model	Carburetor Model	Unloader Setting
Hudson (all models)	329-S, 330-S	7/16"
Oldsmobile	327-S, 339-S, 342-S	½"
Pontiac Six	324-S, 340-S	½"
Pontiac Eight	322-S	¼"
Reo	338-S	½"
Terraplane	329-S	7/16"

1937-39 TYPE

DESCRIPTION:—Consists of a cam on the throttle lever which opens choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall (see table below for checking gauge and clearance for each model). To adjust, bend cam on throttle lever using tool T109-41.
NOTE—Unloader on Studebaker 371-S (drop bar type fast idle) adjusted in same manner as '1936 Type' above. Setting should be ¼".

Car Model	Carburetor	Gauge No.	Unloader Setting
Hupmobile 6	398-S	T-109-85	⅜"
Nash 3920	435-S	T-109-82	31/64"
Oldsmobile 6	351-S, 85-S, 88-S		⅜"
Oldsmobile 6	425-S, 426-S	T-109-81	7/16"
Pontiac 6 & 8	350-S, 352-S		¼"
Pontiac Taxi	364-S		½"
Pontiac 6 & 8	400-S, 401-S		5/16"
Pontiac 6	433-S	T-109-106	7/32"
Pontiac 8	432-S	T-109-31	¼"
Studebaker '37	371-S		¼"

CHOKE VALVE LOCK:—Prevents choke valve closing when throttle valve held wide open. To adjust, hold throttle and choke valves wide open, bend lip at lower end of fast idle link so that clearance between lip and lock on throttle lever is 1/32" (use Tool T-109-105) except Studebaker 371-S (1/16").

CARTER FAST IDLE

NOTE:—This type fast idle used with Carter Climatic Control on all of the 1937-39 car models listed above (see separate article for 'Drop Bar' type Fast Idle used on 1936 car models and 1937 Studebaker 371-S carburetor).

DESCRIPTION & OPERATION:—Consists of a fast idle cam serving as a stop for the throttle lever stopscrew which is linked to the choke valve lever. Cam is rotated to the fast idle position when the choke valve is closed for cold starting and opens the throttle valve. As choke valve opens, cam is rotated back to the hot or slow idle position.

ADJUSTMENT:—To check setting, turn fast idle cam to normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against (not on) first step on cam, check clearance between lower edge of choke valve and air horn wall using tool T109-85 (clearance should be ⅝"—all models). To adjust, use tool T109-41 and bend offset portion of fast idle link.

This type automatic choke used with Carter Carburetors as standard equipment on the following car models:

Car Model	Year	Carburetor Type
Buick 39-40	1939	419-S, 440-S
Cadillac V16 38-90	1938	407-S, 408-S
Cadillac 39-90 V16	1939	407-S, 408-S
Chrysler Imperial C14	1937	373-S
Hudson Six 73	1937	344-S, 377-S
Hudson Eight 74, 5, 6, 7	1937	344-S, 377-S
Hudson Six 83, Eight 84, 5, 7	1938	402-S
Hudson Six & Eight 92, 93, 95, 97	1939	430-S
Hupmobile 521-O, 621-O, N	1935-36	317-S
Hupmobile Eight H-825	1938	399-S
Hupmobile Eight 925-H	1939	399-S
La Salle 37-50	1937	374-S
La Salle 38-50	1938	392-S
LaSalle 39-50 V8	1939	423-S
Nash Ambassador Eight 3980	1939	436-S
Oldsmobile Eight L-36	1936	341-S, 328-S
Oldsmobile Eight L-37	1937	345-S, 367-S
Oldsmobile Eight L-37, L-38	1937-38	386-S, 389-S
Oldsmobile Eight L-39	1939	389-S
Packard Eight 120C	1937	366-S
Terraplane Super 72	1937	344-S, 377-S
Terraplane Super 82	1938	402-S

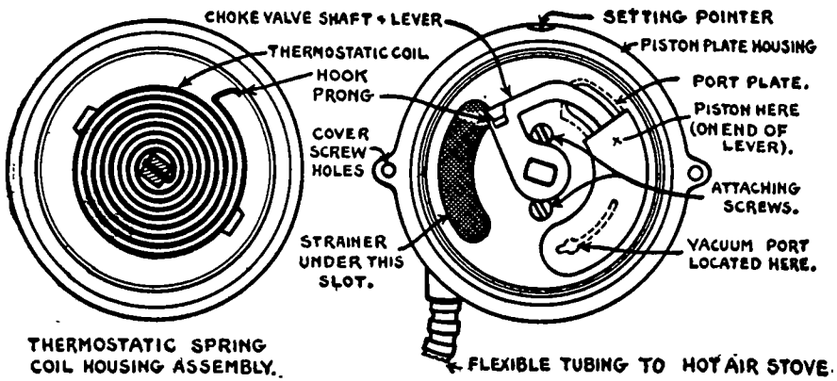
DESCRIPTION:—Design same as single barrel type with flat piston except piston plate housing now attached to air horn by three screws and Fast Idle and Choke Unloader mechanism now mounted directly on opposite end of choke valve shaft from Climatic Control and must be removed when choke control is being disassembled.
NOTE—On Hudson and Terraplane models, a dashpot assembly is mounted on the carburetor and linked to the fast idle lever arm.

OPERATION:—Same as for other models. Thermostatic spring coil closes choke valve when engine is cold and controls choke during warming up period. Choke valve is offset and tends to open as thermostatic coil tension decreases when engine warms up. Vacuum piston opens choke valve slightly when engine begins to fire to prevent over-choking.

SERVICING:—Disassembly. Remove screw holding choke trip lever (fast idle end of choke lever shaft), take off choke shaft washer, trip lever, fast idle cam and collar assembly. Remove two thermostat housing attaching screws and lockwashers, take off thermostatic coil and housing assembly. Remove two screws holding choke valve on shaft, take out choke valve assembly. Move choke piston lever counter-clockwise until piston is out of cylinder, remove piston, pull lever and shaft assembly out. Take out the three screws holding the piston plate housing on the air horn, remove piston plate, port plate, piston plate strainer, cork insulator disk, piston plate housing, piston plate housing gasket, and hot air passage gasket.

Servicing. Wash all parts in gasoline except cork pieces and thermostatic coil and housing assembly (do not remove coil from housing). Blow out all passages with compressed air, replace all worn or damaged parts. Use all new gaskets when reassembling.

Choke Valve Installation—When installing choke valve, make certain that it is correctly aligned in air horn so that it does not drag or stick in closed position which will interfere with correct Climatic Control operation. Centralize valve by tapping lightly in closed position with attaching screws loose, then tighten screws.



Assembly. Reverse disassembly directions above. Install new cork insulator disk in piston plate housing so that small hole in disk fits over boss on housing. Use new piston plate strainer if old strainer clogged or damaged. After installing piston lever assembly, place bakelite piston on lever and rotate lever so that piston enters housing. Use new choke valve screws and see that choke valve operates freely without binding or rubbing on carburetor after screws have been tightened securely. Replace cork insulator strip inside control housing, if old insulator not in good condition, to insure tight seal. Install thermostatic coil and housing assembly with label down, insert attaching screws and lockwashers loosely, then rotate housing counter-clockwise one-half turn until pointer on piston plate housing and notch in coil housing line up and tension can be felt on choke valve, tighten attaching screws.

Installing Carburetor on Engine. Make certain that hot air flexible tubing is properly connected at both ends (air leaks will interfere with choke operation). Thermostatic coil setting as given above is standard. If operation is unsatisfactory, see Adjustment directions below.

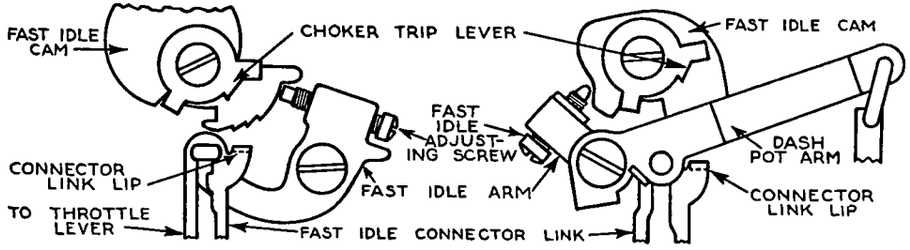
SETTING:—Thermostatic coil setting given in Assembly Directions above (center index mark or notch on thermostatic coil housing lined up with mark on piston plate housing) is correct for all car models except those listed in following table. For these special car models, rotate coil housing counter-clockwise (for Richer setting), clockwise (for Leaner setting) the correct number of graduations or 'points' before tightening the housing mounting screws. See Adjustment directions below if car performance is not satisfactory with these standard settings.

Car Model	Carburetor	Thermostat Setting
Buick 39-40	419-S	1 point Rich
Buick 39-40	440-S	1 point Lean
Hudson 6 & 8 '37	377-S	2 points Rich
LaSalle V8 '38	392-S	1 point Rich
Nash 3980	436-S	1 point Rich
Terraplane '37	377-S	2 points Rich
All Others		Centered

Adjustment:—Check engine performance when cold (70°) to determine whether standard setting satisfactory. If engine runs lean during warming up period attaching screws should be loosened and housing turned counter-clockwise one graduation at a time until performance is satisfactory. If engine loads up or runs ruch, housing should be turned clockwise. Adjustments should be made only when engine is cold (allow four hours for engine to cool off after running), and settings should be checked by noting performance after housing position has been changed.

UNLOADER & CHOKE VALVE LOCK

UNLOADER:—Consists of a lip on the throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened to correct flooding when the throttle valve is held wide open. To adjust, hold throttle valve wide open, bend lip on fast idle connector link so that clearance between upper edge of choke valve and air horn wall is correct as shown in table below



Car Model	Carburetor	Gauge No.	Unloader Setting
Buick 39-40	419-S	T-109-125	3/32"
Buick 39-40	440-S	T-109-28	3/16"
Cadillac 90	407-S, 408-S	T-109-28	3/16"
Chrysler C14	373-S	T-109-31	¼"
Hudson 6 & 8	344-S, 77-S; 402-S, 30-S	T-109-31	¼"
Hupmobile	317-S	T-109-31	¼"
Hupmobile	399-S	T-109-34	9/64"
LaSalle	374-S	T-109-28	3/16"
LaSalle	392-S, 423-S	T-109-36	⅛"
Nash 3980	436-S	T-109-34	9/64"
Oldsmobile	328S, 41S, 45S, 67S, 86S, 89S	T-109-31	¼"
Packard	366S	T-109-31	¼"
Terraplane	344-S, 77-S, 402-S	T-109-31	¼"

CHOKE VALVE LOCK:—With Unloader properly adjusted, choke valve will be locked open with throttle valve wide open, and released when valve closed.

CARTER FAST IDLE

NOTE:—This type Fast Idle used with Carter Climatic Control on all of the car models listed above.

DESCRIPTION & OPERATION:—Consists of a fast idle cam mounted on the choke valve shaft which rotates the fast idle arm to which the throttle connector link is attached so that the throttle is opened to the fast idle position while the choke valve is in use during the warming up period. An adjusting screw is provided on the fast idle arm.

ADJUSTMENT:—To adjust, hold choke valve tightly closed, turn adjusting screw on fast idle arm until throttle valve opening or clearance between edge of valve and carburetor wall on side opposite idle port is correct as shown in table below using special checking gauge for each model as listed in table.

Car Model	Carburetor	Gauge No.	Throttle Opening
Buick 39-40	419-S, 440-S	T-109-44	.018"
Cadillac 90	407-S, 408S		.026"
Chrysler	373-S	T-109-44	.018"
Hudson 6 & 8	344-S, 77-S; 402-S, 30S	T-109-44	.018"
Hupmobile	317-S	T-109-44	.018"
Hupmobile	399-S	T-109-29	.030"
LaSalle	374-S	T-109-44	.015"
LaSalle	392-S, 423-S	T-109-29	.030"
Nash	436-S	T-109-44	.015"
Oldsmobile	328S, 41S, 45S, 67S, 86S, 89S	T-109-44	.018"
Packard	366-S	T-109-44	.018"
Terraplane	344-S, 77-S, 402-S	T-109-44	.018"

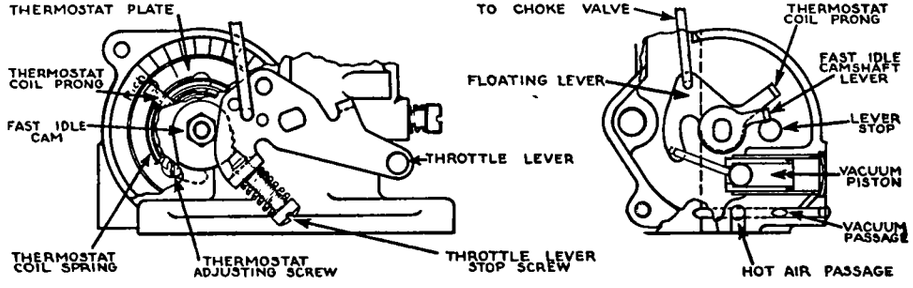
CHANDLER-GROVES AUTOMATIC CHOKE

INTEGRAL TYPE

This type Automatic Choke and Fast Idle used on the following car models:

Car Model	Carburetor
Packard Six, 115C ('37)	AOC-2
Packard Six, 1600 ('38), 1700 ('39)	AOC-25

DESCRIPTION:—Designed to control choke valve and throttle for cold starting and warming up. Entire mechanism is built in carburetor body and consists of a thermostatic spring coil in a case on the lower end of the throttle valve body and a vacuum piston in a cylinder directly under thermostat case. Thermostat coil and piston are linked to a floating lever from which a rod extends up to the choke valve lever. The floating lever is mounted on the fast idle cam shaft and actuates the fast idle cam through a spring link.



OPERATION:—As the engine cools off, the thermostatic spring coil winds up which tends to raise the connecting rod and close the choke valve. This action is prevented by the interference of the throttle lever stopscrew and the fast idle cam. However, when the throttle is opened before starting a cold engine, the stopscrew is raised from the cam and the thermostat snaps the choke valve closed. As soon as the engine begins to fire, the vacuum built up in the manifold causes the vacuum piston to move out in the cylinder (vacuum chamber in cylinder connected with carburetor barrel below throttle valve) rotating the floating lever and opening the choke valve slightly to prevent overchoking. As the engine warms up, the thermostatic spring coil tension lessens, allowing the offset choke valve to open, so that at operating temperature the choke valve is wide open and the fast idle cam has been rotated to the hot or slow idle position.

TROUBLE SHOOTING:—Engine Fails to Start. See that throttle opened to place automatic choke in operation. Check choke valve and linkage for binding, see that choke valve falls open from any position with thermostat case removed (thermostat coil unhooked) and closes without binding when floating lever is rotated clockwise (stopscrew must clear fast idle cam). Check thermostat setting (see adjustment section below), see that thermostat coil hooked on prong on floating lever, examine case for rust caused by condensation which will result in linkage binding or sticking (see note below to correct this condition).

Carburetor floods or Fast Idle continues after Engine warm. Check thermostat setting, see that vacuum piston moves freely in cylinder and that vacuum passages from chamber to carburetor barrel is clean and not obstructed, check spring linking floating lever and fast idle cam shaft, see that shaft operates freely and that levers do not strike carburetor casting. See that heat channel (hole in carburetor flange leading to thermostat case) is open and that correct gasket used between thermostat case and carburetor body.

NOTE—To correct condensation in thermostat case which will cause rust resulting in binding of the linkage, manufacturer recommends drilling #60 hole in throttle valve body, ⅜" to left of heat hole and 7/32" up from bottom of carburetor flange, through into the vacuum channel. This will ventilate thermostat case.

ADJUSTMENT:—To remove thermostatic coil and case assembly, take out two mounting screws on edge of case and lift off assembly taking care that thermostat coil is unhooked from prong on floating lever without distorting coil. Do not remove the thermostatic coil from the holder plate.

Thermostatic Coil Calibration. With thermostatic coil at 100°F., the free end of the thermostat should be directly over the mark on the holder plate. No adjustment is provided.

Thermostat Setting—Standard setting is with mark on thermostat holder plate lined up with mark on thermostat case. This setting may be varied not more than 3 graduations, if necessary, to secure satisfactory warming up performance. When making this adjustment, change setting ½ graduation at a time and note performance. If satisfactory performance cannot be secured with this variation, install new thermostatic coil.

Choke Valve Position—On cars with Overdrive, long side of choke valve must clear carburetor air horn by .005" with valve fully closed (do not centralize valve in air horn).

This type automatic choke used on the following car model:

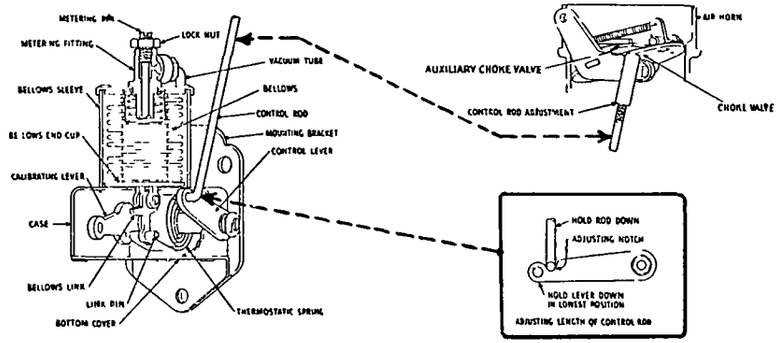
Car Model	Carburetor
Oldsmobile Six, Model F-35 (optional)	EX-22

DESCRIPTION:—This device is an automatic choke designed to choke the carburetor for cold starting and to control the choking action during the warming up period. It is similar to previous designs except that the accelerating feature is omitted (accelerating piston on two cylinder types, or accelerating piston and floating piston on three cylinder types) and the single cylinder contains the spring-loaded bellows mechanism. The accelerating feature is taken care of in the carburetor design. The choking action is controlled by a thermostatic spring coil linked to the operating lever with the opposite end of the spring coil linked to the bellows, as in previous designs.

OPERATION:—As the engine cools off the thermostatic spring coil tends to wind up, rotating the shaft and operating lever, so that the choke valve is fully closed at a temperature of 55°F. The choke valve is thus in the correct position for cold starting. When the engine begins to fire the manifold vacuum tends to collapse the bellows, rotating the end of the thermostatic spring coil, so as to release the tension of the spring and allow the choke valve to open partially. As the engine warms up, the thermostatic spring coil unwinds until the choke valve is fully open with the engine at normal running temperature. The choke does not operate again until the engine is stopped and allowed to cool off.

TROUBLE SHOOTING:—If the action of the Carburetor Control is not satisfactory, check the following points:

Binding—Disconnect control rod (link connecting operating lever and choke valve lever) at operating lever and move rod up and down to see that choke valve operates freely without binding at any point. On carburetors with auxiliary fly or split choke valves see that the spring controlled fly moves freely. Operate automatic choke by hand and see that lever moves freely and returns to initial position when released. All moving parts should be free and clean. Do not oil any part of the Automatic Choke.



Control Rod Adjustment—Hold automatic choke operating lever and choke valve lever down at end of stroke (choke valve will be closed) and check length of control rod. Lower end of rod should fit in adjusting notch on upper face of operating lever. Adjust by turning rod in or out of socket at upper end. Starting mixture will be too rich if rod is too long, or too lean if rod is too short.

Manifold Leaks—See that mounting screws are tight. Examine gasket between mounting flange and manifold. Use new gasket whenever automatic choke is removed from engine. Shellac or any other gasket compound must not be used on this gasket.

Improper Choking or Flooding—If carburetor floods while checking automatic choke action, open choke valve by hand and crank engine to correct this condition. Then start engine and note operating lever action when engine begins to fire. Lever should travel 5/16" up in 12-15 seconds time to partially open choke valve and prevent overchoking. Incorrect bellows or lever travel may be caused by incorrect bellows travel setting, vacuum leak at mounting flange, leaky bellows, or obstruction in vacuum passage. See Servicing directions below.

ADJUSTMENT:—Bellows travel and timing can be checked on the bench by connecting to the windshield wiper connection on the engine and operating engine at idling speed. In any event the vacuum source should be equivalet to a vacuum of 15-20" of mercury. Check movement of operating lever and time required for this travel when vacuum is applied. Lever should move 5/16" upward in 12-15 seconds (this is not total lever movement). To adjust, loosen locknut on metering pin and turn pin in (clockwise) to increase time or out (counter-clockwise) to decrease time. Tighten locknut after completing adjustment. If no lever travel is observed, remove and examine metering pin. With metering pin out and vacuum source connected to automatic choke, close metering pin hole momentarily and note bellows action. Bellows should collapse and move lever up rapidly. If bellows action is correct, metering pin orifice was probably clogged and metering pin should be reseated as directed below. If no bellows action is observed, bellows are leaky and should be replaced as directed below. A leak too small to be detected by this test may be checked by noting length of time required for lever to drop after vacuum is cut off. This test should be made with metering pin in place and properly timed (12-15 seconds for 5/16" travel of lever). When vacuum is cut off, lever should require not less than 30 seconds to return to original position at bottom of stroke.

SERVICING:—**Metering Pin and Orifice**—If metering pin is found to be gummed or dirty when removed, clean in alcohol. The tapered hole or metering pin orifice can be cleaned with a #000 taper pin reamer (use reamer carefully and remove only dirt or gum—do not enlarge hole or remove any metal), or a tool can be made by grinding the threads off the end of a regular metering pin so that a rotating or wiping action can be secured. The pin should be dipped in alcohol and then turned in the orifice. This should be repeated until all dirt has been removed. Bellows travel must be retimed when automatic choke is reassembled and installed on the engine.

Replacing Bellows—Bend back small ears at lower end of choke case and remove bottom cover. Take out small 'hairpin' retainer on upper link pin coupling bellows end bracket and link, withdraw pin. Unscrew tube compression nut on metering pin fitting. Bend back three ears on cover at top of choke case, lift off bellows and cover assembly. When new bellows are installed see that bellows end cup rests against support plate below bellows when fully extended. Bellows travel is not adjustable. Do not disassemble choke unnecessarily to avoid damaging ears holding top and bottom covers. Do not stretch or compress bellows.

Thermostatic Spring and Shaft Assembly—It should not be necessary to disturb thermostatic spring coil assembly. To remove, unscrew nut on end of shaft at operating lever, remove bearing bushing through case by pulling off retainer spring within case. Assembly can then be removed. Extreme care should be taken if link pin in end of thermostatic coil is removed not to distort spring or change relative position of spring and calibrating lever.

These Carburetor Controls are used on the following car models:

Car Model	Carburetor Control	Control Type
Buick Model 40 ('34)	498-D	Two Cylinder
Buick Model 40 ('34-35)	498-D, E, F	Two Cylinder
Buick 40 ('36), 40, 60, 80, 90 ('37)	498-H	Two Cylinder
Buick Models 50, 60, 90 ('34-35)	498-C	Three Cylinder
Buick Models 60, 80, 90 ('36)	498-J	Three Cylinder
Oldsmobile Eight, Model L-35 ('35)	498-G	Two Cylinder

NOTE—Type 498-H used on 1937 Buick models when Marvel Carburetors are installed. Cars with Stromberg carburetors fitted with Type 490-A Carburetor Control (see following article).

DESCRIPTION:—The Automatic Carburetor Control is an automatic choke designed to choke the carburetor for cold starting and to control the choking action under all operating conditions during the warming up period. It employs a combination of engine temperature (thermostatic spring), manifold vacuum (bellows mechanism), and carburetor inlet air velocity (accelerating piston) to control the choke action, The choke valve operating lever is linked to one end of a spiral thermostatic spring so that the lever is rotated and the choke valve opened when the spring unwinds as the engine warms up. The collapsible bellows is linked to the other end of the thermostatic spring and the collapse of the bellows, when the engine begins to fire and manifold vacuum is built up, releases the thermostatic spring tension slightly and opens the choke valve to prevent over-choking. The floating piston of the three-cylinder type accelerating piston assembly is likewise held down by manifold vacuum and is forced up by the spring when the vacuum collapses as the engine is accelerated. This transfers air to the top of the accelerator piston, forcing the piston down, and increasing the choke action momentarily since the piston is linked to the operating lever shaft. The accelerating piston action after the engine warms up, with choke valve open, is negligible.

TROUBLE SHOOTING:—If Automatic Choke action is unsatisfactory, check the following points in order:

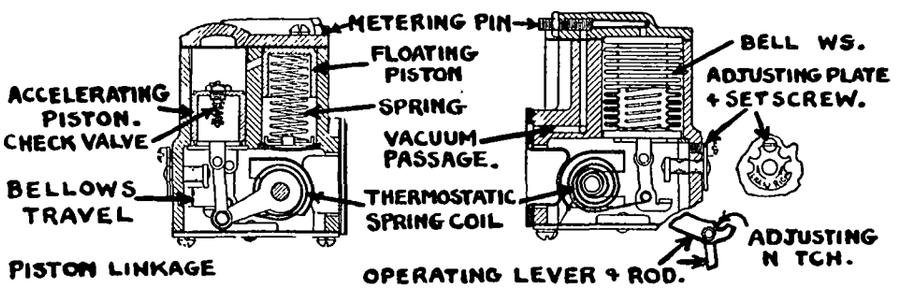
Binding of Parts. Disconnect link connecting carburetor choke valve and operating lever of automatic choke, see that choke valve lever moves freely. Operate automatic choke by hand. Lever should move freely and should return to initial position when released. All moving parts should be clean and free from oil. Do not oil any part of the choke mechanism.

Initial Choke Position. With operating linkage disconnected, hold both choke valve lever and choke operating lever down as far as they will go, check length of control rod or connecting link. The end of the link should rest in the notch in the upper face of the choke operating lever. Adjust by loosening lock nut and turning turnbuckle to increase or decrease length of link. Reassemble linkage. Starting mixture will be too rich if connecting link is too long, or too lean if connecting link is too short.

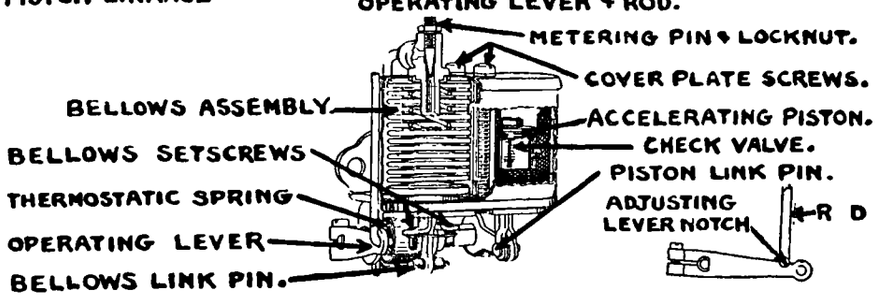
Initial Running Position (Take-off). See that control lever moves upward 7/8" (3-cylinder), 5/16" (2-cylinder) in 12-15 seconds time immediately after engine begins to fire. Measurements should be made at rod hole in lever. This movement is not total bellows travel except on 3-cylinder models. The timing is controlled by the metering pin at the top of the unit. To adjust, loosen locknut on metering pin, turn pin in or clockwise to increase 'take-off' time, and out or counter-clockwise to decrease 'take-off' time. Lever movement is controlled by bellows travel (see section below).

Manifold Leaks. Examine gasket between unit and manifold, see that mounting screws are tight. Use new gasket whenever units are removed from the engine. Do not use shellac or any other compound on these gaskets.

Improper Choking or Flooding. If engine cannot be started and carburetor floods, open choke valve by hand and crank engine to correct this condition. Check initial take-off and if correct setting cannot be secured, check unit as directed below.



SERVICING AND ADJUSTMENT:—To disassemble control unit, disconnect control rod, take off bottom cover, take out link pin in thermostatic spring, being careful not to distort spring or change spring tension, take out piston link pin, disconnect vacuum line, remove top screws. The head and bellows can then be removed (3-cyl.). On 2-cyl. models cylinders and bellows are removed by rotating the top cover until the bracket at the bottom end of the bellows can be withdrawn through the hole in the support plate. Examine cylinders and pistons. Cylinders should be dry and free from oil or dirt. Do not stretch or compress bellows (see instructions below). Use a new head gasket when reassembling and retime vacuum 'take-off' (bellows stroke timing) as directed above.



Obstructions in Vacuum Passage. Take out metering pin, clean out any dirt in metering pin passage, dry out unit if moisture is found in the bellows. Metering pin can be cleaned in alcohol. Clean metering pin orifice with a #000 taper pin reamer (use reamer lightly, remove only dirt or gum, do not enlarge hole or remove any metal). Spare metering pin can be used instead of the reamer by grinding off threads on end of pin so that wiping action can be secured. Pin should be dipped in alcohol and then turned in orifice. Bellows travel must be retimed (see Initial Take-off in Trouble Shooting section above) whenever metering pin is removed or setting disturbed.

Bellows or Vacuum Passage Leaking. With metering pin removed, collapse bellows by hand (do not compress bellows solid—bellows stroke is 3/8" or 1/4"), hold a finger tightly over metering pin hole and vacuum passage hole in head, note whether bellows remains collapsed. If bellows extends to original length, bellows or vacuum passage leaks.

Bellows Travel. See that bellows end cup rests against support plate with bellows fully extended. If it does not, bellows should be replaced. Bellows travel should be 3/8" (3-cylinder models with adjusting plate set at midpoint between 'rich' and 'lean'), or 1/4" (2-cylinder models—this is adjusting setscrew clearance with bellows extended). Bellows travel on 3-cylinder models is controlled by the adjusting plate. On the 2-cylinder models travel is controlled by the two setscrews in the bellows connecting linkage below the bellows.

Three Cylinder Type

Two Cylinder Type

Accelerating Piston Check Valve. Inspect check valve in top of accelerating piston. See that valve opens freely and that face of valve and valve seat are free from dirt or oil. Check valve spring tension by inverting piston. Spring tension should be sufficient to hold valve closed in this position. If valve is removed, be careful not to distort valve seat when replacing in piston (do not tighten excessively). A leaking check valve will cause a lean mixture on acceleration or the 'hop-off' or momentary opening of the choke valve when engine begins to fire will not occur. If check valve sticks or remains closed, the choke valve will not close again after this momentary opening.

Type No. **Used On:**

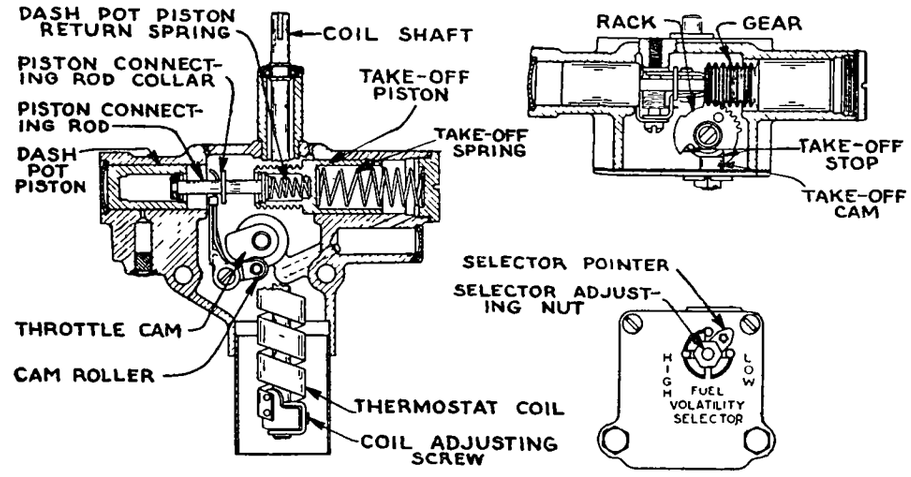
490-A—BUICK, MODELS 40, 60, 80, 90 (1937)—STROMBERG CARBURETORS
1990001—ABOVE MODELS WITH NEW TYPE (CD) MARVEL CARBURETORS
1990101—BUICK, MODELS 40, 60, 80, 90 (1938)—ALL CARBURETORS
1990102—REPLACEMENT UNIT FOR 1990101 (LESS VACUUM SWITCH)

TYPE:—This control is an automatic choke of entirely new design utilizing engine temperature, manifold vacuum, air intake velocity, and throttle valve opening to control the choke valve for cold starting and all possible warming up conditions. It is mounted on the engine side of the carburetor with a tongue-and-slot coupling for throttle valve shaft engagement and vacuum connection to vacuum passage in carburetor body on the face of the mounting pad. The upper end of the vertical control shaft is linked to the choke valve shaft by a flexible cable with a tubular rubber cover, and the lower end is clamped to one end of the thermostatic spring coil by the thermostat calibrating screw. The thermostat is wound spirally up the shaft with the upper end clamped to a gear which engages the rack of the vacuum 'take-off' piston so that thermostat tension can be varied by the vacuum piston and throttle shaft cam in accordance with operating conditions. The lower end of the thermostat extends down into the manifold heat tube on the top surface of the exhaust manifold so that it is affected by engine temperature changes. All types are similar in design (except for minor differences described below) and are serviced in same manner (exceptions due to differences in design noted in servicing sections).

Second Type (1990001)—Port hole and bleeder passage for dashpot piston not used and relief groove cut in side of cylinder wall instead. Connecting rod made integral with dashpot piston and small spring in take-off piston at end of rod discontinued, a second reload spring being wound on the pull-out lever shaft and hooked to the lever to secure the same performance. This type serviced in same manner as first type (490-A).

New Type With Starter Vacuum Switch (1990101, 1990102):—Vacuum switch (for starter solenoid control) mounted on take-off piston end of choke housing and operated by pushrod in choke which contacts ear on throttle cam. When switch not installed, special cover plate and gasket installed to close end of choke housing (takes place of screw plug used on first type). Design similar to second type (above) in all other particulars.

OPERATION:—The thermostat winds up as the engine cools off rotating the control shaft and closing the choke valve so that it is in position for starting (fully closed for temperatures below 85°). In this position, the vacuum 'take-off' piston and rack will be pushed in by the piston spring and the dashpot piston will be seated with no pressure being exerted on the piston connecting rod by the pull-out lever which is controlled by the throttle shaft cam. When the accelerator pedal is depressed to start the engine, the resultant throttle opening winds up the pull-out lever spring so that the lever presses on the dashpot piston connecting rod. If the engine does not begin to fire within a few seconds, the movement of the dashpot piston due to the pull-out lever pressure moves the rack forward, rotating the thermostat and control shaft assembly, and opening the choke valve slightly to prevent overchoking. This stroke of the dashpot piston requires 7-10 seconds (moves slowly to point where port hole is uncovered which admits air to cylinder and then rapidly to complete the stroke). The return stroke of the dashpot piston requires approximately 1 minute so that for repeated short cranking attempts the choke will not completely close. When the engine begins to fire, manifold vacuum pulls the vacuum take-off piston forward against the spring tension, opening the choke valve to provide the initial 'take-off' necessary for continued running (dashpot piston will retard this motion also). With the engine running, air velocity past the offset choke valve tends to open the valve and, as the thermostat unwinds as the engine warms up, the choke valve will be wide open at regular operating temperature.



ADJUSTMENT:—No adjustment required except when regular fuel used by car owner is more or less volatile than standard and necessitates special setting of Volatility Selector for correct choke action.

Volatility Selector. Consists of adjusting nut and pointer on control unit cover. Standard setting as shown with pointer in second notch on 'Low' side of scale. Three additional notches provided toward 'high' end. If mixture too rich, move pointer toward 'High' end of scale (this will correct for more volatile fuels). If mixture too lean, move pointer toward 'Low' end.

CHECKING (ON CAR):—If choking action not satisfactory, check control unit before removing from car. Remove air cleaner so that choke valve can be seen. See that choke valve is free and that it returns to original position when opened or closed manually. With engine cold and not running, open throttle wide. Choke valve should open slowly after 7-10 second delay. Close throttle. Choke valve should close immediately. If this action faulty, check for sticking control unit pistons or linkage binding. Start the engine cold. Choke valve should move toward open position when engine begins to fire. If it does not, check for clogged vacuum passage in carburetor and control unit, leaks at gasket (mounting screws loose) or at vacuum take-off cylinder plug (plug loose or gasket defective), or for binding vacuum piston. Accelerate engine before it has warmed up. Choke valve should move toward closed position momentarily and then return. If it does not, check for sluggish dashpot piston, weak or broken dashpot piston lever spring, binding in linkage generally. If choke valve action is not correct in above tests, remove control unit for disassembly and inspection on the bench.

SERVICING:—Removal—Take off carburetor and control unit as an assembly (lift straight up so that thermostat unit clears manifold heat tube). Pull back control shaft rubber cover at either end slipping shaft out of engagement with cover. Take out two mounting screws on face of control unit.

NOTE—On types with vacuum switch, disconnect and tape two leads on vacuum switch terminals before removing unit.

Disassembly—Take out two screws in cover plate, remove cover. Take out dashpot pull-out lever pivot screw and remove lever. Remove take-off cylinder plug and gasket, take out piston spring. Pull piston assembly out until rack and gear disengage, then turn thermostat shaft and gear assembly approximately 180° so that dashpot piston will clear gear when piston assembly is pulled out (sight through bottom of casting and use extreme care that dashpot piston is not scratched in removal). Do not loosen thermostat calibrating screw which clamps lower end of thermostat to control shaft so that thermostat setting will not be disturbed (special calibrating tool required to reset thermostat).

NOTE—On types with vacuum switch (or end plate installed instead of switch), snap ring and spring retainer must be removed before take-off piston spring can be taken out.

Servicing—Wipe off pistons with clean cloth, wipe out cylinders with alcohol, dry all parts. See that all passages are open and clean (if air line used to blow out passages, air must be free of all water, oil and rust). Check flexible linkage between pistons, see that thermostat and gear assembly rotates freely in bearings. Do not oil any part of the choke mechanism.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Reassembly—Reverse directions given above. With pistons in place mesh gear and rack so that first gear tooth overlaps the first tooth on the rack (this is important, wrong engagement will throw off thermostat calibration). See that take-off spring is installed in take-off piston and that plug gasket is in good condition, tighten plug securely. Install dashpot piston pull-out lever and make certain that curved end of pull-out spring is behind cross head on flexible linkage. Check to see that thermostat clip is meshed with the take-off gear through the pin and that the throttle shaft cam is engaged with the pull-out lever roller in the closed throttle position before replacing cover.

NOTE—On types with vacuum switch, after take-off piston spring, spring retainer and snap ring are installed, use screwdriver or coin inserted in throttle shaft slot to turn shaft to wide open position, then push switch operating rod into choke as far as possible and assemble switch. This will prevent rod distorting contact point spring in switch case which may cause a ground. On type with end plate, make certain that gasket is assembled so that small square in center of gasket hollow square covers the ⅛" hole adjacent to take-off cylinder.

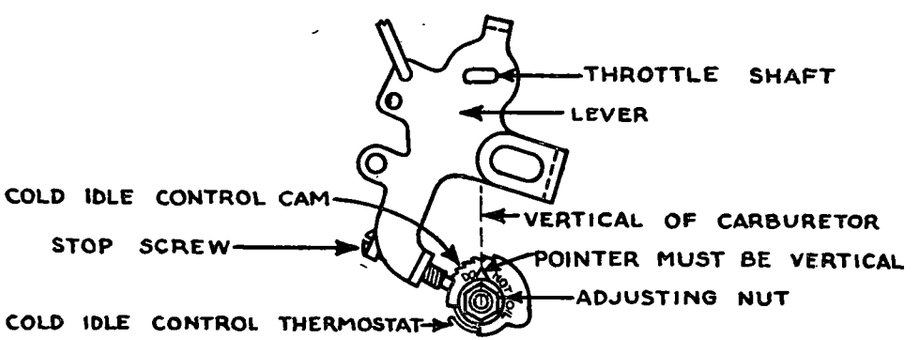
Mounting & Checking—Assemble control unit on carburetor, see that mounting screws tightened securely and gasket pulled down to prevent leaks at this point. Open and close throttle several times to see that linkage does not bind. Engage tip of flexible shaft in control unit shaft, slip rubber cover down over shaft and over pilot on control unit (shoulder in cover must bottom on pilot). Engage upper end of flexible shaft and slip rubber cover over choke valve shaft pilot as single operation (at temperatures below 85° open throttle valve wide to align tongue and slot to avoid necessity of twisting shaft). See that rubber cover does not touch flexible shaft at any point. Check choke valve clearance in air horn (flexible shaft exerts thrust and valve must clear at opposite side of air horn when all end thrust in shaft is taken up). To adjust valve, loosen two mounting screws, tap valve lightly, tighten screws securely. Open and close choke valve several times to see that flexible shaft firmly engaged, choke valve operates freely and returns to original position. Recheck vacuum switch types (or end plate when installed) to make certain that no leakage can occur at cover gasket.

NOTE—Cut-away cover available which can be installed in place of regular cover so that operation of choke mechanism can be watched. To check dashpot piston timing with this cover in place, see that piston fully back in cylinder, rotate throttle shaft cam to wide open position. Piston linkage cross head (where pull-out lever contacts piston rod) should move up to the end of the take-off piston in 4-8 seconds. Rotate throttle shaft cam to closed throttle position. Dashpot piston should move to the bottom of the cylinder in one minute maximum. All movement should be smooth.

THERMOSTAT CALIBRATION:—With Test Fixture. Consists of pointer clamped on control unit shaft and graduated dial mounted on control unit. With Volatility Selector pointer set in second notch on 'Low' end of scale, test fixture pointer should line up with 'O' mark on scale when control unit is at room temperature of 72° F. (control unit should be allowed to stand until it reaches room temperature and temperature should be read on thermometer placed near unit when test is made). Pointer will register minus 1° on dial for each 2° in temperature below 72° or plus 1° for each 2° temperature rise above 72°. To adjust thermostat, use special Allen wrench to loosen thermostat calibrating screw (clampscrew at lower end of thermostat), rotate pointer to correct position, tighten screw. Be careful not to bend or distort thermostat in making this adjustment.

Without Test Fixture. Thermostat cannot be set without fixture but may be compared with a new unit by allowing both units to reach same temperature and then noting control shaft angularity (place units side by side, insert thin blade or match stick in shaft slot, note whether these blades are parallel).

BUICK COLD IDLE (FAST IDLE) CONTROL



This type control standard equipment on the following Buick car models:

Car Model	Carburetor
40 (1934)	Marvel BB-1 10-1633
40 (1934-35-36)	Stromberg EE-1
50 (1934-35)	Marvel ED-1S 10-1577
60 (1934-35)	Marvel ED-2S 10-1579
90 (1934-35)	Marvel ED-3 10-1581
60, 80, 90 (1936)	Stromberg EE-22
40 (1937)	Stromberg AA-1 or Marvel BD-1 10-1749
60, 80, 90 (1937)	Stromberg AA-2 or Marvel BD-1S 10-1751
40 (1938)	Stromberg AAV-1 or Marvel CD-1B 10-1796,7
60, 80, 90 (1938)	Stromberg AAV-2 or Marvel CD-2B 10-1798,9

DESCRIPTION:—The Cold Idle Control consists of a thermostatically operated cam mounted on manifold heat jacket which serves as a stop for throttle-stop screw. Thermostat is located within cam and rotates cam in a clockwise direction when the engine is cold. The cam then moves the idle adjusting screw outward and automatically increases the idling speed, providing a 'fast idle' for warming up. As the engine temperature rises the cam is rotated counter-clockwise, allowing the idle adjusting screw to move toward the cam until the engine speed drops to the normal 'hot' or slow idle speed of 8 M.P.H.

ADJUSTMENT:—The Cold Idle Control should not require adjustment or attention in service. The setting can be checked as follows: Loosen nut in center of cam, rotate cam hub until pointer is vertical, tighten nut, open throttle momentarily to allow cam to assume correct position (thermostatic spring will not rotate cam while idle screw is resting on cam surface). Warm up engine, note position of idle screw on cam. Idle screw should contact cam on its thinnest portion within ¼" limit adjoining the first cam step. If idle screw contact point is not within these limits, loosen cam nut and rotate cam hub slightly (opening throttle to allow cam to assume correct position). If hub must be rotated more than 5° to secure correct idle screw position on cam, replace entire cold idle cam assembly. Do not oil any part of the mechanism.

NOTE—On Models 50, 60, 90 (1934-35) with Marvel updraft carburetors, the cam hub was punchmarked to indicate the correct setting. The punchmark should be vertical (same position as pointer on other models).

DESCRIPTION:—Two types of Sisson automatic chokes, AC-600 series, and AC-700 series, are used on the following car models:

Std. or Optl. Equipment On:

1934-37 CAR MODELS

Car Model	Choke Type Number
Chrysler Models CA, CU, CV (1934)	AC-600
Chrysler Models C-6, CZ, C1 (1935)	AC-700
Chrysler Models C7, C8, C9 (1936)	AC-751
Chrysler Models C2, C3 (1935), C10, C11 (1936)	AC-600
Chrysler Royal C-16	AC-751B
Chrysler Imperial C14, Cust. Imp. C-15	AC-600
Chrysler Airflow C17	AC-600
De Soto Model SE (1934)	AC-600
De Soto Models SF, SG (1935)	AC-700
De Soto Models S-1, S-2 (1936)	AC-751
De Soto S3	AC-751B
Dodge Models DR, DS (1934)	AC-600
Dodge Model DU (1935)	AC-700B
Dodge Models D2, D3, D4 (1936)	AC-751B
Dodge D5	AC-751B
Plymouth Models PF, PG (1934)	AC-600
Plymouth Model PJ (1935)	AC-700B
Plymouth Models P1, P2 (1936)	AC-751B
Plymouth P3, P4 (Optl.)	AC-751B

1938 CAR MODELS

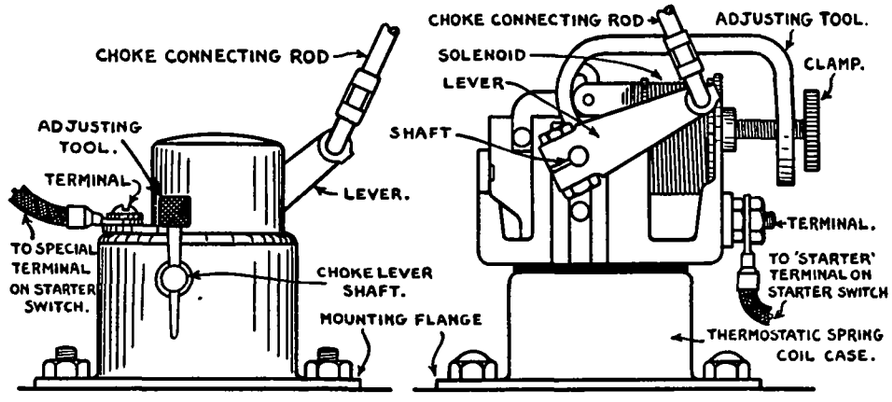
Chrysler, C18 Royal (1938)	AC-758B
Chrysler, C19 Imp., C20 Cust. Imp. (1938)	AC-600
DeSoto, Model S5 (1938)	AC-758B
Dodge, Model D8 (1938)	AC-758B
Plymouth, Models P5, P6 (1938)—Optional	AC-758B

1939 CAR MODELS

Car Model	Carburetor	Sisson Choke No.
Chrysler Model C22 (1939)	Carter (B&B) E6N1, N2	AC-758B
Chrysler C23, C24 (1939)	Stromberg AAV-2	AC-600
DeSoto S6 (1939)	Carter (B&B) E6N1, N2	AC-758B
Dodge D11 (1939)	Stromberg BXV-3	AC-758B
Plymouth P7, P8 (1939)	Carter (B&B) D6A1, A2	AC-758B
Plymouth P7, P8 Econ. ('39)	Carter (B&B) B6K1, M1	AC-758B

Models AC-758, AC-758B. These models have minor refinements in design and are interchangeable with previous Models AC-700, AC-700B, AC-751, AC-751B.

These models are entirely similar in design and operation but are adjusted differently (see instructions below). The design is similar to that of previous Sisson models and employs a solenoid coil (to close choke valve when starter is operated with engine cold) and a thermostatic spring (to control choking action during warming up period). The terminal on the top or side of the choke case is connected to starter side of the starting switch.



OPERATION:—When the starter is operated to crank the engine, the automatic choke solenoid is energized, attracting the armature, and rotating the choke lever, which is attached to the choke valve lever through a control rod so that the choke valve is closed if the engine is cold. When the engine is warm this armature movement does not take place and no choking action results. When the engine begins to fire and the starting switch is opened, the solenoid circuit is broken. The choke lever is then controlled entirely by the thermostatic spring within the choke case and this tends to rotate the lever and open the choke valve as the engine warms up. With the engine at normal operating temperatures, the choke valve will be entirely open.

ADJUSTMENT:—**AC-700 Series**—Remove air cleaner so that the choke valve can be noted. Insert special adjusting tool (obtainable from Pierce Governor Co., Anderson, Ind.), or #42 wire drill in hole in choke valve shaft opposite end from lever), operate choke lever by hand to close choke until adjusting tool engages slot in choke housing. This will lock choke mechanism in closed position. Then loosen clamp screw on shaft end of choke lever, lift up on lever until carburetor choke valve is entirely closed. Hold lever in this position and tighten clampscrew. Remove adjusting tool and test to see that there is no backlash or play between choke lever and choke valve. These chokes are shipped from the factory with a cotter pin in the adjusting hole. The cotter pin must be removed when the choke is installed on the engine and the adjustment tested as above. When replacing this type choke, always install the special Steelbestos gasket on the exhaust manifold under the choke base. This gasket will prevent excessive heat from damaging the choke mechanism.

NOTE—If choke operation is not satisfactory, see that choke valve is free (air cleaner clamp must not be so tight as to cause valve to bind), and that all linkage operates freely. If internal mechanism of choke sticks, thoroughly clean unit (installation of steelbestos gasket noted above will prevent rust forming within unit). Do not lubricate any part of choke mechanism and be careful not to bend the thermostat.

AC-600 Series—Take off automatic choke cover, remove air cleaner so that position of choke valve can be checked. Clamp special adjusting tool (obtainable from Pierce Governor Co., Anderson, Ind.) in place on choke so that end of tool enters and lines up the holes in the armature and magnet core. This will lock choke in closed position. Then loosen clamp screw on shaft end of the operating lever, move the lever until carburetor choke valve is fully closed, tighten clampscrew. Remove adjusting tool and see that there is no backlash or play between automatic choke lever and carburetor choke valve. Replace air cleaner and choke cover and check to see that choke mechanism operates freely without binding or striking these parts.

SISSON AUTOMATIC CHOKE.

AC-700 SERIES **AC-600 SERIES**

TROUBLE SHOOTING:—If car does not start promptly or if warming up performance is unsatisfactory, check entire ignition system and then check carburetor and choke operation as follows:

Hard Starting with Cold Engine:

1. Check fast idle mechanism to see that it is free and not binding at any point (fast idle connecting rods usually connected to choke valve lever and binding will interfere with choke action).
2. See that choke rod connecting Automatic Choke lever and choke valve lever does not bind in levers.
3. Examine carburetor choke lever, Automatic Choke lever, and fast idle mechanism and remove all paint, grease, or dirt which might cause binding.

CONTINUED ON NEXT PAGE

4. Check carburetor choke valve, see that edges are smooth and that valve does not rub against air horn walls or bind in any position. See that air cleaner does not interfere with choke valve and that mounting screw is not tightened excessively which will distort air horn and bind choke valve (check choke valve operation with air cleaner in place).

5. Check electrical connections at Automatic Choke and starter switch. Examine wire for short-circuits and breaks.

6. Check Automatic Choke ground (unit grounded through case). See that mounting screws are tight and that manifold under mounting flange is clean.

7. Check throttle cracking linkage (see Tune up instructions on car model page). This is important to insure correct throttle opening for starting and to place automatic choke in operation (on some cars with fast idles, fast idle will prevent choke valve closing until throttle valve has been opened to free fast idle cam).

8. Check Automatic Choke adjustment (see instructions above). If Automatic Choke does not function correctly after checking these points, the unit should be replaced.

Hard Starting with Hot Engine:

1. Check for rich mixture or flooding caused by percolating discharge of carburetor when engine stopped. To check, remove air cleaner immediately after stopping engine, note whether gasoline dripping into manifold from carburetor nozzle (this overflow should show up within 3-5 minutes after engine is stopped), Correct by installing special size Float Valve Needle and Seat Assembly and checking float level. See carburetor article in Carburetor Section for float level specifications.

INSTALLATION (PLYMOUTH):—A mounting pad is provided on the exhaust manifold for the automatic choke. Position choke on mounting pad with operating lever pointing toward carburetor, drill two 3/16" holes in line with mounting holes in base flange, tap with ¼x20 USS. tap, use studs furnished to mount choke on manifold. Take off all hand choke linkage, replace with control rod linking choke valve lever and choke operating lever. Connect terminal on choke case to special terminal on side of switch case on starter (do not connect to battery side of starting switch). On cars where this terminal is not provided, remove starter switch, mount pad on end of cable under switch with copper strip against starter terminal post and solder in place.

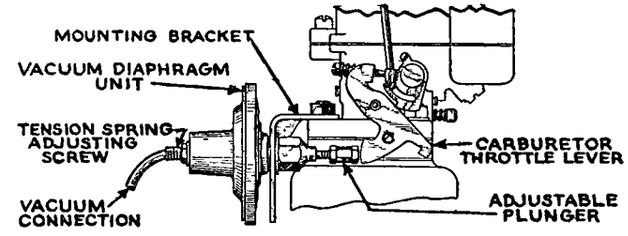
1939 PACKARD THROTTLE GUARD

Standard equipment on following car models with Overdrive Transmissions:

PACKARD SIX, MODEL 1700 (1939)

PACKARD '120' EIGHT, MODELS 1701, 1702 (1939)

PACKARD SUPER EIGHT, MODELS 1703, 1705 (1939)



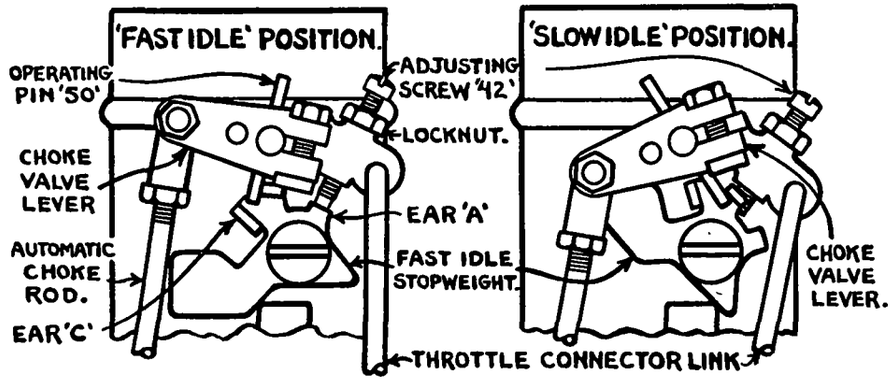
DESCRIPTION:—Throttle Guard designed to prevent engine stalling when freewheeling in the 0-20 MPH. range. Consists of a vacuum diaphragm unit, similar to those used on distributors for vacuum spark control, mounted on the carburetor so that the diaphragm plunger actuates the throttle valve fast idle lever. Unit has adjusting screw and locknut on vacuum diaphragm spring boss (opposite end from actuating plunger).

OPERATION:—Throttle Guard cuts in at 4 MPH. when manifold vacuum decreases sufficiently so that spring within unit forces plunger out against throttle lever opening throttle and accelerating engine to prevent stalling. Throttle Guard kicks out at 9 MPH. when manifold vacuum increases sufficiently to retract plunger and allow throttle valve to close to regular 5 MPH. hot or slow idle speed position.

ADJUSTMENT & TESTING:—**Note**—Make certain that carburetor correctly adjusted and set for 6 MPH. hot or slow idling speed before adjusting Throttle Guard.

Adjustment—Check clearance between outer end of throttle guard plunger and lug on throttle lever. This should be .060" (Six), .020" (Eight, Super Eight). Loosen locknut and turn tension spring and adjusting screw on outer face of throttle guard until distance from top of locknut to end of screw is 3/16" (Six, Eight), 3/32" (Super Eight), tighten locknut. Check adjustment by road-testing car.

Road Testing—See that Overdrive Control knob pushed in (Overdrive operative), allow car to coast in high gear (accelerator pedal released) and decrease car speed slowly by applying brakes. Throttle guard should cut in at 4 MPH. (slight movement of accelerator pedal will be noted) and bring car speed up to 9 MPH. (with brakes released) at which speed it should kick out. If cut in speed is above 4 MPH., decrease spring tension by turning adjusting screw out slightly; if cut in speed below 4 MPH., increase spring tension by turning screw in. If kick out speed is higher than 9 MPH., increase gap between diaphragm plunger and throttle lever (loosen locknut and turn plunger on rod); if kick out speed below 9 MPH., decrease gap.



NOTE:—See table below for list of car models using this type Fast Idle.

FAST IDLING DEVICE:—The 'Fast Idling' Device used in conjunction with the Automatic Choke consists of a series of levers connected to the throttle valve, choke valve, and the Automatic Choke Control so that the carburetor choke valve does not close with either a hot or cold motor until the throttle is opened to a position equivalent to 20 M.P.H. As a result, when a hot motor is stopped and the throttle is closed, the contraction of the thermostat spring will close the choke valve from a wide open position to a partially closed position when the movement of the pin '50' against the ear 'C' causes the ear 'A' to contact with the adjustment screw '42'.

Operation. When the car is started the throttle must be opened to a position corresponding to a car speed of 20 M.P.H. The movement of the throttle valve raises the adjusting screw '42', releasing the ear 'A' and allowing the choke valve to snap closed. As soon as the engine begins to fire, the Automatic Choke Control partially opens the choke valve, causing the fast idle stop weight to rotate slightly counter-clockwise. As a result, when the throttle is closed after car has started, the adjustment screw rides on the ear 'A' of the fast idle stop weight, holding the throttle open in a position corresponding to a car speed of 20 M.P.H. When the carburetor is installed this adjustment is set for a car speed of 15-20 M.P.H. with a hot motor, or approximately 12 M.P.H. with a cold motor. As the motor warms up, the fast idle stop weight is rotated slightly clockwise so that the adjustment screw slides off of ear 'A', allowing throttle to close.

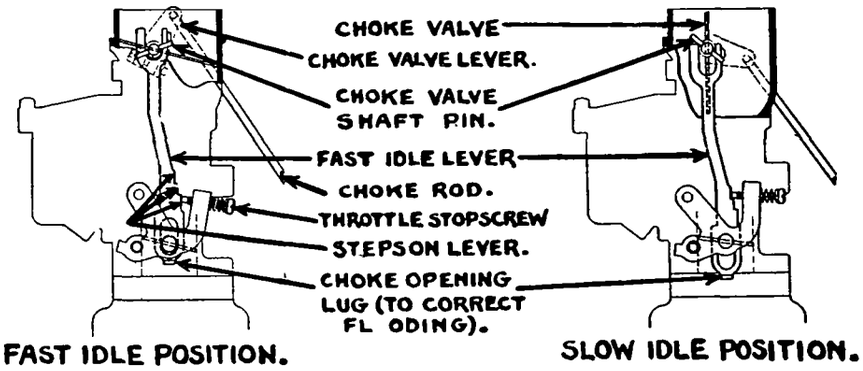
Adjustment. Whenever adjustment is being made with a hot motor it will be necessary to hold the fast idle stop weight in position so that the adjustment screw '42' rides on ear 'A' of fast idle stopweight with choke valve held closed. To adjust fast idle, back off throttle stopscrew (hot or slow idle speed adjusting screw) until throttle valve is completely closed. Close choke valve by hand, see that ear 'A' is directly under adjusting screw '42', loosen locknut on adjusting screw, turn screw down or clockwise until it just contacts ear 'A', then turn screw the correct number of additional turns as given in table below for each car model, tighten lockscrew. In some cases this adjustment is made in a slightly different manner by opening the throttle valve the correct amount (using a feeler gauge or wire drill of correct size inserted between edge of throttle valve and carburetor wall to hold throttle valve open) and then turning the adjusting screw '42' in until it just contacts ear 'A'.

Car Model and Year	Carburetor	Fast Idle Setting
Chrysler CL* (33), CW (34), CW* (35)	EE-3	1½ complete turns
Chrysler CU, CV (34), C2, C3 (35)	EE-22	.016-.020" throttle opening
Oldsmobile F-33 (1933)	EC-22	#55 drill (see Note)
Oldsmobile L-33 (1933)	EE-22	.090" feeler (see Note)
Packard Twelve (1933-34)	EE-3	6¾ complete turns
Packard Eight, Super Eight (33-34)	EE-22	1¾ complete turns
Pierce Arrow Eights (1933-38)	EE-3	1⅛ complete turns
Pierce Arrow Twelves (1933-38)	EX-32	¾ of one turn
Reo S3 (33), S4 (34), 7S (35)	EX-32	#60 drill throttle opening
Studebaker 56 (1933)	EX-22	1½ complete turns
Studebaker 73, 82, 92 (1933)	EE-22	1¾ complete turns
Studebaker Pres. C (1934)	EE-22	1¾ complete turns

Loading. If the engine becomes loaded when cranking, this condition can be corrected by holding the throttle in wide open position, which will open the choke valve approximately 40%.

Linkage. See article on Type C Automatic Choke for adjustment of choke connecting rod. Backlash in linkage should be .006". Endplay in choke valve shaft should be held to .003" with valve closed (measure with feeler gauge between air horn and shaft washers.

LEVER TYPE



NOTE:—This type Fast Idle used on the following car models:

Car Model and Year	Carburetor
Auburn 850-X (1934), 851 (1935)	EE-1
Oldsmobile L-34 (1934)	EE-1
Studebaker Comm. 1-B, Pres. 1-C (1935)	EE-1

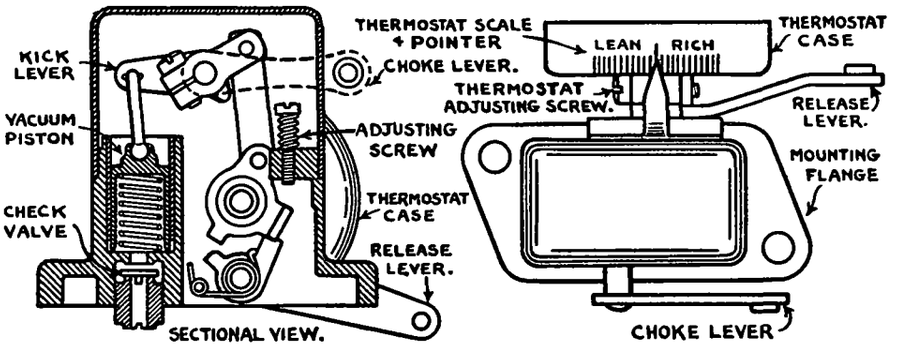
DESCRIPTION:—This type fast idle mechanism consists of a lever or bar linked to the choke valve shaft and having several steps or notches on its lower end which serve as stops for the throttle stop screw which controls idling speed. The pin on the choke valve shaft bears against a lug on the upper end of the lever so that the lever is raised as the choke valve closes. When the choke valve is opened, the lever falls of its own weight, allowing the stop screw to slide off each step in turn until the upper step or 'slow idle' position is reached.

OPERATION:—When this type fast idle is used on carburetors equipped with an automatic choke, the choke valve is closed by the thermostatic spring as the engine cools off until the stop screw engages the first step on the fast idle lever. When the engine is started, the momentary opening of the throttle (throttle must be opened by hand if no hook-up is provided with the starter mechanism), allows the choke valve to snap closed, raising the lever to the fast idle position. As the choke valve is opened, the lever is freed and drops so that the idling speed is increased (by the stop screw sliding from one step to another) until the final or slow idle position is reached.

TO CORRECT FLOODING:—With the throttle wide open, the throttle valve lever engages an ear on the lower end of the fast idle lever, pulling the lever down and opening the choke valve. If the carburetor loads up and engine will not start, the throttle should be opened wide and the engine turned over several times.

NOTE:—This type Automatic Choke used on the following car models:

Car Model and Year	Carburetor	Choke Type No.
Oldsmobile Model F-32 (1932)	EC-2	A-16130
Oldsmobile Model F-32 (1932)	EC-2	A-16400 (X)
Oldsmobile Model L-32 (1932)	EE-2	A-16210
Oldsmobile Model L-32 (1932)	EE-2	A-16410 (X)
Packard Twelve Models 905, 6 (32)	EE-3	A-16510



(X) These models same as preceding model except they are less choke rod and gasket.

DESCRIPTION:—This device is intended to choke the carburetor for cold starting and to control the choking action during the warming-up period. It employs a thermostatic spring coil controlled by exhaust manifold heat and a vacuum piston controlled by intake manifold vacuum to operate the lever which is linked to the carburetor choke valve. A second lever (release lever) is linked to the throttle valve lever and is designed to open the choke valve when the throttle valve is opened wide. This is designed to correct flooding.

OPERATION:—When the engine is cold the tension of the thermostatic spring closes the choke valve so that it is in position for starting. The choke valve is held closed during cranking by the locking of the linkage within the choke case. When the engine begins to fire, the downward motion of the vacuum piston unlocks the linkage and opens the choke valve slightly to prevent over-choking. As the engine warms up the tension of the thermostatic spring decreases, allowing the choke valve to open. The automatic choke is designed to completely close the choke valve at 70°F. and the choke valve should be wide open when the engine temperature reaches 120°F.

ADJUSTMENT:—(1932). Choke can be removed from engine by disconnecting control levers and taking out two mounting screws. Choke thermostat must be at normal room temperature of 70°F. before any adjustments are made. If engine has been running, remove choke and allow to cool off. If choke case temperature is under 70°, take choke into warm room and allow to come up to room temperature. The release lever must be held in a horizontal position (parallel to base) while the choke is being tested or adjusted. To check choke, unhook thermostat spring from prong in case, set the case at correct figure for car (5 notches lean for Oldsmobile F-32, 8 notches lean for Oldsmobile L-32, 16 notches lean for Packard 905, 6), raise choke lever to highest position and check distance from thermostat spring hook to prong on case. Correct figure should be .002-.020". Distance can be set by loosening set screw and turning the shaft. Tighten the set screw and see that thermostat does not bind on case. Invert choke, lift choke lever and allow it to drop. It should drop freely and the linkage should come back to the 'lock' position. Assemble thermostat spring hook on prong, set thermostat case at '0'. With this setting, choke lever should catch in the closed position but should yield to a light pressure. Revolve thermostat case one quarter turn so that prong is under pointer. With this setting, choke lever should resist slight pressure but should yield to a tap by hand. There should be a noticeable difference between the two settings. The amount of resistance offered by the choke lever is controlled by the adjusting screw in the choke case. Turn this screw down or clockwise to decrease resistance and up or counter-clockwise to increase resistance. Set the thermostat case for the correct figure, securely tighten the thermostat case clamp screw, assemble choke on engine, see that backlash between choke control and carburetor choke levers is not more than .006". This can be adjusted by changing position of carburetor choke lever on choke valve shaft. Release lever should be connected to accelerator rod. This release lever opens the choke valve when the accelerator is opened wide.

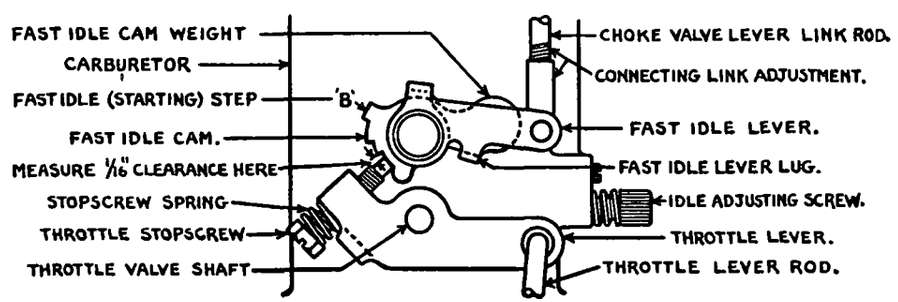
MODEL 'B'.

SETTING:—Thermostatic spring coil is set for each car model by loosening spring case clampscrew and rotating spring case the correct number of notches rich or lean from the center mark (count from center mark to mark under pointer). Tighten clampscrew. Settings are as follows:

Car Model	Setting
Oldsmobile F-32 (1932)	5 notches lean
Oldsmobile L-32 (1932)	8 notches lean
Packard Twelve (1932)	16 notches lean

STROMBERG FAST IDLE

NOTE:—This type Fast Idle used on the following car models:



Car Model and Year	Carburetor
Oldsmobile F-35 (1935)	EX-22
Oldsmobile L-35 (1935)	EE-1

DESCRIPTION:—This type Fast Idle consists of a stepped cam (located directly above the throttle lever) which serves as a stop for the throttle lever stopscrew (idling speed adjustment). The lever which operates this cam is linked to the choke valve lever so that the cam is controlled by the automatic choke mechanism.

OPERATION:—When the engine cools off after being driven, the thermostatic spring in the automatic choke tends to close the choke valve but is prevented from doing so by the engagement of the throttle stopscrew with the first step on the fast idle cam. When the cold engine is started, the opening of the throttle valve lifts the throttle stopscrew and releases the fast idle cam, the automatic choke then closes the choke valve and rotates the fast idle cam so that the stopscrew rests on the highest step 'B' of the cam. This prevents the throttle from closing and provides the fast idling speed. As the engine warms up and the thermostatic spring tension decreases, allowing the choke valve to open, the fast idle cam lever is moved downward away from the lug on the fast idle cam. This allows the fast idle cam to rotate (by reason of the weight on the lever end of the cam) so that the throttle stopscrew slides over the various steps of cam and finally comes to rest on the lowest step, which provides the 'hot' or slow idling speed when the choke valve is fully open.

ADJUSTMENT:—No adjustment will ordinarily be required. The clearance between the throttle lever stopscrew and the notch or step at the end of the low speed step on the fast idle cam should be 1/16" with the choke valve wide open (see illustration). To adjust, disconnect rod linking choke valve lever and fast idle cam lever and adjust length of rod by turning rod in or out of adjusting link on lower end of rod.

All carburetor adjustments should be made with the engine warmed up so that the choke valve is wide open and the throttle stopscrew rests on the smallest step of the fast idle cam.

NOTE:—This type Automatic Choke used on the following car models:

Car Model and Year	Carburetor	Choke Type No.
Oldsmobile F-33 (1933)	EC-22	A-17220
Oldsmobile L-33 (1933)	EE-22	A-17220

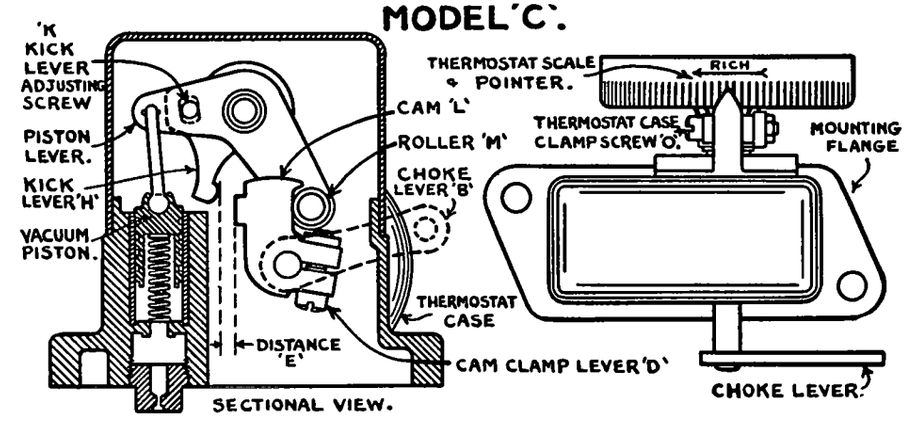
Stutz DV-32 (1933-34)	EE-3	A-17380



NOTE:—Packard Twelve. New 10-9A choke used on late '37 and all '38-39 cars. This model may be installed on early '37 cars to improve choke action by removing asbestos between choke hot plate and manifold and installing 3/32" plain washer No. 239304 on each screw as spacer. Choke valve lever to fast idle cam lever rod must be replaced by new 5 9/32" rod (old rod 5 9/16" long).
NOTE—New 10-9A choke setting 16 Notches Rich, old 10-9 setting 28 notches.

DESCRIPTION:—The Stromberg Automatic Choke Control is a device designed to automatically choke the carburetor when the engine is started cold and to automatically control the choke valve during the warming up period of the engine. It is designed to be mounted on the manifold and is operated by the engine heat and manifold vacuum.

OPERATION:—The coiled thermostat spring in the thermostat case on the side of the unit will close the carburetor choke valve at an engine temperature of 70°. The choke will thus be in position for starting and is held closed during the cranking operation by the locking of the roller 'M' against the cam 'L'. When the engine begins to fire, the vacuum in the manifold will act to pull down the piston 'G' (since the lower end of the piston cylinder is connected to the manifold), unlocking the roller 'M' and cam 'L'. As soon as the engine begins to fire regularly the piston will be drawn down to the end of the stroke so that cam 'L' bears against lever 'H', opening the choke valve slightly against the tension of the thermostatic spring.

ADJUSTMENT:—When the Type C Automatic Choke requires adjustment, it should be removed from the engine by disconnecting the carburetor connecting rod and taking out the two mounting screws. The Choke should then be allowed to cool off to 70° before any attempt is made at adjusting (this is particularly important if engine has been running and Choke is heated). However if temperature is under 70° choke should be taken into a room heated to 70° (this is normal room temperature) and allowed to come up to room temperature before adjustment is made. To adjust, first take off Choke case cover and see that all working parts operate freely. With roller 'M' in locked position against first notch of cam 'L' the distance between the center of the hole in the choke lever 'B' and the lower surface of the choke base plate should be measured (see Table #1). If not correct, loosen cam clamp lever 'D' and shift position of control lever until correct setting is secured. Measure the distance 'E' between the face of the cam 'L' and the surface of the kick lever 'H' (use a wire drill) with cam in locked position (see Table #2). Adjust by loosening kick lever adjusting screw 'K'. Then unhook thermostat spring end 'A' from prong 'N' in thermostat case, loosen clamp screw 'O' and rotate thermostat case 'Q' until the zero mark of the scale on the rim of the case is directly under the pointer. In this position the hook of the thermostat should be flush with the prong in the case. Place the hook on the prong, revolve the thermostat case the correct number of divisions toward the 'rich' or 'lean' side of the scale (see Table #3 below for each car model), securely tighten clamp screw 'O'. See that piston operates freely and does not stick in any position, assemble Choke case cover, mount choke on manifold, making certain that gasket is in good condition and that mounting screws are pulled down evenly and securely. Then connect control rod to carburetor choke lever and see that there is only .006 inch backlash between levers. If it is necessary to adjust control rod to secure correct backlash, loosen the clamp screw on the carburetor choke lever and shift the carburetor choke lever on its shaft. See that the carburetor air cleaner does not interfere with the free movement of the control rod.

CALIBRATING THERMOSTATIC COIL:—If the hook on the thermostatic coil is not flush with the prong on the case at 70°F with the pointer at '0' (see adjustment paragraph above), a new '0' location should be located as follows: loosen thermostat case clampscrew, revolve case until hook on thermostatic coil is flush with prong, tighten clampscrew and make a new '0' mark opposite the pointer. Obliterate the old '0' mark and use the new mark in setting the thermostatic coil (Table #3 above). This procedure may be necessary when installing a new thermostatic coil or when the old coil has taken on a permanent 'set'. Replace coils which have been deformed by rough handling.

Car Model and Year	Table #1 Lever Height	Table #2 Distance 'E'	Table #3 Setting Notches
Oldsmobile F-33 L-33 (1933)	1 5/8"	#20 drill	28 Rich.

Studebaker Com. 1B, Pres. 1C ('35)	1 1/16"	#17 drill	16 Rich.
Studebaker 2C ('36) all models	1 3/32"	#20 drill	16 Rich.
Studebaker 3C ('37)	See Note.	#20 drill	8 Rich.
Stutz DV-32 (1933-34)	1 15/16"	#22 drill	3/8" (x)

*—This setting may be varied not more than 5 notches in either direction if engine runs rich or lean during warming up period.

(x) On these models the thermostat case should be revolved until the hook on the spring coil is this distance from the prong on the case with the choke at 70°F. These settings must be made before the thermostat spring coil hook is engaged with the prong.

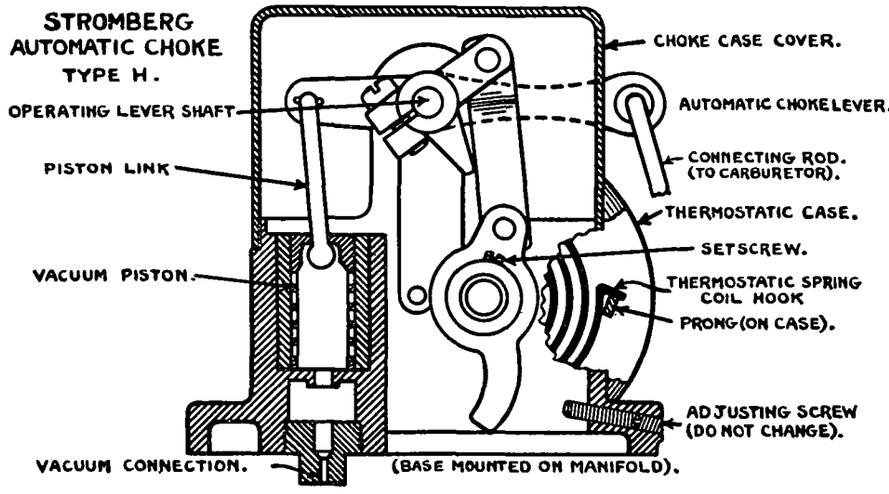
NOTE—On Studebaker models, adjust kick lever cam setscrew so that roller is in contact with first notch of cam with .005-.009" clearance between setscrew and stop. Thermostat case housing is stamped 'R', 'M' and 'H'. Setting for standard grades of gasoline is at 'R' (8 notches rich). If engine loads up when cold with this setting, 'M' (4 notches rich) should be used. Setting 'H' (at zero) should only be used with highly volatile gasoline.

Std. Equipment On:
OLDSMOBILE EIGHT, MODEL L-34 (1934)

DESCRIPTION:—The Stromberg Automatic Choke is designed to completely close the choke valve at a temperature of 70°F. (engine not running) and to open the choke valve progressively as the engine heats up until the valve is wide open at an engine temperature of 120°. It employs both engine temperature (thermostatic spring coil) and manifold vacuum (vacuum piston) to control the choke under all operating conditions. Choke is locked in position (with lever against adjusting screw) with choke valve closed while engine is being cranked, and is unlocked by the vacuum piston movement when the engine begins to fire. See paragraph below for adjustment of locking action.

OPERATION:—With the engine cold and not running, the choke valve will be closed (thermostatic spring wound up and vacuum piston up at upper end of stroke). When the engine begins to fire, the manifold vacuum will cause the vacuum piston to move down, opening the choke partly. The choke valve is then controlled by the thermostatic spring and is opened as the engine heats up and the spring unwinds until the engine temperature reaches 120°, when the choke valve will be wide open.

ADJUSTMENT:—Linkage. See that operating linkage moves freely and does not bind. Check connecting rod clearance or backlash with choke valve in closed and wide open positions. With automatic choke lever in uppermost position and choke valve closed, backlash in connecting rod should be not more than .006". Adjust by shifting position of choke valve lever on choke valve shaft.



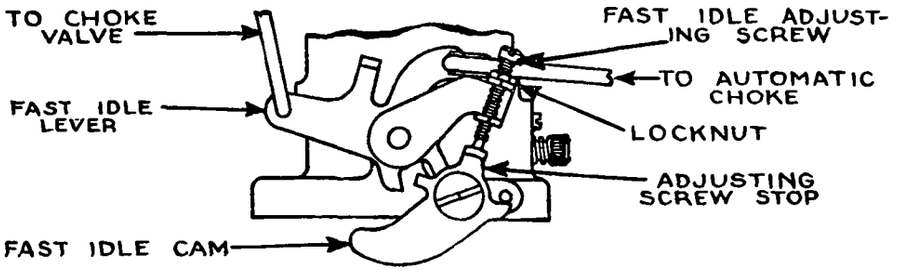
Lever Height. The height of the choke lever should be checked with the choke in the closed position. Center of hole in end of lever should be 2 25/64" plus or minus 1/64" above the lower face of the mounting flange. To adjust, loosen clamp screw which holds choke link and lever on shaft within choke case and shift position of lever. Tighten clamp screw after making adjustment.

Thermostatic Spring. Thermostatic spring must be at exactly 70°F. when this check is made. If engine has been running, allow car to stand until it has cooled off to 70°, or if engine temperature is under 70°, allow choke to come up to room temperature before testing. Remove thermostatic spring hook from prong on thermostat case. Revolve thermostat case until '0' mark of calibration is opposite pointer. In this position thermostatic spring hook should be flush with the prong on the case (with thermostat at 70°F.). To adjust, loosen setscrew which clamps choke link and lever on thermostatic spring shaft (within choke case), rotate thermostat shaft until hook is flush with prong, tighten setscrew. Check to see that thermostatic coil does not rub against case. Then reset choke as directed below.

Vacuum Piston. If automatic choke is removed from engine manifold, see that gasket between base and manifold is in good condition and tighten attaching screws evenly and firmly. An air leak at this point will interfere with the choke action.

Locking Action. To check locking action (cranking position with choke valve closed), revolve spring case so that setting is 27 notches rich. Locking action should break loose (lever move from its position against adjusting screw) when a force of ¾-1¼ lbs. is applied at outer end of choke operating lever. Adjust by turning adjusting screw (marked 'Do not change' in illustration) in or out. Choke must then be reset as directed below.

SETTING:—To set automatic choke, revolve the spring case the correct number of divisions on the scale rich or lean as directed for each car model. Correct setting for Oldsmobile L-34 is 3 notches rich.



STROMBERG FAST IDLE

Std. Equipment On:
PACKARD TWELVE, 1207,8('35), 1407,8('36), 1506,7('37), 1606,7('38), 1707,8('39)

DESCRIPTION & OPERATION:—*Consists of a fast idle cam on the carburetor* casting below the throttle shaft which serves as a stop for the special fast idle adjusting screw on the throttle lever. Fast idle cam is controlled by fast idle lever linked to choke valve and is rotated to fast idle position when the choke is closed for cold starting (throttle must be opened momentarily to allow choke to close and fast idle to operate). In the fast idle position (see illustration), the fast idle screw rests on the ear of the fast idle cam. When the choke valve opens with the engine warm, the fast idle cam is released by the fast idle lever and falls of its own weight so that the ear is rotated past the fast idle screw. The throttle valve then closes to the hot or slow idle position (controlled by the throttle stopscrew on the opposite end of the throttle shaft).

ADJUSTMENT:—If adjustment is made with engine hot, throttle should be opened momentarily and fast idle cam rotated so that fast idle screw is directly over ear on cam. Hold fast idle cam in this position while adjusting. Back off throttle stopscrew (slow idle speed adjusting screw) until throttle valve is completely closed, loosen locknut on fast idle adjusting screw, turn this screw in until it just contacts ear on fast idle cam, then turn screw in an additional 6¾ turns, tighten locknut. Readjust throttle stopscrew for correct hot or slow idle speed.

STROMBERG AUTOMATIC CHOKE

Car Model and Year	Carburetor
La Salle Model 350, Series 50 (1934-35)	EE-23
Oldsmobile Model F-34 (1934)	EX-23
Studebaker Dict. A (1934)	UR-23
Studebaker Comm. B (1934)	E-33

DESCRIPTION:—Similar to previous designs except that units located differently and a fast idle cam is built in choke on carburetor. Fast idle stop screw on the throttle valve lever rests on this cam, and the cam is rotated to this high idle position when the choke valve is closed by the automatic choke. The operation of the vacuum piston when the engine begins to fire opens the choke valve slightly and also rotates the high idle cam so that the stop screw rests on the second step or intermediate idle position. Finally when the choke valve is entirely open, the cam is revolved so that the stop screw drops off to the slow idle or flat portion of the cam and the idling speed is then controlled by the throttle stop screw.

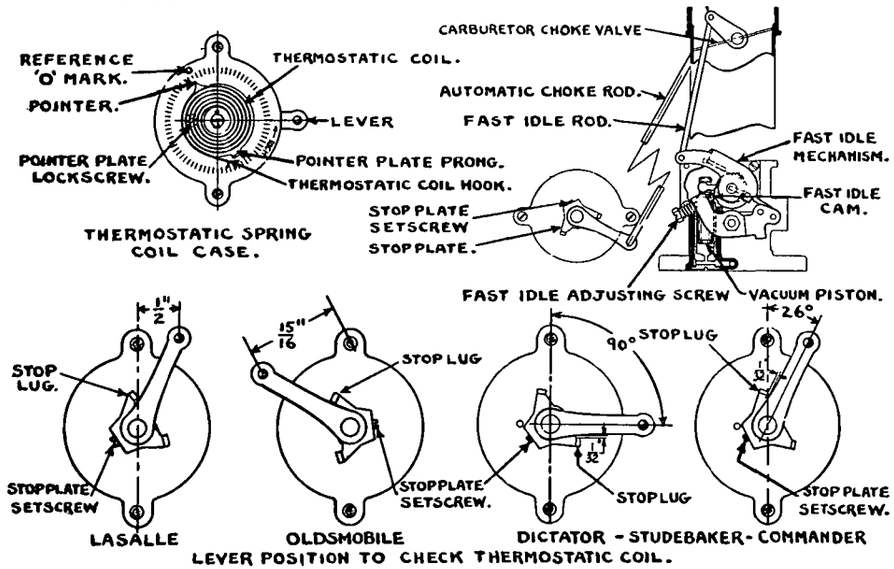
OPERATION:—The thermostatic spring coil on the exhaust manifold or exhaust pipe is linked directly with the choke valve lever through a connecting rod and is designed to close the choke valve completely at a temperature of 70° (engine not running). When the throttle is opened for starting, the high idle cam will be revolved to the high idle position, holding the throttle partly open, providing a high idling speed. When the engine begins to fire, the vacuum piston in the carburetor body will be drawn up (updraft carburetors) or down (downdraft carburetors) so that the choke valve is opened partly and the high idle cam is revolved to the intermediate idle position. As the engine temperature increases, the tension of the thermostatic spring coil decreases, allowing the off-center mounted choke valve to open. At an engine temperature of 120°, the choke valve should be wide open.

ADJUSTMENT:—High Idle Speed. The throttle stop screw should first be adjusted for correct hot or slow idle speed. To make this adjustment, engine must be thoroughly warm so that the choke valve is wide open and high idle cam is revolved to slow idle position so that throttle stop screw is operative. Adjust throttle stop screw so that idling speed is 6 M.P.H. on La Salle, 8 M.P.H. on Studebaker Dictator and Commander, and 6 M.P.H. on Oldsmobile (on Oldsmobile, throttle stop screw and high idle adjusting screw are the same so this is the only adjustment necessary). Then adjust high idle speed as follows:

La Salle 350. Turn high idle adjusting screw until it makes contact with the low or small diameter step on the high idle cam, then back off screw about ½ turn until clearance between screw and cam is .010". Use a feeler gauge to check this setting. Choke valve must be open when adjustment is made.

Studebaker Dictator and Commander. Insert a feeler gauge .034" (Dictator) or .060" (Commander) between the low idle screw (throttle stop screw) and the carburetor body. Open throttle, rotate high idle cam so that high idle adjusting screw rests on largest step or high idle portion of cam, close throttle, turn high idle adjusting screw in or out until it has a slight drag on the cam. This adjustment can also be made without using a feeler gauge by first turning the low idle screw (throttle stop screw in one turn (Dictator) or 1⅝ turn (Commander) from the correct or 8 M.P.H. position and then adjusting the high idle screw as directed above. In this case it will be necessary to reset the low idling speed by turning the stop screw out one turn (Dictator), or 1⅝ turns (Commander), after adjustment is completed.

TO CHECK OR ADJUST THERMOSTATIC COIL:—Disconnect operating rod and remove thermostatic coil assembly from position on manifold. Check position of operating lever as follows:



La Salle Model 350. With lever held in closed choke position (lever pointing up and to right of vertical line through mounting screw holes) and against upper lug or stop on thermostat case hub, the distance between the center of the upper mounting screw hole and center of lever connecting hole (outer end of lever) should be ½". To adjust, with lever held in correct position, loosen set screw in hub, rotate hub until lug is against lever, tighten set screw. This is a preliminary adjustment for thermostatic coil testing. After testing, the stop lug should be adjusted so that clearance is not more than 1/32" with choke valve closed.

Studebaker Dictator. Hold lever in closed choke position at right angles (90°) to right of vertical line through mounting screw holes, check clearance between lever and lower lug or stop on thermostat case hub. This clearance must be exactly 1/32". Adjust by loosening set screw in hub and rotating hub

Studebaker Commander. Hold lever in closed choke position. Lever should be 26° to right of vertical line through mounting screw holes and pointing upward. Check clearance between lever and upper stop or lug on thermostat case hub. Adjust by loosening set screw in hub and rotating hub.

Oldsmobile F-34. Hold lever in closed choke position. Center of hole in outward end of lever should be 15/16" from center of upper mounting screw hole. Loosen set screw in thermostat case hub, rotate hub until the upper lug or stop on the hub is against the lever, tighten set screw. This is a preliminary setting for testing of thermostatic coil. After testing is completed, adjust hub so that clearance between lever and lug is 1/32" with choke valve closed.

Thermostatic Coil Test:—See that thermostat temperature is exactly 70° (allow thermostat to stand until it comes up to room temperature (70°), check temperature with a thermometer placed adjacent to thermostat coil. When temperature is correct, unhook end of thermostat coil from prong on thermostat case, loosen pointer plate lock screw, rotate pointer plate until pointer is directly opposite '0' on scale, check position of thermostat coil hook. Hook

LEVER POSITION TO CHECK THERMOSTATIC COIL.

should be flush with the prong on the thermostat case. If hook is flush with the prong, thermostat coil tension is correct and thermostat can be reset and replaced on engine (see below).

If the above check indicates that thermostatic coil has taken on a permanent set and that original '0' position is incorrect, this can be corrected by locating a new '0' mark as follows (if coil has been deformed by rough handling, it should be replaced). Loosen pointer plate lock screw, revolve pointer plate until the thermostatic coil hook is flush with the hook on the case. Tighten lock screw, mark case with a new '0' opposite the pointer, obliterate the old '0' mark. This establishes a new reference point and thermostatic coil can then be reset and reinstalled on engine.

Setting Thermostatic Coil:—Correct settings for these car models are as follows:

Car Model	Thermostatic Coil Setting
La Salle 350	12 notches rich
Studebaker Dictator, Model A	3 notches rich
Studebaker Commander, Model B	11 notches rich
Oldsmobile, Model F-34	15 notches rich

To set the thermostatic coil, loosen pointer plate lock screw, revolve pointer plate the correct number of notches rich or lean, tighten lock screw. Install thermostat on manifold, connect choke lever operating rod, with choke lever closed, see that clearance between thermostat lever and stop lug on hub is 1/32" (it will be necessary to set this clearance on La Salle and Oldsmobile—see above).

DESCRIPTION:—This type Automatic Choke and Fast Idle is similar in design to the type used previously on these carburetor models. Used as standard equipment on the following car models.

Car Model	Year	Carburetor Type
Graham Model 73	1935	EX-23
La Salle 350 Series 50	1935	EE-23
Packard 1200, 1, 2, 3, 4, 5	1935	EE-23
Packard 1400, 1, 2, 3, 4, 5	1936	EE-23
Packard Super 8, All Models	1937-38-39	EE-23
Studebaker Dictator 1A, 2A	1935	EX-23
Studebaker Dictator 3A, 4A	1936	EX-23
Studebaker Dictator 5A, 6A	1937	EX-23

OPERATION:—The thermostatic spring coil lever is linked directly to the choke valve lever by a rod. A second rod links the choke valve lever with the fast idle cam so that the cam is rotated as the choke valve opens and closes. The thermostatic spring is designed to completely close the choke valve at 70°F. This action does not take place until the throttle valve is opened to the 20 M.P.H. position, lifting the fast idle screw off the low or hot idle portion of the cam and allowing the cam to be rotated to the fast idle position as the choke valve closes. Choke valve is offset and is not locked in position while the engine is being cranked. As soon as the engine begins to fire and vacuum is built up in the manifold, the vacuum piston is drawn down, opening the choke valve slightly and rotating the fast idle cam to the second or intermediate idle position. As the engine warms up, the tension of the thermostatic spring decreases, allowing the offset choke valve to open fully and rotate the fast idle cam to the low or hot idling position.

Choke Opening to Correct Flooding—The choke valve can be opened manually to correct a flooded carburetor by opening the throttle valve wide open. In this position the cam on the end of the throttle lever contacts the ear on the fast idle lever, rotating the lever and opening the choke valve.

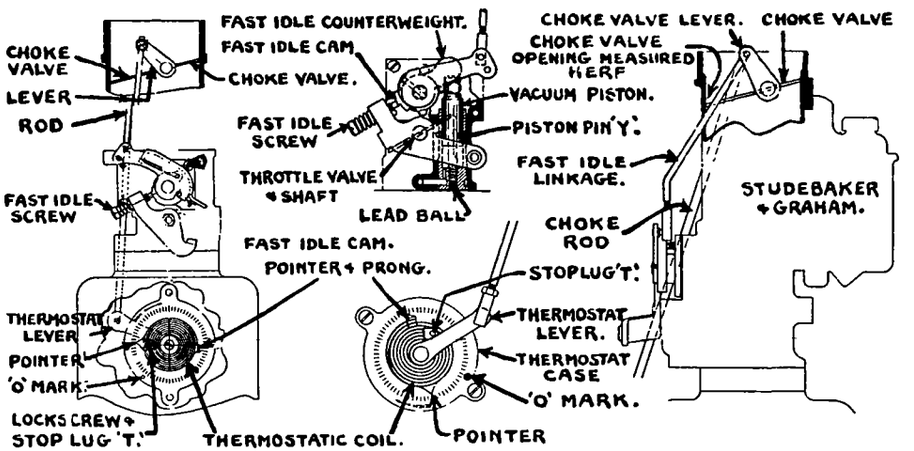
ADJUSTMENT:—**Slow Idle Screw.** The hot or slow idling speed is controlled by the throttle stopscrew (see Carburetor Adjustment). This adjustment should be made only when the engine is warm with the fast idle screw resting on the low or slow idle portion of the fast idle cam. Standard settings for these models are given below. Setting indicates number of turns of the screw past the closed throttle position.

Car Model	Carburetor	Slow Idle Screw Setting
Graham	EX-23	1 turn
La Salle	EE-23	½ turn
Packard (all models)	EE-23	½ turn
Studebaker (all models)	EX-23	¾ turn

Fast Idle Screw. On some models a separate screw is used to control the fast idle speed. This screw should be set at ½ turn or .010" clearance between screw and low idle (small diameter) step of fast idle cam with throttle valve closed on La Salle.

Fast Idle Screw (Packard Models). Back off throttle stopscrew (hot or slow idle speed adjustment) so that throttle closes tightly, hold choke valve closed so that fast idle cam is rotated to fast idle position (open throttle momentarily to permit this rotation), turn fast idle screw in until it just contacts the fast idle cam, then turn screw in additional 2½-3 turns. This will provide throttle opening of .016-.020".

Choke Rod Linkage. The rod connecting the thermostatic spring coil lever and the choke valve lever should be adjusted so the choke valve is fully closed with approximately 1/32" clearance between thermostat lever and stop lug (T).



Fast Idle Linkage. The rod connecting the choke valve lever and the fast idle lever should be adjusted so that the choke valve is open 29/64" (EX-23), 5/16" (EE-23) with the vacuum piston down at the end of its stroke so that the fast idle screw rests on the middle step or intermediate idle position of the fast idle cam (see Vacuum Piston Servicing below). Choke valve opening should be checked on the long side of the valve (offset mounting) and can be measured by passing a drill rod of the correct size between the edge of the valve and the carburetor wall.

THERMOSTATIC SPRING:—To check the thermostatic spring, remove unit from manifold, allow unit to stand until it has cooled off or warmed up to room temperature (70°F). Temperature can be checked with an accurate thermometer held near the thermostat. Tests should be made at 70° as thermostat spring changes one notch for each 5° above or below 70°. Unhook end of thermostat coil from prong on pointer plate, loosen pointer plate lockscrew (T), revolve pointer until it is opposite '0' on scale, see that lever is against stop lug (T), note position of thermostat spring hook. If hook is flush with prong, thermostatic spring tension is correct and can be reset as directed below. If hook is not flush with prong, indicating that thermostat has a permanent 'set', thermostatic coil should be recalibrated (see Servicing paragraph below). Thermostatic coils which have been deformed by rough handling should be replaced.

Car Model	Carburetor Model	Thermostat Setting
Graham Model 73	EX-23	17 notches rich
La Salle Model 50	EE-23	6 notches rich
Packard (all models)	EE-23	10 Notches Rich
Studebaker Dictator	EX-23	10 notches rich
Studebaker Dict. '37	EX-23	See Note

NOTE—**Packard Models.** Setting may be varied 3 notches in either direction from the '0' mark which indicates the standard setting if the engine runs rich or lean during the warming up period. Replace thermostatic coil if this variation does not give satisfactory performance.

Studebaker Models. The thermostat case is stamped 'R', 'M' and 'H'. Setting for standard gasolines is at 'R' (7 notches rich). If engine loads up when cold with this setting, 'M' (4 notches rich) should be used. Setting 'H' (at zero) should be used only for highly volatile gasoline.

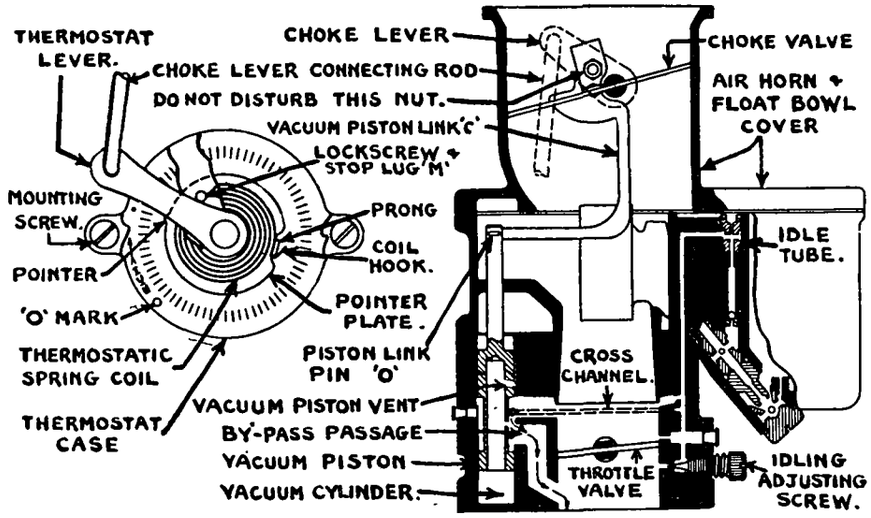
SERVICING:—**Recalibrating Thermostatic Coil.** If thermostatic coil hook is not flush with prong at 70°F with pointer set at '0' on scale and lever against stop, loosen pointer plate lockscrew (T), revolve pointer plate and prong until prong and hook are flush, tighten lockscrew, stamp a new '0' mark on the case opposite the pointer. Obliterate the old '0' mark and proceed with the setting, using the new '0' mark as the reference point.

Vacuum Piston. Vacuum piston stroke is regulated by pin (Y) mounted on vacuum piston sleeve within the piston. If pin or sleeve are replaced, piston stroke should be regulated by turning pin up or down until choke valve opening (measured on the long side of the valve is 29/64" (EX-23), 5/16" (EE-23) with the piston down against the pin. The pin setting should be sealed by a lead ball inserted in the pin hole below the pin. See Fast Idle Linkage adjustment above.

STROMBERG AUTOMATIC CHOKE

This type automatic choke and fast idle used on the following cars:

Car Model	Carburetor
Graham Eight, Model 72 (1935)	EE-14
Packard '120', 120 ('35), 120B ('36), 120C ('37)	EE-14
Packard Eight, Model 1601, 1A, 2 (1938)	EE-14



DESCRIPTION:—This type Automatic Choke and Fast Idle employs a thermostatic spring coil mounted on the manifold and a vacuum piston built in the throttle valve body. The Fast Idle consists of a fuel channel and by-pass passage around the throttle valve controlled by the vacuum piston. The entire fast idle mechanism is located within the carburetor body and no adjustment is required.

NOTE—Whenever the carburetor is disassembled or the air horn and float bowl cover is removed, first take out the cover screws, then lift top assembly straight up until pin (O) in upper end of vacuum piston stem is flush with the top of the casting, take out pin and lift off the top assembly. The nut on the screw connecting the vacuum piston link and the choke valve should not be disturbed. This is properly set at the factory.

OPERATION:—Thermostatic spring coil lever is linked directly to choke valve lever and is designed to completely close the choke valve at 70°F. Choke valve is offset and is not locked while the engine is being cranked. The vacuum piston is linked to the choke valve through the arm (C) so that the piston will be lifted to the top of its stroke when the choke valve is closed, uncovering the fuel cross-channel and opening the by-pass passage. The increased fuel discharge through this by-pass passage provides the fast idle with closed throttle. When the engine begins to fire, the vacuum built up in the manifold pulls the vacuum piston down (part stroke only) until the air vent in the piston is uncovered, relieving the vacuum and stopping the piston. In this position the choke valve is opened slightly but the by-pass and fuel channel remain open so that the fast idle remains operative during the warming up period. As the engine warms up, the thermostatic spring tension decreases, allowing the choke valve to open and the vacuum piston to complete its stroke, closing off the fuel channel and by-pass passage. The engine then idles at the hot or slow idling speed controlled by the throttle valve stopscrew and fuel is supplied by the regular idling system.

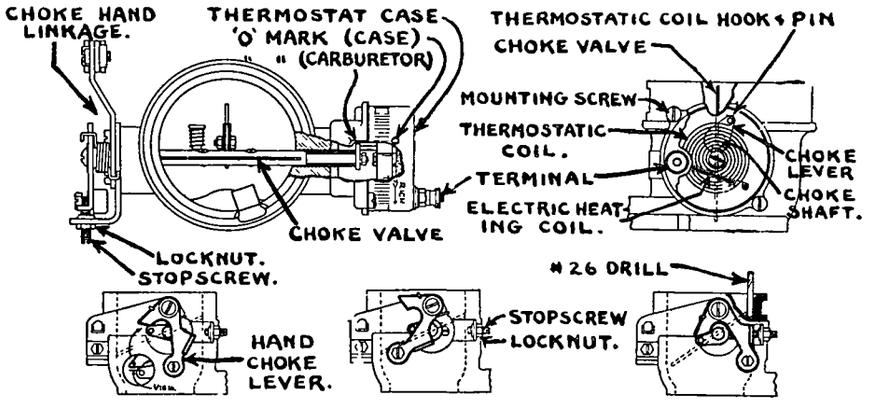
ADJUSTMENT:—Thermostatic Coil. To check thermostatic coil, remove unit from manifold, allow unit to stand until it has cooled off or come up to room temperature (70°F). All tests should be made at 70° as thermostat changes 1 notch for each 5° above or below 70°. Unhook end of thermostat coil from prong, loosen pointer plate lockscrew (M—this is also the lever stop lug), rotate pointer until it is opposite '0' mark on scale, see that lever is against stop lug (M), note position of thermostat coil hook. If hook is flush with prong, thermostatic coil tension is correct and unit can be reset as directed below. If hook is not flush with prong (indicating that coil has a permanent 'set'), thermostatic coil should be recalibrated as directed below. Coils which have been deformed by rough handling should be replaced.

Recalibrating Thermostatic Coil—If the thermostatic coil hook is not flush with the prong in the above test, loosen pointer plate lockscrew (M) and revolve pointer plate until prong is flush with hook, tighten lockscrew, stamp a new mark '0' mark on the case opposite the pointer, obliterate the old '0' mark, proceed with the setting, using the new '0' mark as the reference point.

Setting:—After completing test above, engage coil hook on prong, revolve pointer to rich or lean side of scale the correct number of notches for each car model as indicated in table below, tighten lockscrew (M), replace unit on manifold, connect choke valve rod, adjust rod so that choke valve is fully closed with thermostatic spring coil lever against stop (M).

Car Model	Carburetor Model	Thermostat Setting
Graham Model 72	EE-14	15 notches rich
Packard (all models)	EE-14	11 notches rich

NOTE—On Packard models, setting may be varied 5 notches in either direction from the 'O' mark which indicates the standard setting if the engine runs rich or lean during the warming up period. Replace thermostatic coil if this variation does not give satisfactory performance.



Car Model	Year	Carburetor
Cadillac V8, 36-60, 70, 75	**1936**	**EE-25**
Cadillac V8, 37-60, 65, 70, 75	**1937**	**AA-25**
Cadillac V8, 38-60, 60S, 65, 75	**1938**	**AAV-25**
Cord 810, 812	**1936-37**	**EE-15**
Cord Supercharged 812	**1937**	**AA-25**
La Salle 35-50, 36-50	**1935-36**	**EE-15**
La Salle 37-50 (first cars)	**1937**	**AA-25**

DESCRIPTION:—This type Automatic Choke consists of a thermostatic spring coil mounted on the carburetor and engaged directly with the choke valve shaft. An electric heating coil within the choke case and controlled by the ignition switch (turned on when ignition turned on to start engine) is used to warm up the thermostatic coil at a pre-determined rate irrespective of the exhaust manifold temperature.

Vacuum piston and fast idle mechanism (fuel channel and by-pass passage controlled by vacuum piston) design and operation is entirely similar to that used on Model EE-14 carburetors (see previous article).

THERMOSTATIC COIL ADJUSTMENT:—Thermostatic coil is designed to completely close choke valve at 70°F. and all tests should be made at this temperature (thermostat changes 1 notch for each 5° above or below 70°). To check thermostatic coil, remove thermostat case from carburetor, allow it to stand until it cools off or comes up to 70°, check position of thermostatic coil hook. The inside of the hook should be in line with the '0' mark on the case. If the hook is not in line with the '0' mark (this may be caused by coil taking on permanent set, installation of new coil or other new parts, etc.), stamp a new '0' mark on the case opposite the hook, obliterate the old '0' mark. In replacing thermostat case on carburetor, engage thermostatic coil hook with pin on choke valve lever, line up '0' marks on thermostat case and carburetor, then revolve thermostat toward rich side of scale the correct number of notches as shown below.

Car Model	Carburetor	Thermostat Setting
Cadillac (all models)	EE-25	16 Notches Rich.
Cadillac (all models)	AA-25	17 Notches Rich.
Cadillac (all models)	AAV-25	15 Notches Rich.
Cord	EE-15	17 Notches Rich.
Cord (Supercharged)	AA-25	17 Notches Rich.
La Salle (all models)	EE-15, AA-25	17 Notches Rich.

Cadillac Triple Range Choke Control on EE-15, EE-25 Carburetors.

CADILLAC 'TRIPLE RANGE' CHOKE CONTROL

NOTE:—This manual choke control used only on Model EE-25 Carburetor on Cadillac Models 60, 70, 75 (1936) and EE-15 Carburetor on LaSalle Models 35-50, 36-50 (1935-36). Not used on other Cadillac models (AA-25, AAV-25 Carburetors) or on Cord EE-15 carburetor.

MANUAL CONTROL:—The choke control button on the instrument panel has three operating positions, as follows:

1. Normal or Automatic Choke Position. Choke control button in middle position or flush with throttle button. Automatic choke is free to operate.

2. Manual Choke Position. Choke control button pulled out. Carburetor is choked by hand independently of any Automatic Choke action.

3. Partial Choke Position. Choke control button pushed in beyond the normal or flush position. Choke valve is held partially open.

Manual choke control linkage and choke valve lever stopscrew should be adjusted to secure choke operation as outlined above. Make adjustments as follows:

Stopscrew Adjustment—Open choke valve .147" or close choke valve on #26 drill placed between edge of choke valve on short side and carburetor wall. With choke valve in this position, loosen locknut on choke control operating lever adjusting screw and turn screw in or out until lever rests against screw with the cam or short leg of the 'V' shaped lever against the pin on the choke valve lever. Tighten the locknut. This adjustment provides the correct choke valve opening for #3 choke control button position

Linkage Adjustment—Place choke control button in normal position flush with throttle valve. With choke valve fully closed, adjust linkage to provide clearance of approximately 1/16" between the cam or short leg of the 'V' shaped choke control operating lever and the pin on the choke valve lever.

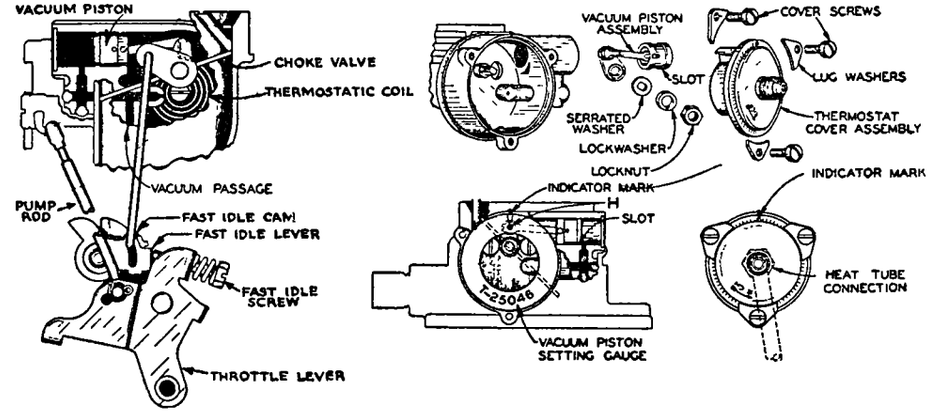
Std. Equipment On: Car Model	Carburetor Model
Buick Models 39-60, 80, 90 (1939)	AAV-26
Cadillac V8 Models 39-60S, 61, 75 (1939)	AAV-26
Packard '120' Eight Models 1701, 1A, 2 (1939)	EE-16

DESCRIPTION & OPERATION:—Thermostatic coil and vacuum piston type. Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam, but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).

Fast Idle:—Consists of a stepped cam linked to the choke valve. When choke valve closed for cold starting, cam is revolved so that fast idle screw (EE-16), throttle stopscrew (AAV-26) rests on highest step of cam and throttle valve is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.

ADJUSTMENT:—Thermostatic Coil Setting—Inverted 'V' mark or '0' mark on thermostatic coil housing should line up with reference mark on choke housing. This standard setting may be varied not more than 2 graduations (AAV-26) for use of high test fuel or with exceptional operating conditions. If warming up performance is not satisfactory with this setting, check choke valve and linkage for binding or replace thermostatic coil assembly. When installing thermostatic coil, place coil housing in position with coil hook down, then rotate housing in 'Rich' direction until correct setting secured (this will insure coil hook engaging prong properly).

CAUTION—When connecting heat tube, use extreme care not to use excessive pressure in tightening connection which may rotate thermosatic coil housing and change setting.



Fast Idle Speed—On Buick model, no separate fast idle screw used and fast idle speed will be correct if throttle stopscrew set for proper 7-8 M.P.H. hot or slow idle speed. On Cadillac (AAV-26) and Packard (EE-16) models, after throttle stopscrew set for correct hot or slow idle speed, turn fast idle screw in until it just contacts lowest step of fast idle cam (choke valve open), then turn screw out ½ turn which will provide correct clearance between screw and cam.

Fast Idle Setting—After setting both slow idle speed (throttle stopscrew adjustment), and fast idle speed (fast idle adjusting screw adjustment), see that choke valve is wide open and close throttle valve completely so that throttle stopscrew is against stop on body. Hold throttle valve in this position, close choke valve by hand as far as possible until fast idle screw strikes first step on fast idle cam (do not force choke valve beyond this position which may cause fast idle linkage to bind or distort fast idle cam spring), measure choke valve opening by inserting drill rod between choke valve edge and air horn wall. This distance should be 5/16" (Buick), .102" or #38 drill (Cadillac), 35/64" (Packard). Adjust by bending fast idle connector rod slightly.

Choke Release (Wide Open Throttle Adjustment)—Open throttle to wide open position so that choke valve is opened by ear on fast idle lever contacting lug on fast idle cam. Check choke valve opening with special gauge T-25057 (Buick), T-25056 (Cadillac) or by inserting drill rod between edge of choke valve and air horn wall. Opening should be .156-.187" (11/64" drill) on all models. Adjust by bending ear on fast idle lever slightly.

SERVICING:—Disassembly—Disconnect heat tube, remove carburetor from manifold, remove thermostatic coil housing attaching screws and lug washers, remove coil assembly. Remove locknut (use wrench T-25047) on end of choke valve shaft, remove nut, lockwasher, serrated washer (AAV-26 only) from shaft, take out vacuum piston assembly.

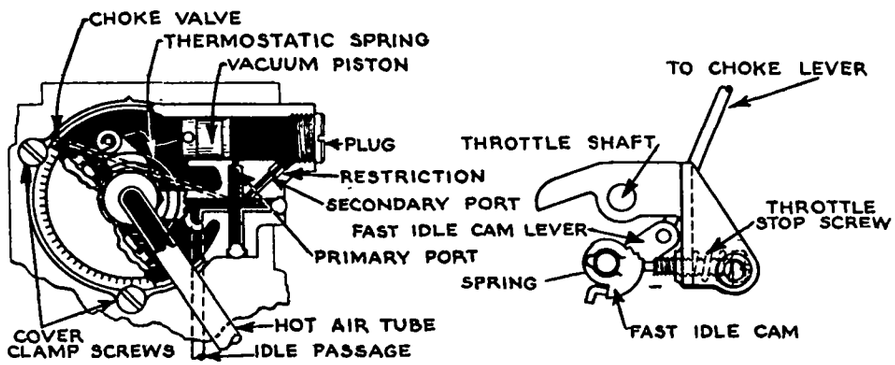
Servicing—Clean cylinder with cloth saturated with Acetone or alcohol, blow out all channels with air, clean screen on inside of cover by blowing through heat tube connection (use care not to distort screen. Do not attempt to remove thermostat coil (coil and cover serviced as an assembly).

Assembly & Adjustment—When installing vacuum piston, make certain that slot is down (toward vacuum port) on AAV-26 models. Do not lubricate cylinder. On AAV-26 models, assemble serrated washer, lockwasher, and locknut on shaft and tighten nut only loosely (do not tighten fully until vacuum piston adjusted). Install gauge ring, tool T-25046, with small hole in tool fitting over pin on choke lever and indicator line on rim of tool in line with reference mark on choke housing. Hold choke valve closed against #70 drill (.028") on Buick models, tool T-25057 or ¼" drill on Cadillac models, tighten locknut with wrench T-25047. Recheck choke valve opening to make certain that it was not changed while tightening nut. See that choke valve operates freely. NOTE—On Model EE-16 (Packard), vacuum piston lever is slotted and engages flatted portion of shaft so that above adjustment not required (lever can be installed in one position only). On AAV-26 models (with lever loose on shaft and positioned by serrated washer when nut is tightened), this adjustment important to properly position vacuum piston and thermostatic coil hook.

Used On:

Car Model	Carburetor
Studebaker Commander, 7A, 8A ('38), 9A ('39)	BXO-26
Studebaker President, 4C ('38), 5C ('39)	AAO-161

DESCRIPTION & OPERATION:—Thermostatic coil type. Thermostatic coil and vacuum piston mounted in housing on carburetor air horn and linked directly to choke valve shaft without external linkage. Vacuum passage (for vacuum piston operation) drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermosatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermosatic coil winds up and tends to close choke valve (on Model BXO-26, throttle must be opened momentarily to free fast idle cam before this choke valve closing can occur). As soon as engine begins to fire, vacuum piston is pulled into cylinder and choke valve is opened slightly to prevent overchoking (with choke valve fully closed, both primary and secondary vacuum ports are open, as soon as piston moves slightly, primary port is cut off and vacuum is regulated by restriction in secondary port passage). As the engine warms up, thermostatic coil unwinds allowing the offset choke valve to open so that at normal running temperature the valve is wide open.



Fast Idle (Model BXO-26):—Consists of a spring-loaded fast idle cam and lever linked to the choke valve shaft and serving as the stop for the throttle stopscrew. With choke valve fully closed, fast idle cam is rotated so that the highest step of the cam is under the stopscrew and the throttle is held open in the fast idle position. As the choke valve opens, the cam is rotated so that successively smaller steps on the cam pass under the stopscrew, providing less throttle opening. At normal running temperatures (with choke valve wide open) throttle stopscrew rests on lowest step of fast idle cam providing the normal hot or slow idle speed. No adjustment is required, but stopscrew should rest on highest step of cam when choke valve is fully closed.

Model AAO-161. Fast idle on this model consists of a by-pass passage around the throttle valve controlled by the vacuum piston (see Carburetor article in Carburetor Section for illustration). Entire fast idle mechanism is within carburetor and requires no attention.

ADJUSTMENT:—Thermostat case marked with three settings 'H', 'M', 'R' on outer rim. To adjust, loosen mounting screws on edge of case, rotate case until mark 'R' lines up with highest projection on housing flange, tighten screws (standard setting). If engine tends to load up or over-choke while warming up with this setting, rotate case to 'M' position. Use 'H' setting only when highly volatile fuels used continuously.

Thermostat Checking (Model BXO-26):—With cover and thermostatic coil assembly removed, make certain that assembly is at exactly 70°F. (immerse assembly in pan of water at 70°F. for at least ten minutes), mark the cover flange in line with the center of the thermostatic coil hook. 'H' mark on cover should be two graduations, 'M' mark four graduations, 'R' mark six graduations from this reference mark.

Model AAO-161. This type must be checked on the carburetor. Immerse cover and thermostatic coil in water of 70°F. temperature for at least 10 minutes, see that air horn on carburetor is at 70°F., install thermostat on housing and see that hook engages choke valve lever, rotate cover until choke valve just closes. In this position, mark 'R' on cover should be approximately in line with projection on housing flange.

①—Cars with Swinging Windshield. ②—Optional Equipment.

These Pumps same design as used on previous car models (except AX).

PERFORMANCE:—Capacity & Pressure specifications for all models shown in tables below. See 'Fuel Pump Testing' in Carburetion Equipment Section of manual for complete testing instructions on all pump models.

Pump Capacity (Minimum)

Pump Model	Minimum Capacity
E, R, T, W, AD, AF, AS, AT	1 Pint in 1 Minute
AH, AJ, AK, AU, AW, AX	1 Pint in 45 Seconds

Pump Pressure (Maximum)

Pump Model	Maximum Pressure
E, R, T, W, AD	3½ lbs.
AF	3 lbs.
AH, AW	3¾ lbs.
AJ	4 lbs.
AS, AT	4¼ lbs.
AK, AU	4½ lbs.
AX	4¾ lbs.

Pontiac Note—Pressure on Type AH & AJ pumps on Pontiac cars should be 3-3¾ lbs. (1937-38 models), 4-5 lbs. (1939-40 models).

SERVICING & TROUBLE SHOOTING:—All data and service instructions same as for pumps of same type as used on previous car models (except AW & AX new types—see below). ***See articles on each Pump Type and on Fuel Pump Trouble Shooting in Carburetion Equipment Section of manual (or previous Supplements) and note new data as follows:***

TYPE AW

Number — Used On:

1523869—CHRYSLER 8, MODELS C23, C24 (1939); C26, C27 (1940)

DESCRIPTION:—This fuel pump same design as Type AH except for different mounting studs, air dome, and curled hair air cleaner.

PERFORMANCE:—See article on Fuel Pump Testing (in manual) for data.

SERVICING:—See article on Type AH Fuel Pump for complete instructions.

TYPE AX

Number — Used On:

1537088—CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)
LA SALLE V8, SERIES 40-50, 52 (1940)

DESCRIPTION:—This combination fuel-and-vacuum is same design as Type AB except that it is fitted with a Type AA combination fuel cover.

PERFORMANCE:—See article on Fuel Pump Testing (in manual) for data.

SERVICING:—See article on Type AB combination fuel-and-vacuum pump for all data except for fuel cover for which see article on Type AA pump.

1940 CHRYSLER FAST IDLE

Car Model	Carburetor	Automatic Choke
Chrysler 8, C26, C27 (1940)	Stromberg AAV-2	Sisson AC-600

NOTE:—This carburetor and fast idle is used on conjunction with a separately mounted automatic choke, Sisson Model AC-600. See Sisson Automatic Choke article for data on this unit.

DESCRIPTION & OPERATION:—Fast Idle—Consists of a stepped fast idle cam and a fast idle lever pivoted directly above the throttle valve shaft and linked to the choke valve lever. Fast idle cam serves as the stop for the throttle stopscrew. When the choke valve is closed for cold starting, fast idle cam is rotated so that the stopscrew rests on the highest step of the cam and the throttle valve is opened to the fast idle position. As the engine warms up and the choke valve opens, fast idle cam is allowed to drop down and throttle valve to close progressively until, when the choke valve is wide open, the throttle is closed to the hot or slow idle position with the stopscrew resting on the lowest step of the cam.

Unloader or Choke Release—Consists of an ear on the throttle lever which strikes an extended arm on the fast idle lever when the throttle is opened wide so that the choke valve is opened somewhat to correct flooding caused by over-choking.

SETTING & ADJUSTMENT:—Fast Idle—To check setting, close throttle valve so that stopscrew is against first step of fast idle cam. Move choke valve toward closed position as far as possible (do not force valve beyond point where stopscrew strikes edge of next step on fast idle cam). Choke valve opening in this position should be ⅛" (check by inserting ⅛" drill rod between edge of valve and air horn wall). Adjust by loosening locknut and changing position of ball joint on lower end of connector rod.

Choke Release—To check setting, open throttle valve wide, note choke valve opening by inserting drill rod between edge of valve and air horn wall. Opening should be 7/32". Adjust by bending arm on fast idle cam lever slightly.

1940 SISSON AUTOMATIC CHOKE

Car Model	Carburetor	Sisson Choke Model
Chrysler C25 (1940)	Carter (B&B) E6S1, 2	AC-758B
Chrysler C26, C27 (1940)	Stromberg AAV-2	AC-600
De Soto S7 (1940)	Carter (B&B) E6N2, 3	AC-758B
Dodge D14, D17 (1940)	Stromberg BXV-3	AC-758B
Plymouth P9, P10 (1940) Optl.	Carter (B&B) D6C2	AC-758B

These Chokes same design as used on corresponding 1939 car models.

ADJUSTMENT:—Model AC758B—Remove air cleaner, open throttle approximately ¼. Move choke lever until hole in automatic choke shaft (opposite end from lever) lines up with slot in bearings, insert special tool, Sisson No. C-723, through hole in shaft and push tool down so that lower end engages slot in choke base mounting flange. Loosen clampscrew on choke lever, press up on lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool.

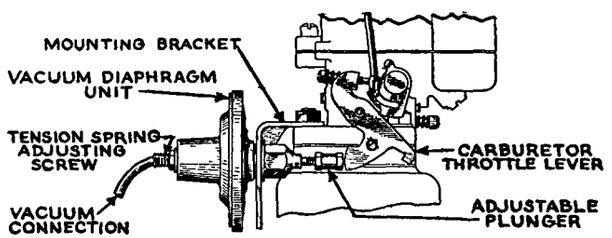
Model AC-600—Remove air cleaner, open throttle approximately ¼, take off automatic choke cover. Clamp special adjusting tool, Sisson No. AC-620, in place on choke so that end of tool enters and lines up hole in armature and hole in magnet core, move flat bar on tool so that armature is locked tightly against magnet core. Loosen clampscrew on choke lever, move lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool and replace automatic choke cover.

CAUTION—When replacing air cleaner, make certain that clamp not tightened excessively which may cause choke valve to bind. See that choke valve does not bind or stick and that entire choke mechanism and fast idle linkage operate freely. Always check choke adjustment with throttle partly open. See car model 'T&E' page for Throttle-Cracker adjustment.

SERVICING & TROUBLE SHOOTING:—Same as for previous models. ***See Sisson Automatic Choke in Carburetion Equipment Section of manual for complete data.***

PACKARD TYPE

Used on following Models with Econo-Drive



PACKARD 6, '110' MODEL 1800 (1940)
PACKARD 8, '120' MODEL 1801, 1A (1940)
PACKARD SUPER 8, '160' MODELS 1803, 4, 5 (1940)
PACKARD CUSTOM SUPER 8, '180' MODELS 1806, 7, 8 (1940)

DESCRIPTION:—Throttle Guard is designed to prevent engine stalling in the range from 0 to 20 M.P.H. It consists of a vacuum diaphragm unit, similar to those used on distributors for vacuum spark control, mounted on the carburetor so that the diaphragm plunger actuates the throttle valve fast idle lever. Unit has adjusting screw and locknut on vacuum diaphragm spring boss (opposite end from actuating plunger).

OPERATION:—Throttle Guard cuts in at 4 MPH. when manifold vacuum decreases sufficiently so that spring within unit forces plunger out against throttle lever opening throttle and accelerating engine to prevent stalling. Throttle Guard kicks out at 9 MPH. when manifold vacuum increases sufficiently to retract plunger and allow throttle to close to regular 6 MPH hot or slow idle speed position.

ADJUSTMENT & TESTING:—**Note**—Make certain that carburetor correctly adjusted and set for 6 MPH. hot or slow idling speed before adjusting Throttle Guard.

Adjustment—Check clearance between outer end of throttle guard plunger and lug on throttle lever. This should be .060" (Six), .020" (Eight, Super Eight). Loosen locknut and turn tension spring and adjusting screw on outer face of throttle guard until distance from top of locknut to end of screw is 3/16" (Six, Eight), 7/32" (Super 8), tighten locknut. Check adjustment by road-testing the car.

Road Testing—See that Overdrive Control knob pushed in (Overdrive operative), allow car to coast in high gear (accelerator pedal released) and decrease car speed slowly by applying brakes. Throttle guard should cut in at 4 MPH. (slight movement of accelerator pedal will be noted) and bring car speed up to 9 MPH. (with brakes released) at which speed it should kick out. If cut in speed is above 4 MPH., decrease spring tension by turning adjusting screw out slightly; if cut in speed below 4 MPH., increase spring tension by turning screw in. If kick out speed is higher than 9 MPH., increase gap between diaphragm plunger and throttle lever (loosen locknut and turn plunger on rod); if kick out speed below 9 MPH., decrease gap.

CHRYSLER TYPE

Used on following Models with Fluid Drive:

CHRYSLER 8, C26 SARATOGA & NEW YORKER (1940)
CHRYSLER 8, C27 CROWN IMPERIAL (1940)

DESCRIPTION & OPERATION:—Throttle Guard is designed to prevent engine stalling when the accelerator pedal is released quickly. It consists of a plunger operating on a swivel block which is part of the accelerator linkage. Plunger is actuated by a spring-loaded vacuum diaphragm unit (similar to those used for vacuum spark control) connected to the engine manifold and having a relief valve at the point where it is connected to the Throttle Guard body. In normal operation, the throttle guard plunger follows the swivel in the linkage as the accelerator pedal is depressed (due to the vacuum unit spring pressure). When the accelerator pedal is released quickly, the increase in manifold vacuum acting with the throttle return spring pull offsets the vacuum unit spring pressure and the accelerator pedal return is retarded, the speed of the pedal return being controlled by the metered relief valve in the vacuum line.

SETTING:—With engine running at idle speed of 5 MPH. (5-7 MPH) in high gear on level road, throttle control plunger should just touch swivel block on throttle rod. Setting can be adjusted by loosening capscrews holding vacuum unit on throttle cross-shaft and rotating unit to proper position. Tighten capscrews after completing adjustment.

SERVICING:—**Assembly & Adjustment**—When installing throttle guard, see that carburetor adjusted for correct idle mixture and speed (smooth firing and idle speed of 5 MPH). With push pin removed, attach throttle guard and bracket so that bracket is horizontal and 1⅛" from end of tube. Hold choke valve open, close throttle so that stopscrew is against low step on fast idle cam (hot or slow idle speed position), insert stub pin setting tool, adjust nut on rear end of bell crank-to-carburetor rod so that slight drag secured on .010" feeler placed between swivel block and stub pin setting tool. Tighten locknut using extreme care not to disturb position of adjusting nut. Remove stub pin setting tool and install throttle guard push pin.

KING-SEELEY ELECTRIC GASOLINE GAUGE

1940 CAR MODEL TYPE:—King-Seeley Electric Gasoline Gauges installed on 1940 car models are similar to design used on previous cars except for new style Tank Unit as follows (Dash Unit design unchanged):

Style 'N' Tank Unit—Supersedes earlier Style 'O' units (for original equipment and replacement use). Can be identified by shorter body and more direct actuation of thermostatic arm contacts (long contact lever and cam design of earlier 'O' units not used).

TROUBLE SHOOTING & SERVICING:—All operations same as for previous type. *See 'King-Seeley Electric Type Gauges' in Carburetion Equipment Section of manual for complete instructions.*

1939 & EARLIER CAR MODEL REPLACEMENT UNITS:—Original Style 'O' Tank Unit has been superseded by new Style 'N' (see 1940 data above) and Style 'N' Tank Units only are furnished for service. King-Seeley Part Nos. for this new Tank Unit are given in table below for all car models.

Ford Note—Ford Part No. given for Ford, Lincoln, Lincoln-Zephyr, and Mercury models.

King-Seeley Replacement Tank Units

Car Model	New Part No.	Original Part No.
Ford Pass. Cars ('36-37-38-39)	01A-9275A	78-9275

Pontiac Torpedo 8, 40-29 (1940)	WDO 469-S
Studebaker President, 6C (1940)	WDO 409-S

PRODUCTION CHANGES:—**Nash-Lafayette 458-S**—New Climatic Control Assembly No. 6-334-S (supersedes 6-357-S) used on later cars for improved warming up performance. The new assembly has a new Thermostatic Coil & Housing Assembly No. 170K64S (supersedes 170B64S) which requires a different setting (see setting table below). This new assembly can be installed on early cars. When this change made by car dealers, new Hot Air Stove and Tube Assembly is also installed.

Pontiac Torpedo 8 469-S—New type Thermostatic Coil Assembly No. 170F16S (supersedes 170G16S) used on later cars for improved starting and warming up performance. These types may be identified by thermostatic coil number which is stamped on housing (Metering Rods also changed and carburetors with new rods marked '469-SM' for identification). NOTE—See setting table below for recommended change in setting on carburetors with first type thermostatic coil to correct complaints of hard starting and poor warming up performance.

THERMOSTATIC COIL SETTING:—On all models except those noted in table below, center index mark or notch on thermostatic coil housing should be lined up with mark on piston plate housing. On other models, thermostatic coil housing should be rotated clockwise (Rich), counter-clockwise (Lean), number of notches shown in the table below.

Adjustment—Loosen two mounting screws on rim of thermostatic coil housing, rotate coil and housing assembly, tighten mounting screws. NOTE—See Servicing data below for proper installation of thermostatic coil and housing assembly if taken off carburetor.

Car Model	Carburetor	Thermostatic Coil Setting
Buick 40, 50	440-S, 474-S	1 Notch Lean
Buick 60, 70, 80, 90	448-S	3 Notches Rich
Graham 107	473-S	1 Notch Rich
Graham 109	488-S	1 Notch Rich
Nash 4020	435-S	2 Notches Rich
Nash 4080	465-S	1 Notch Rich
Nash-Lafayette	458-S	See Note
Oldsmobile F & G-40	467-S Only	2 Notches Rich
Pontiac 6 & 8	462-S, 463-S	1 Notch Rich
Pontiac Torpedo 8	469-S	See Note
Studebaker Comm.	410-S	1 Notch Rich
Studebaker Pres.	409-S	1 Notch Rich
All Others		Centered

Nash-Lafayette 458-S Note—Carburetors with first Type 170B64S Thermostatic Coil assembly should be set 1 Notch Rich, later carburetors with new Type 170K64S Thermostatic Coil should be Centered.

Pontiac Torpedo 469-S Note—First carburetors with original Type 170G16S Thermostatic Coil assembly were set 1½ Notches Rich but this setting should be changed to 4 Notches Rich to correct hard starting and poor warming up performance complaints. Carburetors with later Type 170F16S Thermostatic Coil should be set 1½ Notches Rich.

NOTE—If performance not satisfactory with standard settings as given above, thermostatic coil can be rotated 1 notch clockwise to lean setting (if engine runs rich or has a tendency to load up), 1 Notch counter-clockwise to enrich setting (if engine runs lean during warming up period). Adjustments should always be made with engine Cold (allow 4 hours for engine to cool off after being run), setting should be changed only 1 notch at a time, and performance should be checked while engine is warming up.

FAST IDLE, UNLOADER & CHOKE VALVE LOCK:—See separate articles on each Carburetor type in Supplement 'C' Section for adjustment directions and specifications.

SERVICING (SINGLE BARREL CARBURETOR TYPE):—**Disassembly**—Take out attaching screws, remove retainers on rim of piston housing plate, turn thermostatic coil housing clockwise to disengage coil hook from prong, remove thermostatic coil and housing assembly. Remove strainer screen. Take out choke valve retaining screws, remove valve. Loosen clampscrew on fast idle link and lever assembly, bend lip under screw with screwdriver so that it clears portion of choke valve shaft which is not flat, revolve choke valve shaft so that piston clears cylinder, withdraw choke shaft, piston, piston lever and link as an assembly. Do not remove three screws mounting piston plate housing on air horn (these parts line-reamed at factory). If piston plate housing has been removed, line up the three holes so that the choke valve shaft and piston work freely.

Servicing—Wash all parts except thermostatic coil and housing assembly and cork gaskets in clean gasoline. Clean thermostatic coil assembly and blow out all passages with air. Replace all worn or damaged parts, use new gaskets when reassembling.

Reassembly—Install choke shaft, piston lever, link, and piston in air horn and at the same time install choke lever, link, and screw assembly on shaft behind piston plate housing. Install choke valve using new screws and turning screws down loosely, close choke valve and tap valve lightly to centralize valve in air horn, then tighten valve screws securely. See that choke valve operates freely without binding in air horn. Tighten choke lever screw. Install strainer in piston plate housing (replace if dirty or clogged). Install thermostatic coil housing with reference mark or label at bottom, turn counter-clockwise until mark is at top and in line with mark on piston plate housing, tighten retaining screws. Check Thermostatic Coil Setting (above) and Unloader adjustment (see Carburetor article).

SERVICING (DUAL CARBURETOR TYPE):—**Disassembly**—Take out attaching screws, remove retainers on rim of piston plate housing, turn thermostatic coil housing clockwise to disengage coil hook from prong, remove thermostatic coil assembly. Remove screw holding choke trip lever (fast idle end of choke valve shaft), remove washer, trip lever, fast idle cam and collar assembly from shaft. Take out choke valve attaching screws, remove valve. Turn shaft counter-clockwise until piston clears cylinder, remove piston (flat type) pull shaft and lever assembly out of air horn (round type piston removed as part of shaft assembly—use care not to lose piston pin).

Servicing—Same as Single Barrel type (above).

Reassembly—Install choke shaft, lever, and piston assembly in air horn. Install choke valve using new screws and tapping valve lightly before screws tightened to centralize it in air horn bore. Check to see that valve operates freely and does not bind (valve should fall open of own weight). Install fast idle cam and collar assembly, washer, and trip lever on shaft, tighten mounting screw. Install piston housing strainer. Install thermostatic coil and housing assembly with reference notch at bottom, turn assembly counter-clockwise until notch is at top in line with reference mark on piston plate housing, tighten retaining screws. Check Thermostatic Coil setting (above), adjust Fast Idle, Unloader, and Lock (see Carburetor articles in 'C' Section for instructions).

INSTALLATION CAUTION:—Make certain that hot air flexible tubing connections are tight. Air leak at housing will interfere with correct Climatic Control operation. See that choke valve operates freely without binding at any point.

Std. Equipment On:

Car Model	Carburetor Model
Buick, Series 40-40, 50 (1940)	AAV-16
Buick, Series 40-60, 70, 80, 90 (1940)	AAV-26
Cadillac V8, Series 40-60S, 62, 72, 75 (1940)	AAV-26
Packard Six, '110' Model 1800 (1940)	BXOV-26
Packard Eight, '120' Models 1801, 1A (1940)	EE-16
Packard Super 8, '160' 1803,4,5; '180' 1806,7,8 (1940)	AAV-26
Studebaker Commander, Model 10A (1940)	BXO-26
Studebaker President, Model 6C (1940)	AAO-161

NOTE:—Studebaker Commander Changes—Vacuum piston linkage has been simplified and is now non-adjustable. A single #70 drill hole is located in the piston head to reduce fluttering.

Studebaker President Fast Idle & Changes—Fast idle consists of a piston located within the carburetor body and linked to the choke valve: This type is not adjustable. Choke has been changed from type used on 1939 cars by adding .076" reducer in thermostat heat suction pipe, thermostat spring is thinner, and vacuum piston hole in throttle body has been changed from #52 to #56 drill size. New thermostat spring and cover assembly is stamped '8' for identification.

DESCRIPTION & OPERATION:—Thermostatic coil and vacuum piston type. Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam, but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).

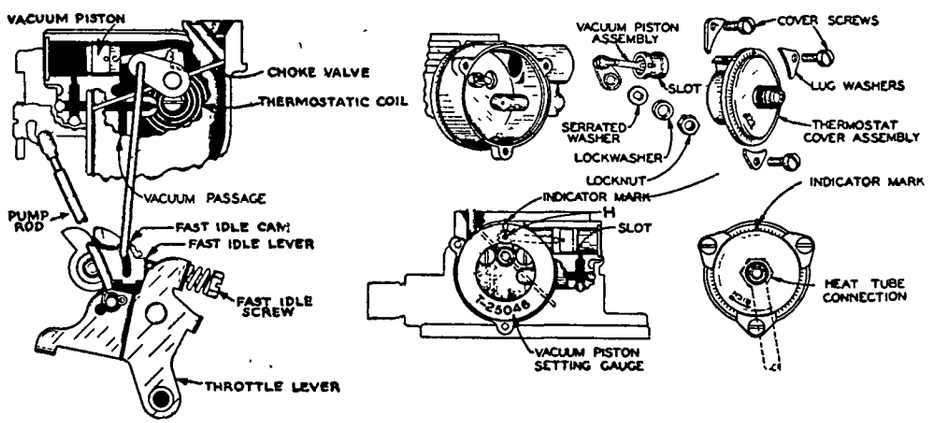
Fast Idle:—Consists of a stepped cam linked to the choke valve. When choke valve closed for cold starting, cam is revolved so that fast idle screw (EE-16), throttle stopscrew (others) rests on highest step of cam and throttle is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.

ADJUSTMENT:—Thermostatic Coil Setting—Inverted 'V' mark or '0' mark on thermostatic coil housing should line up with reference mark on choke housing. This standard setting may be varied not more than 2 graduations (AAV-26) for use of high test fuel or with exceptional operating conditions. If warming up performance is not satisfactory with this setting, check choke valve and linkage for binding or replace thermostatic coil assembly. When installing thermostatic coil, place coil housing in position with coil hook down, then rotate housing in 'Rich' direction until correct setting secured (this will insure coil hook engaging prong properly).

Studebaker Models—Choke housing on these models marked by three letters 'H', 'M', 'R'. To adjust, loosen mounting screws, rotate housing until 'R' mark lines up with reference projection on housing flange. This is standard setting. If engine tends to load up or over-choke, change setting to 'M' position. Use 'H' setting only when highly volatile fuels used.
CAUTION—When connecting heat tube, use extreme care not to use excessive pressure in tightening connection which may rotate thermosatic coil housing and change setting.

Fast Idle Speed (Packard EE-16 only)—On this model, after the throttle stopscrew set for correct hot or slow idle speed, turn fast idle screw in until it just contacts lowest step of fast idle cam (choke valve open), then turn screw out ½ turn which will provide correct clearance between screw and cam.

Fast Idle Setting—After setting both slow idle speed (throttle stopscrew adjustment), and fast idle speed (fast idle adjusting screw adjustment), see that choke valve is open, close throttle valve so that stopscrew is on high lobe of cam (AAV-26 except Buick for which see note below), or on first or low step of cam (BXO-26, BXOV-26), or with low speed screw against stop on body and high speed screw on low stem of fast idle cam (EE-16). Move choke valve toward closed position as far as possible (do not force beyond point where stopscrew strikes against next step on fast idle cam), measure remaining choke valve opening by inserting drill rod between edge of valve and air horn wall. Opening should be .102" or #38 drill (Cadillac AAV-26), 3/32" drill (Packard AAV-26), 35/64" (Packard EE-16), 11/32" drill (Studebaker BXO-26). Adjust by bending fast idle connector rod slightly.



Buick Models—To check fast idle setting on these models, close choke valve against #53 drill (between valve and wall), open and close throttle and note clearance between locking lever on throttle valve lever and lug on loose lever mounted on fast idle cam shaft. Lever should just clear lug. Adjust by bending fast idle connector rod slightly.

Choke Release (Wide Open Throttle Adjustment)—Open throttle to wide open position so that choke valve is opened by ear on fast idle lever contacting lug on fast idle cam. Check choke valve opening with special gauge T-25057 (Buick), T-25056 (Cadillac) or by inserting drill rod between edge of choke valve and air horn wall. Opening should be .156-.187" or 11/64" drill (AAV-16, AAV-26, EE-16), 11/32" (BXOV-26), 13/64"-14/64" (AAO-161). Adjust by bending ear on throttle lever or fast idle lever slightly.

EE-16 Caution—Throttle must be opened by pressing on throttle lever only on EE-16. Do not press on fast idle lever.

SERVICING:—Disassembly—Disconnect heat tube, remove carburetor from manifold, remove thermostatic coil housing attaching screws and lug washers, remove coil assembly. Remove locknut (use wrench T-25047) on end of choke valve shaft, remove nut, lockwasher, serrated washer (AAV-26 only) from shaft, take out vacuum piston assembly.

Servicing—Clean cylinder with cloth saturated with Acetone or alcohol, blow out all channels with air, clean screen on inside of cover by blowing through heat tube connection (use care not to distort screen. Do not attempt to remove thermostat coil (coil and cover serviced as an assembly).

Assembly & Adjustment—When installing vacuum piston, make certain that slot is down (toward vacuum port) on AAV-26 models. Do not lubricate cylinder. On AAV-26 models, assemble serrated washer, lockwasher, and locknut on shaft and tighten nut only loosely (do not tighten fully until vacuum piston adjusted). Install gauge ring, tool T-25046, with small hole in tool fitting over pin on choke lever and indicator line on rim of tool in line with reference mark on choke housing. Hold choke valve closed against 15/64" drill (Buick AAV-16), #3 drill (Buick AAV-26), .028" or #70 drill (Cadillac & Packard AAV-26), tighten locknut with wrench T-25047. Recheck choke valve to make certain that setting not changed by tightening of locknut. See that choke valve operates freely. This adjustment is extremely important to properly position vacuum piston and thermostatic coil prong. When assembly fast idle connector rod, install bushing (washer—Buick) on lower end of rod only after rod has been assembled to lever. See that fast idle cam torsional spring is assembled with end of spring hook against ear of lever. See that cam operates freely and make certain that rod does not bind in slot in cam. This is very important.
NOTE—On all models except AAV-16 & AAV-26, vacuum piston lever is slotted and engages flattened portion of choke valve shaft so that no adjustment of the lever on the shaft is required.

MECHANICAL CAR MODEL SECTION

'M' PAGES

This section covers the GENERAL MECHANICAL Service Data on Each *Car Model,* such as Engine Data and Motor Overhaul, Valve Timing, Clutch, Brakes, Steering, Rear Axle, Transmission, Lubrication System, etc.

IMPORTANT: Be sure to refer to the *Special Shop Notes* for the different car makes. This information precedes the regular car pages.

For *Complete Separate Treatment* of Each TYPE OF MECHANICAL DEVICE OR EQUIPMENT *refer to the Mechanical Equipment Section.*

NOTE: The Tune Up & Electrical Data on Each Car Model is located in the Tune Up & Electrical Car Model Section.

SERIAL NUMBER:—First number 8-100-1001 ('32), 8-101-1001, 8-105-1001 ('33). On right hand side of cowl under hood. Letter following number designates body type.

ENGINE NUMBER:—On left hand lower half of crankcase.

ENGINE:—Lycoming Model GU (8-100, 8-100A '32), GC (8-101, 8-105 '33). Eight cylinder, 'L' head type.

Dimensions—Bore 3". Stroke 4¾". Displacement 268.64 cubic inches.

Horsepower—Rated 28.8. Developed 100 HP. at 3400 R.P.M.

Compression—5.26-1 (GU), 5.3-1 (GC). Pressure approximately 90-95 lbs. at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Bohn, aluminum alloy, Invar Strut, split skirt type.

Weight—16 ozs. (stripped), 21.92 ozs. (with rings and pin).

Removal—Piston and rod assembly removed through bottom of engine.

Piston Length—3¾" (total), 2.3155" (top to center of pin).

Clearance—.0015" (skirt). See Fitting new pistons.

Fitting New Pistons—Use feeler stock ½" wide to check clearance. .0015" feeler should be withdrawn easily but .0025" feeler should lock. If spring scale is used, tension required to withdraw .002" feeler should be 7-12 pounds.

NOTE:—Install pistons with slot toward left (camshaft side).

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings.

Ring	Width	End Gap	Side Clearance
Comp. (#1, 2)	⅛"	.006-.012"	.0015-.003"
Oil Cont. (#3)	⅛"	.007-.015"	.0015-.003"
Oil Con. (#4)	3/16"	.010-.018"	.0015-.003"

Piston Pin:—Diameter, .8750-.8748". Length, 2.520-2.500". Pin is locked in rod. Bushing not used in piston.

Pin Fit in Piston—Tight push fit at 70°F. (selective fit).

Connecting Rod:—Weight, 2.34 lbs. Length, 9½" (center-to-center).

Big End Bearing—Spun babbitt type. No shims.

Clearance—.0015-.003". Sideplay .004-.008".

Adjustment—Adjust when wear exceeds .004" by filing bearing caps (no shims used).

NOTE:—Connecting rods are numbered and must be installed in same numbered cylinders. Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing. Oil jet holes in lower bearing upper half must be toward camshaft side of engine on all rods.

Crankshaft:—Five main bearing type.

Journal Sizes—2⅜" diameter (all bearings).

Bearing Type—Removable bronze-backed, babbitt-lined type.

Clearance—.002-.00325".

Adjustment—Take up bearings when wear exceeds .003". Check adjustment by assembling .002" feeler ½" wide between bearing and shaft. Crankshaft should turn by hand with feeler in place and bearing caps tight.

End Thrust—Taken by #3 (center) main bearing. Endplay, .003-.004". Use .003" feeler to check clearance.

Camshaft:—Six bearing type. Drive—Non-adjustable chain.

Clearance—.002-.003" (front bearing), .0017-.0047" (all others).

Timing Chain—Whitney. Width 1¼". Pitch ½". Length 24½" or 49 links.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so there are 12 links on lower side of chain between marks. With sprockets in this position the top dead center mark '⅛' on flywheel will be in line with indicator on housing with pistons #1 and 8 on top dead center.

Valves:—	Head Diameter	Stem Diameter	Stem Lgth.	Seat Angle	Lift
Intake	1 7/16"	.3410-.3425"	5¼"	30°	11/32"
Exhaust	1 13/32"	.3410-.3425"	5¼"	45°	11/32"

Tappet Clearance—.006-.008" (all valves—engine hot). Clearance for timing only, .012".

Valve Springs—	Spring Pressure	Spring Length
Valve Closed	42-47 lbs.	2 3/16"
Valve Open	88-94 lbs.	1 27/32"

Valve Timing

Intake Valves Open—5° BTDC. Close—40° ALDC.
Exhaust Valves Open—50° BLDC. Close—10° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .010" cold. This valve should open with piston 5° or .0113" before top dead center when point on flywheel approximately 1.347 teeth (8-100, 100A), 1.527 teeth (8-105) before dead center mark lines up with indicator on housing. Reset tappet clearance at .006-.008" with engine hot.

Motor Gauge—Weldenhoff Adapter #102. Rod #2.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—15 lbs. (idling), 40 lbs. (maximum R.P.M.) warm.

Oil Pressure Relief Valve—Operates at 30 lbs. Located on left hand side of crankcase. Adjustable by adding or removing shims behind relief valve spring.

Capacity and Oil—8 qts. Use SAE. #30 (summer—first 3000 miles with new engine), #40 (summer—after 3000 miles), #20 (winter).

CLUTCH:—Long Model 9AB. Single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.

Facings—Moulded type, 2 required. Thickness .137". Inside Diameter 5½". Outside Diameter 9¾".

Adjustment—Clutch pedal free movement should be 1". To adjust, loosen clamp bolt at lower end of pedal, change pedal location.

STEERING:—**Steering Gear**—Ross Cam-and-Roller type. See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Caster—1° minimum, 2° maximum. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—2°. No adjustment provided.

Toe In—⅛-3/16". Adjusted in usual manner by loosening clamp bolts and turning tie rod.

BRAKES (8-100, 8-101):—**Service**—Midland Steeldraulic, four wheel, internal expanding mechanically operated type. Hand lever applies all four service brakes.

Drum Diameter—13".

Lining—Width 1¾". Thickness .205". Length 33¾" per wheel.

NOTE—Brake shoes are semi-flexible and special moulded lining is used.

Clearance—.040".

Hand Brake:—See Service Brake adjustment.

BRAKES (8-105):—**Service**—Bendix Hydraulic, Single anchor due-servo type. Hand lever applies rear wheel service brakes through mechanical linkage. See article in Brake Section for complete adjustment instructions.

Drum Diameter—13".

Lining—Moulded type. Width 1¾". Thickness 3/16". Length 27¾" per wheel.

Clearance—.010" at heel and toe of each shoe.

Hand Brake:—See Service Brake adjustment.

SERIAL NUMBER:—First number 850X1001 or 850Y1001. On right hand side of cowl under engine hood. Letter following number designates body type.

ENGINE NUMBER:—On left hand lower side of crankcase.

ENGINE:—Lycoming Model GF (850X), GG (850Y). Eight cylinder, 'L' head type.

Dimensions—Bore 3 1/16". Stroke 4¾". Displacement 279.92 cu. ins.

Horsepower—Rated 30.0. Developed 100 at 3400 R.P.M. (GF), 115 at 3600 R.P.M. (GG).

Compression Ratio—(GF) 5.3-1. (GG) 6.2-1 Std.

Compression Pressure—Approximately 90-95 lbs. (GF), 105 lbs. (GG) at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Bohn, aluminum alloy, Invar Strut, Split skirt type.

Weight—16 ozs. (stripped), 21.92 ozs. (with rings and pin).

Removal—Piston and rod assembly removed through bottom of engine.

Piston Length—3¾" (total), 2.3155" (top to center of pin).

Clearance—.0015" (skirt). See Fitting New Pistons.

Fitting New Pistons—Use feeler stock ½" wide to check clearance. 0015" feeler should be withdrawn easily but .0025" feeler should lock. If spring scale is used, tension required to withdraw .002" feeler should be 7-12 pounds.

NOTE:—Install pistons with slot toward left (camshaft side).

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings.

Ring	Width	End Gap	Side Clearance	Wall Thickness
Comp. (#1, 2)	⅛"	.010-.018"	.0015-.003"	.135-.125"
Oil Cont. (#3)	⅛"	.006-.012"	.001-.0025"	.135-.125"
Oil Cont. (#4)	3/16"	.006-.012"	.001-.0025"	

Piston Pin:—Diameter, .8750-.8748". Length, 2.520-2.500". Pin is locked in rod. **Pin Fit in Piston**—Tight push fit at 70°F. (selective fit).

Connecting Rod:—Weight, 2.34 lbs.. Length, 9½" (center-to-center).

Big End Bearing—Spun babbitt type. No shims.

Clearance—.001-.0025". Sideplay .004-.009".

Adjustment—Adjust when wear exceeds .004" by filing bearing caps (no shims).

NOTE:—Connecting rods are numbered and must be installed in same numbered cylinders. Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing. Oil jet holes in lower bearing upper half must be toward camshaft side of engine on all rods.

Crankshaft:—Five main bearing type.

Journal Sizes—2⅜" diameter (all bearings).

Bearing Type—Removable bronze-backed, babbitt-lined type.

Clearance—.002-.00325".

Adjustment—Take up bearings when wear exceeds .003". Check adjustment by assembling .002" feeler ½" wide between bearing and shaft. Crankshaft should turn by hand with feeler in place and bearing caps tight.

End Thrust—Taken by #3 (center) main bearing. Endplay, .003-.004". Use .003" feeler to check clearance.

Camshaft:—Six bearing type. Drive, Non-adjustable chain.

Bearing Clearance—.0025-.0035" (radial).

Chain—Whitney. Width, 1". Length, 49 links. Pitch, ½".

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so there are 12 links on lower side of chain between marks. With sprocktts in this position the top dead center mark '⅛' on flywheel will be in line with indicator on housing with pistons #1 and 8 on top dead center.

Valves:—	Head Diameter	Stem Diameter	Stem Lgth.	Seat Angle	Lift
Intake	1 7/16"	.3410-.3425"	5¼"	30°	11/32"
Exhaust	1 13/32"	.3410-.3425"	5¼"	45°	11/32"

Tappet Clearance—.006-.008" (all valves—engine hot). Timing—.012".

Valve Springs—	Spring Pressure	Spring Length
Valve Closed	42-47 lbs.	2 3/16"
Valve Open	88-94 lbs.	1 27/32"

Valve Timing

Intake Valves Open—5° BTDC. Close—40° ALDC.
Exhaust Valves Open—50° BLDC. Close—10° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 5° or .0113" before top dead center when a point on the flywheel approximately 1.527 teeth before dead center mark lines up with indicator on housing. Reset tappet clearance at .006-.008" with engine hot.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—15 lbs. (idling), 40 lbs. (maximum R.P.M.) warm.

Oil Pressure Relief Valve—Operates at 30 lbs. Located on left hand side of crankcase. Adjustable by adding or removing shims behind relief valve spring.

Capacity and Oil—8 qts. Use SAE. #30 (summer—first 3000 miles with new engine), #40 (summer—after 3000 miles), #20 (winter).

CLUTCH:—**Long Model 9AB-6CI.** Single plate dry disc type. See article in Clutch Section for complete relining and assembling directions.

Facings—Moulded type, 2 required. Thickness .137". Inside Diameter 5½". Outside Diameter 9¾".

Adjustment—Free movement of clutch pedal must be 1". To adjust, loosen clamp bolt at lower end of clutch pedal, change pedal location.

STEERING:—**Steering Gear**—Ross Cam-and-Roller type. See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs. Axle is Columbia Model 1700A-5.

Kingpin Inclination—7½° crosswise.

Caster—2° maximum (without load), 3° (loaded). Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1½°. No adjustment provided.

Toe In—⅛-3/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Bendix Hydraulic, Single anchor, duo-servo type. Hand lever applies rear wheel service brakes through mechanical linkage. See article in Brake Section for complete adjustment instructions.

Drum Diameter—12" all models.

Lining—Hard moulded type (Raybestos #451). Width 2". Thickness 3/16". Length 24 9/32" per wheel.

Clearance—.010" at heel and toe of each shoe.

Hand Brake—See Service Brake adjustment.

Vacuum Power Cylinder:—Std. on Model 850Y only. Bendix type vacuum cylinder. See article in Brake Section for complete data.

SERIAL NUMBER:—First number 652X-1001, 652Y-1001, 653-1001. On right hand side of cowl under hood.

ENGINE NUMBER:—On front left hand upper half of crankcase.

ENGINE:—Lycoming, Model WF. Six cylinder, 'L' head type.

Bore—3 1/16". **Stroke**—4¾".

Piston Displacement—209.94 cubic inches.

Rated Horsepower—22.51.

Developed Horsepower—85 at 3500 R.P.M.

Compression Ratio—6.2-1 Std. aluminum head.

Pistons:—Bohn, aluminum alloy, split skirt, Invar strut type. Piston length, 3¾".

Weight—16 ozs. stripped, 21.92 ozs. with rings and pin.

Removal—Pistons and rods removed from below.

Clearance—Top .00975-.00825". Skirt .0015".

Fitting New Pistons—Use .0015" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 5-10 lbs.

Installing Pistons—Slot should be toward left or camshaft side of engine.

Piston Rings:—Two compression, two oil control rings per piston, all above pin. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.008-.013"	.0015-.003"
Oil Cont. (3)	⅛"	.008-.013"	.001-.0025"
Oil Cont. (4)	3/16"	.008-.013"	.001-.0025"

Piston Pin:—Diameter .8750-.8748". Length 2.520-2.500". Pin is locked in the rod. No bushing used in piston.

Pin Fit in Piston—Tight push fit at 70°F. (selective).

Connecting Rod:—Weight 2.34 lbs. Length 9½".

Crankpin Journal Diameter—2⅛".

Lower Bearing Type—Spun babbitt lined. No shims.

Clearance—.001-.0025" (total), .004-.009" (total sideplay).

Adjustment—Adjust by filing bearing caps when wear exceeds .004". No shims used.

Installing Rods—Rods are numbered and must be installed in same numbered cylinders. Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing. Oil jet holes in upper half of lower bearing must be toward camshaft side of engine on all rods.

Crankshaft:—4 bearing. Integral counterweights with Lancaster type vibration dampener at front of engine.

Journal Diameters—2⅜" all bearings.

Bearing Type—Bronze-backed, babbitt-lined.

Clearance—.001-.00162".

Adjustment—Take up bearings when wear exceeds .003". Check adjustment by assembling .002" feeler ½" wide between bearing and shaft. Crankshaft should turn by hand with feeler in place and bearing caps tight.

End Thrust—Taken by second intermediate (#3) main bearing. Endplay .005" (minimum), .010" (maximum).

Camshaft:—Five bearing. Non-adjustable chain drive. Camshaft design changed on 653 ('35) model after 3034 engines (see Valve Timing below).

Bearing Type—Bronze and cast-iron.

Clearance—.0025-.0035".

Timing Chain—Whitney. Width 1¼". Pitch ½". Length 24½" or 49 links.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so there are 12 links on lower side of chain between marks. This is equal to 13 teeth inclusive of teeth meshed opposite marks. With sprockets in this position, pistons 1 and 6 will be on top dead center with dead center mark on flywheel at indicator on housing. This setting correct for all engines. Change in valve timing (see below) is due to new camshaft design.

Valves:—	Head Dia.	Stem Dia.	Length
Intake	1 9/16"	.3424-.3425"	5¼"
Exhaust	1 13/32"	.3420-.3425"	5¼"

NOTE—On 652 X, Y models Intake valve head diameter 1 7/16".

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.0045-.008"
Exhaust	45°	5/16"	.0045-.008"

Tappet Clearance—(652-X, Y) .006-.008" all valves with engine hot. (653). .008-.010" all valves with engine hot. Clearance for timing .010" (652-X, Y), .012" (653).

Valve Springs—	Spring Pressure	Length
Valve Closed	42-47 lbs.	2 3/16"
Valve Open	88-94 lbs.	1⅞"

Valve Timing—See Camshaft Setting (above).

1934-35 Cars ('35—before Serial #653-3034)

Intake Valves—Open 5° BTDC. Close 40° ALDC.
Exhaust Valves—Open 50° BLDC. Close 10° ATDC.

1935 Cars (after Serial #653-3034)

Intake Valves—Open 7½° BTDC. Close 37½° ALDC.
Exhaust Valves—Open 50° BLDC. Close 5° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .010" (652-X, Y), .012" (653). This valve should open with piston #1 .0113" (652-X, Y—First 653), .0253" (653—after 3034 cars) before top dead center when flywheel mark '1/6' is approximately 1.53 teeth (652-X, Y—First 653), or 2.29 teeth (653—after 3034 cars) before the indicator on the housing. Reset tappet clearance .006-.008" (652-X, Y), .008-.010" .653) with engine hot.

Lubrication:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure—15 lbs. idling, 40 lbs. maximum engine R.P.M. with warm oil.

Oil Pressure Relief Valve—Located in bracket bolted on left hand side of crankcase. Operates at 30 lbs. Adjustable by changing spacer washers between plug and relief valve spring (plug at lower end of bracket).

Capacity and Oil—6 qts. Use SAE. #30 (summer, first 3000 miles with new engine), #40 (summer, after 3000 miles), #20 (winter).

CLUTCH:—**Long Model 9AB-CS.** Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.

Clutch Pedal Adjustment—Free movement of clutch pedal must be 1". To adjust, loosen transverse bolt at lower end of clutch pedal, change position of pedal (bolt hole is slotted).

Clutch Facings—Moulded type, 2 required, 5¾" I.D., 9" O.D., .137" thick. Clutch facings are Raybestos #250.

STEERING:—**Front Suspension.** Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs. Axle is Columbia Type 10000A-1.

Kingpin Inclination—7½° crosswise.

Caster—3½-4°. Adjust by using wedge shims between spring and spring pad on axle.

Camber—1½°.

Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.

Steering Gear:—Ross Model 140 Cam-and-Lever type.
See article in Mechanical Equipment Section for data.

BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—12".
Lining—Moulded type. Width 1½". Thickness 3/16". Length 24 9/32" per wheel.
Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number, 851-1001. On right hand side of cowl under hood. Letter following serial number designates body type.

ENGINE NUMBER:—On front left hand upper half of crankcase.

ENGINE:—**851**—Lycoming Model GG. Eight cylinder, In Line, 'L' head type.

Supercharged 851—Lycoming Model GH—Eight cylinder, In Line, 'L' head type. Engine is supercharged by centrifugal type supercharger mounted on left side of crankcase and driven by separate chain.

Bore—3 1/16". **Stroke**—4¾".

Piston Displacement—279.92 cubic inches.

Rated Horsepower—30.0.

Developed Horsepower—**(851)**—115 HP. at 3600 R.P.M. **(SC 851)** 150 HP. at 4000 R.P.M.

Compression Ratio—**(851)** 6.2-1 standard aluminum head. **(SC 851)** 6.5-1 standard aluminum head.

Pistons 851, SC 851 (before Eng. No. 4759):—Bohn, aluminum alloy, Invar strut, split skirt type.

Length—3¾".

Weight—16 ozs. stripped, 21.92 ozs. with rings and pin.

Removal—Rods and pistons removed from below.

Clearance—Top .00975-.00825". Skirt .0015".

Fitting New Pistons—Use .0015" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 5-10 pounds.

Installing Pistons—Slot should be toward left or camshaft side of engine.

Pistons SC 851 (after Engine No. 4759):—Ray Day, Ray Day metal type.

Length—3¾".

Weight—14.40 ozs. stripped, 19.84 ozs. with rings and pin.

Removal—Pistons and rods removed from below.

Clearance—Top .01125-.01325". Skirt .002-.0025".

Piston Rings:—**Bohn Pistons**—Two compression, two oil control rings per piston, all above pin. **Ray Day Pistons**—Two compression, one oil control ring per piston, all above pin. Rings used on Bohn pistons are all Sealed Power Corp. Rings used with Ray Day pistons are Perfect Circle #70 (compression), #85 (oil control).

Ring	Width	End Gap	Side Cl'rance
Comp. (#1, 2)	⅛"	.008-.013"	.0015-.003"
Oil Cont. (#3 Bohn)	⅛"	.008-.013"	.001-.0025"
Oil Cont. (#4 Bohn)	3/16"	.008-.013"	.001-.0025"
Oil Cont. (Ray Day)	3/16"	.007-.015"	.001-.0025"

Piston Pin:—Diameter .8750-.8748". Length 2.520-2.500". Pin is locked in the rod. No bushing used in piston.

Pin Fit in Piston—Tight push fit at 70°F (selective).

Connecting Rod:—Weight 2.34 lbs. Length 9½".

Crankpin Journal Diameter—2⅛".

Lower Bearing Type—Spun babbitt-lined. No shims.

Clearance—.001-.0025" (total). .004-.009" (total sideplay).

Adjustment—Adjust by filing bearing caps when wear exceeds .004". No shims used.

Installing Rods—Rods are numbered and must be installed in same numbered cylinders. Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing. Oil jet holes in upper half of lower bearing must be toward camshaft side of engine on all rods.

Crankshaft:—Five bearings with Lanchester type vibration dampener. Shaft counterweighted on Supercharged (SC 851).

Journal Diameters—2⅜" all bearings.

Bearing Type—Bronze-backed, babbitt-lined.

Clearance—.0010-.00162".

Adjustment—Take up bearings by filing caps when wear exceeds .003". Check adjustment by assembling .002" feeler ½" wide between bearing and shaft. Crankshaft should turn by hand with feeler in place and bearing caps tight.

End Thrust—Taken by center main bearing. End-play .005" minimum, .010" maximum.

Camshaft:—Six bearing. Non-adjustable chain drive. Camshaft design changed on Model 851 (after 5169 engines). See Valve Timing (following).

Bearing Type—Bronze and cast-iron (851), Steel-backed babbitt lined type (SC 851).

Clearance—.0025-.0035" (851).

Timing Chain—Whitney. Width 1". Pitch ½". Length 24½" or 49 pitches.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so there are exactly 12 links on lower side of chain between marks. This is equal to 13 teeth inclusive of teeth meshed opposite marks. With sprockets in this position, pistons #1 and 8 will be on top dead center with dead center mark on flywheel at indicator on housing. This setting correct for all engines. Change in valve timing on Model 851 (see below) is due to new camshaft design.

Valves:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3420-.3425"	5¼"
Exhaust	1 13/32"	.3420-.3425"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.0045-.008"
Exhaust	45°	5/16"	.0045-.008"

Tappet Clearance—.008-.010" all valves—running clearance with engine hot. Clearance for timing .012".

Valve Springs—	Spring Pressure	Length
Valve Closed	42-47 lbs.	2 3/16"
Valve Open	88-94 lbs.	1⅞"

Valve Timing—See Camshaft Setting above.

851 (Cars before Engine No. 5169)

Intake Valves—Open 5° BTDC. Close 40° ALDC.
Exhaust Valves—Open 50° BLDC. Close 10° ATDC.

851 (Cars after Engine No. 5169)—All SC 851

Intake Valves—Open 7½° BTDC. Close 37½° ALDC.
Exhaust Valves—Open 50° BLDC. Close 5° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 slightly before top dead center when flywheel mark '⅛' (dead center mark) is approximately 1.53 teeth (first Model 851 cars), or 2.29 teeth (later Model 851 cars—All Model SC 851 cars) before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Lubrication:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure—15 lbs. idling, 40 lbs. at maximum engine R.P.M. with warm oil.

Oil Pressure Relief Valve—Located in bracket bolted on left hand side of crankcase. Operates at 30 lbs. Adjustable by changing spacing washer between plug and relief valve spring (plug at lower end of bracket).

Capacity and Oil—8 qts. Use SAE. #30 (summer—first 3000 miles with new engine), #40 (summer—after 3000 miles), #20 (winter).

CLUTCH:—**Long, Model 9AB-6C1.** Single plate, dry disc type. No adjustment for wear required. *See article in Mechanical Equipment Section for data.*

Clutch Pedal Adjustment—Free movement of clutch pedal must be 1". To adjust, loosen transverse bolt at lower end of clutch pedal, change position of pedal (bolt hole is slotted).

Clutch Facings—Moulded type, 2 required. 5½" I.D., 9¾" O.D., .137" thick. Clutch facings are Raybestos #250.

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs. Axle is Columbia Type 1700A-5.

Kingpin Inclination—7½° crosswise.

Caster—2° maximum without load, 3° loaded. Use wedge shims inserted between spring and spring pad on axle to correct caster.

Camber—1½°.

Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.

Steering Gear:—Ross Model 615 Cam-and-Lever type. *See article in Mechanical Equipment Section for data.*

BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel brakes. *See article in Mechanical Equipment Section for data.*

Drum Diameter—12".

Lining—Moulded type. Width 2". Thickness 3/16". Length 24 9/32" per wheel.

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number—6601. Stamped on front left hand upper half of crankcase.

ENGINE SPECIFICATIONS:—Lycoming Model WF. Six cylinder 'L' head type.

Bore—3 1/16". Stroke—4¾".

Displacement—210 cubic inches.

Rated Horsepower—22.5 (SAE).

Developed Horsepower—85 at 3500 R.P.M.

Compression Ratio and Pressure—6.2-1 Std. aluminum head. No optional ratios. Pressure approximately 105 lbs. at cranking speed.

Vacuum Reading—Gauge should show steady reading of approx. 20" with engine idling at 7-8 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, split skirt, Invar Strut type.

Length—3¾".

Weight—16 ozs. (stripped), 21.92 ozs. (with rings and pin).

Removal—Pistons and rods removed from below.

Clearance—Top .020". Skirt .0015". See Fitting Pistons.

Replacement Pistons:—Pistons furnished .003" and .005" oversize.

Fitting New Pistons:—Use .0015" feeler stock ½" wide. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 5-10 lbs.

Installing Pistons:—Slot should be toward left or camshaft side of engine.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Lower ring grooves drilled with eight 1/16" oil drain holes (#3), eight 1/8" holes and oil holes to piston pin bosses (#4).

Ring	Width	End Gap	Side Clearance
Comp. (all)	⅛"	.006-.012"	.0015-.003"
Oil Cont. (3)....	⅛"	.010-.013"	.001-.0025"
Oil Cont. (4)....	3/16"	.010-.013"	.001-.0025"

PISTON PIN:—Diameter—.8750-.8748". **Length**—2.52-2.50". Pin is locked in rod. No bushing used in pist'n.

Pin Fit in Piston—Tight push fit at 70° F. (selective).

CONNECTING ROD:—Length—9½" (center-to-center).

Weight—37.4 ozs. with bushings and caps.

Crankpin Journal Diameter—2⅛".

Lower Bearing—Spun babbitt-lined. No shims.

Clearance—.001-.0025" (total), .004-.009" (total side-play).

Bearing Adjustment:—Adjust by filing bearing caps when wear exceeds .004". No shims used.

Installing Rods:—Rods are numbered and must be installed in same numbered cylinders. Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing. Oil jet holes in upper half of lower bearing must be toward camshaft side of engine.

CRANKSHAFT:—Four bearing. Integral counterwgts.

Journal Diameters—2⅜" all bearings.

Bearing Type—Bronze-backed, babbitt-lined.

Clearance—.001-.00162".

Bearing Adjustment:—Take up bearings when wear exceeds .003". Check adjustment by assembling .002" feeler ½" wide between bearing and shaft. Crankshaft should turn by hand with feeler in place and bearing caps tight.

End Thrust:—Taken by #3 intermediate bearing. Endplay .005" minimum, .010" maximum.

CAMSHAFT:—5 Bearing. Non-adjustable chain drive.

Bearing Type—Bronze and cast-iron.

Clearance—.0025-.0035".

End Thrust:—Taken by thrust button riveted to inside face of chain case cover. Endplay .015".

Timing Chain:—Whitney. Width 1¼". Pitch ½". Length 24½" or 49 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so there are 12 links on lower side of chain between marks. This is equal to 13 teeth inclusive of teeth meshed opposite marks. With sprockets in this position, pistons 1 and 6 will be on top dead center with dead center mark on flywheel at indicator on housing. This setting correct for all engines.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3424-.3425"	5¼"
Exhaust	1 13/32"	.3420-.3425"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.0045-.008"
Exhaust	45°	5/16"	.0045-.008"

Tappet Clearance—.008-.010" all valves—running clearance with engine hot.

Valve Guides:—Pressed in block and finish reamed to size providing correct stem clearance.

Valve Springs:—Springs have 'closed coils' at one end. Install springs with closed coil end up.

	Spring Pressure	Spring Length
Valve Closed	42-47 lbs.	2 3/16"
Valve Open	88-94 lbs.	1⅞"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 7½° BTDC. Close 37½° ALDC.

Exhaust Valves—Open 50° BLDC. Close 5° ATDC.

NOTE—Figures correct with .012" tappet clearance.

To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 .0253" before top dead center when flywheel mark '1/6' (dead center mark) is approximately 2.29 teeth before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—15 lbs. idling, 40 lbs. maximum engine R.P.M. with warm oil.

Oil Pressure Relief Valve:—Located in bracket bolted on left hand side of crankcase. Operates at 30 lbs. Adjustable by changing spacer washers between plug and relief valve spring (plug at lower end of bracket).

Crankcase Capacity:—6 quarts (refill).

CLUTCH:—Long Model 9AB-CS. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type, 2 required. Inside Diam. 5¾". Outside Diam. 9". Thickness .137".

Adjustment—Free movement of clutch pedal must be 1". To adjust, loosen transverse bolt at lower end of clutch pedal, change position of pedal (bolt hole is slotted).

Removal:—Drop drive shaft by disconnecting front universal, remove transmission, take off pan on underside of clutch housing. Take out capscrews mounting clutch on flywheel, turning all screws out evenly to relieve spring tension, remove clutch from below through pan opening.

STEERING:—Steering Gear—Ross Model 140 Cam-and-Lever type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliot ends and semi-elliptic springs.

Kingpin Inclination—7½° crosswise.

Camber—1½°. No adjustment.

Caster—3½-4°. Adjust by using wedge shims between spring and spring pad on axle.

Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.

Tread—59" (front), 62" (rear).

BRAKES:—Service—Bendix Hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—12".

Lining—Moulded type. Width 1½". Thickness 3/16". Length 24 9/32" per wheel.

Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—Stamped on left hand upper half of crankcase at front of engine. First serial number (on right hand side of cowl under hood) 4501 (852), 34501 (Schgd. 852).

ENGINE SPECIFICATIONS:—**Type**—Lycoming Model GG and GH (Supercharged). 8 cylinder In Line, 'L' head.

Bore—3 1/16". **Stroke**—4¾".

Displacement—279.92 cubic inches.

Rated Horsepower—30.01 (SAE).

Developed Horsepower—115 at 3600 R.P.M., 150 at 4000 R.P.M. (Supercharged).

Compression Ratio and Pressure—6.2-1 Std. aluminum head. Pressure approximately 105 lbs. at cranking speed.

Vacuum Reading—Gauge should show steady reading of 20" with engine idling at 5-6 M.P.H.

PISTONS—852:—Bohn, aluminum alloy, Invar strut, split skirt type. Length—3¾".

Weight—16 ozs. stripped, 21.92 ozs. with rings and pin.

Removal—Pistons and rods removed from below.

Clearance—Top .00975-.00825", Skirt .0015".

Replacement Pistons:—Pistons furnished in .003" and .005" oversizes.

Fitting New Pistons:—Use .0015" feeler stock ½" wide inserted between piston and wall on side opposite slot to check clearance. Pull required to withdraw feeler must be between 5-10 lbs.

Installing Pistons:—Slot should be toward left or camshaft side.

PISTONS—SCHGD. 852:—Ray Day, Ray Day metal alloy type. Length—3¾".

Weight—14.40 ozs. stripped, 19.84 ozs. with rings and pins.

Removal—Pistons and rods removed from below.

Clearance—Top .01125-.01325". Skirt .002-.0025".

Fitting New Pistons:—Use .002" feeler ½" wide inserted between piston and cylinder wall at right angles to pin bosses to check clearance. Pull required to withdraw feeler should be 6-11 lbs.

PISTON RINGS—852 (BOHN PISTONS):—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled with eight 1/16" oil drain holes (#3), eight ⅛" oil holes and oil holes to piston pin bosses (#4).

Ring	Width	End Gap	Side Clearance
Comp. (all) ..	⅛"	.008-.013"	.0015-.003"
Oil (#3)	⅛"	.008-.013"	.001-.0025"
Oil (#4)	3/16"	.008-.013"	.001-.0025"

PISTON RINGS—SCHGD. 852 (RAY DAY PISTONS):—Two compression, one oil control ring per piston, all above pin. Rings are Perfect Circle #70 (comp.), #85 (oil control).

NOTE—Compression rings are stepped or grooved and must be installed with the groove downward.

Ring	Width	End Gap	Side Clearance
Comp. (all) ..	⅛"	.008-.013"	.0015-.003"
Oil Cont.	3/16"	.007-.015"	.001-.0025"

PISTON PIN:—**Diameter**—.8750-.8748". **Length**—2.520-2.500". Pin is locked in rod. No bushing used in piston. Pins furnished for service standard and .003" oversize.

Pin Fit in Piston—Tight push fit at 70° F. (selective).

CONNECTING ROD:—**Length**—9½".

Weight—2.34 lbs. (852 only).

Crankpin Journal Diameter—2⅛".

Lower Bearing—Spun babbitt-lined type. No shims.

Clearance—.001-.0025" (total), .004-.009" (total side-play).

Bearing Adjustment:—Adjust by filing bearing caps when wear exceeds .004".

Installing Rods:—Rods are numbered and must be installed in same numbered cylinders. Lower bearings are offset. Install rod with narrow half of bearing toward nearest main bearing. Oil jet holes in upper half of lower bearing must be toward camshaft side of engine on all rods.

CRANKSHAFT:—Five bearing. Counterweights used on Schgd. 852 only. Lanchester type vibration dampener used on both models.

Journal Diameters—2⅝" all bearings.

Bearing Type—Bronze-backed, babbitt-lined.

Clearance—.001-.00162".

Bearing Adjustment:—Take up bearings by filing bearing caps when wear exceeds .003". Check adjustment by assembling .002" feeler ½" wide between bearing and shaft. Crankshaft should turn by hand with feeler in place and bearing cap tight.

End Thrust:—Taken by center (#3) bearing. Endplay .005" minimum, .010" maximum.

CAMSHAFT:—Six bearing. Non-adjustable chain drive.

Bearing Type—Bronze and cast-iron (852), steel-backed, babbitt-lined bushings (Schgd. 852).

Clearance—.0025-.0035".

End Thrust:—Taken by thrust pin riveted on inside face of chain case cover. Endplay .015".

Timing Chain:—Whitney. Width 1" (852), 1¼" (Schgd. 852), Pitch ½". Length 24½" or 49 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that there are 12 links or 13 teeth (inclusive of teeth meshed opposite marks) between marks. With sprockets in this position, pistons #1 and 8 will be on top dead center with dead center mark on flywheel lined up with indicator on housing.

SUPERCHARGER:—Centrifugal type mounted at left of engine and driven through accessory sprocket and shaft by separate chain in chain case. Chain is adjustable.

Chain Adjustment:—Accessory sprocket mounted on eccentric with slotted mounting holes. Adjusted by loosening screws and rotating eccentric to take up chain slack.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3420-.3425"	5¼"
Exhaust	1 13/32"	.3420-.3425"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.0045-.008"
Exhaust	45°	5/16"	.0045-.008"

Tappet Clearance.—.008-.010" all valves, engine hot.

Valve Guides:—Pressed in block and finish reamed to provide correct stem clearance (see table above).

Valve Springs:—Springs have 'closed coils' at one end. Install springs with closed coil end up.

	Spring Pressure	Spring Length
Valve Closed	42-47 lbs.	2 3/16"
Valve Open	88-94 lbs.	1⅞"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 7½° BTDC. Close 37½° ALDC.

Exhaust Valves—Open 50° BLDC. Close 5° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 .0253" before top dead center when flywheel mark '1/8' (dead center mark) is approximately 2.29 teeth before the indicator on the flywheel housing. Reset tappet clearance at .008-.010" with engine hot.

Motor Gauge—Weidenhoff Adapter #105, Rod #5.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—15 lbs. idling, 40 lbs. at maximum engine R.P.M. with warm oil.

Oil Pressure Relief Valve:—Located in bracket bolted on left hand side of crankcase. Operates at 30 lbs. Adjustable by changing spacing washer between plug and relief valve spring (plug at lower end f bracket).

Crankcase Capacity:—8 quarts (refill).

CLUTCH:—Long Model 9AB-6CI. Single plate, dry disc type. See article in Clutch Section for relining and assembling data.

Facings—Moulded type, 2 required. Inside Diam. 5½". Outside Diam. 9¾". Thickness .137".

Adjustment—Free movement of clutch pedal should be 1". To adjust, loosen transverse bolt at lower end of clutch pedal, change position of pedal (bolt is slotted).

Removal—Drop drive line (disconnect at front universal), remove transmission, take off pan under clutch housing, take out screws mounting clutch on flywheel, turning all screws out evenly, remove clutch from below through pan opening in housing.

STEERING:—**Steering Gear**—Ross Model 615 Cam-and-lever type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliot ends and semi-elliptic springs.

Kingpin Inclination—7½° crosswise.
Caster—2° maximum without load, 3° maximum loaded. Adjusted by inserting wedge shims between spring and spring pad on axle.

Camber—1½°. No adjustment.
Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.
Tread—59" (front), 62" (rear).

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—12".

Lining—Moulded type. Width 2". Thickness 3/16". Length 24 9/32" per wheel.

Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

HOOD LATCH HANDLE NOTE:—On 1939 cars, latch handles located in driver's compartment on extreme right and left hand sides.

SERIAL NUMBER:—First number 60,001. Stamped on left frame side member below oil level gauge or on left side of cowl under engine hood.

ENGINE NUMBER:—First number 60,001. Stamped on left hand side of crankcase above Starter Bendix.

ENGINE SPECIFICATIONS:—Four cylinder, 'L' head type. Cylinders cast en-bloc and bolted to aluminum alloy crankcase (integral with flywheel housing). **Bore**—2.2". **Stroke**—3".
Displacement—45.6 cubic inches.
Rated Horsepower—7.8 S.A.E.
Developed Horsepower—20 at 4000 R.P.M.
Compression Ratio—7.0-1 Al. or CI. head.
Compression Pressure—90 lbs. at 150 R.P.M.

PISTONS:—Bohn Autothermic, steel strut, split skirt, Cam-ground, aluminum alloy type with tin-plated finish. **Length**—2 3/64".
Removal—Pistons and Rods removed from above except on engines with oil baffles (block assembly must be removed first).
Clearance—.0005" (skirt). See Fitting Pistons.
Replacement Pistons:—Pistons furnished in standard size and .003", .005", .010", .020", .030" oversize.
Fitting New Pistons:—Use .0025" feeler installed between piston and cylinder wall on side opposite slot at right angles to piston pin. Pull required to withdraw feeler must be within 7-12 lbs.
Installing Pistons:—Slot toward left hand side.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr.	3/32"	.004-.006"	.0015"
Oil Cont.	1/8"	.004-.006"	.0015"

Replacement Rings:—Rings furnished standard size and .003", .005", .010", .020", .030" oversize.

PISTON PIN:—**Diameter**—39/64". **Length**—1 15/16". Pin is locked in connecting rod.
Pin Fit in Piston—.002" clearance. When correctly fitted and installed, 3 lbs. pressure at end of rod should be required to rock rod from side to side.
Replacement Pins:—Furnished .003", .005" oversize.

CONNECTING ROD:—'H' section. **Length**—5¾".
Crankpin Journal Diameter—1 5/16".
Lower Bearing—Babbitt-lined type. No shims.
Clearance—.0008-.002". **Sideplay**—.0065".
Bearing Adjustment:—File bearing caps (use fine emery cloth on surface plate).
Installing Rods:—Install rods with oil dippers on bearing cap faces toward right side (all rods).

CRANKSHAFT:—Two bearing, counterweighted type.
Journal Diameters—2½" (all bearings).
Bearing Type—Babbitt-lined bushings. Front bushing has separate bearing retainer, rear bushing and retainer are integral. **Clearance**—.0008-.0025".
Bearing Adjustment:—None. Replace bearings. To remove bearing retainers proceed as follows:
Front Bearing Removal—Remove timing gear cover, pull both timing gears, take out four capscrews in retainer flange, use gear puller to remove bearing.
Rear Bearing Removal—Remove Transmission and Clutch (see Transmission and Clutch sections for directions), remove flywheel by removing 4 bolts and prying centering flange off crankshaft carefully. Remove nuts on bolts in bearing retainer flange, screw capscrew in each of two tapped holes in retainer, turn screws up evenly to force retainer and bearing out.
Replacement Bearings:—Finished bearing bushings furnished .003", .006", .009" undersize.
End Thrust:—Taken by rear bearing. Endplay .0045".

CAMSHAFT:—Three bearing. Helical gear drive.
NOTE—Front camshaft bushing retained by special-headed setscrew in upper part of crankcase which extends down into hole in bushing. Setscrew must be taken out before bushing can be removed.
Bearing Type—Bronze bushings. **Clearance**—.002".
Replacement Bearings:—Front bushing furnished finished to size. Other bushings must be reamed.
End Thrust:—Taken by rear face of camshaft gear hub and front end of camshaft front bushing. When installing timing gears, install camshaft gear first, tighten nut securely and make certain that all endplay removed and camshaft assembly rotates freely.
Camshaft Setting:—Two adjacent teeth on camshaft gear punchmarked. One crankshaft gear tooth also marked. Mesh this marked tooth between the marked camshaft gear teeth.

VALVES:—Intake valves marked 'INL', exhaust valves 'EXH' under head. Exhaust valves also have groove around stem under spring seat.

	Head Diameter	Stem Diameter	Length
All Valves	1 1/32"	.279"	3¼"

	Seat Angle	Lift	Stem Clearance
All Valves	30°	.257"	.0022"

Tappet Clearance—.006" Intake, .009" Exh. (hot).
Valve Guides:—Pressed in block. Top of guide should be 1" below valve port. Finish ream new guides to inside diameter of .2807-.2817".
Valve Springs:—Free length 1 11/16".

	Pressure	Length
Valve Closed	28 lbs.	1¼"

Valve Lifters:—Plunger type. Operate in individual guides in cylinder block. Guides removable from lower end after block removed from crankcase (retained by flange engaging recess in block). Serviced by installing new lifter and guide assembly.
Lifter Clearance in Guide—.001".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 19° BTDC. Close 50° ALDC.
Exhaust Valves—Open 57° BLDC. Close 12° ATDC.
To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 19° or .1025" before top dead center when point on flywheel 1 5/32" before 'TDC' mark lines up with pointer on flywheel housing.

LUBRICATION:—Pressure system. Vane type oil pump in crankcase (at rear) feeds oil to all main and connecting rod bearings, front and rear camshaft bearings (center camshaft bearing lubricated by splash).
Oil Pump:—Vane type. In crankcase at rear of engine. To remove pump, remove cylinder block from crankcase, take off flat cover on crankcase over oil pump driving gear, pull this gear, remove woodruff key in shaft. Remove oil pan, take out two screws holding oil pump body to crankcase, withdraw oil pump from below. Install pump in same manner.
Normal Oil Pressure:—Over 10 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Spring-loaded ball check valve type located on right hand side of crankcase above pump (in large plug). Not adjustable.
Crankcase Capacity:—6 pints or 3 quarts.

COOLING:—**Circulation**—Thermo-syphon (no pump).
NOTE—When installing lower water connection on left hand side of cylinder block, install shortest screw in rear hole. **Capacity** 6 qts. ('37-38), 4 ('39).

CLUTCH:—**Rockford.** Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. 6½" I.D., 8 7/16" O.D., .125" thick. NOTE—Facings are riveted to flywheel and pressure plate (not driven disc).
Adjustment—Clutch pedal free travel should be 2". Adjust by loosening locknut and turning clevis on clutch throw-out link rod.
Removal:—Disconnect drive shaft at front universal flange, remove flywheel housing top cover, take out screws in flywheel housing rear cover, remove rear cover and transmission as a unit. Take out screws in clutch cover around flywheel rim (turn all screws out evenly to relieve pressure), lift clutch out.
NOTE—When installing clutch, turn clutch cover screws in loosely (so that driven disc can be moved by hand), place transmission in position on mounting studs and maneuver driven disc so that clutch shaft enters disc hub and pilot bearing in crankshaft, remove transmission and tighten clutch cover screws securely (do not disturb clutch disc).

TRANSMISSION:—**Warner.** Synchro-mesh, helical gears (second, high), sliding spur gear (low, reverse).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect drive shaft at front universal flange, drop shaft, take off nuts on transmission mounting studs, pull transmission back.
NOTE—If transmission removed for work on clutch, take out rear flywheel cover screws and remove transmission and cover as an assembly.

UNIVERSAL JOINTS:—**Detroit Series 4100.** Roller bearing Ball and Trunnion type, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer Model 10.** Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—5.87-1. **Backlash**—.005".
Removal:—Disconnect drive shaft at rear universal. Disconnect brake cables and shock absorber links. Free spring clips at axle housing (or disconnect spring shackles to remove springs with axle), remove axle assembly from beneath car.
Axle Shaft Removal—Remove wheel, take out four capscrews in bearing retainer flange, remove grease retainer, bearing shims, brake flange. Use axle shaft puller to remove shaft and bearing.
Wheel Bearing Adjustment:—Controlled by shims under bearing retainer at outer end of axle shaft. Remove wheel, take out capscrews in retainer, remove retainer to adjust. Endplay—.008".

SHOCK ABSORBERS:—**Own Make.** Double faced, adjustable, friction disc type. One at front, two at rear.
Servicing:—Center bolt should be removed, lubricated with light oil and replaced at 15,000 mile intervals. To remove center bolts on rear units, disconnect rear spring front shackle bolt. This will allow shock absorber to drop down and provide clearance.
NOTE—To eliminate squeaks in shock absorbers, remove friction disc (after taking out center bolts), clean with a scraper and roughen with tool (do not use emery or sandpaper), oil center bolt when replacing (keep oil off of discs).

STEERING:—**Steering Gear**—Lavine Model A, Worm and Ball type (1937-38), Ross T-12, S-12 Cam-and Lever Type (1939). NOTE—T-12 is Twin-lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional, 'I' beam section front axle with transverse spring. Axle positioned by torque arm at each end.
Kingpin Inclination—1½° crosswise.
Toe In—3/32" plus or minus 1/32". Adjusted in usual manner by changing length of tie rod.
Caster—11°. No adjustment provided.
Camber—1½-1¾°. No adjustment provided.

BRAKES:—**Service**—Own make. Four wheel, mechanical type. Hand lever applies all four service brakes.
Drum Diameter—8".
Lining—Semi-molded type. Width 1⅛". Thickness 3/16". Length 17" per wheel.
Hand Brake:—See Service Brakes above.

1938 MODELS

HOOD SIDE PANEL REMOVAL:—Remove panel bolts at body and radiator shell, hood fastener rod screws at radiator shell, and lift panel off.

1939 MODELS

HOOD SIDE PANEL REMOVAL:—Remove bolt at rear upper end of side panel at shroud bracket, loosen front fender to shroud bolts. Remove headlamps by taking out three ⅜" capscrews and two bolts holding side panels to headlamp reinforcement plate. Remove bolts holding side panel to front fender hood side and radiator shell, lift panel out.

1939 MODELS

FRONT END ASSEMBLY:—Radiator shell, fenders, fender skirts and hood sides all bolted together and mounted as one unit as follows: One bolt in center of radiator mounting strap engages slotted hole in front frame cross-member (shims on bolt control height, slotted hole permits entire assembly to be moved fore-and-aft or sideways for alignment). Five bolts on each fender skirt at rear attach assembly to body shroud panel (bolt hole clearance permits assembly to be raised or lowered for alignment). All parts of assembly must be bolted together so that exposed joints are flush.

Alignment—See that radiator to frame bolt (at front), five fender to shroud bolts on each side, and shroud to hood side bracket on each side are loose to permit movement. Install upper hood and hinge assembly leaving front and rear saddle bolts loose. Shift entire front end assembly backward or forward for correct hood opening, adjust height at front end by adding or removing shims on front mounting bolt, adjust height at rear by raising or lowering entire assembly on rear mounting bolts to meet shroud bracket (bend bracket if necessary). Center radiator shell at front hood hinge saddle by loosening strut rods (between shell and fender skirt brace) and bending shell in proper direction (hold in position while tightening strut rods).

Front Fender Removal—May be removed separately as follows: Remove capscrews and nuts at shroud (rear end), remove bolts holding fender skirt and side panel to fender, remove headlamp, remove fender bolts at radiator shell and grille.

1932-35 MODELS

REPLACEMENT ANOLITE PISTONS:—Buick Anolite (aluminum alloy) pistons available for these past models (original equipment cast-iron). Pistons (with pins fitted) furnished in following sizes:

***Series 50 (1932-35)**

Size	Part Number
Standard	1399958
.001" High limit	1399959
.005" Oversize	1399960
.010" Oversize	1399961
.015" Oversize	1399962

*—On 1932-33 models bore must be increased 1/32" to take standard size piston.

Series 80 (1932-33), 90 (1932-35)

Size	Part Number
Standard	1399963
.001" High limit	1399964
.005" Oversize	1399965
.010" Oversize	1399966
.015" Oversize	1399967
.020" Oversize	1399968
.030" Oversize	1399969

***Series 60 (1932-33), 40, 60 (1934-35)**

These models take same size pistons as listed below for Series 40 (1936). See listing below.

*—On Series 60 (1932-33) bore must be increased 1/32" for standard (Original Production) pistons.

1936-39 MODELS

PISTONS (ORIGINAL & REPLACEMENT):—Pistons graded for size in .0003" steps and marked by one or two color marks below pin bosses within piston skirt. Paper sticker on replacement pistons indicates piston size and cylinder bore for which intended. Pistons fitted in .010" oversize blocks are all low limit .010" oversize (see Replacement Piston table). All replacement pistons furnished with pins fitted. See table below for piston size for all bore diameters.

PISTONS (1939):—'Dome head' type pistons have been modified by cutting dome back 1/32" from piston edge, increasing land clearance to .023-.030" (40), .026-.033" (60, 80, 90), and relieving top edge of skirt (at horizontal slot).

NOTE—These pistons used on 1938 engines after Eng. No. 3530562 (40), 3524480 (60, 80, 90).

CYLINDER BORE SIZES:—Original production (new engine) bore size indicated on '37-39 engines by number and color of paint marks on lower crankcase flange, under gasket, in line with each cylinder (not uniform for all cylinders of one block). See table below for sizes and markings. On engines where engine number followed by dash, all cylinders are .010" oversize.

Series 40—Original Production

Piston diam. 3 3/32", #1399803 ('36), 1394063 ('37), 1394421 ('38), 1394590 ('39).

CONTINUED FROM PRECEDING PAGE

1939 MODELS

ROCKER ARMS & COVERS:—Rocker arms are mounted on tubular shaft and held against side of shaft brackets by spring installed on shaft between adjacent rocker arms. Shaft retained in brackets by pilot setscrew installed in top of #2 bracket. When installing rocker arms, make certain that lug on side of arm at adjusting screw end is toward bracket (all rocker arms Series 40, intake rocker arms Series 60, 80, 90). Exhaust rocker arms for Series 60, 80, 90 are straight (no offset) and do not have reference lug.

Rocker Arm Clearance—.002-.004".

Rocker Arm Lubrication Connection:—Metering restriction for oil feed to hollow rocker arm shaft located in cylinder head (can be distinguished from previous threaded sleeve fitting by turning groove on center of hexagonal head) and oil pipe fitted directly into top of #1 bracket. #1 and #2 brackets are same part and shaft pilot screw is self-tapping type. NOTE—This type design used on late 1938 engines.

Rocker Arm Cover:—Covers interchangeable with 1938 except that center stud not used on 1939 engines (plug center stud hole if 1938 cover used on 1939 engine, remove center stud if new cover used on 1938 engine, studs for new cover are ⅜" shorter and must be used with cover).

1937-38-39 MODELS

REPLACEMENT MAIN BEARINGS:—Unfinished—Furnished with .014" (diameter) extra babbitt stock which must be line reamed to size (Tool HM-517).

Finished Sets—Furnished in sets of 5 only which are finish reamed as a set (must not be used singly).

Series 40 (1939) Bearings—The rear main bearing oil seal on 39-40 same as type used on 39-60, 80, 90. Series 40 replacement bearings not interchangeable with 1938 type for this reason (60, 80, 90 bearing sets interchangeable 1937-38-39).

1936-39 MODELS

OIL PUMP (1939):—New type drive. Slot in pump shaft engages tongue on end of distributor shaft (distributor shaft only pinned to drive gear).

Drive Clearances—Drive shaft bearing .001-.0025". Drive gear backlash .003-.005".

Pump Gear Clearances—Idler gear bearing .001-.0025". Backlash .003-.006". End Clearance .0005-.004".

1938 MODELS

CLUTCH PEDAL RETURN SPRING:—Used on 38-60, 80, 90. Over-center type connected to angular link (attached to lower end of clutch pedal) and by eye-bolt and nut to transmission support (60), front frame cross-member (80, 90). Over-center design allows spring pressure to be exerted to help hold pedal down with clutch disengaged and out with clutch engaged. Spring overall length 6 21/32" (60), 8¾" (80, 90).

Adjustment—Angular link self-positioned on pedal shaft. Only adjustment is nut on eye-bolt which must be turned up as far as possible to give proper spring tension of 200 lbs.

IMPORTANT—Spring tension must always be relieved (by backing off eye-bolt nut) before disconnecting clutch linkage.

1939 MODELS

ENGINE & REAR AXLE ALIGNMENT (40, 60):—New type drive (Inclined engine, front propeller shaft, frame mounted Universal Joint Ball) requires that engine and Universal Joint ball alignment must be accurately maintained for smooth and quiet operation. If alignment required by incorrect engine, rear axle, or universal removal, or if new frame installed, align engine as follows (NOTE—frame center-line marked on all frames at bottom rear flange of center cross-member plate).

Engine Installation:—Install engine mountings leaving all bolts finger-tight. Install engine, securely tighten bolts holding front support to front engine mountings, start (do not tighten) bolts holding engine to rear mountings. Attach rear axle to rear of transmission, tighten attaching screws (rear springs must not support car, support axle lightly at ball joint with jack, make certain that upward pressure not sufficient to affect alignment). Shift rear of engine sideways to align center mark on frame with mark on torque ball outer retainer (cold chisel marks), tighten front and rear engine mountings on frame. Check to see that flywheel housing contacts both rear engine mountings (use plain washers as shims, if required, to secure contact), tighten bolts holding engine on rear mountings.

Torque Ball Installation:—Install torque ball mounting assembly (mounting bracket and stud) on each rear leg of frame 'X' member with corrugated side of outer torque ball mounting washer (between frame and retainer) toward frame member. Loosen locknut on outer end of each torque ball mounting stud, adjust studs so that mounting washer is in solid contact with outer torque ball retainer but without exerting any pressure, tighten locknut on each stud partly (do not fully tighten locknut until after nut on opposite end of stud securely tightened). Install inner torque ball mounting washer (corrugated side toward frame member), lockwasher, and nut on each stud (do not tighten nut). Connect rear chassis springs and radius rod, install separate jack directly under each rear spring seat and allow jacks to support full weight of rear end of car. Tighten nuts on inner end of each torque ball mounting stud securely, then tighten torque ball mounting stud locknuts.

1939 MODELS

ENGINE ALIGNMENT (80, 90):—Install and align engine as directed for Series 40, 60 above. Special torque ball installation and alignment procedure not required. See Transmission Steady Rest adjustment directions below.

1938 MODELS

TRANSMISSION STEADY REST MOUNTING:—Transmission support at universal joint housing is part of engine mounting. Consists of cross-member bolted at each end to leg of frame X-member and secured to universal joint housing, together with positioning brace rod secured between support and lower center plate of frame X-member.

Adjustment—Bolt holes in frame and support slotted. Centering shims between frame and support provide adjustment at this point. Center screw (40) and two nuts (60, 80, 90) of support-to-universal joint housing must be tight up against spacer. Support must be adjusted so that no upward tension placed on transmission. Adjust positioning brace rod (nut on rod on each side of support) so that no tension placed on rod.

1939 MODELS

TRANSMISSION STEADY REST (80, 90):—Transmission support at universal joint housing which is part of engine mounting. Consists of cross-member bolted to leg of 'X' member at each end and to universal joint housing at center. A positioning brace rod is connected between the steady rest and the lower center plate of the 'X' member.

Adjustment—Bolt holes in frame and support are slotted and shims installed at each of support for centering. Make certain that shims in place when installing steady rest, tighten nuts on two center bolts up tight against spacer, adjust steady rest so that no upward tension placed on transmission, adjust brace rod so that it is tight with no tension placed on rod.

1937-38-39 MODELS

BRAKE ASSEMBLY REMOVAL FOR WORK ON FRONT SUSPENSION:—To facilitate work and avoid necessity for bleeding wheel cylinder, proceed as follows:

40, 60—Remove wheel, disconnect tie rod ball stud, remove hub and drum assembly, free backing plate and wire assembly to frame (without disturbing brake shoe assembly or brake line).

80, 90—Remove wheel, disconnect tie rod ball stud, loosen one caster adjuster cap screw ½ turn (do not disturb other cap screw), remove upper caster adjuster bolt nut and lower caster adjuster nut, remove complete brake assembly (with steering knuckle, hub, and drum assembly) as a unit, wire assembly to frame.

ENGINE NUMBER:—Stamped on right side of upper crankcase well above oil filler.

ENGINE SPECIFICATIONS:—Eight cylinder 'I' or overhead valve type.
Bore—2 15/16" (50), 3 1/16" (60).
Stroke—4¼" (50), 4⅝" (60).
Displacement—230.4 cu. ins. (50), 272.6 cu. ins. (60).
Rated Horsepower—27.61 (50), 30.2 (60).
Developed Horsepower—At 3200 R.P.M. (50), 3000 R.P.M. (60) for each year and each head as follows:

Model	Comp. Ratio	1932	1933
50	4.84-1	78.5	83
50	5.25-1	82.5	86
60	4.84-1	89	91
60	5.25-1	95	97

Compression Ratio—See table above. Low Comp. head (4.84-1) std. 1932, Optl 1933. High Comp. head (5.25-1) Std. 1933, Optl. 1932. See note below.
Compression Pressure—Approximately 86 lbs. (4.84-1 head), 92 lbs. (5.25-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

CYLINDER HEAD NOTE:—Same head used with thin gasket for high compression, and with special thick gasket (steel spacer insert) for low compression. H.C. engines marked by red label and mark 'HC' on valve rocker cover. Use only 9" wrench in tightening down heads to avoid distorting cylinder bores.

PISTONS:—Light weight cast-iron, relieved at pin bosses. 1933 type electroplated (tin plated) after finishing and cannot be ground. Recondition cylinder bores to take standard oversize pistons. Length 3½" (50), 3 13/32" (60).
Weight—25 ozs. (50), 26¾ ozs. (60).
Removal—Pistons and rods removed from below.
NOTE—Pistons #3 to 8 can be removed without removing counterweights by setting counterweights ahead of piston and rotating shaft as pistons are withdrawn on side opposite camshaft. To remove #1 and #2, take off balancer by taking out castellated nuts and washers on retaining bolts and taking out balancer halves. Do not remove spring banks and seats.
Clearance—.0015" (50), .00175" (60). See Fitting Pistons.
Replacement Pistons:—Finished pistons furnished .001", .005", .010", .015", .030" oversize.
See Buick Special Shop Notes for Replacement Anolite Pistons for use on these models.
Fitting New Pistons:—Use feeler stock ½" wide between piston and cylinder wall to check clearance. Piston should pass through bore of own weight on .00125" (50), .0015" (60) feeler and hold own weight on .002" (50), .00225" (60).
Installing Pistons:—Pin hole in piston offset 3/64". Install pistons with offset toward camshaft.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin (1932). Additional oil control ring below pin (1933). Oil ring grooves drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (top)	⅛"	.010-.015"	.0015-.003"
Comp. (#2)	⅛"	.010-.015"	.001-.0025"
Oil Control ('32)	3/16"	.007-.015"	.001-.0025"
Oil Control ('33)	5/32"	.007-.015"	.001-.0025"

NOTE—New rings electro-plated in 1933.

PISTON PIN:—Diameter ¾" (50), 13/16" (60). Pin is hollow and is clamped in rod. Pin bosses in piston bronze bushed.
NOTE—Use only 5½" wrench in tightening pin clamp bolt in rod to avoid distorting pin or damaging piston bushings.
Pin Fit in Piston Bushing—.0002-.0004" clearance.

CONNECTING ROD:—Length—9" (50), 9¾" (60).
Weight—32 ozs. (50), 39.5 (60).
Crankpin Journal Diameter—2⅛" (50), 2 3/16" (60).
Lower Bearing—Spun babbitt type integral with rod and cap. Shims used.
Clearance—.001-.002". Sideplay .005-.009".
Adjustment:—Shims provided. Do not file rods or caps.
Installing Rods:—Lower bearings offset. Install rods with mark on cap pointing to nearest main bearing (narrow half of bearing toward main bearing).

CRANKSHAFT:—Five bearing. Bolted counterweights.
Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4, 2½", #5, 2 9/16".
Bearing Type—Removable steel-backed, babbitt-lined.
Clearance—.001-.002".
Adjustment:—Shims provided. Do not file bearing caps. New bearings assembled with .000-.002" projection above face to insure contact and must be line-reamed.
End Thrust:—Taken by center main bearing. End-play .004-.007" total (1/32" clearance at each end for other bearings).

CAMSHAFT:—Five bearing (50), six bearing (60). Helical gear drive.
Bearing Diameters (50)—#1, 2 9/32"; #2, 2 7/32"; #3, 1 59/64"; #4, 1⅞"; #5, 1 21/32".
Bearing Diameters (60)—#1, 2 9/32"; #2, 2 7/32"; #3, 2 5/32"; #4, 2 3/32"; #5, 2 1/32"; #6, 1 21/32".
Bearing Type—Removable steel-backed, babbitt-lined bushings.
Clearance—.0005-.0025"(front), .0005-.0035"(others).
Timing Gears:—Crankshaft gear Steel. Camshaft gear Textolite. Backlash between gears .0005-.0015".
NOTE—Camshaft gears marked +1S furnished for service which are .001" thicker on pitch circle and will reduce backlash by this amount. If backlash is excessive after installation of this gear, replace both gears as a set.
Camshaft Setting:—Gears are marked. Mesh marked tooth opposite marked space on other gear.

VALVES:—	Head Dia.	Stem Dia. '32	Stem Dia. '33
Intake (50)	1 15/32"	.3407-.3417"	same
Exhaust(50)	1 11/32"	.3392-.3402"	.3403-.3411"
Intake (60)	1 9/16"	.3715-.3725"	same
Exhaust (60)	1 7/16"	.370 -.371 "	.3711-.3719"

	Seat Angle	Lift	Stem Clearance
Intake (50)	45°	.340"	.0015-.0035"
Exhaust (50)	45°	.340"	.003 -.005 "
Intake (60)	45°	.335"	.0015-.0035"
Exhaust (60)	45°	.335"	.003 -.005 "

Tappet Clearance—.008" all valves, engine hot.

Valve Springs:—Double springs used on all valves. Pressure for each spring as follows:

Model	Valve Closed	Valve Open
50 (inn.)	7½-12½ lbs.@1 13/16"	25-30 lbs.@1 15/32"
50 (out.)	25-30 lbs.@1 15/16"	74-80 lbs.@1 19/32"
60 (in.)	11½-16½ lbs.@1 21/32"	49-55 lbs.@1 5/16"
60 (out.)	28-33 lbs.@1 15/16"	82-89 lbs.@1 19/32"

Valve Timing:—See Camshaft Setting above.

Opening and Closing Points
Intake Valves—Open 13½° BTDC Close 65°46' ALDC
Exhaust Valves—Open 68½° BLDC Close 43½° ATDC

Timing Points
Intake Valves—Open 4½° BTDC Close 54° ALDC
Exhaust Valves—Open 58° BLDC Close 30° ATDC
NOTE—Timing point indicates valve .004" off seat with .008" tappet clearance.
To Check Valve Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve movement. Check tappet clearance. Valve should be .180" open with pistons #1 and 8 on top dead center.

LUBRICATION:—Pressure type. Gear type oil pump mounted in crankcase. Oil temperature regulator mounted on right hand side of crankcase.
Normal Oil Pressure—35 pounds.
Oil Pressure Relief Valve—On oil pump. Not adjustable. Operates at 35 lbs. Second non-adjustable by-pass valve located in temperature regulator.
Crankcase Capacity—(50) 9 qts. (dry), 7 qts. (refill). (60) 11½ qts. (dry), 8 qts. (refill).

CLUTCH:—Own Make. Single plate, dry disc type with 'Wizard' automatic clutch control. See article in Clutch Section for relining and assembling directions.
Facings—Moulded and woven type, 2 required. Thickness .135". Inside Diameter 6¼". Outside Diameter 9½" (50), 9⅞" (60).
Adjustment (50)—Free movement of clutch pedal should be 1". Adjust whenever this is less than ¾". To adjust, loosen locknut and turn adjusting screw on clutch link at rear of clutch pedal shaft.
Adjustment (60)—Clearance between pedal and underside of toeboard should be ¼". To adjust, loosen locknut and turn stopscrew at lower end of pedal behind shaft. Free movement of pedal should be 1". To adjust, turn nut on forward end of clutch release rod at release fork.

STEERING:—Steering Gear:—Jacox Worm-and-Sector type (50), Worm-and-Roller type (60). See article in Steering Section for complete adjustment instructions.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.
Kingpin Inclination—9½° (50), 8° (60) crosswise.
Caster—1½-2°. Correct by inserting wedge shims between spring and spring pad on axle. Shims furnished ½° (220408), ¾° (188128), 1° (220409).
Camber—1-2°. No adjustment.
Toe In—5/32-7/32" measured at center of tire tread. Model 50 adjusted in usual manner by loosening clamp bolts and turning tie rod. Model 60 tie rod has right hand threads on both ends and is adjusted by turning rod in or out of one end socket.
Steering Shock Eliminator—Should be adjusted so that distance from front face of spring horn (under bolt head) to rear face of washer under nut is 3 17/32".

BRAKES:—Service—Own Make. 'Controlled Servo' four wheel mechanical type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diameter—12" (50), 14" (60).
Lining—Width 1¾". Thickness 3/16". Length per wheel one piece 6 15/32", one piece 12 9/16" (50); one piece 7 49/64", one piece 14 27/64" (60) per wheel.
Hand Brake Adjustment:—See Service Brakes above.

ENGINE NUMBER:—Stamped on right side of upper crankcase wall above oil filler.

ENGINE SPECIFICATIONS:—Eight cylinder, 'T' or overhead valve type.
Bore—3 5/16". **Stroke**—5".
Displacement—344.8 cubic inches.
Rated Horsepower—35.12.
Developed Horsepower—For each year and head as follows:

Comp. Ratio	R.P.M.	1932	1933
L.C.—4.40-1	2900	104 HP	105 HP.
H.C.—4.80-1	3200	113 HP	113 H.P.

Compression Ratio—See table above. Low compression head (4.40-1) standard 1932, Optl. 1933. High compression head (4.84-1) standard 1933, Optl. 1932. See note below.
Compression Pressure—Approximately 80 lbs. (4.40 head), 86 lbs. (4.84 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

CYLINDER HEAD NOTE:—Same head used with thin gasket for high compression, and with special thick gasket (steel spacer insert) for low compression. H.C. engines marked by red label and mark 'HC' on valve rocker cover. Use only 9" wrench in tightening down heads to avoid distorting cylinder bores.

PISTONS:—Light weight cast-iron, relieved at pin bosses. 1933 type electroplated (tin-plated) after finishing and cannot be ground. Recondition cylinder bores to take standard oversize pistons. Length 3 29/32".
NOTE—Buick Anolite (aluminum alloy) pistons available for use on these models.
Weight—30½ ozs.
Removal—Pistons and rods removed from below.
NOTE—Pistons #3 to 8 can be removed without removing counterweights by setting counterweights ahead of piston and rotating shaft as pistons are withdrawn on side opposite camshaft. To remove #1 and #2, take off balancer by taking out castellated nuts and washers on retaining bolts and taking out balancer halves. Do not remove spring banks and seats.
Clearance—.002". See Fitting pistons.

Replacement Pistons:—Finished pistons furnished .001", .005", .010", .015", .030" oversize.
See Buick Special Shop Notes for Replacement Anolite Pistons for use on these models.

Fitting New Pistons:—Use feeler stock ½" wide between piston and cylinder wall to check clearance. Piston should pass through bore of own weight on .0015" feeler and hold own weight on .00225".

Installing Pistons:—Pin hole in piston offset 3/32". Install pistons with offset toward camshaft.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin (1932). Additional oil control ring below pin (1933). Oil ring grooves drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp (top)	⅛"	.010-.015"	.0015-.003"
Comp. (#2)	⅛"	.010-.015"	.001-.0025"
Oil Contr. ('32)	3/16"	.007-.015"	.001-.0025"
Oil Contr. ('33)	5/32"	.007-.015"	.001-.0025"

NOTE—New rings electro-plated in 1933.

PISTON PIN:—Diameter ¾" (50), 13/16" (60). Pin is hollow and is clamped in rod. Pin bosses in piston bronze bushed.
NOTE—Use only 5½" wrench in tightening pin clamp bolt in rod to avoid distorting pin or damaging piston bushings.
Pin Fit in Piston Bushings—.0002-.0004" clearance.

CONNECTING ROD:—Length 11".
Weight—49½ ozs.
Crankpin Journal Diameter—2⅜".
Lower Bearing—Spun babbitt type integral with rod and cap. Shims used.
Clearance—.001-.002". Sideplay .005-.009".

Adjustment:—Shims provided. Do not file rods or caps.

Installing Rods:—Lower bearings offset. Install rods with mark on cap pointing to nearest main bearing (narrow half of bearing toward main bearing).

CRANKSHAFT:—Five bearing. Bolted counterweights.
Journal Diameters—#1, 2 9/16"; #2, 2⅝"; #3, 2 11/16"; #4, 2¾"; #5, 2 13/16".
Bearing Type—Removable steel-backed, babbitt-lined.
Clearance—.001-.002".

Adjustment:—Shims provided. Do not file bearing caps. New bearings assembled with .000-.002" projection above face to insure contact and must be line-reamed.

End Thrust:—Taken by center main bearing. End-play .004-.007" total (1/32" clearance at each end for other bearings).

CAMSHAFT:—Six bearing, Helical gear drive.
Bearing Diameters—#1, 2 9/32"; #2, 2 7/32"; #3, 2 5/32"; #4, 2 3/32"; #5, 2 1/32"; #6, 1 21/32".
Bearing Type—Removable steel-backed, babbitt-lined bushings.
Clearance—.0005-.0025"(front), .0005-.0035"(others).

Timing Gears:—Crankshaft gear Steel. Camshaft gear Textolite. Backlash between gears .0005-.0015".
NOTE—Camshaft gears marked +1S furnished for service which are .001" thicker on pitch circle and will reduce backlash by this amount. If backlash is excessive after installation of this gear, replace both gears as a set.

Camshaft Setting:—Gears are marked. Mesh marked tooth opposite marked space on other gear.

VALVES:—

	Head Diam.	Stem Diam '32	Stem Diam. '33
Intake	1 25/32"	.3715-.3725"	same
Exhaust	1 19/32"	.370 -.371 "	.3711-.3719"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.340"	.0015-.0035"
Exhaust	45°	.340"	.003 -.005"

Tappet Clearance—.008" all valves, engine hot.

Valve Springs:—Double springs used on all valves. Pressure for each spring as follows:

Model	Valve Closed	Valve Open
(Inner)	11½-16½ lbs.@1 21/32"	49-55 lbs.@1 5/16"
(Outer)	28-33 lbs.@1 15/16"	82-89 lbs.@1 19/32"

Valve Timing:—See Camshaft Setting above.

Opening & Closing Points		
Intake Valves	Open 13½° BTDC.	Close 65°46' ALDC
Exh. Valves	Open 68½° BLDC.	Close 43½° ATDC

'Timing' Points		
Intake Valves	Open 4½° BTDC.	Close 54° ALDC
Exh. Valves	Open 58° BLDC.	Close 30° ATDC

NOTE—Timing point indicates valve .004" off seat with .008" tappet clearance.

To Check Valve Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve movement. Check tappet clearance. Valve should be .180" open with pistons #1 and 8 on top dead center.

LUBRICATION:—Pressure type. Gear type oil pump mounted in crankcase. Oil temperature regulator mounted on right hand side of crankcase.
Normal Oil Pressure—35 lbs.
Oil Pressure Relief Valve—On oil pump. Not adjustable. Operates at 35 lbs. Second non-adjustable by-pass valve located in temperature regulator.
Crankcase Capacity—12½ qts. (dry), 9 qts. (refill).

CLUTCH:—Own make. Double plate, dry disc type with 'Wizard' automatic clutch control. See article in Clutch Sect. for relining and assembling directions.
Facings—Woven type, 4 required. Thickness .135". Inside Diameter 6½". Outside diameter 9".
Adjustment—Clearance between pedal and underside of toeboard should be ¼". To adjust, loosen locknut and turn stopscrew at lower end of pedal behind shaft. Free movement of pedal should be 1". To adjust, turn nut on forward end of clutch release rod at release fork.

STEERING:—**Steering Gear.** Saginaw Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'T' beam section front axle with Reverse Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—1½-2°. Correct by inserting wedge shims between spring and spring pad on axle. Shims furnished ½° (220408), ¾° (188128), 1° (220409).
Camber—1-2°. No adjustment.
Toe In—5/32-7/32" measured at center of tire tread. Tie rod has right hand threads on both ends and is adjusted by turning rod in or out of one end socket.
Steering Shock Eliminator—Should be adjusted so that distance from front face of spring horn (under bolt head) to rear face of washer under nut is 3 17/32".

BRAKES:—**Service**—Own Make. 'Controlled Servo' four wheel mechanical type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diamter—15".
Lining—Width 2". Thickness 3/16". Length per wheel one piece 15 27/64", one piece 8¼".
Hand Brake:—See Service Brake Adjustment.

SERIAL NUMBER:—First number, 2,777,650. On right front side of frame front cross member.

ENGINE NUMBER:—Stamped on right side of crankcase above oil filler.

ENGINE:—**Own Model 40.** Eight cylinder, In line, 'I' or overhead valve type.
Bore—3 3/32". **Stroke**—3⅞".
Piston Displacement—233 cubic inches.
Rated Horsepower—30.63.
Developed Horsepower—93 at 3200 R.P.M.
Compression Ratio—5.45-1. No optional ratios.
Compression Pressure—121 lbs. at 1000 R.P.M. or 100 lbs. at cranking speed (100 R.P.M.).

Pistons:—Electro-plated cast-iron. Pistons are tin-plated after finishing and cannot be ground. Refinish cylinders to take replacement pistons furnished .001", .005", .010", .015", .020", .030" oversize. *See Buick Special Shop Notes for Replacement Anolite Pistons for use on these models.*
Weight—26.0 ozs (stripped), 32.8 ozs. (with rings, pin, and pin bushings).
Removal—Pushrods must be removed before head can be taken off. Pistons and rods removed from above.
Clearance—.0075" top. .00175" bottom.
Fitting New Pistons—Use feeler stock ½" wide. Piston should pass through cylinder of own weight with .0015" feeler and should hold own weight with .00225" feeler.
Installing Pistons—Pin hole in piston offset 3/64". Install pistons with offset toward camshaft side

Piston Rings:—Four rings per piston, two compression rings, one oil control ring above piston pin, one oil control ring below pin. Both oil ring grooves drilled radially with ten ⅛" drain holes.

Ring	Width	End Gap	Wall Thickness	Side Clearance
Comp. (top)	⅛"	.010-.015"	.140"	.0015-.003"
Comp. (lower)	⅛"	.010-.015"	140"	.001-.0025"
Oil Cont. (all)	5/32"	.010-.018"	.135"	.001-.0025"

Piston Pin:—Diameter 13/16". Length 2 11/16". Pin is clamped in rod. Pin bosses in piston are bronze-bushed.
Clearance in Piston Bushings—.0003-.0005" radial.
NOTE—Use only 5½" wrench in tightening pin bolt to avoid damage to hollow pin.

Connecting Rod:—Weight 27.0 ozs. Length 7¼"
Lower Bearing Diameter—2".
Lower Bearing—Spun-babbittt lined type.
Clearance—.001-.002". Sideplay .005-.008".
Adjustment—Shims. Do not file bearing caps.

Installing Rods—Assemble rods with marks on rods and caps together and pointing toward rear of engine.
NOTE—Ground bolts used for cap and rod assembly and must not be replaced by any other type bolt. 45° rod caps used on '34 models only.

Crankshaft:—Five bearing type. Integral counterweights.
Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4 2½"; #5 2 9/16".
Bearing Type—Steel-backed, babbitt-lined. Bearings are dowelled in crankcase and cap and are assembled with .000-.002" projection above cap and crankcase to insure contact. New bearings should be line-reamed after installing.
Clearance—.001-.002". 1/32" clearance at each end (except #3).
Adjustment—Shims provided. Do not file caps.
End Thrust—Taken by #3 (center) bearing. Endplay .004-.007".

Camshaft:—Five bearings. Non-adjustable chain drive.
Journal Diameters—#1 2 1/32"; #2 2"; #3 1 31/32"; #4 1 15/16"; #5 1 21/32".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—(#1) .0005-.0025"; (all others) .0005-.0035"; Endplay .002-.006" (all bearings).
Timing Chain—Morse '34, Link Belt '35, Width 1". Pitch .500". Length 25" or 49 links.
Camshaft Setting—Both sprockets marked at space between teeth. Two teeth on chain also marked. Mesh chain so that marked tooth is opposite marked space on each sprocket.

Valves:	Head dia.	Stem Dia.	Seat Angle
Intake	1 17/32"	.3715-.3725"	45°
Exhaust	1 11 /32"	.3711-.3719"	45°

	Valve Lift	Stem Clearance
Intake	.334"	.0015-.0035"
Exhaust	.339"	.0021-.0039"

NOTE—Exhaust valve stems are copper-plated.

Tappet Clearance—.008" all valves—engine hot.

Valve Springs—Double springs used on all valves.

Pressure	Inner Springs	Length
Valve Closed—20-25 lbs.		**1 21/32"**
Valve Open—55-61 lbs.		1 5/16"

Pressure	Outer Springs	Length
Valve Closed—35-40 lbs.		**1 15/16"**
Valve Open—96-103 lbs.		**1 19/32"**

	Total Spring Pressure	Length
Valve Closed	55-65 lbs.	1 15/16"
Valve Open	151-164 lbs.	1 19/32"

Valve Timing—See camshaft setting above.
Intake Valves—Open 4½° BTDC. Close 54° ALDC.
Exhaust Valves—Open 57½° BLDC. Close 21° ATDC
NOTE—Above figures represent 'timing points'

To Check Valve Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve opening (gauge rod should rest on valve spring cap). Valve should be .163" open when dead center mark for pistons #1 and 8 is visible in flywheel inspection hole.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—35 lbs.
Oil Pressure Relief Valve—Operates at 35 lbs. No adjustment.
Oil Pump Gear Clearances—.003-.006" (back lash), .0005-.004" (end clearance).
Capacity and Oil—7 qts. (dry), 6 qts. (refill). Use SAE. #30 (100 to 30°F.), #20-W (30 to 0°F.), #10-W (0° to —15°F.).

CLUTCH:—**Own Make.** Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement or lash of clutch pedal should be 1". To adjust, turn nut on clutch release yoke.
Clutch Facings—Molded asbestos. 2 required, 6⅛" I.D., 9⅜" O.D., .130-.136" thick.
NOTE—Driven disc is segmented and care must be taken not to distort disc in removing and installing facings. Driven disc assembly should be balanced to with in ¼" ounce (static) with new facings by grinding outer edge of disc. Release lever heights must be equal within .005".

STEERING:—**Front Suspension**—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Caster—2¾-3¼° with car weight on wheels. See note below for preliminary checks. Toe-in must be adjusted first. To adjust caster, loosen nuts on upper adjuster bolt and adjuster shaft (on inner side of steering knuckle support, back off locknuts on adjustment screws at top of steering knuckle support (these screws bear against caster adjustment bolt). Turn rear adjusting screw out (counter-clockwise) and front screw in (clockwise) an equal amount to increase caster angle, or turn rear adjusting screw in (clockwise) and front screw out (counter-clockwise) to decerease caster angle. Adjustment range is 6°. Both screws must be tight against adjuster bolt. Tighten adjusting screw locknuts, adjuster bolt nut, and adjuster shaft nut. One turn of adjusting screws changes caster angle 1°.
Camber—¼° with car weight on wheels. See note below. No adjustment provided.
Toe In—⅛-3/16". Roll car ahead one complete revolution before checking toe-in. Adjust by changing length of each tie rod equally. With wheels in straight-ahead position, intermediate steering arm must be midway between rear lower support arm bolts. Correct by equalizing length or tie rods, check toe-in, and steering wheel position. Turning tie rods ⅛ turn changes toe-in 5/64".
NOTE:—All front wheel checks should be made with frame height corrected (by adding load or or raising frame) to following figures:
Distance from bumper seat on frame front cross member to top of lower support arm, 4 9/16"
Distance from frame to top of spring clip at rear—4 dr. Sedan and 2 dr. Sedan, 6⅞" with spare at rear or 7¼" with fender wells. Coupes, 6¼" with spare tire at rear or 6⅝" with fender wells.
Steering Gear:—Saginaw Worm-and-Roller type with center steering. See article in Steering Section for adjustments.

BRAKES:—**Service**—Bendix mechanical, Duo-Servo, single anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment procedure.
Drum Diameter—12". Pressed steel type.
Lining—Moulded. Width 1¾". Thickness 3/16". Length 25⅞" per wheel.
Clearance—.010" at heel and toe of each shoe.

SERIAL NUMBER: — First number, 2,706,453 ('34), 2,777,650 ('35). On right frame side rail in front of shock absorber.

ENGINE NUMBER:—Stamped on right upper crankcase wall above oil filler.

ENGINE:—**Own Model 50.** Eight cylinder, In line, 'I' or overhead valve type.
Bore—2 31/32". **Stroke**—4¼"
Piston Displacement—235.3 cubic inches.
Rated Horsepower—28.2.
Developed Horsepower—88 at 3200 R.P.M.
Compression Ratio—5.25-1. No optional ratios.
Compression Pressuse—114 lbs. at 1000 R.P.M. or 97 lbs. at cranking speed (135 R.P.M.).

Pistons:—Electro-plated, cast-iron. Pistons are tin-plated after finishing and cannot be ground. Refinish cylinders to take replacement pistons furnished .001", .005", .010", .015", .020", .030" oversize. Length, 3½".
See Buick Special Shop Notes for Replacement Anolite Pistons for use on these models.
Weight—25.0 ozs. (stripped), 31.2 ozs. (with rings, pin, and bushings).
Removal—At bottom of engine. Remove pistons #3 to 8 on side opposite camshaft without removing counterweights by setting counterweights ahead of piston and rotating shaft as pistons are removed Take off balancer by removing castellated nuts and washers on retaining bolts and slipping off balancer halves as shaft is rotated before removing #1 and 2 pistons. Do not remove spring banks and seats from balancer halves.
Clearance—.0077" top, .0017" bottom.
Fitting New Pistons—Use feeler stock ½" wide. Piston should pass through cylinder of its own weight with .00125" feeler and hold its own weight with .002" feeler.
Installing Pistons—Pin hole in piston offset 3/64". Install pistons with offset toward camshaft side.

Piston Rings:—Four rings per piston, two compression rings, one oil control ring above pin, one oil control ring below pin. Both oil ring grooves drilled radially with ten ⅛" oil drain holes.

Ring	Width	End Gap	Wall Thickness	Side Clearance
Comp. Top	⅛"	.010-.015"	.130"	.0015-.003"
Comp.Lower	⅛"	.010-.015"	.130"	.001-.0025"
Oil Cont. All	5/32"	.010-.018"	.130"	.001-.0025"

Piston Pin:—Diameter ¾". Length 2 17/32". Pin is clamped in rod. Pin holes in piston bronze-bushed.
Clearance in Piston Bushings—.0003-.0005".
NOTE—Use only 5½" wrench in tightening pin bolt to avoid damage to hollow pin.

Connecting Rod:—Weight 32 ozs. Length, 9".
Lower Bearing Diameter—2⅛".
Lower Bearing—Spun-babbitt lined type.
Clearance—.001-.002": Sideplay, .005-.008".
Adjustment—Shims. Do not file bearing caps.
Installing Rods—Connecting rod lower bearings offset. Assemble rods with marks on caps pointing toward nearest main bearing.
NOTE—Ground bolts used for cap and rod assembly and must not be replaced by any other type bolt.

Crankshaft:—Five bearing type. Bolted-on counterweights.
Journal Diameters—#1, 2 5/16"; #2 2⅜"; #3 2 7/16"; #4 2½"; #5 2 9/16".
Bearing Type—Steel-backed, babbitt-lined type. Bearings are dowelled in crankcase and cap and are assembled with .000-.002" projection above cap and crankcase to insure contact. New bearings should be line-reamed after installing.
Clearance—.001-.002". 1/32" clearance at each end (except #3).
Adjustment—Shims provided. Do not file caps.
End Thrust—Taken by #3 (center bearing. Endplay, .004-.007".

Camshaft:—Five bearing. Helical gear drive.
Journal Diameters—#1 2 9/32"; #2 2 7/32"; #3 1 59/64"; #4 1⅞"; #5 1 21/32".
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—(#1) .0005-.0025"; (all others) .0005-.0035"; endplay (all bearings) .002-.006".
Timing Gears—Crankshaft and generator gears Steel. Camshaft gear Textolite.
Gear Backlash—.0005-.0015" for new gears.
Adjustment—Install '+1S' replacement camshaft gear (with teeth .001" thicker on pitch circle) when backlash exceeds .0015". If lash is still excessive, install complete set new gears.
Camshaft Setting—Gears are marked. Mesh marked tooth opposite marked space between teeth.

Valves:—	Head Dia.	Stem Dia.	Seat Angle
Intake	1 15/32"	.3407-.3417"	45°
Exhaust	1 11/32"	.3403-.3411"	45°

	Valve Lift	Stem Clearance
Intake	.340"	.0007-.0015"
Exhaust	.340"	.0010-.0019"

NOTE—Exhaust valve stems are copper-plated.

Tappet Clearance (Lash)—.008" hot (all valves).
Valve Springs—Double springs on all valves.

	Total Spring Pressure	Length
Valve Closed	45-55 lbs.	1 15/16"
Valve Open	132-145 lbs.	1 19/32"

Valve Timing—See Camshaft Setting above.
Intake Valves open 4½° BTDC. Close 54° ALDC.
Exhaust Valves open 58° BLDC. Close 30° ATDC.
NOTE:—Above figures represent 'timing' points

To Check Valve Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve movement (gauge rod should rest on valve spring cap). Set tappet clearance at .008". Valve should be .180" open when dead center mark for pistons #1 and 8 is visible in inspection hole.

Lubrication:—Pressure type. Gear type pump located in crankcase.
Oil Pressure—35 lbs.
Oil Pressure Relief Valve—Not adjustable. Operates at 35 lbs.
Capacity and Oil—9 quarts (dry), 7 quarts (refill). Use SAE. #40 (100°F. and above), #30 (100°-30°F.), #20 (30°-0°F.), #10 (0° to —15°F.).

CLUTCH:—**Own Make.** Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement or lash of clutch pedal should be 1". Adjust by turning nut on forward end of clutch release rod. Clearance between pedal and under side of toeboard should be ⅛". Adjust by turning stopscrew at rear of clutch pedal shaft.
Clutch Facings—Woven type, 2 required. 6¼" I.D., 9½" O.D., .130-.135" thick.
NOTE:—When replacing linings, driven plate assembly should be balanced within ¼ oz. (static) by grinding outer edge of disc. Release lever height must be equal within .005". Use J-285B gauge plate in setting up levers.

STEERING:—**Front Suspension**—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4°53' crosswise.
Caster—1¾-2¼° with car weight on wheels. See note below for preliminary checks. Toe In must be correct. To adjust caster, loosen nuts holding upper and lower knuckle support yokes to outer ends of control arms, loosen clampbolt on top of knuckle support, turn upper support bolt clockwise (facing forward—head of bolt to rear) to increase caster angle, or counter-clockwise to decrease caster angle. Tighten clamp bolt, tighten upper and lower yoke retaining nuts. Turning support bolt three complete turns will change caster angle 1°. Caster of both front wheels must be equal within ⅛°.
Camber—¼° with car weight on wheels. See note below. To adjust, insert special washers between upper knuckle support yoke and upper control arm to increase camber, or between lower knuckle support yoke and lower control arm to decrease camber. A 1/16" washer will change camber 1/3°.
Toe In—5/32-7/32". Roll car ahead one complete revolution of wheels before checking toe in. Adjust by changing length of each tie rod equally. With wheels in straight-ahead position, intermediate steering arm must be midway between rear lower support arm bolts. Correct by equalizing length of the tie rods, recheck toe-in, and steering wheel position. Turning tie rod ⅛ turn changes toe-in 1/16".
NOTE—All front wheel checks should be made with frame height correct (distance from top of jack pad to lower face of frame cross member must be equal within 1/64" on both sides of car.

Steering Gear:—Saginaw Worm-and-Roller type with center steering. See article in Steering Section for adjustments.

BRAKES:—**Service**—Own make. Internal-expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies all four service brakes. See article in Brake Section.
Drum Diameter—12". Cast-iron.
Lining—Woven and Moulded. Width 1¾". Thickness 3/16". Length 25⅛" per wheel.
Hand Brake Adjustment:—See Service Brakes.
Power Unit:—Own make. Consists of (1) vacuum control valve (mounted on inner side of left frame side member below brake pedal) linked to brake pedal pull rod and (2) power cylinder (mounted on right side of flywheel housing) linked directly to brake cross shaft rod operating front and rear wheel brakes. See article in Brake Section.

SERIAL NUMBER:—First number, 2,706,453 ('34), 2,777,650 ('35). On right frame siderail in front of front shock absorber.

ENGINE NUMBER:—Stamped on right side of upper crankcase wall above oil filler.

ENGINE:—**Own. Models 60 and 90.** Eight cylinder, In line, 'I' or overhead valve type.

Bore & Stroke—3 3/32 x 4⅝" (60), 3 5/16 x 5" (90).

Displacement—278.1 (60), 344.8 (90) cubic inches

Rated Horsepower—30.63 (60), 35.12 (90).

Developed Horsepower—100 (60), 116 (90) at 3200 R.P.M.

Compression Ratio—5.25-1 (60), 4.95-1 (90).

Compression Pressure—114 lbs. (60), 103 lbs. (90) at 1000 R.P.M. or 114 lbs. (60), 95 lbs. (90) at cranking speed (120 R.P.M.).

Pistons:—Electro-plated cast-iron. Pistons are tin-plated after finishing and cannot be ground. Refinish cylinders to take replacement pistons furnished .001", .005", .010", .015", .020", .030" oversize. Piston length, 3 13/16" (60), 3 29/32" (90).

See Buick Special Shop Notes for Replacement Anolite Pistons for use on these models.

Weight—26.7 ozs. (60), 30.4 ozs. (90) stripped or 33.6 ozs. (60), 38.4 ozs. (90) with rings, pin and bushings.

Removal—At bottom of engine. Remove pistons #3 to 8 on side opposite camshaft without removing counterweights by placing adjacent counterweights ahead of pistion and revolving shaft as piston is withdrawn. Take off balancer by removing castellated nuts and washers and slipping off balancer halves as shaft is rotated before taking out pistons #1 and 2. Do not remove spring banks and seats from balancer halves.

Clearance—Top .0075" (60), .0097" (90), Bottom .00175" (60), .002" (90).

Fitting New Pistons—Use feeler stock ½" wide. Piston should pass through cylinder of own weight with .0015" feeler and hold own weight with .00225" feeler.

Installing Pistons—Pin hole in piston offset 3/64" (60), 3/32" (90). Install pistons with offset toward camshaft side.

Piston Rings:—Four rings per piston, two compression rings, one oil control ring above pin, one oil ring below pin. Both oil ring grooves drilled radially with ten ⅛" oil drain holes.

Ring	Width	End Gap	Wall Thickness	Side Clearance
Comp. Top	⅛"	.010-.015"	.140"	.0015-.003"
Comp. Lower	⅛"	.010-.015"	.140"	.001-.0025"
Oil Cont. (60)	5/32"	.010-.018"	.135"	.001-.0025"
Oil Cont. (90)	5/32"	.010-.018"	.145"	.001-.0025"

Piston Pin:—Diameter 13/16" (60), ⅞" (90). Length 2 11/16" (60), 2 27/32" (90). Pin is clamped in rod. Pin holes in piston are bronze-bushed.

Clearance in Piston Bushing—.0003-.0005".

NOTE—Use only 5½" wrench in tightening pin bolt to avoid damage to hollow pin.

Connecting Rod:—Weight 39.65 ozs. (60), 49.5 ozs. (90). Length 9¾" (60), 11" (90).

Lower Bearing Diameter—2 3/16" (60), 2⅜" (90).

Lower Bearing Type—Spun-babbitt lined type.

Clearance—.001-.002". Sideplay, .005-.008".

Adjustment—Shims. Do not file bearing caps.

Installing Rods—Lower bearings are offset. Assemble rods with marks on rods and caps toward nearest main bearing.

NOTE—Ground bolts used for cap and rod assembly and must not be replaced by any other type bolt.

Crankshaft:—Five bearings. Bolted-on counterweights.

Journal Diameters—(60) #1 2 5/16", #2 2⅜", #3 2 7/16", #4 2½", #5 2 9/16". (90) #1 2 9/16", #2 2⅝", #3 2 11/16", #4 2¾", #5 2 13/16".

Bearing Type—Steel-backed, babbitt-lined type.

Clearance—.001-.002". 1/32" clearance at each end (except #3).

Adjustment—Shims. Do not file bearing caps.

End Thrust—Taken by #3 (center) bearing. End-play .004-.007".

Camshaft:—Six bearings. Helical gear drive.

Bearing Type—Steel-backed, babbitt-lined type.

Clearance—(#1) .0005-.0025"; (all others) .0005-.0035"; (endplay—all bearings) .002-.006".

Timing Gears—Crankshaft and generator gears Steel. Camshaft gear Textolite.

Gear Backlash—.0005-.0015" for new gears.

Adjustment—Install '+1S' replacement camshaft gear (with teeth .001" thicker on pitch circle when backlash exceed .0015". If lash is still excessive, install complete set of new gears.

Camshaft Setting—Gears are marked. Mesh marked tooth opposite marked space between teeth.

Valves:—

Engine	Head Diameter	Stem Diameter
60—Intake	1 9/16" (overall)	.3715-.3725"
60—Exhaust	1 7/16" "	.3711-.3719"
90—Intake	1 25/32" "	.3715-.3725"
90—Exhaust	1 19/32" "	.3711-.3719"

	Seat Angle	Lift	Stem Clearance
Intake-all	45°	.340"	.0007-.0015"
Exhaust-all	45°	.340"	.0010-.0019"

NOTE:—Exhaust valve stems are copper-plated.

Tappet Clearance (Lash)—.008" hot (all valves).

Valve Springs—Double springs used.

Inner Spring—	Pressure	Length
Valve Closed	20-25 lbs.	1 21/32"
Valve open	55-61 lbs.	1 5/16"
Outer Spring—	Pressure	Length
Valve Closed	35-40 lbs.	1 15/16"
Valve Open	96-103 lbs.	1 19/32"

Valve Timing—See Camshaft Setting above.

Intake Valves open 4½° BTDC. Close 54° ALDC.
Exhaust Valves open 58° BTDC. Close 30° ALDC.

NOTE:—Above figures represent 'timing' points when valve is .004" off seat with .008" lash.

To Check Valve Timing—Set up micrometer gauge over #2 or #7 exhaust valve so as to measure valve movement (gauge rod should rest on valve spring cap). Set tappet clearance at .008". Valve should be .180" open when dead center mark for pistons #1 and #8 is visible in inspection hole.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Oil Pressure—35 pounds.

Oil Pressure Relief Valve—Not adjustable.

Capacity—Dry, 11½ quarts (60), 12½ quarts (90). Refill, 8 quarts (60), 9 quarts (90).

Recommended Oil—Use SAE. #40 (100°F. and above), #30 (100°-30°F.), #20 (30°-0°F.), #10 (0° to —15°F.).

CLUTCH:—**Own Make.** (60) Single plate, dry disc type. All specifications and data same as for Series 50 except facing outside diamter 9⅞". (90) Double plate, dry disc type. See data below. No adjustment required for wear.

See article in Mechanical Equipment Section for data.

Pedal Adjustment—Free movement or lash of clutch pedal should be 1". Adjust by turning nut on forward end of clutch release rod. Clearance between pedal and toeboard should be ⅛". Adjust by turning stopscrew at rear of pedal shaft.

Clutch Facings—Woven type, 4 required, 6½" I.D., 9" O.D., .135-.140" thick.

NOTE:—Center driving plate is bolted to flywheel and acts as a clutch pilot. Driven discs are clamped betwen center driving plate and front and rear driving plates when clutch is engaged.

Clutch Assembly—With clutch disassembled, check length of four center plate driving pins from face of center plate to end of pins on lever side. If lengths are not equal within .0005" replace plate. With one clutch driven plate tight against centerplate, check total clearance between center plate and other driven plate. Clearance must be equal within .005" from one side to the other. Correct by installing brass or steel shims between driven disc and clutch hub on low side, passing hub bolt through hole in shim and locking bolt by peening nut on flat side of bolt. Total clearance between discs and center plate should be .020-.045". Clearance between release levers and driving pins should be .001". With this clearance, release bearing run-out should be less than .005" with bearing resting solidly on all levers. Correct by grinding bottom of release lever clip slightly on levers which are low.

STEERING:—**Front Suspension**—Independent, linked parallelogram type with coil springs. See Series 50 for complete data and Caster, Camber, and Toe In adjustments.

See article in Mechanical Equipment Section for data.

Kingpin Inclination—4°53' crosswise.

Caster—1-1¼° with car weight on wheels.

Camber—¼° with car weight on wheels.

Toe In—5/32-7/32".

Steering Gear:—Saginaw Worm-and-Double Roller type with center steering. See article in Steering Section for adjustments.

BRAKES:—**Service**—Own make. Internal-expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies all four service brakes. See article in Brake Section.

Drum Diameter—14". Cast-iron.

Lining—Woven and Moulded. Width 1¾". (60), 2¼" (90). Thickness 3/16". Length 28 27/32" per wheel.

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—See Buick Model 50 (1934-35).

ENGINE NUMBER:—First number—4-2,995,239. Stamped on right front of engine block above oil filler.

ENGINE SPECIFICATIONS:—**Type**—8 cylinder 'I' head.
Bore—3 3/32". **Stroke**—3 7/8".
Displacement—233 cubic inches.
Rated Horsepower—30.63 (AMA).
Developed Horsepower—93 at 3200 R.P.M.
Compression Ratio & Pressure—5.55-1 Std. cast-iron head. Pressure 118 lbs. at 1000 R.P.M. or approximately 98 lbs. at cranking speed of 135 R.P.M.
Vacuum Gauge—Steady reading of 18-20" of HG. with engine idling at 400-450 R.P.M. or 7-8 M.P.H.
NOTE—To drop oil pan for work on engine, first remove front stabilizer by disconnecting frame brackets and stabilizer links at lower control arms.

PISTONS:—Buick Anolite, Aluminum alloy, 'T' slot, cam ground type with anodized finish (special hard oxide bearing surface). Pistons cannot be ground. Recondition cylinders to take finished replacement pistons.
Weight—13.75 ozs. (stripped), 19.6 ozs. (with rings).
Length—3 4/5".
Removal—Pistons and rods removed from above.
Clearance—Top of skirt .0021", Limits .0018-0024".

Replacement Pistons:—*See Buick Shop Notes*

Fitting New Pistons:—Check piston with micrometer gauge at point just below 'T' slot junction on both sides of vertical slot and below lower end of slot. Finish cylinder bore to size giving correct clearance. Feeler gauge ½" wide can be used on side opposite slot. Piston should fall of own weight with .0015" feeler and hold on .00225" feeler with engine temperature of 65-75° F.

Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston all above pin. Both oil ring grooves drille radially with ten ⅛" drain holes.
NOTE—Narrow heat deflector groove located above top ring groove. No ring fitted in this groove.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.010-.015"	.002-.0035"
Oil Cont.	5/32"	.010-.018"	.0015-.003"

NOTE—Compression rings must be placed with undercut corner down. Service rings furnished .010", .020", .030" oversizes.

PISTON PIN:—Diameter 13/16". Length 2 11/16".
Pin is clamped in rod. Oversize pins not furnished. Pins are fitted and furnished with all replacement pistons.
Pin Fit in Piston—.0003-.0004" clearance at 70° F. or a hard push thumb fit.
NOTE—Use only 5½" wrench in tightening pin bolt to avoid damage to hollow pin.

CONNECTING ROD:—Weight 29.37 ozs. Length 7¼".
Crankpin Journal Diameter—2".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0008-.0018". Sideplay .005-.010".

Bearing Adjustment:—Shims. Do not file rods or caps.

Installing Rods:—Cap and rod must line up. Install rod with mark toward rear of engine and oil spray hole in lower bearing upper half toward camshaft.
NOTE—Special diameter ground bolts used for cap and rod assembly. Common bolts must not be used.

CRANKSHAFT:—Five bearing. Integral counterweights.
Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4, 2½"; #5, 2 9/16".
Bearing Type—Steel-backed, babbitt-lined. Bearings dowelled in crankcase and cap and assembled with .000-.002" projection. Line-ream new bearings.
Clearance—.0007-.0022". 1/32" clearance at each end.

Bearing Adjustment:—Shims provided. Do not file caps.

End Thrust:—Taken by #3 (center) bearing. Endplay .004-.007".

CAMSHAFT:—Five bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1 25/32".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0005-.0035". Endplay .002-.006".

End Thrust:—Taken by thrust plate assembled between front bearing and camshaft sprocket.

Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 24½" or 49 links.
Installing Chain—Install chain (new) with ¼"-⅜" slack midway between sprockets. Replace when sideplay exceeds 2" or chain becomes noisy.

Camshaft Setting:—Sprockets marked. Mesh chain on sprockets so that brass washers on link pins are opposite marked teeth on each sprocket. These chain markers are 10 links apart.

VALVES:—Head Diameter Stem Diameter Length
Intake .....1 17/32".....3715-.3725".....4.5"
Exhaust ....1 11/32".....3711-.3719".....4.037"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.332-.338"	.0015-.0035"
Exhaust	45°	.332-.338"	.0021-.0039"

NOTE—Exhaust valve stems are copper-plated.
Tappet Clearance—.015" all valves. Engine hot.

Valve Guides:—Press fit in head. Install with undercut end up and finish ream to size for correct clearance.

Valve Springs:—Double springs on all valves.

Inner Spring	Pressure	Length
Valve Closed	21½-26½ lbs.	1 21/32"
Valve Open	53-59 lbs.	1 5/16"
Outer Spring	**Pressure**	**Length**
Valve Closed	31-36 lbs.	1 15/16"
Valve Open	81½-87½ lbs.	1 19/32"

Total Spring Pressure
Closed—52½-62½ lbs. Open—134½-146½ lbs.
NOTE—Tapers on valve keys and spring caps have been increased.

Valve Lifters—Single piece cast-iron. Lifter guide holes reamed in crankcase. Clearance .0005-.0025".

Rocker Arms:—Drop-forged fitted with steel-backed, babbitt-lined bushings.
Clearance—.0005"-.0025".
NOTE—When installing bushings see that oil hole to push rod ball lines up with hole in bushing.

Valve Timing:—See Camshaft Setting above. 'Timing Point' when valve .004" off seat with .015" tappet clearance or lash customarily listed instead of actual opening and closing points.

Timing Points
Intake Valves ....Open 8° BTDC.....Close 58° ALDC.
Exhaust Valves ..Open 58° BLDC.....Close 23° ATDC.

Opening and Closing Points
Intake Valves ..Open 21½° BTDC..Close 71° ALDC.
Exhaust Valves Open 71° BLDC..Close 36½° ATDC.

Valve Timing Check—#2 or #7 exhaust valve should be .150" open (actual opening as measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' at indicator in inspection hole in right front face of flywheel housing above starter.

LUBRICATION:—Pressure system from oil pump in crankcase through main oil channel in right side of crankcase.

Oil Pump:—Helical gear type in crankcase driven through tongue-and-slot coupling from camshaft gear. Ignition timing not disturbed by removal of oil pump.

Oil Pump Clearances—*See Buick Shop Notes.*

Normal Oil Pressure:—10 lbs. idling, 45 lbs. maximum at 35 M.P.H. and above.

Oil Pressure Regulator:—Operates at 45 lbs. Mounted on oil pump. Not adjustable.

Crankcase Capacity:—7 qts. (dry), 5 qts. (refill).

CLUTCH:—Own Make. Borg & Beck Driven Member. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 9½". Thickness .133".
Adjustment—Clearance between pedal and underside of toeboard must be ⅜-⅝". To adjust, loosen locknut and turn setscrew at rear of pedal above pedal stop. Free movement of clutch pedal must be ¾-1". To adjust, take out clevis pin connecting clutch rod and clutch fork, turn clevis on rod. One full turn of clevis changes pedal free movement 7/16".
Removal:—Remove rear end (take out flange bolts in front end of torque tube, pull rear end back to disconnect drive shaft at splined joint at universal), remove transmission and transmission support (support transmission at rear while it is being withdrawn), take off clutch pan, take out clutch mounting screws (turning all screws out evenly).
NOTE—When installing transmission support which is bolted to universal joint flange and frame, see that centering shims are in place at each end and that cross member is positioned so that rubber insulation is not compressed (bolt holes are slotted).

STEERING:—Steering Gear—Saginaw Worm-and-Double Roller type with center steering. See article in Steering Section for adjustments.

Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for description and adjustment procedure.
NOTE—To avoid damage to brake assembly when work is being done on front suspension, disassemble as follows: Remove wheel, disconnect tie rod ball stud, loosen one caster adjuster capscrew one-half turn (do not disturb second capscrew or caster adjustment will be lost), remove upper and lower caster adjuster bolt nuts, remove complete steering knuckle, hub and brake drum assembly and wire to frame to prevent damage to brake hose.
King Pin Inclination—3½-4½° crosswise.
Camber—Minus ¼ to plus ¾°. No adjustment.
Caster—3-3½°. Adjustable.
Toe In—1/16-⅛". Adjustable.
Steering Geometry (Toe Out)—Outer wheel turned 20°, inner wheel 23¼° plus or minus ¾°. Check tie rod ends, steering arms, kingpin, or wheel bearings for loosesness.

BRAKES:—Service—Buick (Bendix) Hydraulic Single-anchor four-wheel type. Hand lever applies rear wheel brakes. See article in Brake Section for complete adjustment procedure.
NOTE—Wheel cylinder diameters are 1 1/16" (front wheels), 1" (rear wheels) and no part of assembly is interchangeable between front and rear wheels.
Brake Drum Diameter—12".
Brake Lining—Ferodo BZ-10 Woven type. Width 1¾". Thickness 3/16". Length 9 15/16" (primary shoe), 12¾" (secondary shoe) or 22 11/16" per wheel.
Brake Clearance—.010" plus or minus .002" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brake Adjustment.

ENGINE NUMBER:—First number (60) 6-3001000, (80) 8-3001000, (90) 9-3001000. Stamped on right front of engine block above oil filler.

ENGINE SPECIFICATIONS:—**Type** 8 cylinder 'T' head. **Bore**—3 7/16". **Stroke**—4 5/16". **Displacement**—320.2 cubic inches. **Rated Horsepower**—37.81 (AMA). **Developed Horsepower**—120 at 3200 R.P.M. **Compression Ratio & Pressure**—5.45-1 Std. cast-iron head. Pressure 108 lbs. at 1000 R.P.M. or approximately 95 lbs. at cranking speed of 135 R.P.M. **Vacuum Gauge**—Steady reading of 18-20" of HG. with engine idling at 400 R.P.M. or 7-8 M.P.H.
NOTE—To drop oil pan for work on engine, first remove front stabilizer by disconnecting frame brackets and stabilizer links at lower control arms.

PISTONS:—Buick Anolite, Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide bearing surface). Pistons cannot be ground. Recondition cylinders to take finished replacement pistons.
Weight—22.56 ozs. (stripped), 25.81 ozs. (with rings). **Length**—4.16".
Removal—Pistons and rods removed from above.
Clearance—Top of Skirt .0023". Limits .0020-.0026".
Replacement Pistons:—*See Buick Shop Notes.*
Fitting New Pistons:—Check piston with micrometer gauge at point just below 'T' slot junction on both sides of vertical slot and below lower end of slot. Finish cylinder bore to take replacement pistons. Feeler gauge ½" wide can be used on side opposite slot. Piston should fall of own weight with .0015" feeler and lock on .00225" feeler. Engine at 65-75° F.
Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston all above pin. Both oil ring grooves drilled radially with ten ⅛" drain holes.
NOTE—Narrow heat deflector groove located above top ring groove. No ring fitted in this groove.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.010-.015"	.002 -.0035"
Oil Cont.	5/32"	.010-.018"	.0015-.003"

NOTE—Install compression rings with undercut corner down. Rings furnished .010", .020", .030" oversize.

PISTON PIN:—**Diameter** ⅞". **Length** 2 31/32".
Pin is clamped in rod. Oversize pins not furnished. Pins fitted and furnished with all new pistons.
Pin Fit in Piston—.0003-.0004" clearance at 70°F. or a hard thumb push fit.
NOTE—Use only a 5½" wrench in tightening pin bolt to avoid damage to hollow pin.

CONNECTING ROD:—**Weight** 36.49 ozs. **Length** 8¼".
Crankpin Journal Diameter—2¼".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0008-.0018". Sideplay .005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Cap and rod must line up. Install rod with mark toward rear and oil spray hole in lower bearing upper half toward camshaft.
NOTE—Special diameter ground bolts used for cap and rod assembly. Common bolts must not be used.

CRANKSHAFT:—Five bearing. Integral counterweights.
Journal Diameters—#1, 2 9/16"; #2, 2⅝"; #3, 2 11/16", #4, 2¾"; #5, 2 13/16".
Bearing Type—Steel-backed, babbitt-lined. Bearings dowelled in crankcase and cap and assembled with .000-.002" projection. Line ream new bearings.
Clearance—.0007-.0022".
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Taken by #3 (center) bearing. Endplay .004-.007".
NOTE—Torsion balancer mounted ahead of fan pulley. Dynamically balanced before assembling and must be replaced as a complete assembly.

CAMSHAFT:—Five bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1 25/32".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0005-.0035". Endplay—.002-.006".
End Thrust:—Taken by thrust plate assembled between front bearing and camshaft sprocket.
Timing Chain:—Link-Belt. Width 1¼". Pitch .500". Length 50 links or 25".
Installing Chain—Install new chain with ¼"-⅜" slack midway between sprockets. Replace when sideplay is over 2" or chain becomes noisy.
Camshaft Setting:—Sprockets marked. Mesh chain on sprockets so that brass washers on link pins are opposite marked teeth on each sprocket. These chain markers are 10 links apart.

VALVES:—

Head Diameter	Stem Diameter	Length
Intake 1 25/32"	.3715-.3725"	4 ⅝"
Exhaust 1 7/16"	.3711-.3719"	4 1/5"

Seat Angle	Lift	Stem Clearance
Intake 45°	.347-.348"	.0015-.0035"
Exhaust 45°	.347-.348"	.0021-.0039"

NOTE—Exhaust valve stems are copper-plated.
Tappet Clearance—.015" all valves engine hot.
Valve Guides:—Press fit in head. Installed with undercut end up and finish reamed to size for correct stem clearance.
Valve Springs:—Double springs on all valves.

Inner Spring	Pressure	Length
Valve Closed	21½-26½ lbs.	1 21/32"
Valve Open	53-59 lbs.	1 5/16"
Outer Spring	**Pressure**	**Length**
Valve Closed	31-36 lbs.	1 15/16"
Valve Open	81½-87½ lbs.	1 19/32"

Total Spring Pressure
Closed—52½-62½ lbs. **Open**—134½-146½ lbs.
NOTE—Tapers on valve keys and spring caps have been increased and parts are now copper-plated.
Valve Lifters:—Single piece cast-iron. Lifter guide holes reamed in crankcase. Clearance—.0005-.0025".
Rocker Arms:—Drop-forged fitted with steel-backed babbitt-lined bushings. **Clearance**—.0005-.0025".
NOTE—When installing bushings, see that oil hole to push rod ball lines up with hole in bushing. Water connections at each end of oil temperature regulator must be drawn down at same time rocker arm shaft brackets are bolted down. Run engine and check fittings for water leaks before replacing rocker arm valve cover.
Valve Timing:—See Camshaft Setting above. 'Timing Point' when valve .004" off seat with .015" tappet clearance or lash customarily listed instead of actual opening and closing points.

Timing Points

Intake Valves	Open 14° BTDC	Close 71° ALDC.
Exhaust Valves	Open 56° BLDC	Close 25° ATDC.

Opening and Closing Points

Intake Valves	Open 27° BTDC	Close 84½° ALDC.
Exhaust Valves	Open 69° BLDC	Close 38½° ATDC.

Valve Timing Check—#2 or #7 exhaust valve should be .155" open (actual opening is measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' at indicator in inspection hole in right front face of flywheel housing above starter.

LUBRICATION:—Pressure system with oil pump in crankcase and main oil channel on right side.
Oil Pump:—Helical gear type in crankcase. Driven through tongue-and-slot coupling from camshaft. Ignition timing not disturbed by oil pump removal.
Oil Pump Clearances—*See Buick Shop Notes.*
Normal Oil Pressure:—10 lbs. idling, 45 lbs. maximum at 35 M.P.H. and above.
Oil Pressure Regulator:—Operates at 45 lbs. Mounted on oil pump. Not adjustable.
Oil Temperature Regulator:—Consists of water tube running through rocker arm shaft. Disassemble and remove oil deposit in tube after considerable mileage. See Rocker Arms above for assembly directions.
Crankcase Capacity:—10 qts. (dry), 8 qts. (refill).

CLUTCH:—**Own Make. Long Driven Member.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven type, 2 required. Inside Diam. 6½". Outside Diam. 11". Thickness .137".
Adjustment—Clearance between pedal and underside of toeboard must be ⅜-⅝". To adjust, loosen locknut and turn setscrew at rear of pedal above pedal stop. Free movement of clutch pedal must be ¾-1". To adjust, turn adjusting nut on rod connecting pedal and clutch throwout yoke. One full turn of adjusting nut changes pedal lash 5/16".
Removal:—Remove rear end (take out flange bolts in front end of torque tube, pull rear end back to disconnect drive shaft at splined joint at universal), remove transmission and transmission support (support transmission at rear while it is being withdrawn), take off clutch pan, take out clutch mounting screws (turning all screws out evenly).
NOTE—When installing transmission support which is bolted to universal joint flange and frame, see that centering shims are in place at each end and that cross member is positioned so that rubber insulation is not compressed (bolt holes are slotted).

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type with center steering. See article in Steering Section for adjustments.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for description and adjustment procedure.
NOTE—To avoid damage to brake assembly when work is being done on front suspension, disassemble as follows: Remove wheel, disconnect tie rod ball stud, loosen one caster adjuster capscrew one-half turn (do not disturb second capscrew or caster setting will be lost), remove upper and lower caster adjuster bolt nuts, remove complete steering knuckle, hub and brake drum assembly and wire to frame to prevent damage to brake hose.
Kingpin Inclination—4½-5½° crosswise.
Camber—Minus ¼° to plus ¾°. No adjustment.
Caster—1¾-2¼°. Adjustable. **Toe In**—1/16-⅛".
Steering Geometry—Outer wheel turned 20°, inner wheel (60, 80) 23¾°, (90) 24° plus or minus ¾°.

BRAKES:—Buick (Bendix) Hydraulic, Single Anchor, four-wheel type. Hand lever applies rear brakes. See article in Brake Section for complete data.
NOTE—Wheel cylinder diameters are 1¼" (front), 1 3/16" (rear) and no part of assembly is interchangeable between front and rear wheels.
Brake Drum Diameter—12".
Brake Lining—Ferodo BZ-10 Woven type. Width 2". Thickness 3/16". Length 9 15/16" (primary shoe), 12¾" (secondary shoe) or 22 11/16" per wheel.
Brake Clearance—.010" plus or minus .002" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—1st number 4-3,166,225. On boss on lower right hand side of engine block behind starter. NOTE—Dash (-) following engine number indicates that engine factory-equipped with .010" oversize pistons.

ENGINE SPECIFICATIONS:—8 cylinder, 'I' head.
Bore—3 3/32". **Stroke**—4⅛".
Displacement—248 cubic inches.
Rated Horsepower—30.63 (S.A.E.).
Developed Horsepower—100 at 3200 R.P.M.
Compression Ratio & Pressure—Std. 5.7-1 cast-iron head. Pressure 97-103 lbs. at 150 R.P.M. Check pressure with engine warm, all plugs removed, throttle wide open and starter cranking engine.
Vacuum Reading—18-20" steady at 7-8 M.P.H.
NOTE—To drop oil pan, remove front stabilizer.

PISTONS:—Buick anolite, aluminum alloy, 'T' slot, cam ground type. Refinish cylinders to take finished replacement pistons. **Length**—3 4/5".
Weight—13.75 ozs. (stripped), 19.6 ozs. (with rings).
Removal—Pistons and rods removed from above.
Clearance—Top of skirt .0021". Limits .0018-.0024".
Original Bore Size & Replacement Pistons:—*See Buick Special Shop Notes.*
Fitting New Pistons:—Micrometer Gauge—Check at points just below 'T' slot junction on both sides of vertical slot and below lower end of slot, finishing cylinder bore to size giving correct clearance.
Feeler Gauge—Use ½" wide stock inserted on side opposite slot. Piston should pass on .0015" feeler and hold on .00225" with engine at 65-75° F.
Installing Pistons:—Slot to left or away from camshaft.

PISTON RINGS:—2 compression, 2 oil control rings per piston all above pin. Oil ring grooves drilled radially with 5/32" drain holes (10 top groove, 8 lower groove).

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.010-.015"	.0015-.003"
Oil Control	3/16"	.010-.015"	.0015-.003"

NOTE—'Top' mark on compression rings to top of piston. Rings furnished .010", .020", .030" oversize.

PISTON PIN:—Diameter—13/16". **Length**—2 11/16".
Pin clamped in rod. Oversize pins not furnished. Replacement pistons have pins fitted.
Pin Fit in Piston—.0003-.0004" at 70° F. or light finger push.
NOTE—5½" wrench only, for use on pin bolt.

CONNECTING ROD:—Weight—29.92 ozs. **Length**—7⅝".
Crankpin Journal Diameter—2".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0008-.0018". Sideplay .005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Align cap and rod. Marks to rear of engine, oil spray hole toward camshaft.
NOTE—⅜" diameter ground bolts used for rod and cap assembly. Common bolts must not be used.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4, 2½"; #5, 2 9/16".
Bearing Type—Steel-backed, babbitt-lined. Bearings dowelled in crankcase and cap and assembled with .000-.002" projection. Line-ream new bearings.
Clearance—.0007-.0022". 1/32" clearance at each end.
Replacement Bearings—*See Buick Shop Notes.*
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Center (#3) bearing. Endplay .004-.007".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0005-.0035". Endplay .002-.006".
End Thrust:—Taken by thrust plate assembled between front bearing and camshaft sprocket.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 24½" or 49 links.
Installing Chain—¼ - ⅜" play midway between sprockets on new chain. 1" maximum play if worn.
Camshaft Setting:—Mesh chain with copper-plated washers opposite mark on each sprocket. Chain markers 10 links apart.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.3715-.3725"	4 5/16"
Exhaust	1 11/32"	.3711-.3719"	4 3/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.348"	.0015-.0035"
Exhaust	45°	.342"	.0021-.0039"

NOTE—Intake valves 'streamlined' tulip type.
Tappet Clearance—.015" all valves, engine hot.
Valve Guides:—Press fit in head. Install undercut end up. Finish ream to size for correct clearance.
Valve Springs:—Double springs on all valves.

Inner Spring	Pressure	Length
Valve Closed	15½-20½ lbs.	1 21/32"
Valve Open	45-51 lbs.	1 5/16"
Outer Spring	**Pressure**	**Length**
Valve Closed	26½-31½ lbs.	1 15/16"
Valve Open	63-73 lbs.	1 19/32"

Total Spring Pressure
Closed—42-52 lbs. Open—112-124 lbs.
NOTE—Valve springs not interchangeable with earlier models.
Valve Lifters:—Single piece,, cast-iron. Lifter guide holes reamed in crankcase. Clearance .0005-.0025".
Rocker Arms:—Drop-forged fitted with steel-backed, babbitt-lined bushings. Rocker arm shaft brackets are of aluminum alloy.
Clearance—.001-.003".
NOTE—Install bushings with oil holes aligned.

VALVE TIMING:—See Camshaft Setting above. 'Timing Point' when valve .004" off seat with .015" tappet clearance or lash customarily listed instead of actual opening and closing points.
Timing Points
Intake Valves—Open 13° BTDC. Close 68° ALDC.
Exhaust Valves—Open 55° BLDC. Close 22° ATDC.
Opening and Closing Points
Intake Valves—Open 26° BTDC. Close 81½° ALDC.
Exhaust Valves—Open 68° BLDC. Close 35° ATDC.
Valve Timing Check:—#2 or #7 exhaust valve should be .145" open (actual opening as measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' lined up with indicator in inspection hole in right front face of flywheel housing above starter.

LUBRICATION:—Pressure with oil pump in crankcase.
Oil Pump:—Helical gear type driven through tongue-and-slot coupling from camshaft gear. Ignition timing not disturbed by removal of oil pump.
Oil Pump Clearances—*See Buick Shop Notes.*
Normal Oil Pressure:—45 lbs. at normal speeds.
Oil Pressure Regulator:—Operates at 45 lbs. Mounted on oil pump. Not adjustable.
Crankcase Capacity:—7 qts. (dry), 6 qts. (refill).

CLUTCH:—Own (with Long 10CF-CI driven member). Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required. I.D. 6". O.D. 10". Thickness .125".
Adjustment—Clearance between pedal and underside of toeboard must be ⅜-⅝". To adjust, loosen locknut and turn setscrew at rear of pedal, above pedal stop. Free movement—¾-1". To adjust take out clevis pin connecting clutch rod and clutch fork, turn clevis on rod. One full turn equal to 3/16" free movement.
Removal:—Remove transmission (see Transmission Removal below), take off clutch pan, screw out cover mounting screws evenly, remove assembly from below.

TRANSMISSION:—Buick. Synchro-mesh on second and high gears. All gears helical type.
See article in Mechanical Equipment Section for data.
Removal:—Hoist rear of car by frame, disconnect rear brake cables at equalizer bar and brake tube connection on torque tube at rear of X-member, remove spring seat U-bolts, flange bolts on front of torque tube, pull axle assembly back withdrawing propeller shaft from ball and universal joint. Remove transmission rear support and mounting bolts. Support at rear while withdrawing unit to avoid clutch plate distortion.
NOTE—Centering shims at frame ends must be in place when installing rear transmission support.

UNIVERSAL JOINT:—Spicer (Buick Design). Plain bearing type. 1 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Buick, semi-floating, hypoid gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.40-1.
Backlash—.008-.010". Shim adjustment.
Removal:—Axle shaft retained by horseshoe 'C' washer recessed in differential side gear. Remove housing cover, pinion shaft lockscrew, pinion shaft and spacer block, push axle shaft in, remove 'C' washer, withdraw shaft. For complete axle assembly removal see Transmission Removal (above) and disconnect rear spring shackles.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—Delco. Model 1945-A, B (front), 1713-A, B (rear). Double acting, piston type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-&-Double Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—To avoid damage to brake hose for work on front suspension proceed as follows: remove wheel, disconnect tie rod ball stud, remove drum, knuckle and steering knuckle support (as a unit), wire to frame. Removing shock absorber bolts allows absorber unit to shift (caster will not be disturbed).
Kingpin Inclination—3½-4½° crosswise.
Camber—Minus ¼° to plus 1°. Not adjustable.
Caster—¼° plus or minus ⅜°. Adjustable.
Toe In—0-1/16". Adjustable.
Steering Geometry (Toe Out)—Inner wheel turned 23¼°, outer wheel 20°, plus or minus ¾°.

BRAKES:—Service—Bendix Hydraulic, single anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameters: front 1 1/16", rear wheels 1". Front and rear assemblies not interchangeable.
Drum Diameter—12".
Lining—Ferodo BZ-10 woven. Length per wheel (front shoe 9 15/16", rear shoe 12¾"). Width 1¾". 3/16" thick.
Clearance—.010" plus or minus .002" heel and toe each shoe.
Braking Power—47% rear.
Hand Brake Adjustment:—See Service Brake (above).

ENGINE NUMBER:—First number (60) 6-3,176,225, (80) 8-3,176,225, (90) 9-3,176,225. Stamped on boss on lower right side of engine block behind starter.
NOTE—Dash (-) following engine number indicates engine factory-equipped with .010" oversize pistons.

ENGINE SPECIFICATIONS:—8 cylinder, 'I' head.
Bore—3 7/16". **Stroke**—4 5/16".
Displacement—320.2 cubic inches.
Rated Horsepower—37.81 (S.A.E.).
Developed Horsepower—130 at 3400 R.P.M.
Compression Ratio & Pressure—Std. 5.75-1 cast-iron head. Pressure 100-106 lbs. at 150 R.P.M. Check pressure with engine warm, all plugs removed, throttle wide open and starter cranking engine.
Vacuum Reading—18-20" steady at 7-8 M.P.H.
NOTE—To drop oil pan, remove front stabilizer.

PISTONS:—Buick Anolite, aluminum alloy, 'T' slot, cam ground type. Refinish cylinders to take finished replacement pistons. **Length**—4.161-4.163".
Weight—22.56 ozs. (stripped), 25.80 ozs. (with rings).
Removal—Pistons and rods removed from above.
Clearance—Top of skirt .0023". Limits .0020-.0026".
Original Bore Size & Replacement Pistons:—*See Buick Special Shop Notes.*
Fitting New Pistons:—Micrometer Gauge—Check at points just below 'T' slot junction on both sides of vertical slot and below lower end of slot, finishing cylinder bores to give correct clearance. **Feeler Gauge**—Use ½" wide stock inserted on side opposite slot. Piston should pass on .0015" feeler and hold on .00225" with engine at 65-75° F.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston all above pin. Oil ring grooves drilled radially with 5/32" drain holes (10 top groove 8 lower groove).

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.010-.015"	.0015-.003"
Oil Control	3/16"	.010-.015"	.0015-.003"

NOTE—Install compression rings with mark 'Top' toward the top of piston. Oversize rings furnished in sizes .010", .020", and .030" oversize.

PISTON PIN:—Diameter—⅞". **Length**—3 1/16"
Pin clamped in rod. Oversize pins not furnished. Replacement pistons have pins fitted.
Pin Fit in Piston—.0003-.0004" at 70° F. or light finger push.
NOTE—5½" wrench only, for use on pin bolt.

CONNECTING ROD:—Weight—38.43 ozs. **Length**—8¼".
Crankpin Journal Diameter—2¼".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0008-.0018". **Sideplay**—.005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Align cap and rod. Mark on rod and cap to rear of engine, oil hole toward camshaft.
NOTE—7/16" diameter ground bolts used for rod and cap assembly. Common bolts must not be used.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—#1, 2 9/16"; #2, 2⅝"; #3, 2 11/16"; #4, 2¾"; #5, 2 13/16".
Bearing Type—Steel-backed, babbitt-lined. Bearings dowelled in crankcase and cap.
Clearance—.0007-.0022".
Replacement Bearings—*See Buick Shop Notes.*
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—#3 (center) bearing. **Endplay** .004-.007"

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0005-.0035". Endplay—.002-.006".
End Thrust:—Taken by thrust plate assembled between front bearing and camshaft sprocket.
Timing Chain:—Link-Belt. Width 1¼". Pitch .500". Length 50 links or 25".
Installing Chain—¼-⅜" play midway between sprockets on new chain. 1" maximum play if worn.
Camshaft Setting:—Mesh chain with copper-plated washers opposite mark on each sprocket. Chain markers 10 links apart.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 25/32"	.3715-.3725"	4⅜"
Exhaust	1 7/16"	.3711-.3719"	4 7/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.347"	.0015-.0035"
Exhaust	45°	.348"	.0021-.0039"

NOTE—Intake valves 'streamlined' tulip type.
Tappet Clearance—.015" all valves, engine hot.
Valve Guides:—Press fit in head. Install undercut end up. Finish ream to size for correct clearance.
Valve Springs:—Double springs on all valves.

Inner Spring	Pressure	Length
Valve Closed	15½-20½ lbs.	1 21/32"
Valve Open	45-51 lbs.	1 5/16"
Outer Spring	**Pressure**	**Length**
Valve Closed	26½-31½ lbs.	1 15/16"
Valve Open	63-73 lbs.	1 19/32"

Total Spring Pressure
Closed—42-52 lbs. Open—112-124 lbs.
Valve Lifters:—Single piece, cast-iron. Lifter guide holes reamed in crankcase. Clearance .0005-.0025".
Rocker Arms:—Drop-forged fitted with steel-backed, babbitt-lined bushings. Rocker arm shaft brackets are of aluminum alloy (no oil temp. regulator).
Clearance—.001-.003".
NOTE—Install bushings with oil holes aligned.

VALVE TIMING:—See Camshaft Setting above. 'Timing Point' when valve .004" off seat with .015" tappet clearance or lash customarily listed instead of actual opening and closing points.

Timing Points
Intake Valves—Open 14° BTDC. Close 71° ALDC.
Exhaust Valves—Open 56° BLDC. Close 25° ATDC.

Opening and Closing Points
Intake Valves—Open 27° BTDC. Close 84½° ALDC.
Exhaust Valves—Open 69° BLDC. Close 38½° ATDC.

Valve Timing Check:—#2 or #7 exhaust valve should be .155" open (actual opening as measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' at indicator in inspection hole in right front face of flywheel housing above starter.

LUBRICATION:—Pressure with oil pump in crankcase.
Oil Pump:—Helical gear type driven through tongue-and-slot coupling from camshaft gear. Ignition timing not disturbed by removal of oil pump.
Oil Pump Clearances—*See Buick Shop Notes.*
Normal Oil Pressure:—45 lbs. at normal speeds.
Oil Pressure Regulator:—Operates at 45 lbs. Mounted on oil pump. Not adjustable.
Crankcase Capacity:—9 qts. (dry), 8 qts. (refill).

CLUTCH:—Own Make. Long Driven Member (11CF-CI)
Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required, 6½" I.D., 11" O.D., 9/64" thick.
Adjustment—Clearance between pedal and underside of toeboard must be ⅜-⅝". To adjust, loosen locknut, turn setscrew at rear of pedal above stop. Free movement of clutch pedal must be ¾-1". To adjust, turn nut on rod connecting pedal and yoke.
Removal:—Remove transmission (see Transmission Removal below), take off clutch pan, take out clutch cover mounting screws evenly, lower assembly.

TRANSMISSION:—Buick. Synchro-mesh on second and high gears. All gears helical type.
See article in Mechanical Equipment Section for data.
Removal:—Hoist rear of car by frame, disconnect rear brake cables at equalizer bar and brake tube connection on torque tube at rear of X-member, remove spring seat U-bolts, flange bolts on front of torque tube, pull axle assembly back withdrawing propeller shaft from ball and universal joint. Remove brake master cylinder, pedal support, transmission rear support and mounting bolts. Support at rear while withdrawing transmission.
NOTE—Replace centering shims in same position when installing rear transmission support.

UNIVERSAL JOINT:—Spicer. (Buick Design). Plain bearing type. One used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Buick. Semi-floating, hypoid (60 only), spiral bevel gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
NOTE—Bronze bushing used at front end of propeller shaft on Series 90 only.
Ratio—3.9-1 (60), 4.222-1 (80), 4.625-1 (90).
Backlash (Pinion & Ring Gear)—.008-.010". Shims.
Removal:—Axle shaft retained by horseshoe 'C' washer (60), nut and cotter pin (80, 90), recessed in differential side gear. Remove housing cover, pinion shaft lockscrew, pinion shaft and spacer block, push axle shaft in, remove 'C' washer (60), nut and cotter pin (80, 90), withdraw shaft. For complete axle assembly removal disassemble axle as outlined under Transmission Removal, disconnect rear spring shackles, and withdraw housing from under car.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—Delco. Model Nos. as follows:

	Model 60	Models 80, 90
Front	1945-A, B	1902-D, C
Rear	1713-A, B	1713-C, D

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear. Saginaw Worm-&-Double Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data. See Buick Special Shop Notes for brake assembly removal for work on Front Suspension.
Kingpin Inclination—3½-4½° (60), 4¼-5¼° (80), 4-5° (90).
Camber—Minus ¼° to plus 1°. No adjustment.
Caster—¼° plus or minus ⅜° (60), 0° plus or minus ⅜° (80, 90). Adjustable.
Toe In—0-1/16". Adjustable.
Steering Geometry—Outer wheel turned 20°, inner wheel 23¾° (60, 80), 24° (90) plus or minus ¾°.

BRAKES:—Service—Bendix Hydraulic, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
NOTE—For Model 60 specifications see Model 40. All data same except for lining width 2", on 60.
Wheel Cylinders—Diameters: front 1¼", rear wheels 1 3/16". Not interchangeable front and rear.
Drum Diameter—12" (80), 14" (90).
Lining—Woven (Ferodo BZ-10) type. Width 2". Thickness 3/16" (80), ¼" (90). Length per wheel front shoe 9 15/16" (80), 12 1/16" (90), rear shoe 12¾" (80), 14¾" (90).
Clearance—.010" + or — .002" at heel and toe.
Braking Power—47.4% rear.
Hand Brake Adjustment:—See Service Brake (above).

HOOD SIDE PANEL REMOVAL:—See Buick Shop Notes.
SERIAL NUMBER:—First number, 13219848 (Flint). 23238767 (South Gate, Calif.), 33245765 (Linden, N. J.). Stamped on top right frame side rail at dash.
ENGINE NUMBER:—First number 4-3396937. Stamped on boss on right side of crankcase above starter. NOTE—Dash (—) following engine number indicates engine equipped with .010" oversize pistons.
ENGINE SPECIFICATIONS:—8 cylinder, 'I' head.
Bore—3 3/32". **Stroke**—4⅛".
Displacement—248 cubic inches.
Rated Horsepower—30.63 (S.A.E.).
Developed Horsepower—107 at 3400 R.P.M.
Compression Ratio—6.15-1 cast-iron head.
Compression Pressure—110-118 lbs. at cranking speed. Cylinders should be uniform within 6 lbs.
Vacuum Reading—18-20" steady at 7-8 M.P.H.
PISTONS:—Buick new 'Dome-shaped head', Lo-Ex alloy, Tri-slot, cam ground type with anodized finish. Refinish cylinders to take finished replacement pistons. **Length**—4 9/32". **Weight**—14.5 ozs.
Removal—Pistons and rods removed from above.
Clearance—Land .018-.025". Skirt .0021" desired, .0015-.0021" limits. See Fitting (following).
Original Bore Size & Replacement Pistons:—*See Buick Special Shop Notes.*
Fitting New Pistons:—**Micrometer Gauge**—Check at points just below T-slot junction on both sides of vertical slot and below lower end of slot. Use light contact only. Clearance given above for 70°F.
Feeler Gauge—Piston (with pin) and engine must be 65-70°F. Insert ½x12" feeler in cylinder, piston (with pin parallel to crankshaft and T-slot on opposite side from feeler) should pass on .0015" feeler and hold on .00225" feeler.
Installing Pistons:—T-slot away from camshaft.
PISTON RINGS:—2 compression, 2 oil control rings per piston all above pin. Top compression ring carries relief on upper inner diameter. #2 comp. assembled with mark TOP toward piston head.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	⅛"	.010-.015"	.0015-.003"
Comp. (#2)	3/32"	.010-.015"	.0015-.003"
Oil Control	3/16"	.010-.015"	.0015-.003"

Replacement Rings:—.010", .020", .030" oversize.
PISTON PIN:—**Diameter**—13/16". **Length**—2 11/16". Pin clamped in rod. Pins not furnished separately.
Pin Fit in Piston—.0003-.0004" at 70°F. or easy finger push fit at room temperature.
NOTE—Use No. 25 wrench 5½" long on pin bolt.
CONNECTING ROD:—**Weight**—29.92 ozs. **Length**—7⅝".
Crankpin Journal Diameter—2".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0008-.0018". **Sideplay**—.005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Align cap and rod. Mark on rod and cap to rear, oil hole to camshaft.
NOTE—Max. weight variation ⅛ oz. Special ground bolts used for cap assembly.
CRANKSHAFT:—5 bearing, integral counterweights with torsional balancer mounted on forward end.
Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4, 2½"; #5, 2 9/16".
Bearing Type—Steel-backed, babbitt-lined. See Buick Shop Notes for replacement bearings.
Clearance—.0007-.0022".
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Center (#3) bearing. **Endplay** .004-.008".
CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0005-.0035". **Endplay**—.002-.006".
End Thrust:—Taken by thrust plate assembled between front bearing and camshaft sprocket.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 24½" or 49 links.
Camshaft Setting:—Mesh copper-plated washers (on chain) with marks on sprockets (on upper side).
VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.3715-.3725"	4 5/16"
Exhaust	1 11/32"	.3711-.3719"	4 3/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.348"	.0015-.0035"
Exhaust	45°	.342"	.0021-.0039"

Tappet Clearance—.015" all valves (hot).
Valve Guides:—Press fit in block. Install with taper end to top. Finish ream to size.
Valve Springs:—Double springs on all valves.
Free length: Inner 1⅞". Outer 2 5/16".

Inner Spring	Pressure	Length
Valve Closed	15½-20½ lbs.	1 21/32"
Valve Open	45-51 lbs.	1 5/16"
Outer Spring	**Pressure**	**Length**
Valve Closed	26½-31½ lbs.	1 15/16"
Valve Open	67-73 lbs.	1 19/32"

Valve Lifters:—Single piece, cast-iron. Lifter guide holes reamed in crankcase. **Clearance** .0005-.0025".
Rocker Arms:—Drop-forged fitted with steel-backed babbitt bushings. Rocker arm shaft brackets are of aluminum alloy. **Clearance**—.001-.003".
VALVE TIMING:—See Camshaft Setting.
NOTE—'Timing Point' when valve .004" off seat with .015" tappet clearance or lash customarily listed instead of actual opening and closing points.
Timing Points
Intake Valves—Open 13° BTDC. Close 68° ALDC.
Exhaust Valves—Open 55° BLDC. Close 22° ATDC.
Opening and Closing Points
Intake Valves—Open 26° BTDC. Close 81½° ALDC.
Exhaust Valves—Open 68° BLDC. Close 35° ATDC.
Valve Timing Check:—#2 or #7 exhaust valve should be .145" open (actual opening as measured by dial indicator contacting spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' lined up with indicator in inspection hole in right front face of flywheel housing above starter.
LUBRICATION:—Pressure with oil pump in crankcase.
Oil Pump:—Helical gear drive from camshaft. Ignition timing not disturbed by pump removal.
Oil Pump Clearances—*See Buick Shop Notes.*
Normal Oil Pressure:—45 lbs. at 35 MPH.
Oil Pressure Regulator:—On pump. Opens at 45 lbs.
Crankcase Capacity:—7 qts. (dry), 6 qts. (refill).
COOLING SYSTEM:—**Capacity** 13¼ qts. (14¼ with heater).
Water Pump:—Plain bushing, self-adjusting packing type (first cars), ball-bearing packless type (After Engine No. 4-3535259).
See articles in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts. Lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts 148-153°F. Fully open 170-175°F.
CLUTCH:—**Own (with Long 10CF-CS driven member).** Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven-joined, 2 required. I.D. 6". O.D. 10". Thickness .125".
Adjustment—Clearance between pedal and underside of toeboard must be ⅜-⅝". To adjust, loosen locknut and turn setscrew at rear of pedal, above pedal stop. Free movement ¾-1". To adjust, turn self-locking nut on yoke end of equalizer lever.
Removal:—Remove Rear axle (see Rear Axle) and Transmission (see Transmission). Take off clutch underpan, disconnect clutch linkage at yoke, remove spring washer (retains release bearing support in flywheel housing), bearing support, pull yoke out (with release bearing). Mark cover and flywheel, remove mounting screws evenly and lower assembly. NOTE—Metal spacers used between release levers and cover will facilitate removal.
TRANSMISSION:—**Buick**—Constant mesh, synchromesh type with all helical gears.
See article in Mechanical Equipment Section for data.
Removal:—Remove Rear Axle (see Rear Axle). Take off steady rest rod, transmission support (with shims attached to each end), use Guide Pins (J-851) in upper bolt holes and withdraw transmission.
See Buick Special Shop Notes for Transmission Steady Rest Mounting data.
SELF-SHIFTING TRANSMISSION:—Optional.
See article in Mechanical Equipment Section for complete Removal and Adjustment instructions.
UNIVERSAL JOINT:—**Spicer** (Buick design). Plain bearing type. One used.
See article in Mechanical Equipment Section for data.
REAR AXLE:—**Buick**—Semi-floating, hypoid gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.40-1 (std.). 3.615-1 (with self-shift trans.).
Backlash—.006-.010".
Removal:—Hoist rear of car, remove front floor, disconnect parking brake at equalizer and remove brake conduit from torque tube, disconnect brake line at rubber hose connection (end of torque tube), rear shocks at bottom, rear radius rod at frame, coil springs at lower end (tie ends to bumper), disconnect torque tube at U-joint, pull assembly out.
Axle Shaft Removal—Remove housing cover, differential pinion shaft screw, shaft, and spacer block. Push axle assembly in, remove 'C' washer on inner end, withdraw shaft assembly. NOTE—Right axle shaft ¾" longer than left shaft.
Wheel Bearing Adjustment—None.
Rear Suspension:—Coil springs, conventional axle.
See article in Mechanical Equipment Section for data.
SHOCK ABSORBERS:—**Delco**—Model 1947-A,B (front), 1100-S (rear). Double acting, hydraulic type. Direct acting (rear only).
See article in Mechanical Equipment Section for data.
STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—See Buick Shop Notes for brake assembly removal for work on Front Suspension.
Kingpin Inclination—3½-4½°.
Camber—Minus ¼° to plus 1°. Not adjustable.
Caster—Minus ⅞° plus or minus ⅜°. Adjustable.
Toe In—0-1/16". Adjustable.
Steering Geometry (Toe Out)—Inner wheel turned 23¼° plus or minus ¾°. Outer wheel 20°.
BRAKES:—**Service**—Bendix hydraulic, rigid cylinder type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameters: Front 1 3/32". Rear 1".
Drum—Centrifuse. 12".
NOTE—Drum turn down limit .030" cut.
Lining—Ferodo BZ-10 (woven—primary), Manhattan 2320-K (moulded—secondary). Length per wheel (front shoe 9 15/16", rear 12¾"). Width 1¾" (40), 2" (60). Thickness 3/16".
Clearance—.010" plus or minus .002" at heel and toe.
Braking Power—47% rear.
Hand Brake Adjustment:—See Service Brakes (above).

HOOD SIDE PANEL REMOVAL:—See Buick Shop Notes.

SERIAL NUMBER:—First number (All Series) 13219848 (Flint), 23238767 (South Gate, Calif.), 33245765 (Linden, N. J.). On top right frame side rail at dash.

ENGINE NUMBER:—Stamped on boss on right side of crankcase above starter. First number 60 (6-3396937), 80 (8-3396937), 90 (9-3396937). NOTE—Dash (—) following engine number indicates engine factory-equipped with .010" oversize pistons.

ENGINE SPECIFICATIONS:—8 cylinder, 'I' head.
Bore—3 7/16". **Stroke**—4 5/16".
Displacement—320.2 cu. ins. **Rated H.P.**—37.81
Developed Horsepower—141 at 3600 R.P.M.
Compression Ratio—6.35-1 cast-iron head.
Compression Pressure—111-118 lbs. at cranking speed. Cylinders should be uniform within 6 lbs.
Vacuum Reading—18-20" steady at 7-8 M.P.H.

PISTONS:—Buick new 'Dome-shaped head', Lo-Ex alloy, Tri-slot, cam ground type with anodized finish. Refinish cylinders to take finished replacement pistons. **Length**—4 7/16". **Weight**—17.7 ozs.
Removal—Pistons and rods removed from above.
Clearance—Land .021-.028". Skirt .0023" desired, .0017-.0023" limits. See Fitting (following).
Original Bore Size & Replacement Pistons:—*See Buick Special Shop Notes.*
Fitting New Pistons:—**Micrometer Gauge**—Check at points just below T-slot junction on both sides of vertical slot and below lower end of slot. Use light contact only. Clearance given above for 70°F.
Feeler Gauge—Piston (with pin) and engine must be at 65-75°F. Insert ½x12" feeler in cylinder, piston (with pin parallel to crankshaft and T-slot on opposite from feeler) should pass on .0015" feeler and hold on .00225" feeler.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil control rings per piston all above pin. Top compression ring carries relief on upper inner diameter. #2 comp. assembled with face marked TOP toward piston head.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	1/8"	.010-.015"	.0015-.003"
Comp. (#2)	3/32"	.010-.015"	.0015-.003"
Oil Control	3/16"	.010-.015"	.0015-.003"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—3 1/16". Pin clamped in rod. Pins not furnished separately.
Pin Fit in Piston—.0003-.0004" at 70°F. or easy finger push fit at room temperature.
NOTE—Use No. 25 wrench 5½" long on pin bolt.

CONNECTING ROD:—**Weight**—38.43 ozs. **Length**—8¼".
Crankpin Journal Diameter—2¼".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0008-.0018". **Sideplay**—.005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Align cap and rod. Mark on rod and cap to rear of engine, oil hole to camshaft.
NOTE—Max. weight variation ⅛ oz. Special ground 7/16" diam. bolts used for cap assembly.

CRANKSHAFT:—5 bearing, integral counterweights with torsional balancer mounted on forward end.
Journal Diameters—#1, 2 9/16"; #2, 2⅝"; #3 2 11/16"; #4, 2¾"; #5, 2 13/16".
Bearing Type—Steel-backed, babbitt-lined. See Buick Shop Notes for replacement bearings.
Clearance—.0007-.0022".
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0005-.0035". **Endplay**—.002-.006".
End Thrust:—Taken by thrust plate assembled between front bearing and camshaft sprocket.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 50 links or 25".
Camshaft Setting:—Mesh copper-plated washers (on chain) with marks on sprockets (on upper side).

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 25/32"	.3715-.3725"	4 13/32"
Exhaust	1 7/16"	.3711-.3719"	4 7/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.347"	.0015-.0035"
Exhaust	45°	.348"	.0021-.0039"

Tappet Clearance—.015" all valves (hot).
Valve Guides:—Press fit in block. Install with taper end to top. Finish ream to size.
Valve Springs:—Double springs on all valves.

Inner Spring	Pressure	Length
Valve Closed	15½-20½ lbs.	1 21/32"
Valve Open	45-51 lbs.	1 5/16"
Outer Spring	**Pressure**	**Length**
Valve Closed	26½-31½ lbs.	1 15/16"
Valve Open	63-73 lbs.	1 19/32"

Valve Lifters:—Single piece, cast-iron. Lifter guide holes reamed in crankcase. **Clearance** .0005-.0025".
Rocker Arms:—Drop-forged fitted with steel-backed babbitt-lined bushings. **Clearance**—.001-.003".

VALVE TIMING:—See Camshaft Setting above.
NOTE—'Timing Point' when valve .040" off seat with .015" tappet clearance or lash customarily listed instead of actual opening and closing points.
Timing Points
Intake Valves—Open 14° BTDC. Close 71° ALDC.
Exhaust Valves—Open 56° BLDC. Close 25° ATDC.
Opening and Closing Points
Intake Valves—Open 27° BTDC. Close 84½° ALDC.
Exhaust Valves—Open 69° BLDC. Close 38½° ATDC.
Valve Timing Check:—#2 or #7 exhaust valve should be .155" open (actual opening as measured by dial indicator contacting valve spring cap), with #1 and 8 pistons on top dead center and flywheel mark 'TDC/1-8' at indicator in inspection hole in right front face of flywheel housing above starter.

LUBRICATION:—Pressure with oil pump in crankcase.
Oil Pump:—Helical gear drive from camshaft. Ignition timing not disturbed by pump removal.
Oil Pump Clearances—*See Buick Shop Notes.*
Normal Oil Pressure:—45 lbs. at 35 MPH.
Oil Pressure Regulator:—On pump. Opens at 45 lbs.
Crankcase Capacity:—9 qts. (dry). 8 qts. (refill).

COOLING SYSTEM:—**Capacity** 17 qts. (18 with heater).
Water Pump:—Plain bushing, self-adjusting packing type (all 80, 90; first 60), ball-bearing, packless type (Model 60 after Engine No. 6-3524449).
See articles in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts. Lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts 148-153°F. Fully open 170-175°.

CLUTCH:—**Own (with Borg & Beck driven member).** Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven type, 2 required. I.D. 6½". O.D. 11". Thickness ⅛".
Pedal Return Spring—See Buick Shop Notes.
Adjustment—Clearance between pedal and underside of toeboard must be ⅜-⅝". To adjust, loosen locknut, turn setscrew at rear of pedal above top. Free movement of pedal must be ¾-1". To adjust, turn nut on yoke end of inner equalizer lever (60), on pedal rod (80, 90).
Removal:—Remove Rear Axle (see Rear Axle) and Transmission (see Transmission). Take off clutch underpan, release tension on pedal return spring by backing off nut on eye bolt, disconnect clutch linkage at yoke, remove spring washer (retains release bearing support), pull yoke out (with release bearing). Mark cover and flywheel, remove mounting screws evenly and lower assembly out. NOTE—Metal spacers used between release levers and cover will facilitate removal of mounting screws.

TRANSMISSION:—**Buick**—Constant mesh, synchro-mesh type with all helical gears.
See article in Mechanical Equipment Section for data.
Removal:—Remove Rear Axle (see Rear Axle). Release nut on eye bolt of clutch pedal return spring. Remove pedal bracket and brake master cylinder. Take off steady rest rod, transmission support (with shims attached to each end), use Guide Pins (J-851) in upper mounting holes, withdraw transmission.
See Buick Special Shop Notes for Transmission Steady Rest Mounting data.

UNIVERSAL JOINT:—**Spicer** (Buick design). Plain bearing type. One used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Buick**—Semi-floating, hypoid gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—3.9-1 (60), 4.1818-1 (80), 4.555-1 (90).
Backlash—.006-.010".
Removal:—Hoist rear of car, remove front floor, brake conduit from torque tube, disconnect brake line at rubber hose connection (end of torque tube), rear shocks at bottom, rear radius rod at frame, coil springs at lower end (tie ends to bumper), disconnect torque tube at U-joint, pull assembly out.
Axle Shaft Removal—Remove housing cover, differential pinion shaft screw, shaft, and spacer block. Push axle assembly in, remove 'C' washer on inner end, withdraw shaft assembly. Right axle shaft ¾" (60), 15/16" (80, 90) longer than left shaft.
Wheel Bearing Adjustment—None.
Rear Suspension:—Coil springs, conventional axle.
See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS:—**Delco**—Model 1947-A, B (60—front), 1902-C, D (80, 90—front). 1100-S (all—rear). Double acting, hydraulic type. Direct acting (rear).
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—See Buick Shop Notes for brake assembly removal for work on front suspension.
Kingpin Inclination—3½-4½° (60), 4¼-5¼° (80), 4-5° (90).
Camber—Minus ¼° to plus 1°. Not adjustable.
Caster—Minus ⅞° plus or minus ⅜°. Adjustable.
Toe In—0-1/16". Adjustable.
Steering Geometry (Toe Out)—Inner wheel turned 23¾° (60, 80), 24° (90). Outer 20°.

BRAKES:—**Service**—Bendix hydraulic, rigid cylinder type. Hand lever applies rear service brakes.
See previous page (38-40) for 60 specifications.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diam. Front 1¼". Rear 1 3/16".
Drum—12" (80), 14" (90). Cast-iron, ribbed.
Lining—Ferodo BZ-10 (woven—primary), Manhatten 2320-K (moulded—secondary). Length per wheel (front shoe 9 15/16"—80, 12 1/16"—90; rear 12¾"—80, 14¾"—90). Width 2". Thickness 3/16" (80), ¼" (90).
Clearance—.010" plus or minus .002" at heel and toe.
Braking Power—47.4% rear.
Hand Brake Adjustment:—See Service Brakes (above).

SERIES 60 NOTE:—All data on chassis units (Universal Joint, Transmission, Rear Axle, Shock Absorbers, Steering and Brakes) given below applies also to Series 60 cars.

SERIAL NUMBER:—First number 13388547 (Flint), 23395088 (Calif.), 33405088 (Linden). Stamped on top of right frame side rail at dash.

ENGINE NUMBER:—First number 3572652. Stamped on boss on right side of crankcase above starter.
NOTE—Dash (—) following engine number indicates engine equipped with .010" oversize pistons.

ENGINE SPECIFICATIONS:—Own Model 40. 8 cylinder, 'I' head type. **Bore** 3 3/32". **Stroke** 4⅛".
Piston Displacement—248 cu. ins.
Rated Horsepower—30.63.
Developed Horsepower—107 at 3400 RPM.
Compression Ratio—6.1-1 Std. cast-iron head.
Compression Pressure—126 lbs. at 1000 RPM., 112 lbs. at cranking speed (uniform within 6 lbs.).
Vacuum Reading—18-20" idling at 7-8 MPH.

PISTONS:—Modified type 'Dome head,' aluminum alloy, tri-slot, cam-ground, anodized type.
See Buick Shop Notes for description and all Replacement Piston specifications and data.
Length—4 9/32". Weight—14¼ ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—.0021" (.0018-.0024") top of skirt.
Fitting New Pistons:—If micrometer used, check at points on each side of vertical slot at top of skirt, and at lower end of slot (light contact only). Clearance above correct for pistons at 70°F. If feeler gauge used, install ½" wide feeler between piston and cylinder wall on side opposite slot (piston inverted, pin parallel to crankshaft). Piston should pass on .0015" feeler, hold on .00225" feeler.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Two compression, two oil control rings, all above pin (narrow heat-dam groove above top ring). Both oil ring grooves drilled for oil drains.
NOTE—Install top compression ring with relief on inner rim up, #2 ring with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	1/8"	.010-.020"	.002-.004"
Compr. (#2)	3/32"	.010-.015"	.0015-.003"
Oil Contr.	3/16"	.010-.015"	.0015-.003"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—Diameter .8127". **Length** 2 11/16".
Pin clamped in rod. Not furnished separately (all replacement pistons have pins installed).
Pin Fit in Piston—.0003-.0004" at 70°F. (easy finger push fit at room temperature).
NOTE—Use #25 wrench (5½") only on pin bolt.

CONNECTING ROD:—Length 7⅝". **Weight** 30¾ ozs. (maximum variation ⅛ ounce).
Crankpin Journal Diameter—2".
Lower Bearing—Spun babbitt-lined type.
Clearance—.0008-.0018". **Sideplay** .005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Marks on rod and cap toward rear of engine, oil hole toward camshaft. Align rod and cap.
NOTE—Special ground bolts must be used on rod caps.

CRANKSHAFT:—5 bearing, integral counterweights.
Journal Diameters—#1, 2 5/16".; #2, 2⅜"; #3, 2 7/16"; #4, 2½"; #5, 2 9/16".
Bearings—Steel-backed, babbitt-lined type. *See Buick Shop Notes for Replacement Bearing data.*
Clearance—.0007-.0022".
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0005-.0035". **Endplay**—.004-.008".
End Thrust:—Thrust plate between front bearing and camshaft sprocket.
Timing Chain:—Link Belt. Width 1". Pitch .500", Length 24½" or 49 links.
Camshaft Setting:—Mesh copper-plated washers on chain with marks on sprockets (marks upward).

VALVES:—

	Head Diam.	Stem Diam.	Overall Length
Intake	1 17/32"	.3720"	5.1"
Exhaust	1 11/32"	.3715"	5.1"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.348"	.0015-.0035"
Exhaust	45°	.342"	.0021-.0039"

Tappet Clearance:—.015" all valves—engine hot.
Valve Guides:—Press fit in head, installed with taper end up. Finish ream for correct clearance.
Valve Springs:—Double springs on all valves. Spring free length 1⅞" (inner), 2 5/16" (outer).

	Inner Spring. Pressure	Inner Spring. Length	Outer Spring. Pressure	Outer Spring. Length
Closed	15½-20½ lbs.	1 21/32"	26½-31½ lbs.	1 15/16"
Open	45-51 lbs.	1 5/16"	67-73 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Lifter guide holes reamed in block. **Clearance** .0005-.0025".
Rocker Arms:—*See Buick Shop Notes for installation and fitting directions.*
Valve Timing:—See Camshaft Setting above.
Timing Points (Valve .004" Open).
Intake Valves — Open 13° BTDC. Close 68° ALDC.
Exhaust Valves—Open 55° BLDC. Close 22° ATDC.
Opening & Closing Points.
Intake Valves—Open 26° BTDC. Close 81½° ALDC.
Exhaust Valves—Open 68° BLDC. Close 35° ATDC.
Valve Timing Check—With .015" tappet clearance, #2 or 7 exhaust valve should be .145" open (actual valve opening—use dial indicator) with #1 & 8 pistons at TDC and flywheel mark 'TDC/1-8' at indicator (inspection hole, right front face of housing).

LUBRICATION:—Pressure type (gear type oil pump in crankcase.) *See Buick Shop Notes for Oil Pump data.*
Normal Oil Pressure:—45 lbs. at 35 MPH.
Oil Pressure Regulator:—On pump, opens at 45 lbs. Non-adjustable type.
Crankcase Capacity:—7 qts. (dry), 6 qts. (refill).

COOLING SYSTEM:—Capacity—13¼ qts.
Water Pump:—New ball-bearing, packless type.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts, lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Opens at 148-155°F.
Temperature Gauge:—AC #1510755 Thermo type.
See article in Mechanical Equipment Section for data.

CLUTCH:—Own Make with Borg & Beck 'Borglite' driven member. Single plate, 'crown-spring' type.
See article in Mechanical Equipment Section for data.
Facings—Woven, grooved type, 2 required. Inside Diam. 7". Outside Diam. 10". Thickness .125".
Adjustment:—Pedal free movement ¾-1" (adjusting clevis and locknut on link at clutch fork). Pedal toeboard clearance (underside) ⅞" (setscrew and locknut at lower end of pedal).
Removal:—Remove Rear Axle & Transmission (see below), take off clutch underpan, release return spring (back off nut on spring eyebolt), disconnect linkage, remove yoke and release bearing retainer, mark clutch and flywheel, take out mounting screws in clutch cover flange.
See Buick Shop Notes for 'Over-center' Return Spring installation and adjustment.

TRANSMISSION (40, 60):—Own Make. All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with new remote shift control.
Transmission Control:—Buick 'Handi-shift' type.
See article in Mechanical Equipment Section for data.
Removal:—Remove Rear Axle (see below), disconnect shift linkage at transmission case, remove upper mounting bolts, install guide pins (J-851), remove lower mounting bolts, pull transmission back and out.
NOTE—See Mechanical Equipment Section for shifter linkage adjustment when installing transmission.

UNIVERSAL JOINT (40,60):—Mechanics Type 2C. 1 used
See article in Mechanical Equipment Section for data.

REAR AXLE (40, 60):—Own Make. Semi-floating, hypoid gear type with torque tube drive (new straight-line drive).
See article in Mechanical Equipment Section for data.
Ratio—4.44-1 (Std. 40), 3.9-1 (Std. 60, Optl. 40), 3.615-1 (Optl. 60). **Backlash**—.008-.010".
Removal:—Hoist rear of car; disconnect parking brake at equalizer, hydraulic brake line at frame connection, shock absorber links at lower end, axle end of rear radius rod, lower end of chassis springs (wire springs to bumper for chassis). Disconnect front end of front torque tube at transmission end plate. Remove nut, lockwasher, torque ball mounting washer at inner end of each torque ball mounting stud, take out bolts holding torque ball mounting assembly to frame on each side, remove rear axle assembly. **Do not loosen locknut on torque ball mounting stud or interchange torque ball mounting assemblies from one side of car to the other which will destroy Rear Axle and Engine alignment.** *See Buick Shop Notes for Aligning Instructions.*
Axle Shaft Removal:—Same as 1938 (see 1938 data).
Wheel Bearing Adjustment—None.
Rear Suspension:—Coil springs, conventional axle.
See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS:—Delco. Model 1948-A (right frt.), 1948-B (left frt.), 2103-A, E (right rear), 2103-B, F (left rear). Double acting, hydraulic type. NOTE—Rear Shocks are new parallel cylinder type. Valves for these rear shocks have been changed in production.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Double roller type. *See Mechanical Equipment Section.*
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—3½-4½° crosswise.
Camber—Minus ¼° to plus 1°. Not adjustable.
Caster—Minus ⅞° plus or minus ⅜°. Adjustable.
Toe In—0-1/16". Adjustable.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 22½ plus or minus ¾°, outer wheel 20°.

BRAKES (40, 60):—Service—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever apples rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Centrifuse type. Diameter 12".
Lining—Woven (primary), moulded (secondary). Width 1¾" (40), 2" (60), Thickness 3/16". Length per wheel 22 11/16".
Clearance—.015" (both ends of secondary shoe).
Braking Power—47% rear, 53% front.
Hand Brake:—See Service Brakes above.
NoRol:—Optl. *See article in Mechanical Equipment Section.*

SERIES 60 NOTE:—For data on chassis units (Universal Joint, Transmission, Rear Axle, Shock Absorbers, Steering and Brakes) refer to preceding Series 40 data. Engine and Clutch data below apply to Series 60.

SERIAL NUMBER:—First number 13388547 (Flint), 23395088 (Calif.), 33405088 (Linden). Stamped on top of right frame side rail at dash.

ENGINE NUMBER:—First number (60) 6-, (80) 8-, (90) 9-3572652 (same number all series). Stamped on boss on right side of crankcase above starter. NOTE—Dash (—) following engine number indicates engine equipped with .010" oversize pistons.

ENGINE:—Own Series 60, 80, 90. 8 cylinder, 'I' or overhead valve type.
Bore—3 7/16". **Stroke**—4 5/16".
Piston Displacement—320.2 cu. ins.
Rated Horsepower—37.81.
Developed Horsepower—141 at 3600 RPM.
Compression Ratio—6.25-1 Std. cast-iron head.
Compression Pressure—130 lbs. at 1000 RPM, 113.8 lbs. at cranking speed (uniform within 6 lbs.).
Vacuum Reading—18-20" idling at 7-8 MPH.

PISTONS:—Modified 'Dome-head', aluminum alloy, tri-slot, cam ground, anodized finished type.
See Buick Shop Notes for description and all Replacement Piston specifications and data.
Length—4 7/16". **Weight**—17.3 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—.0023" (.0020-.0026") top of skirt.
Fitting New Pistons:—If micrometer used, check at points on each side of vertical slot at top of skirt, and at lower end of slot (light contact only). Clearance above correct for pistons at 70°F. If feeler gauge used, install ½" wide feeler between piston and cylinder wall on side opposite slot (piston inverted, pin parallel to crankshaft). Piston should pass on .0015" feeler and hold on .00225" feeler.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Two compression, two oil control rings, all above pin (narrow heat-dam groove above top ring). Both oil ring grooves drilled for oil drains. NOTE—Install top compression ring with relief on inner rim up, #2 ring with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	1/8"	.010-.020"	.002-.004"
Compr. (#2)	3/32"	.010-.015"	.0015-.003"
Oil Contr.	3/16"	.010-.015"	.0015-.003"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—Diameter ⅞". **Length** 3 1/16".
Pin clamped in rod. Not furnished separately (all replacement pistons have pin installed).
Pin Fit in Piston—.0003-.0004" at 70° F. (easy finger push fit at room temperature).
NOTE—Use #25 wrench (5½") only on pin bolt.

CONNECTING ROD:—Length 8¼". **Weight** 38½ ozs. (maximum variation ⅛ ounce).
Crankpin Journal Diameter—2¼".
Lower Bearing—Spun babbitt-lined type.
Clearance—.0008-.0018". **Sideplay** .005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Marks on rod and cap toward rear of engine, oil hole toward camshaft. Align rod and cap.
NOTE—Special ground bolts must be used on rod caps.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—#1, 2 9/16"; #2, 2⅝"; #3, 2 11/16"; #4, 2¾"; #5, 2 13/16".
Bearings—Steel-backed, babbitt-lined type. *See Buick Shop Notes for replacement bearing data.*
Clearance—.0007-.0022".
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitted bushings.
Clearance—.0005-.0035". **Endplay** .004-.008".
End Thrust:—Thrust plate between front bearing and camshaft sprocket.
Timing Chain:—Link Belt. Width 1". Pitch .500". Length 25" or 50 links.
Camshaft Setting:—Mesh copper-plated washers on chain with marks on sprockets (marks upward).

VALVES:—

	Head Diam.	Stem Diam.	Overall Length
Intake	1 25/32"	.3720"	5¼"
Exhaust	1 7/16"	.3715"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.347"	.0015-.0035"
Exhaust	45°	.348"	.0021-.0039"

Tappet Clearance:—.015" all valves—engine hot.
Valve Guides:—Press fit in head, installed with taper end up. Finish ream for correct clearance.
Valve Springs:—Double springs on all valves. Spring free length 1⅞" (inner), 2 5/16" (outer).

	Inner Spring.		Outer Spring.	
	Pressure	Length	Pressure	Length
Closed	15½-20½ lbs.	1 21/32"	26½-31½ lbs.	1 15/16"
Open	45-51 lbs.	1 5/16"	67-73 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Lifter guide holes reamed in block. **Clearance** .0005-.0025".
Rocker Arms:—*See Buick Shop Notes for installation and fitting directions.*
Valve Timing:—See Camshaft Setting above.

Timing Points (Valve .004" Open).
Intake Valves — Open 14° BTDC. Close 71° ALDC.
Exhaust Valves—Open 56° BLDC. Close 25° ATDC.

Opening & Closing Points.
Intake Valves—Open 27° BTDC. Close 84½° ALDC.
Exhaust Valves—Open 69° BLDC. Close 38½° ATDC.
Valve Timing Check—With .015" tappet clearance, #2 or 7 exhaust valve should be .155" open (actual valve opening—use dial indicator) with #1 & 8 pistons on TDC and flywheel mark 'TDC/1-8' at indicator in inspection hole in right front face of flywheel housing.

LUBRICATION:—Pressure type (gear type oil pump in crankcase). *See Buick Shop Notes for oil pump data.*
Normal Oil Pressure—45 lbs. at 35 MPH.
Oil Pressure Regulator—On pump. Opens at 45 lbs. Non-adjustable type.
Crankcase Capacity—9 qts. (dry), 8 qts. (refill).

COOLING SYSTEM:—Capacity—17 qts.
Water Pump:—New ball-bearing, packless type.
See article in Mechanical Equipment Section.
Removal—Remove fan belt, pump pulley mounting bolts, lift out pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Open at 148-155°F.
Temperature Gauge:—AC #1510755 Thermo type.
See article in Mechanical Equipment Section for data.

CLUTCH:—Own make with Borg & Beck 'Borglite' driven member. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, grooved type, 2 required. Inside Diam. 6½". Outside Diam. 10½". Thickness .125".
Adjustment:—Pedal free movement ¾-1" (adjusting clevis and locknut on link at clutch fork). Pedal toeboard clearance (underside) ⅞" (setscrew and locknut at lower end of pedal).
Removal:—Remove Rear Axle & Transmission (see below), take off clutch underpan, release return spring (back off nut on spring eyebolt), disconnect linkage, remove yoke and release bearing retainer, mark clutch and flywheel, take out mounting screws in clutch cover flange.
See Buick Shop Notes for 'Over-center' return spring installation and adjustment.

TRANSMISSION (80, 90):—Own make. All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with new remote shift control.
Transmission Control:—Buick 'Handi-shift' type.
See articles in Mechanical Equipment Section.
Removal:—Remove rear axle (see below), remove Steady-rest rod and support with shims attached to each end, remove upper mounting bolts, install guide pins (J-851), remove lower mounting bolts, pull transmission back and out.
NOTE—*See Mechanical Equipment Section for shifter linkage adjustment when installing transmission.*
Transmission Steady Rest—*See Buick Shop Notes for installation and adjustment directions.*

UNIVERSAL JOINT (80, 90):—Spicer No. 302-2. 1 used.
See article in Mechanical Equipment Section for data.

REAR AXLE (80, 90):—Own Make. Semi-floating, hypoid gear type with torque tube drive. NOTE—New straight-line drive used only on Series 40, 60. See Series 40 page for 40, 60 data.
See article in Mechanical Equipment Section for data.
Ratio—4.182-1 (80), 4.555-1 (90).
Backlash—.008-.010".
Removal:—Hoist rear of car; disconnect parking brake at equalizer, hydraulic brake line at frame connection, lower end of shock absorber links, equalizer bar at axle end, lower end of chassis springs (wire springs to bumper for clearance). Disconnect torque tube at universal joint ball, remove axle assembly.
Axle Shaft Removal:—Same as 1938 (see 1938 data).
Wheel Bearing Adjustment—None.
Rear Suspension:—Coil springs, conventional axle.
See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS (80, 90):—Delco. Double acting, hydraulic type (Inertia control for front shocks only).

	Right Frt.	Right Rear.	Left Frt.	Left Rear.
Model 80	1902-D-60	1751-R	1902-C-60	1751-S
Model 90	1902-D-61	1751-R	1902-C-61	1751-S

See article in Mechanical Equipment Section for data.

STEERING (80, 90):—Steering Gear. Saginaw Worm-and-double-roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4¼-5¼° (80), 4-5° (90).
Camber—Minus ¼° to Plus 1°. Not adjustable.
Caster—Minus ⅞° plus or minus ⅜°. Adjustable.
Toe In—0-1/16". Adjustable.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 23¾° (80), 24° (90) plus or minus ¾°, outer wheel turned 20°.

BRAKES (80, 90):—Service. Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter 12" (80), 14" (90).
Lining—Woven (primary), moulded (secondary). Width 2". Thickness 3/16" (80), ¼" (90). Length per wheel 22 11/16" (80), 26 13/16" (90).
Clearance—.015" both ends of secondary shoe.
Braking Power—47.4% rear, 52.6% front.
Hand Brake:—See Service Brakes above.
NoRol:—Optl. *See article in Mechanical Equipment Section.*

1938-39 MODELS

HOOD & SIDE PANEL REMOVAL:—Hood hinged at cowl and lifts from forward end. Tilt radiator ornament back to free latch, lift hood slightly, free safety catch under forward edge of hood, lift up. NOTE—1939 V8 Models equipped with automatic safety catch (released by radiator ornament).

Side Panels—To remove, take out two bolts on upper edge of panel. Lower edge of panel secured by clips (50, 60, 60S, 61, 65), thumb screws (75, 90).

1938-39 MODELS

RADIATOR REMOVAL (ALL SERIES):—To remove radiator core (for work on front of engine), drain cooling system, remove hood side panels (not necessary to remove hood). Remove air cleaner assembly (V8 cars), ignition coils, distributor heads, fuel pumps, and fan assembly (V16 cars). Remove radiator-to-dash brace rods, loosen hoses at radiator fittings (on V16, remove lower elbows also), remove sheet metal shroud above core, take out radiator mounting screws, slide top of core back, lift up.

1936-39 MODELS

CYLINDER HEAD GASKETS (V8 MODELS):—Care must be exercised to install proper gasket. Use of wrong gasket may cause sluggish engine performance. Part numbers stamped between inner bores.

Model	Part Number
36-60	1412661
36-70, 75	1412662
37, 38, 39-50	1419114
37, 38, 39-60, 60S, 61, 65, 70, 75	1419759

Installation—Interchangeable between banks. Install large triangular hole on inner edge to rear.

1938-39 MODELS

CYLINDER HEAD IDENTIFICATION (V8 MODELS):—Same cylinder head used on both the La Salle 50 and the Cadillac 75 models (provides higher compression ratio on 75). All production cylinder heads marked with piston displacement and compression ratio as follows: Right Hand Head—322-625 and 346-670, Left Hand Head—322-625 (La Salle 50), 346-670 (Cadillac 75). Replacement heads marked with both ratios (both right and left hand heads). NOTE—Some of first heads incorrectly marked 346-680, these heads identical with those marked 346-670.

Models 60, 60S, 61, 65. These heads have 6.25-1 ratio. Interchangeable between these models only.

1936-39 MODELS

CYLINDER HEAD INSTALLATION:—V8 Models. Two capscrews used at water outlet connection on each head have oversize head and are ½" longer. Must not be used in any other position (will damage head if installed in any other holes). Tighten all head screws to 70-75 ft. lbs. tension.

1938-39 MODELS

V16 Models. Install short capscrews along lower edge of head, coat all screws with white lead before installing (necessary to prevent leaks as screws enter water jacket). Tighten screws from center of head outward, retighten with engine warmed up.

1937-39 MODELS

LOWERING COMPRESSION RATIO (V8 MODELS):—Standard compression ratio may be lowered by installing two shims between cylinder head and block. Shim part numbers as follows: 50 (#1421931), 60, 60S, 61, 65, 70, 75 (#1421930).

1937 MODELS

V-12, V-16—Standard compression ratio lowered by installing thick gaskets between cylinder heads and blocks. Part numbers as follows: 85 (894339), 90 (896450).

1938-39 MODELS

REPLACEMENT PISTONS (ALL MODELS):—Finished aluminum alloy, T-slot, cam ground pistons with anodized finish furnished for service in sizes (with piston skirt diameter limits) listed below.

1939 V8 Note—Pistons have wider top land and use a narrower top compression ring.

CADILLAC V8 AND LA SALLE V8

Size	La Salle V8	Cadillac V8
Standard	3.3726-3.3746"	3.4979-3.4999"
.003" oversize	3.3761-3.3776"	3.5014-3.5029"
.005" oversize	3.3781-3.3796"	3.5034-3.5049"
.010" oversize	3.3831-3.3846"	3.5084-3.5099"
.015" oversize	3.3881-3.3896"	3.5135-3.5149"
.030" oversize	3.4031-3.4046"	3.5284-3.5299"

CADILLAC V16

Size	Cadillac V16
Standard	3.2483-3.2503"
.005" oversize	3.2538-3.2553"
.010" oversize	3.2588-3.2603"
.015" oversize	3.2638-3.2653"
.030" oversize	3.2788-3.2803"

1936-39 MODELS

PISTON PIN SERVICING (V8 MODELS):—Removal. Heat piston in boiling water to expand pin hole, push pin out by hand from ribbed boss end (one boss marked by raised rib on underside within piston). Do not use arbor press to remove pins.

Pin Bushing in Connecting Rod:—Split type. Press out old bushing in arbor press (use sudden jerk to start bushing). Use special tool kit No. HM-250 to install new bushings. Insert bushing with split at right angles to rod center-line, and oil hole lined up with oil hole in rod, press bushing into rod with special bushing replacer and arbor press. Finish bushing by pressing burnishing bar through bushing (use kerosene as lubricant) using 2 or 3 ton arbor press, check pin fit, repeat burnishing operation until correct clearance secured.

Installing Pin:—Heat piston in boiling water, coat pin with engine oil, press pin in by hand from side opposite ribbed boss.

1938-39 V16 MODELS

PISTON PIN REMOVAL & INSTALLATION (V16):—Rod web split at pin hole with clampscrew below pin (pin hole not split open) and pin must be removed and installed as follows: With locking screw removed, use tool J-1167 to spread split end of connecting rod, then tap pin out of piston and rod with brass drift. Install in same manner, with notch in pin lined up with lockscrew hole, turn lockscrew part way in before removing spreader tool. Tighten lockscrew to 20-25 ft. lbs. tension.

1936-39 MODELS

CONNECTING RODS (V8 MODELS):—Rods are split at an angle at lower end to permit removal through top of block. Caps doweled in rod and held by special capscrews (unequal length) with lockwashers under head. Use new lockwashers (Part #1419129) and tighten bearing capscrews to 55-60 ft. lbs.

Connecting Rod Bearing Installation:—Bearing halves not interchangeable (upper half has oil holes for piston pin oil channel and spray hole for cylinder wall lubrication). When installing upper halves, oil holes must line up with drilled holes in rod.

1936-39 MODELS

MAIN BEARING SERVICING (ALL MODELS):—Removal. To remove bearing upper halves (without removing crankshaft), use cotterpin with head flattened to 'T' shape inserted in crankshaft oil hole, rotate crankshaft in reverse direction to turn bearing shell out. Rotate new bearing shell in place in same manner (making sure locating lug on bearing shell in correct position to seat in groove in block). Tighten cap bolts to 130-140 ft. lbs. (V8), and to 100-110 lbs. (V16).

1938-39 MODELS

Rear Main Bearing Oil Seal Installation:—With crankshaft out of engine (remove bearing shells to prevent damaging), install length of new packing making certain that it is inserted behind sheet metal retainer, drive packing up into place in crankcase with tool J-1177 (pound handle of tool with hammer to seat packing), cut off each end of packing flush with bearing edge before removing tool. Install packing in bearing cap in same manner (use arbor press to seat packing).

1936-39 MODELS

CAMSHAFT BEARING SERVICING (V8 MODELS):—Removal. To remove camshaft, remove radiator and engine front cover, transmission and flywheel housing, distributor and oil pump drive gear, valve lifter assemblies, timing chain and sprockets. Pull camshaft out, press old bushings out (use tool J-829).

Camshaft Bushing Installation:—Paint outside surface of bearings with white lead, install front bearing first, rear bearing second, center bearing last (in each case, pilot installing tool in other two bearings). Make certain that oil holes aligned.

1938-39 MODELS

CAMSHAFT SERVICING (V16 MODELS):—Camshaft must be removed for all service operations.

Removal & Installation:—Remove front end assembly (radiator & frt. fenders) as unit, disconnect the flexible pipes from gasoline lines to fuel pumps and jack up front of engine, remove crankshaft bal-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ancer and pulley, chain case cover, timing chain and camshaft sprocket, valves, valve lifters, vacuum pump and operating plunger. Install special camshaft tool J-1210 (attach by turning tool into tapped hole for sprocket screw), withdraw camshaft. When installing camshaft, make certain that front camshaft bearing is properly installed (offset to insure correct alignment).

1936-39 MODELS

VALVE SERVICING (V8 MODELS):—Valves should be checked with gauge J-1055 for correct stem length when installed (grind off end of stem until gauge slides in place with valve in closed position).

NOTE—Valve lifter assemblies must be removed before valve springs can be compressed to remove spring keepers and free valves. Use tool J-827 to hold plungers down when re-installing lifters. Use tool J-257-X to compress valve springs for spring keeper removal and installation.

1936-39 MODELS

LUBRICATION SYSTEM SERVICING (V8 MODELS):—Clean all oil lines and channels in block before installing new main or connecting rod bearings. To clean channels in block, remove oil pump, filter, take out plug at front end of crankcase oil header (left side at angle of crankcase and cylinder block). Use compressed air and shots of kerosene at plug hole to clean lines (if engine dismantled, take out plugs at line to each bearing, clean lines with wire brush). Clean oil spray hole at lower end of each rod. NOTE—Oil filter used on 1936-37 V8 models cars only.

Oil Pump Specifications ('36-38):—Drive gear Backlash .018" Maximum, Endplay .003-.010" (new), .015" (worn limit). Drive shaft clearance in bushing .001-.0025" (new), .010" (worn limit). Pump gear clearance in pump body .0025-.0085" (new), Endplay .002-.004" (new), .015" (worn limit).

Oil Pump Specifications ('39):—Pump drive gear Backlash .008-.012", Endplay .001-.004" (new), .006" (worn). Drive shaft clearance in pump body .0010-.0025" (new), .005" (worn). Pump gear clearance in pump body .002-.004" (new), .006" (worn).

1938-39 MODELS

LUBRICATION SYSTEM SERVICING (V16 MODEL):—Clean oil passages in block in same manner as for V8 models. If auxiliary relief valve for hydraulic valve lifter lines removed (located at rear of left hand lifter passage) make certain that relief hole turned so that oil will flow against camshaft and not on oil pump gears when valve reinstalled. Do not disturb plugs in crankcase directly above each valve lifter oil passage.

Oil Pump Specifications:—Oil pump drive gear Backlash .008-.012", Endplay .001-.004" (new), .006" (worn). Drive shaft clearance in pump body .0010-.0025" (new), .005" (worn). Pump gear clearance in pump body .002-.004" (new), .006" (worn).

1938-39 MODELS

CLUTCH BALANCING (ALL MODELS):—Balance clutch after installation by running the engine (with rear wheels jacked up) at speeds of 24 to 30 MPH. (for V8), 32 to 38 MPH. (for V16) and checking vibration. Add ⅛" washers with 5/16" hole under mounting screw heads (start at point where clutch drilled for balance) until vibration gone.

Clutch Housing Removal (V16):—Clutch must be removed before housing can be taken off engine (housing will not clear clutch and flywheel).

1939 MODELS

REAR STABILIZER (60S, 75, & 90):—**Installation.** With car at curb weight (no passenger load), attach stabilizer to axle first, and then to frame bracket, finally draw up adjusting nuts securely without disturbing position of rod.

1939 MODELS

FAN PULLEY REPLACEMENT (V8 MODELS):—Two types of fan pulleys used in production. Second type (also used for service replacement) carries metal reinforcement cup 5/64" thick on inner side of hub.

Cadillac V8—No allowance necessary for reinforcement cup (pulley attached to rear face of hub).

La Salle—When replacing first type pulley with second type, driving hub must be forced back 5/64" on shaft for fan belt alignment.

NOTE—Install new fan hub whenever removed.

SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on right side of crankcase below water inlet.

ENGINE SPECIFICATIONS:—8 cylinder, 90 degree 'Vee' 'L' head type.

Bore—3⅜". **Stroke** 4 15/16".

Displacement—353 cubic inches.

Rated Horsepower—36.45 (AMA).

Developed Horsepower—115 at 3000 R.P.M.

Compression Ratio—5.4-1 std. head. 5.7-1 optional high compression head.

Compression Pressure—Approximately 94 lbs. (5.4-1 head), 98 lbs. (5.7-1 optional head) at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

PISTONS:—Cast-iron, light weight. 355-C pistons are tin-plated.

Length—3 21/32".

Weight—23.824 ozs. (stripped), 30.400 ozs. (with rings, pin, and locking screw).

Clearance—Top .0135-.0185". Bottom .002-.003".

Removal—Pistons and rods removed from below.

PISTON RINGS:—Four rings (355-B), five rings (355-C) per piston. Two compression (355-B), three compression (355-C), two oil control rings (all models). Lower ring groove drilled radially with oil drain holes.

355-B Piston Rings

Ring	Width	End Gap	Wall Thickness
Comp. (upper)	⅛"	.008"	.148"
Comp. (lower)	3/16"	.008"	.148"
Oil Control (upper)	3/16"	.008"	.148"
Oil Control (lower)	5/32"	.008"	.148"

355-C Piston Rings

Comp. (upper)	⅛"	.005-.010"	.135"
Comp. (#2)	.0930"	.005-.010"	.135"
Comp. (#3)	.0930"	.005-.010"	.135"
Oil Control (upper)	3/16"	.003-.011"	.140"
Oil Control (lower)	5/32"	.003-.011"	.140"

PISTON PIN:—**Diameter**—⅞". **Length** 3 1/32". Pin is locked in piston by locking screw in one boss. Bushing is split type and must be installed loosely and then expanded with burnishing tool.
Pin Fit in Rod Bushing—.0003-.0007".

CONNECTING ROD:—**Weight**—32.875 ounces.
Length—10½" (center-to-center).
Crankpin Journal Diameter—2⅜".
Lower Bearing—Poured babbitt type. No shims.
Clearance—.003". Endplay .003-.006".

Bearing Adjustment:—None (no shims). Do not file caps. Replace rods.

CRANKSHAFT:—Three bearing type with four counterweights.
Journal Diameters—2⅜" all bearings.
Bearing Type—Bronze backed, babbitt lined.
Clearance—.0015".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps.

End Thrust:—Taken by rear (#3) main bearing.
End Play—.001-.005".

CAMSHAFT—Non-adjustable chain drive.

Timing Chain:—Morse #766. Width 1¾". Pitch .500". Length 27" or 54 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—	**Head Diameter**	**Stem Diameter**	**Length**
Intake	1.660-1.666"	⅜"	6 17/32"
Exhaust	1.634-1.640"	⅜"	6½"

	Seat Angle	**Lift**	**Stem Clearance**
Intake	30°	23/64"	.0025"
Exhaust	45°	23/64"	.0025"

Tappet Clearance—.006" Int., .008" Exh., engine cold.

Valve Springs:—	**Spring Pressure**	**Length**
Valve Closed	79 lbs.	2.500"
Valve Open	160 lbs.	2.148"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 42° ALDC.
Exhaust Valves—Open 38° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance at .006" for intake valve #1 cylinder (second valve from radiator on right hand bank). This valve should open with #1 piston 6° (.0165") before top dead center.
Motor Gauge—Weidenhoff Adapter #104, Rod #29.

LUBRICATION:—Pressure type.
Oil Pump:—Gear type located in crankcase.
Normal Oil Pressure—30 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Relief valve opens at 10 M.P.H. with pressure of 10 pounds.
Crankcase Capacity—8 quarts.

CLUTCH:—**Own Make.** Double plate, dry disc type. See article in Clutch Section for complete data.
Clutch Facings—Woven asbestos, 5½" Inside Diameter, 10" Outside Diameter. .135-.145" thick. Four facings required.
NOTE—Mark clutch cover and flywheel before disassembling and reassemble in same position.

STEERING:—**Steering Gear**—Saginaw Model Worm-and-Sector type. See article in Steering Section Section for adjustments.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7°45' crosswise.
Caster—2½-3½°.
Camber—1½°.
Toe In—⅛-¼". Adjust in usual manner by changing length of tie rod.

BRAKES:—**Service**—Own Make. Internal expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies rear wheel service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—15".
Lining—Semi-moulded Latex type. Width 2". Thickness 3/16". Length per wheel 29¾".
Clearance—.007" between lining and drum for each shoe.
Hand Brake Adjustment:—See Service Brakes.
Power Unit:—Bendix Type. See article in Brake Section for complete data.

ENGINE NUMBER:—Stamped on timing chain case at right of engine directly in front of generator.

Model	Year	First Number
370-B	1932	1,300,001
452-B	1932	1,400,001
370-C	1933	4,000,001
452-C	1933	5,000,001

ENGINE SPECIFICATIONS (370-B, C):—Own make, 12 cylinder, 45° Vee, 'I' or overhead valve type.

Bore—3⅛". **Stroke**—4".

Displacement—368 cubic inches.

Rated Horsepower—46.9.

Developed Horsepower—135 at 3400 R.P.M.

Compression Ratio—5.30-1 (1932). 5.60-1 (1933). Optl. ratios of 5.4-1 and 4.9-1 offered in 1933.

Compression Pressure—Approximately 90-95 lbs. (1932), 95-100 lbs. (1933) at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

ENGINE SPECIFICATIONS (452-B, C):—Own make. 16 cylinder, 45° Vee, 'I' or overhead valve type.
Bore—3". **Stroke**—4".
Displacement—452 cubic inches.
Rated Horsepower—57.5.
Developed Horsepower—165 at 3500 R.P.M. (1932), 3400 R.P.M. (1933).
Compression Ratio—5.35-1 (1932), 5.70-1 (1933). Optl. ratios of 5.4-1 and 4.9-1 offered in 1933.
Compression Pressure—Approximately 90-95 lbs. (1932), 96-100 lbs. (1933) at cranking speed.
Vacuum Reading—Steady reading of 18-20" at idling speed.
NOTE—Optl. lower compression heads installed at factory to compensate for operating conditions such as high altitude or lower grades of fuel.

Pistons:—Own make, molybdenum cast-iron, light weight, tapered skirt type. Pistons are tin-plated after being finished and cannot be ground (except V-16 1932). Recondition engine to size for finished replacement pistons. Length 3 7/16".
Weight (Stripped)—20.88 ozs. (V12), 19.68 ozs. (V16).
Weight (With rings, pin and locking screw)—27.152 ozs. (V12), 25.648 ozs. (V16).
Removal—Pistons and rods removed from below.
Clearance—Top .012" (V12), .0125" (V16). Skirt .002-.003" (V12), .003" (V16).
Installing Pistons—Lock screw boss of piston must be on same side as flanged side off rod (next to crankshaft cheek).

Piston Rings:—Two compression rings, two oil control rings per piston (V12), three compression, one oil control ring per piston (V16). Oil ring grooves have slotted oil drain.

V12 370-B, C Ring Specifications

Ring	Width	End Gap	Wall Thickness
Comp. (#1)	⅛"	.003-.011"	.125"
Comp. (#2)	3/16"	.003-.011"	.125"
Oil Cont. (#3	⅛"	.005-.010"	.125"
Oil Cont. (#4)	3/16"	.005-.010"	.125"

V16 452-B, C Ring Specifications

Comp. (#1, 2)	⅛"	.003-.011"	.120"
Comp. (#3)	3/16"	.003-.011"	.120"
Oil Cont. (#4)	3/16"	.005-.010"	.120"

Piston Pin:—Diameter ⅞". Length 2 15/16" (V12), 2 13/16" (V16). Pin is locked in piston by locking screw in one boss.
Pin Fit in Rod Bushing—.0003-.0007" clearance.

Connecting Rod:—Weight 31.808 ozs. Length 9¼".
Lower Bearing—Spun babbitt type. No shims.
Clearance—.0015". Sideplay .004-.007".
Adjustment—None. Do not file caps. Replace rods.
Installing Rods—Numbers on rods and caps must correspond and must be toward bottom of engine. Flanged side of rod must be next to crankshaft cheek.

Crankshaft:—Four bearing (V12), five bearing (V16). Integral counterweights.
Journal Diameters—2⅝" (all bearings).
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.002-.004".
Adjustment—None. Do not file caps. Replace bearings.
End Thrust—Taken by #3 main bearing. Endplay .001-.005".

Camshaft:—Duplex chain drive with automatic take-up.
Timing Chain—Morse #766 Duplex. Width 1½". Pitch .375". Length 41¼" or 110 links. See Equipment Section for complete data on Morse Automatic Idler Sprocket.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diam.	Stem Diam.	Length
Intake	1.446"	11/32"	6 9/64"
Exhaust	1.452"	11/32"	6 9/64"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.0015"

Tappet Clearance—None in service (automatic take-up).
See article in Mechanical Equipment Section for data.

Valve Springs—Double springs used on all valves.

V12 370-B, C Specifications

	Spring Pressure	Inner Spg. Length	Outer Spg. Length
Valve Closed	69½ lbs.	1.751"	1.922"
Valve Open	167 lbs.	1.407"	1.578"

V16 452-B, C Specifications

Valve Closed	64 lbs.	1.751"	1.875"
Valve Open	141 lbs.	1.407"	1.531"

Valve Timing—See Camshaft Setting above.
Intake Valves Open—At TDC. Close—44° ALDC.
Exhaust Valves Open—39° BLDC. Close 5° ATDC.
To Check Valve Timing—No. 1 intake valve should open with piston on top dead center when flywheel mark 'C/1-11' lines up with indicator.

NOTE:—Automatic valve tappet take-up should not require attention in service but must be reset to initial clearance of .030" when replacing or grinding valves. See Equipment Section for data.

Lubrication—Pressure type. Gear type oil pump mounted in crankcase on rear main bearing cap.
Normal Oil Pressure—30 lbs. at 60 M.P.H.
Oil Pressure Relief Valve—Operates at 14 lbs. Not adjustable. Located under plug on front face of chain case cover.
Capacity & Oil—9 qts. (V12), 10 qts. (V16). Use SAE #40 or 50 (summer), #20 (winter).

CLUTCH:—Own make. Double plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven asbestos compound, 4 required.

Facing Specifications

Model	Thickness	Inside Diam.	Outside Diam.
370-B, C	9/64"	5½"	10"
452-B, C	9/64"	6½"	11"

Clutch Pedal Adjustment—Lash or free movement of clutch pedal should be 1½". Clearance between clutch pedal and under side of toeboard should be ¼" with clutch pedal released (pedal stop screw adjustment).
NOTE—Driven discs and facings should be selected so that difference in thickness of the two disc assemblies is not more than .005". Total clearance between clutch facings and center driving plate should be approximately .030".

STEERING:—**Steering Gear**—Saginaw Worm-and-Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventionel 'I' beam section front axle (rectangular end sections) with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7° 45' crosswise.
Caster—2½-3½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1½°. No adjustment provided.
Toe In—3/16". Adjust in usual manner by loosening clamp bolts and rotating tie rod.

BRAKES:—**Service**—Own make. Internal expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies rear wheel service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diameter—15" (V12), 16" (V16).
Lining—Semi-moulded Latex. Width 2" (V12), 2¼" (V16), Thickness 3/16", Length 29¾" (V12), 31⅝" (V16) per wheel.
Clearance—.007" between lining and drum for each shoe.

Hand Brake Adjustment:—See Service Brakes above.

Power Unit:—Bendix type vacuum cylinder.
See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number, 3,100,001 ('34), 3,105,001 ('35). Stamped on right hand side of crankcase below water inlet.

ENGINE:—Model 355-D. Eight cylinder, 90 degree 'Vee', 'L' head type.

Bore—3⅜". Stroke—4 15/16".

Piston Displacement—353 cubic inches.

Rated Horsepower—36.45.

Developed Horsepower—130 at 3400 R.P.M.

Compression Ratio—6.25-1 (Std.), 5.75-1 (Optional).

Compression Pressure—148 lbs. at 1000 R.P.M. or 160 lbs. at 2800 R.P.M. (standard head).

NOTE—Cylinder heads are stamped with compression ratio at point directly above the front spark plug.

Pistons:—Lynite Lo-Ex, aluminum alloy, 'T' slot, cam ground type with Anodized finish (special hard oxide deposited on bearing surface). Piston diameter across pin bosses is .0065" less than at right angles to bosses. Pistons cannot be ground. Refinish cylinders to take replacement pistons furnished .005", .015", .030" oversize. Piston length, 3 21/32".

Weight—15.008 ozs. (stripped), 20.880 ozs. (with rings, pin, and locking screw).

Removal—Piston and rods removed from below.

Clearance—Top .019". Bottom .0023".

Fitting New Pistons—Check piston with micrometer gauge at point just below and to left of 'T' slot junction midway between pin holes with piston at 70°. Check cylinder bore with micrometer, finish bore to size giving correct clearance. Feeler gauges ⅜-½" wide can be used in side opposite slot. Piston should fall of own weight with .002" feeler and lock on .0025" feeler.

Installing Pistons—Install pistons with slot to left as viewed from driver's seat.

Piston Rings:—Three compression rings, one oil control ring per piston. Oil ring groove drilled with oil drain holes. Install compression rings in #2 and 3 grooves with notch or step toward bottom.

Ring	Width	End Gap	Wall Thickness
Comp. (all)	.0930-.0935"	.007-.012"	.145"
Oil Cont.	.1860-.1865"	.007-.015"	.145"

Piston Pin:—Diameter .8742-.8744". Length 3 1/32". Pin is locked in piston by locking screw in one boss. Heat piston in boiling water to remove or install pins.

Pin Fit in Piston—Locking screw end .0004" press fit or hand push fit with piston at 200-210°F. Free end .0000" clearance or hand push fit with piston at 70°F.

Pin Clearance in Rod Bushing—.0002-.0008".

Connecting Rod:—Weight 34.496 ozs. Length 10½".

Lower Bearing—Spun babbitt type. No shims.

Clearance—.0015". Sideplay .003-.006".

Adjustment—None. Do not file bearing caps. Replace rods.

Installing Rods—Numbers on rods and caps must correspond and must be toward bottom of engine.

Crankshaft:—Three bearing type with four counterweights.

Journal Diameters—2⅜" (all bearings).

Bearing Type—Bronze-backed, babbitt-lined type.

Clearance—.0015".

Adjustment—None. Do not file caps. Replace bearings.

End Thrust—Taken by #3 (rear) main bearing. Endplay .001-.005".

Camshaft:—Non-adjustable chain drive.

Timing Chain—Morse #766. Width 1¾". Pitch .500". Length, 27" or 54 links.

Camshaft Setting—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1.660-1.666"	⅜"	6 17/32"
Exhaust	1.634-1.640"	⅜"	6½"

	Seat Angle	Lift	Stem Clearance
Intake	30°	23/64"	.0015-.0035"
Exhaust	45°	23/64"	.0025-.0045"

Tappet Clearance—.006" Int., .010" Exh., engine cold.

Valve Springs—Double springs used on all valves.

	Spring Pressure	Inner Spg. Length	Outer Spg. Length
Valve Closed	70 lbs.	1.751"	1.922"
Valve Open	185 lbs.	1.407"	1.578"

Valve Timing—See Camshaft Setting above.

Intake Valves—Open 6° BTDC. Close 42° ALDC.
Exhaust Valves—Open 38° BLDC. Close 2° ATDC.

To Check Valve Timing—No flywheel marks. Intake opening point for #1 cylinder is approximately 1.883 teeth before flywheel mark 'C 1/4'.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Oil Pressure—30 lbs. at idling speed.

Pressure Relief Valve—Operates at 11 lbs. or 10 M.P.H. Not adjustable.

Capacity and Oil—8 quarts. Summer, SAE. #30 (moderate driving) or SAE. #40-50 (high speed driving). Winter, SAE. #20-W (temperatures down to 0°F.), SAE. #10-W (temperatures down to —15°F.) for moderate driving.

CLUTCH:—Own make. Double plate, dry disc type.

See article in Mechanical Equipment Section for data.

Clutch Pedal Adjustment—Lash or free movement of clutch pedal should be 1½". Clearance between clutch pedal and under side of toeboard should be ¼" with clutch pedal released (pedal stop screw adjustment).

Clutch Facings—Woven type, 4 required, 6½" I.D., 9½" O.D., .120-.130" thick (see Note).

NOTE—Driven discs and facings should be selected so that difference in thickness of the two disc assemblies is not more than .005". Total clearance between clutch facings and center driving plate should be approximately .030".

STEERING:—**Front Suspension**—Independent, linked parallelogram type with helical springs.

See article in Mechanical Equipment Section for data.

Caster—1½° with car weight on wheels. Adjusted by turning threaded pin linking upper suspension arms (shock absorber arms) to steering knuckle support. To adjust, loosen pin locks, loosen lower suspension arm yoke, turn pin as follows:

Right wheel (head of pin to rear)—Turn pin clockwise to increase caster angle, or counter-clockwise to decrease caster angle.

Left wheel (head of pin to front)—Turn pin counter-clockwise to increase caster angle, or clockwise to decrease caster angle.

One full turn of the pin will change caster ½°. Lock pins in place after making adjustment. Caster must be exactly equal on both wheels.

Camber—¾-1½° with car weight on wheels and top surface of lower spring support 5 3/16" below lower face of frame. No adjustment recommended. Crosswise inclination of kingpin, 4°.

Toe In—⅛-3/16". To adjust, increase or decrease length of each tie rod equally. Turn tie rods in same direction that wheels revolve to increase toe-in, and in opposite direction to decrease toe-in.

Steering Gear:—Saginaw Worm-and-Double Roller Type. See article in Steering Section.

BRAKES:—**Service**—Own Make. Internal-expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies rear wheel service brakes. See article in Brake Section.

Drum Diameter—14.995-15.005". Out-of-round .007" maximum. Run-out (installed) .010" maximum.

Lining—Woven type. 2" (all shoes).

	Thickness	Length per Shoe
Top (aluminum) Shoe	.245-.260"	15 19/32"
Lower (steel) Shoe	.183-.198"	14¼"

Clearance—.007" (approximate).

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—Bendix internal valve type vacuum cylinder mounted on frame 'X' member and linked to relay lever (Series 10 & 20) and to a lever on the pedal shaft (Series 30). See article in Brake Section.

ENGINE NUMBER:—On chain case at right of engine directly in front of engine.

Model	Year	First Number
370-D	1934	4,100,001
452-D	1934	5,100,001
370-D Series 40	1935	4,101,701
452-D Series 60	1935	5,110,001

ENGINE (V12 370-D:—Twelve cylinder, 45° Vee, 'T' or overhead valve type. Cylinder blocks for each bank cast enbloc and separate from crankcase.
Bore—3⅛". **Stroke**—4".
Piston Displacement—368 cubic inches.
Rated Horsepower—46.9.
Developed Horsepower—150 at 3600 R.P.M.
Compression Ratio—6.0-1 (std.), 5.65-1 (optional).
Compression Pressure—145 lbs. at 1000 R.P.M. or approximately 100-105 lbs. at cranking speed.

ENGINE (V16 452-D):—Sixteen cylinder, 45° Vee, 'T' or overhead valve type. Cylinder blocks for each bank cast Enbloc and seperate from crankcase.
Bore—3". **Stroke**—4".
Piston Displacement—452 cubic inches.
Rated Horsepower—57.5.
Developed Horsepower—185 at 3800 R.P.M.
Compression Ratio—6.0-1 (Std.), 5.65-1 (optional).
Compression Pressure—154 lbs. at 1000 R.P.M. or approximately 100-105 lbs. at cranking speed.
NOTE—Cylinder heads are stamped with compression ratio on end of head. Compression ratio may be altered by changing head gasket.

Pistons:—Lynite Lo-Ex, aluminum alloy, 'T' slot, Cam ground type with Anodized finish (special hard oxide deposited on bearing surface). Piston diameter across pin bosses is .0065" less than at right angles to bosses. Pistons cannot be ground. Refinish cylinders to take replacement pistons furnished .005", .015", .030", oversize. Piston length 3 5/16".
Removal—Pistons and rods removed from bottom.
Weight (Stripped)—11.172 ozs. (V12), 12.040 ozs. (V16).
Weight (With rings, pin and locking screw)—16.976 ozs. (V12), 17.232 ozs. (V16).
Clearance (V12)—Top .019". Bottom .0020".
Clearance (V16)—Top .018". Bottom .0018".
Fitting New Pistons—Check piston with micrometer gauge at point just below and to left of 'T' slot junction midway between pin holes with piston at 70°. Check cylinder bore with micrometer, finish to size giving correct clearance. Feeler gauges ⅜-½" wide can be used in side opposite slot. Piston should fall of own weight with .0015" feeler and lock on .002" feeler.
Installing Pistons—Install pistons with slot to left as viewed from driver's seat.

Piston Rings:—Three compression rings, one oil control ring per piston, all above pin. Oil ring groove drilled with oil drain holes. Install compression rings in #2 and 3 grooves with notch or step toward bottom.

Ring	Width	End Gap	Wall Thickness
Comp. (all)	.0930-.0935"	.007-.012"	.130"
Oil Cont.	1545-.1550"	.007-.015"	.135"

Piston Pin:—Diameter .8742-.8744". Length 2.810-2.815". Pin is locked in piston by locking screw in one boss. Heat piston in boiling water to remove or install pin.
Pin Fit in Piston—Locking screw end .0004" press fit or hand push fit with piston at 200-210°F. Free end .0001" clearance or hand push fit at 70°F.
Pin Clearance in Rod Bushing—.0002-.0008".

Connecting Rods:—Weight 31.856 ozs. Length 9¼".
Lower Bearing—Spun babbitt type. No shims.
Clearance—.0015". Sideplay .004-.007".
Adjustment—None. Do not file caps. Replace rods.
Installing Rods—Numbers on rods and caps must correspond and must be toward bottom of engine.

Crankshaft:—Four bearing (V12), five bearing (V16). Integral countreweights.
Journal Diameters—2⅝" (all bearings).
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.002-.004".
Adjustment—None. Do not file caps. Replace bearings.
End Thrust—Taken by #3 main bearing. End-play .001-.005".

Camshaft:—Duplex chain drive with automatic take-up.
Timing Chain—Morse #766 Duplex. Width 1½". Pitch .375". Length 41¼" or 110 links. See equipment section for complete data on Morse automatic idler sprocket.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diam.	Stem Diam.	Length
Intake	1.509-1.515"	11/32"	6 9/64"
Exhaust	1.384-1.390"	11/32"	6 9/64"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-0025"

Tappet Clearance—None in service (automatic take-up).
See article in Mechanical Equipment Section for data.
Valve Springs—Double springs used on all valves.
NOTE—If valve spring pressure (installed) is less than 48 lbs. after valve grinding, correct by installing special .040" spacer, Part No. 889407, under valve spring retainer (spacer will increase pressure 10.9 lbs.).

V12 370-D Spring Specifications

	Spring Pressure	Inner Spring Length	Outer Spring Length
Valve Closed	69½ lbs.	1.751"	1.922"
Valve Open	167 lbs.	1.407"	1.578"

V16 452-D Spring Specifications

Valve Closed	64 lbs.	1.751"	1.875"
Valve Open	141 lbs.	1.407"	1.531"

Valve Timing—See Camshaft Setting above.
Intake Valves Open—At TDC. Close—44° ALDC.
Exhaust Valves Open—39° BLDC. Close— 5° ATDC.
NOTE:—Automatic valve tappet take-up should not require attention in service but must be reset to initial clearance of .030" when replacing or grinding valves. See Equipment Section for complete data.
To Check Valve Timing—No. 1 intake valve should open with piston on top dead center when flywheel mark 'C.1/11' (V12), 'C.1/15' (V16) lines up with indicator.

Lubrication—Pressure type. Gear type oil pump located in crankcase on rear main bearing cap.
Normal Oil Pressure—30 lbs. at 60 M.P.H.
Oil Pressure Relief Valve—Operates at 14 lbs. Not adjustable. Located under plug on front face of chain case cover.
Capacity & Oil—9 qts. (V12), 10 qts. (V16). Use SAE #40 or 50 (summer), #20 (winter).

CLUTCH:—Own make. Double plate, dry disc type. ***See article in Mechanical Equipment Section for data.***
Clutch Pedal Adjustment—Lash or free movement of clutch pedal should be 1½". Clearance between clutch pedal and underside of toeboard should be ¼" with clutch pedal released (pedal stopscrew adjustment).
Clutch Facings—Woven asbestos compound, 4 required.

Model	Thickness	Inside Diam.	Outside Diam.
V12 370-D-	.120-.130"	5⅞"	10"
V16 452-D-	.135-.145"	6½"	11"

NOTE—Driven discs and facings should be selected so that difference in thickness of the two disc assemblies is not more .005". Total clearance between clutch facings and center driving plate should be approximately .030".

STEERING:—**Steering Gear**—Saginaw Worm-and-double roller type. See article in Steering Section for complete adjustment instructions.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for complete description and adjusting directions.
Caster—1½° with car weight on wheels. Adjusted by turning threaded pin linking upper suspension arms (shock absorber arms) to steering knuckle support. To adjust, loosen pin locks, loosen lower suspension arm yoke, turn pin as follows:
Right wheel (head of pin to rear)—Turn pin clockwise to increase caster angle or counter-clockwise to decrease caster angle.
Left wheel (head of pin to front)—Turn pin counter-clockwise to increase caster angle or clockwise to decrease caster angle.
One full turn of the pin will change caster ½°. Lock pins in place after making adjustment. Caster must be exactly equal on both wheels.
Camber—¾-1½° with car weight on wheels and top surface of lower spring support 5 3/16" below lower face of frame. No adjustment recommended. Crosswise inclination of kingpin, 4°.
Camber—1° with car weight on wheels. No adjustment provided. Crosswise inclination of kingpin, 4°.
Toe In—⅛-3/16". To adjust, increase or decrease length of each tie rod equally. Turn tie rods in same direction that whels revolve to increase toe-in or in opposite direction to decrease toe-in.

BRAKES:—**Service**—Own make. Internal expanding, self-energizing, mechanically operated, vacuum power type. Hand lever appiles rear wheel service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diameter—15" all models.
Lining—Woven type. Width 2". Thickness .245-.260" (forward shoe), .183-.198" (rear shoe). Length 15 19/32" (forward shoe), 14¼" (rear shoe) or 29 27/32" per wheel.
Clearance—.007" between lining and drum for each shoe.
Hand Brake:—See Service Brake Adjustment above.
Power Unit:—Bendix vacuum cylinder with internal valve. See article in Brake Section for complete data.

ENGINE NUMBER:—First number—36-60, 6010001; 36-70, 75, 3110001. Stamped on top of crankcase, behind fan support.

ENGINE SPECIFICATIONS:—8 cylinder, 90 degree 'Vee' 'L' head type.
Bore—3⅜" (60), 3½" (70, 75). **Stroke**—4½".
Displacement—322 cu. in. (60), 346 cu. in. (70, 75).
Rated Horsepower—36.45 (60), 39.20 (70, 75).
Developed Horsepower—125 (60), 135 (70, 75) at 3400 R.P.M. Std. 6.25-1 head.
Compression Ratio—6.25-1 Std. cast-iron head. Optl. 5.75-1 cast-iron head.
Compression Pressure—155 lbs. (60), 170 lbs. (70, 75) at 1000 R.P.M. or approx. 105-110 lbs. at cranking speed for std. 6.25-1 head.
Vacuum Reading—Gauge should show steady reading of 20-21" with engine idling at 6 M.P.H.
NOTE—Upper crankcase and two cylinder blocks cast in one piece. Two cylinder head capscrews for water outlet elbow ½" longer than others and must be used for this purpose only. Cylinder head gaskets Part No. 1412661 (60), 1412662 (70, 75) are interchangeable (left and right banks) and must be installed with triangular hole on inner edge to rear.

PISTONS:—Lynite, Lo-Ex aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface).
Length—4⅛". Weight—16.88 ozs. (60), 18.304 ozs. (70, 75).
Removal—Pistons and rods removed from above.
Clearance—Top .023" (60), .025" (70, 75). Bottom of skirt .0019" (60), .0021" (70, 75). See Fitting Pistons.

Replacement Pistons:—Finished anodized pistons furnished as follows:

	Model 36-60	36-70 ,75
Standard	3.3726-3.3746"	3.4979-3.4999"
.003" Oversize	3.3761-3.3776"	3.5014-3.5029"
.005" Oversize	3.3781-3.3796"	3.5034-3.5049"
.010" Oversize	3.3831-3.3846"	3.5084-3.5099"
.015" Oversize	3.3881-3.3896"	3.5135-3.5149"

NOTE—Cylinder bores in same block held within .002" limits. Max. cylinder bore out-of-round .0005".

Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and ½" above lower edge. Using ½" feelers inserted between piston and cylinder wall on side opposite slot, piston should drop of its own weight with .002" feeler and hold its own weight on .0025" feeler.

Installing Pistons:—Slot should be toward left as viewed from drivers seat on all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Lower ring grooves drilled radially with oil drain holes.
NOTE—A narrow heat deflector groove located above top compression groove. No ring fitted.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.012"	.0015-.0028"
Oil Control	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits on all rings .025" (End Gap) and .004" (Side Clearance).

PISTON PIN:—Diameter ⅞". Length 2 15/16" (60), 3 1/16" (70, 75). Pin floats in piston and rod. Held by retaining rings. Split-type bushing used in pin hole in rod. See Note below.
Pin Fit in Piston—.0004" press fit (rib end), .0001" clearance or free fit at 70° F. (other end).
Pin Fit in Rod Bushing—.0002 0008" (new), .0015" max. (worn).
Removal:—Remove snap rings, place piston in boiling water for one minute, then push pin out by hand from rib end (piston boss ribbed on under side for identification). Install pin by same procedure except that pin is pushed in from opposite end. Install snap ring with opening down.
NOTE—In removing and installing split-type bushing an arbor press and special tool kit (Tool No. HM-250) are necessary. Bushings must be pressed in, expanded, then burnished to give correct clearance.

CONNECTING ROD:—Weight 41.26 ozs. **Length** 8¾".
Crankpin Journal Diameter—2.4590-2.4595".
Lower Bearing—Removable steel-backed, babbitt-lined shell type. No shims.
Clearance—.001-.0025" (new), .006" max. (worn). Sideplay .003-.006".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
NOTE—New lock washers (Part No. 1415487) must be used under connecting rod bolts. Wrench for tightening bolts must not be longer than 12". Tool No. J-835 recommended by manufacturer.
Installing Rods:—Numbers on bearing cap and rod must correspond and must point toward oil pan.
NOTE—Crankpin out-of-round .002" maximum.

CRANKSHAFT:—3 bearing, 6 counterweights, #2 and 5 held by capscrews, all others integral.
Journal Diameters—2½" all bearings.
NOTE—Journal out-of-round .002" maximum.
Bearing Type—Removable steel-backed, babbitt-lined shells. New bearings require no line-reaming.
Clearance—.0015" (new), .004" (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Upper halves rotated in and out with 'T' shaped cotter pin in oil passage.
NOTE—When reinstalling rear main bearing cap use new wooden plugs in grooves.
End Thrust:—Taken by center (#2) bearing. Endplay .001-.005" (new), .010" (worn).

CAMSHAFT:—3 bearing. Non-adjustable chain drive.
Journal Diameters—#1 and 2, 2.4076-2.4083"; #3, 2.0014-2.0021".
Bearing Type—Removable steel-backed, babbitt-lined bushings.
Clearance—.002-.004" (new), .005" (worn limit).
NOTE—Use Tool J-829 to remove and install bearings. Bearing out-of-round must not exceed .002".
End Thrust:—Taken by thrust plate behind sprocket. No endplay permissible.
Timing Chain:—Morse #3377. Width 1¼". Pitch ⅜". Length 23¼" or 62 links.
Installing Chain—Install chain 'endless' as an assembly with both sprockets. Use Tool J-836 to pilot camshaft sprocket when installing on shaft.
Camshaft Setting:—Sprockets are marked. Install chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.006" (worn limit)
Exhaust	45°	11/32"	.005" (worn limit)

NOTE—Valve lifter assemblies must be removed before valve springs can be compressed to remove spring keepers and free valves. Use Tool J-827 to hold plungers down when re-installing lifters.
Tappet Clearance—None. (Automatic take-up.)
Valve Guides:—Removable. Pressed in block with long stepped end down and finish reamed to provide clearance of .001-.0023" Int., .002-.0033" Exh.
Valve Springs:—Free length 2.210".

	Spring Pressure	Length
Valve Closed	62-69 lbs	1 15/16"
Valve Open	140-151 lbs	1 9/16"

Valve Lifters:—Mushroom type with Automatic valve tappet takeup. See article in Equipment Section

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
To Check Valve Timing—Intake valve for cylinder #1 (front cylinder—left bank) should open with piston on top dead center when mark 'C.1/' on crankshaft pulley lines up with pointer.
Motor Gauge—Weidenhoff #114 Adapter, #42 Rod.

LUBRICATION:—Pressure system with main oil channel located in left hand crankcase wall.
Oil Pump:—Gear type located in oil pan at rear of engine. Driven through idler gear from camshaft.
Oil Pump Drive Clearances—Drive shaft bushing .001-.0025" (new), .010" (worn). Endplay in accessory idler gear .002-.006" (new), .010" (worn). Endplay in spiral gear on drive shaft .003-.010" (new), .015" (worn). Backlash in spiral drive gears .018" max.
Oil Pump Gear Clearances—Pump body and gears .0025-.0085" (new), .010" (worn). Pump gear endplay .002-.004" (new), .015" (worn).
Normal Oil Pressure:—15 lbs. idling, 30 lbs. at 60 M.P.H.
Oil Pressure Regulator:—Operates at 30 lbs. Located on oil pump. Not adjustable.
Crankcase Capacity:—7 qts. refill.

CLUTCH:—Long Model 11CF-CI (60), 11CF-CL (70, 75). Semi-centrifugal single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required. Inside Diam. 6½". Outside Diam. 11". Thickness .135-.139".
Adjustment—Free movement of clutch pedal should be ⅞-1⅛". Adjust by turning nut on forward end of pedal rod directly below pedal equalizer link.
Removal—Disconnect front universal joint, remove from propeller shaft, remove cross member carrying transmission rear support; remove front propeller shaft housing and propeller shaft (70, 75 only); disconnect clutch release mechanism (70, 75 only); remove transmission (pull straight back to avoid distortion to clutch disc), drop clutch housing pan and remove clutch release yoke retaining screw (60 only). Prick punch clutch cover, spring pressure plate and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly. Remove clutch.
NOTE—On Series 36-60 cars keep transmission in high gear or install brace across face of case to hold clutch connection in position, preventing high-speed synchronizing drum from pulling out of splines.

STEERING:—Steering Gear Saginaw worm-and-double roller type. See article in Steering Section.
Front Suspension:—Independent linked perallelogram type with coil springs. See article in Steering Section for description and adjustments.
Kingpin Inclination—4°51' (60), 5°38' (70, 75) crosswise. **Caster**—1½-2° (60). ¾-1¼° (70, 75).
Camber—¼-1° (60). 0-½° (70, 75). **Toe In**—O-1/16".
Steering Geometry—Inner wheel turned 21¾-23¼° (60), 22-23½° (70, 75), outer wheel turned 20°.

BRAKES:—Bendix Hydraulic, single anchor type. Hand lever applies rear wheel service brakes. See article in Brake Section for complete data.
Wheel Cylinders—Diameters: front 1 1/16" (60), 1¼" (70, 75), rear 15/16" (60), 1 1/16" (70, 75). No part of assembly is interchangeable.
Drum Diameter—11.995-12.005" (60), 13.995-14.005" (70, 75). Out-of-round .007" max. Run out (installed) .010" maximum.
Lining—Moulded (primary), woven (secondary). Width 2" (60), 2¼" (70, 75). Thickness 3/16" (60), ¼" (70, 75). Length 10⅛"-60, 12¼"-70, 75 (frt. wh. primary), 13"-60, 15"-70, 75 (all others).
Clearance—.010" between lining and drum.
Hand Brake Adjustment:—See Service Brake.

ENGINE NUMBER:—First number—4110001 (80, 85), 5110001 (90). On right hand side of chain case in front of generator.

ENGINE SPECIFICATIONS:—12 cylinder (80, 85), 16 cylinder (90), 45° Vee, 'I' or overhead valve type. Cylinder blocks for each bank cast enbloc and separate from crankcase.
Bore—3⅛" (80, 85), 3" (90). **Stroke**—4".
Displacement—368 cu. ins. (80, 85), 452 cu. ins. (90).
Rated Horsepower—46.9 (80, 85), 57.5 (90).
Developed Horsepower—150 at 3600 R.P.M. (80, 85), 185 at 3800 R.P.M. (90). Std. 6.00-1 head.
Compression Ratio—6.0-1 Std. cast-iron head. Optl, ratio of 5.65-1 (80, 85), 5.57-1 (90) for special operating conditions may be secured by installing special thick head gaskets.
Compression Pressure—145 lbs. (80, 85), 154 lbs. (90), at 1000 R.P.M. or approximately 100-105 lbs. at cranking speed.
Vacuum Reading—20-21" steady at 320 R.P.M.

PISTONS:—Lynite, Lo-Ex aluminum alloy. 'T' slot, Cam gound type with anodized finish (special hard oxide formed on bearing surface).
Length—3 5/16". **Weight**—11.712 ozs. (80, 85), 12.038 ozs. (90).
Removal—Pistons and rods removed from below.
Clearance—Top .019" (80, 85), .018" (90). Bottom .0020" (80, 85), .0018" (90). See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished .005", .015" oversize or reground blocks with pistons fitted furnished .015", .030" oversize.
NOTE Cylinder bores in same block held within .002" limits. Max. cylinder bore out-of-round .0005".
Fitting New Pistons:—Check piston with micrometer gauge at point just below and to left of 'T' slot junction midway between pin holes with piston at 70° F. Check cylinder bore with micrometer, finish to size giving correct clearance. Feeler gauges ⅜-½" wide can be used on side opposite slot. Piston should fall of own weight with .0015" feeler and lock on .002"
Installing Pistons:—Install pistons with slot to left as viewed from the driver's seat.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with oil drain holes.
NOTE—A narrow heat deflector groove located above top compression groove. No ring fitted.

Ring	Width	End Gap	Side Clearance
Comp (80, 85)	⅛"	.007-.012"	.0015-.0028"
Comp (90)	3/32"	.007-.012"	.0015-.0028"
Oil Cont	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits on all rings .025" (End Gap) and .004" (Side Clearance).

PISTON PIN:—Diameter ⅞". Length 2.810-2.815". Pin is locked in piston by locking screw in one boss. Heat piston in boiling water and push pin out from lock-screw end (in from opposite end to install).
Pin Fit in Piston—Locking screw end .0004" press fit or hand push fit with piston at 200-210° F. Free end .0001" clearance or hand push fit at 70° F.
Pin Fit in Rod Bushing—.0002-.0008" (new), .0015" (worn).
NOTE—To remove and install split-type bushing manufacturer recommends special tool kit (No. HM-250). Bushings must be pressed in with an arbor press, expanded, then burnished.

CONNECTING ROD:—Weight 31.856 ozs. **Length** 9¼".
Crankpin Journal Diameter—2½".
Lower Bearing—Spun babbitt. No shims.
Clearance—.001-.0025". Sideplay .004-.007".
Bearing Adjustment:—None (no shims). Do not file caps. Replace rods.
Installing Rods:—Numbers on rods and caps must correspond and must be toward bottom of engine.

CRANKSHAFT:—4 (80, 85), 5 (90) bearing type with integral counterweights.
Journal Diameters—2 ⅝" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined shells. New bearings require no line reaming.
Clearance—.001" (new), .004" (worn) (80, 85). .002-.004" (90).
Bearing Adjustment:—None (no shims). Replace bearings (upper halves rotated in or out with 'T' shaped cotter pin in oil passage). Do not file caps.
NOTE—Use new wooden plugs with rear bearing cap.
End Thrust:—Taken by #3 main bearing. Endplay .001-.005".

CAMSHAFT:—Four (80, 85), five (90) bearings. Duplex chain drive with automatic take-up.
Journal Diameters—#1, 2"; all others 2⅛".
Clearance—.0011-.0026" (new), .005" (worn limit).
End Thrust:—Taken by thrust plate at rear of camshaft sprocket. Endplay .005-.015". Replace plate if endplay exceeds .015".
Timing Chain:—*Morse #766 Duplex. Width 1½". Pitch ⅜". Length 41¼" or 110 links. See Equipment Section for complete data on Morse automatic idler sprocket.*
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diam.	Stem. Diam.	Length
Intake	1.509-1.515"	.3392-.3397"	6 9/64"
Exhaust	1.384-1.390"	.3392-.3397"	6 9/64"

	Seat Angle	Lift	Stem Clearance
Intake (80, 85)	45°	11/32"	.001-.0015"
All others	45°	11/32"	.001-.0025"

Tappet Clearance—None (automatic take-up).
See article in Mechanical Equipment Section for data.
Valve Guides:—One piece, removable. Install with long stepped end up and finish ream to correct clearance.
Valve Springs:—Double springs used on all valves.
NOTE—If valve spring pressure (installed) is less than 48 lbs. after valve grinding, correct by installing special .040" spacer, Part No. 889407, under valve spring retainer (will increase pressure 10.9 lbs.).

Inner Spring	Spring Pressure	Length
Valve Closed	18-21 lbs.	1¾"
Valve Open	49-54 lbs.	1 7/16"

Outer Spring	Spring Presure	Length
Valve Closed	48-52 lbs.	1 15/16"
Valve Open	111-120 lbs.	1 9/16"

Valve Lifters:—Roller type lifters or cam slides operating in individual removable guides. Clearance in guide .001-.0025" (new), .005" (worn limit). Roller clearance on pin .0017-.003" (new), .004" (worn).
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close at 44° ALDC.
Exhaust Valves—Open at 39° BLDC. Close at 5° ATDC.
To Check Valve Timing—No. 1 intake valve should open with piston on top dead center when flywheel mark '1C/11' lines up with indicator.
Motor Gauge—Weidenhoff #113 Adapter, #33 Rod.

LUBRICATION:—Pressure system from oil pump in crankcase through oil tube in oil pan.
Oil Pump:—Gear type in crankcase. Driven through tongue-and-slot coupling by gear on camshaft.
Oil Pump Drive Clearances—Drive shaft bushing .001-.0025" (new), .010" (worn limit). Drive gear endplay .009-.015" (new), .020" (worn limit). Drive gear backlash .018" maximum.
Oil Pump Gear Clearances—Pump body and gears .0025-.0085" (new), .010" (worn limit). Pump gear endplay .002-.004" (new), .015" (worn limit).
Normal Oil Pressure—30 lbs. at 60 M.P.H.
Oil Presure Regulator—Operates at 14 lbs. Not adjustable. Under plug on front of chain case cover.
Crankcase Capacity:—9 qts. (80, 85), 10 qts. (90).

CLUTCH—SERIES 80, 85:—Long Model 11CF-C. Semi-centrifugal, single plate, dry disc type. See article in Clutch Section.
See article in Mechanical Equipment Section for data.
Facings—Same as V8 model (see previous page).
Adjustment—Free movement of clutch pedal should be ⅞-1⅛". Adjust by turning nut on forward end of pedal rod directly below pedal equalizer link.
Removal—Clutch removed in same manner as on Series 70, 75 except that clutch housing is integral with transmission case so that clutch is exposed when transmission is removed and no pan is used. See previous page for complete directions.

CLUTCH—SERIES 90:—Own Make. Double plate, dry disc type. See article in Clutch Section.
Facings—Woven type, 4 required. Inside Diam. 6½". Outside Diam. 11". Thickness .135-.145".
Adjustment—Clearance between pedal and underside of toeboard should be ¼" with clutch engaged. Adjust by loosening locknut and turning stopscrew at lower end of pedal at rear of bracket on outside of frame. Free movement of clutch pedal must be 1½". To adjust, remove clevis pin in lower end of pedal, loosen locknut and turn clevis on link.
Removal—Disconnect rear universal joint, remove drive shaft, remove transmission rear support (as unit with cross member on which support is mounted), remove front propeller shaft and shaft housing, disconnect clutch release mechanism, take out transmission mounting screws and pull transmission straight back until clutch connection shaft is free, take off four nuts on studs mounting clutch center driving plate on flywheel (accessible through holes in rear driving plate), remove clutch assembly.

STEERING:—Steering Gear—Saginaw Worm-and-Double-Roller type. See article in Steering Section.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for description and adjustments.
Kingpin Inclination—5°38' (80, 85), 4° (90).
Caster—¾-1¼° (80, 85), 1½° (90).
Camber—0-½° (80, 85), ¾-1½° (90).
Toe In—0-1/16" (all models).
Steering Geometry—Inner wheel turned 22-23½°, outer wheel 20° (all models).
NOTE—When checking camber, springs must be compressed sufficiently so that distance from lower face of frame sidemember to top face of spring lower support is 5 3/16" on all models.

BRAKES—SERIES 80, 85:—Bendix Hydraulic, Single Anchor type. All specifications and adjustments same as for Series 70, 75. See previous page.

BRAKES—SERIES 90:—Service—Own Make. Internal-expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies rear service brakes. See article in Brake Section.
Drum Diameter—15.995-16.005". Out-of-round .007" maximum. Run-out (installed) .010" maximum.
Lining—Woven type. Width 2" (all shoes).

	Thickness	Length per Shoe
Top (aluminum) Shoe	.245-.260"	15 19/32"
Lower (steel) Shoe	.183-.198"	14¼"

Clearance—.007" (approximate).
Hand Brake Adjustment:—See Service Brakes.
Power Unit:—Bendix internal valve type vacuum cylinder mounted on frame 'X' member and linked to equalizer lever between front and rear wheel brake cross shafts. See article in Brake Section.

SERIAL NUMBER:—Same as engine number below.
ENGINE NUMBER:—First number (60) 6030001, (65) 7030001, (70, 75) 3130001. Stamped on left side of crankcase at rear of left cylinder block.
ENGINE SPECIFICATIONS:—Own. 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast Enbloc. **Bore**—3½". **Stroke**—4½".
Displacement—346 cu. ins. **Rated HP.**—39.20.
Developed Horsepower—135 HP. at 3400 R.P.M.
Compression Ratio—6.25-1 Std. 5.75-1 Optl.
Compression Pressure—155 lbs. at 1000 R.P.M. or approx. 105-110 lbs. at cranking speed (std. head). *See Cadillac Special Shop Notes for cylinder head installation instructions, head gasket identification, and changing compression ratios*
Vacuum Reading—Steady 20-21" at idle speed.
PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛".
Weight—18.30 oz. stripped. 25.13 oz. complete.
Removal—Pistons and rods removed from above.
Clearance—Skirt .0021". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished Std. (3.4979-3.4999"), .003" (3.5014-3.5029"), .005" (3.5034-3.5049"), .010" (3.5084-3.5099"), .015" (3.5135-3.5149") oversize.
NOTE—Hold all cylinders in same block within .002" size limits. Max. out-of-round .0005".
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide) used, insert feeler next to T-slot. Piston should fall of own weight with .002" feeler, hold tight on .0025" feeler.
Installing Pistons:—Slot to left, for all pistons.
PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compression	1/8"	.007-.012"	.0015-.0028"
Oil Control	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits .025" (gap), .004" (side clear.).
Replacement Rings: .003",.005",.010",.015",.030" oversize.
PISTON PIN:—Diameter ⅞". Length 3 1/16". Pin floats in piston and rod. Held by locking rings. *See Cadillac Shop Notes for special pin removal and installation instructions.*
Pin Fit in Piston—.0004" press fit (ribbed end), .0001" clearance or free fit at 70° F. (plain end).
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0015" (worn limit).
CONNECTING ROD:—Weight 37.472 oz. **Length** 8¾".
Crankpin Journal Diameter—2.460".
Lower Bearing—Steel-backed, babbitt-lined.
Clearance—.0015" (new), .006" Max. (worn).
Sideplay—.003-.006".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. *See Cadillac Special Shop Notes for connecting rod data and bearing installation.*
Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.
CRANKSHAFT:—3 bearing. 6 counterweights.
Journal Diameters—2½" all bearings.
Bearing—Steel or bronze backed, babbitt-lined.
Clearance—.0015" (new), .004" (worn limit).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. *See Cadillac Special Shop Notes for main bearing removal instructions.*
End Thrust:—Taken by center bearing. Endplay .001-.005" (new), .010" Max. (worn).
CAMSHAFT:—3 bearings. Non-adjustable chain drive.
Journal Diameters—#1 and 2, 2.4071-2.4078"; #3, 2.0009-2.0016".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0027-.0037" (new), .005" (worn limit). *See Cadillac Special Shop Notes for Camshaft Bushing removal and installation instructions.*
End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.
Timing Chain:—Morse Type C #3682-RX Side guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use tool J-836 to pilot camshaft sprockets.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with straightedge across centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.001-.0023"
Exhaust	45°	.345"	.002-.0033"

NOTE—Worn limit for valve stem-to-guide clearance .006" Intake, .005" Exhaust. *See Cadillac Special Shop Notes for valve removal and installation instructions.*
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Pressed in block with long stepped end down and reamed to correct size.
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Lifters are mushroom type operating in removable guide brackets. *See article in Mechanical Equipment Section.*
Clearance—.001-.0025" (new), .005" (worn).

Valve Springs:—	Pressure	Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close at 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
To Check Timing—Intake valve for #1 cylinder opens with piston on top dead center when 'C.1/6' on vibration dampener lines up with pointer.
LUBRICATION:—Pressure system with gear type oil pump located in crankcase. *See Cadillac Special Shop Notes for oil pump data and lubrication system servicing.*
Normal Oil Pressure—30 lbs. at 60 MPH. 15 lbs. idle.
Oil Pressure Regulator—Located on oil pump. Operates at 30 lbs. Not adjustable.
Crankcase Capacity—7 qts. (refill).
COOLING SYSTEM:—Water Pump. Centrifugal type. Belt-driven in tandem with generator. *See article in Mechanical Equipment Section.*
Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 148-153°F., fully open at 170°F. (High Reading Type—use with heaters). Starts to open 163-168°F. Fully open 185°F.
Shutter Adjustment—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.
CLUTCH:—Long Model 11CF-CL. Semi-centrifugal, single plate dry disc type. *See article in Mechanical Equipment Section for data.*
Facings—Woven type. 2 required. Inside Diameter 6½". Outside Diameter 11". Thickness .137".
Adjustment:—Free movement of pedal should be ⅞-1⅛". To adjust, turn nut on forward end of connector link in front of clutch fork.
Removal:—Remove transmission (see Transmission Section below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel to insure correct installation, take out 6 mounting bolts in cover flange, remove clutch from below.
TRANSMISSION:—Own Make. Constant-mesh helical gear (second), synchro-mesh (second and high), sliding helical gear (low and reverse). *See article in Mechanical Equipment Section for data.*
Removal:—With car on blocks, remove floor boards, disconnect drive shaft at front universal joint, support engine with jack under oil pan (use wooden block to avoid damage to pan), free transmission extension at rear support cross-member, disconnect engine support stabilizer (all except 60) on right hand side (take out pin at forward end), disconnect exhaust pipe brace, free cross-member carrying engine rear support (4 bolts at each end on 60, 2 bolts on other models), disconnect speedometer cable. Take out transmission mounting capscrews, pull transmission straight back (plug clutch connection shaft bearing drain hole as soon as it is accessible to prevent lubricant loss). NOTE—When installing, shift transmission in reverse and remove plug.
UNIVERSAL JOINTS:—Mechanics Model 3-C. Needle bearing type. *See Mechanical Equipment Section.*
REAR AXLE:—Own make. Hypoid gear (60), Spiral-bevel gear (65, 70, 75). Semi-floating type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
NOTE—Manufacturer recommend Differential Carrier Assembly be returned to factory for servicing.
Ratio—3.69-1 (60), 4.30-1 (65, 70, 75). No optl. ratios.
Backlash—.004-.008". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on differential carrier flange, pull carrier assembly out without disturbing axle housing.
Axle Shaft Removal—Jack up car, remove rear wheels, pull wheel hub and brake drum assembly, disconnect brake line and remove backing plates (bleed brake line when re-installed). Use tool J-838, pull shaft and bearing assembly out.
NOTE—Early axle shafts have no locating shoulder for wheel bearing. Install bearing with 5/32" clearance between inner edge of hub and bearing.
Wheel Bearing Adjustment:—None (sealed type).
SHOCK ABSORBERS:—Delco. 1946C, D (60 front), 1751A, B (60 rear), 1951D, C (65, 70, 75 front), 2052A, B (65, 70, 75 rear). Double acting, hydraulic type. *See article in Mechanical Equipment Section for data.*
STEERING:—Steering Gear—Saginaw Worm-and-roller type. *See Mechanical Equipment Section.*
Front Suspension:—Independent linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4° 51' (60), 5° 38' (65, 70, 75).
Caster—¼-1° (60), 0° plus or minus ¼° (65, 70, 75). Car weight on wheels, equal within ¼°.
Camber—¼-1° (60). 0-½° (65, 70, 75). Equal within ¼° at both wheels.
Toe In—1/16-3/32" (at rest), 0-1/16" (in motion).
Steering Geometry—Inner wheel turned 21¾-23¼° (60), 22-23½° (65, 70, 75). Outer wheel 20° (all).
BRAKES:—Service—Bendix hydr., Duo-servo. Single Anchor type. Hand lever applies rear serv. brakes. *See article in Mechanical Equipment Section for data.*
Drum Diameter—12" (60, 65, 70), 14" (75). Centrifuse type. Out-of-round .007" max. Run-out (installed) .010" max. Drum turndown limit .030" cut.
Lining—Molded type. Width 2¼" (except 60, 65, 70 rear wheels), 2" (60, 65, 70 rear wheels only); Thickness 3/16" (60, 65, 70), ¼" (75); Length (per shoe) 12 15/16" (60, 65, 70), 12¼" (75—front shoe front brakes), 15" (75—all others).
Clearance—.010" for all models.
Hand Brake:—See Service Brakes above.

ENGINE NUMBER:—First number 4130001 (85), 5130301 (90). Stamped on generator drive chain housing at right front corner of crankcase.

ENGINE SPECIFICATIONS:—12 cylinder (85), 16 cylinder (90), 45° Vee, Overhead valve type.
Bore—3¼" (85), 3" (90). **Stroke**—4".
Displacement—368 cu. ins. (85), 452 cu. ins. (90).
Rated Horsepower—46.9 (85), 57.5 (90).
Developed Horsepower—150 at 3600 R.P.M. (85), 185 at 3800 R.P.M. (90).
Compression Ratio—6.0-1 Std., 5.65-1 Optl.
Compression Pressure—145 lbs. (85), 154 lbs. (90) at 1000 R.P.M. or approx. 100-105 lbs. at cranking speed.
Vacuum Reading—20-21" steady reading with engine idling at 320 R.P.M.

PISTONS:—Lynite Lo-Ex aluminum alloy, 'T' slot, cam ground type with anodized finish. **Length** 3 5/16".
Weight—11.712 ozs. (85), 10.96 ozs. (90) stripped or 16.976 ozs. (85), 16.144 ozs. (90) with rings, pin and locking screw.
Removal—Pistons and rods removed from below.
Clearance—Top .019" (85), .018" (90), Skirt .002" (85), .0018" (90). See Fitting New Pistons.

Replacement Pistons:—Finished pistons furnished .005" and .015" oversize. Reground blocks (pistons fitted) furnished .015", .030" oversize (exchange basis). Hold all bores in same block within .002" limit and maximum out-of-round to .0005".

Fitting New Pistons:—If micrometer used, check cylinder bore and pistons (just below and to left of 'T' slot junction midway between pin holes with piston at 70°). If feeler gauges (⅜-½" wide) used, install on side opposite slot. Piston should fall of own weight with .0015" feeler and hold on .002" feeler.

Installing Pistons:—Slot to left (viewed from driver's seat) for all pistons in both banks.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin (no ring in heat deflector groove at top). Lower ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp.	.0930-.0935"	.007-.012"	.0015-.0028"
Oil Cont.	.1540-.1550"	.007-.015"	.0013-.0026"

NOTE—Worn limits .025" (end gap), .004" (side clearance).

PISTON PIN:—Diameter .8742-.8745", **Length** 2.810-2.815". Pin locked in piston by locking screw in one boss. To remove pins, heat piston in boiling water, push out at lockscrew end (install from opposite end).
Pin Fit in Piston—.0004" press fit or hand push fit with piston at 200-210° F. (lockscrew boss), .0001" clearance or hand push fit at 70° F. (free end).
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0015" (worn limit).

CONNECTING ROD:—Weight 31.856 ozs. **Length** 9¼".
Crankpin Journal Diameter—2¼".
Lower Bearing—Spun babbitt. No shims.
Clearance—.0015". Sideplay .004-.007".

Bearing Adjustment:—None. Replace rods. Do not file bearing caps.

Installing Rods:—Numbers on rods and caps must correspond and point down toward oil pan.

CRANKSHAFT:—Four (85), five (90) bearing type with integral counterweights.
Journal Diameters—2⅝" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. No shims.
Clearance—.001" (new), .004" (worn limit).

Bearing Adjustment:—None. Replace bearings. Do not file caps. Rotate upper halves in or out without removing crankshaft.

End Thrust:—Taken by #3 bearing (center on 85). Endplay .001-.005".

CAMSHAFT:—Four (85), five (90) bearing. Duplex chain drive with automatic take-up idler sprocket.
Journal Diameters—#1, 2"; all others 2⅛".
Clearance—.0011-.0026" (new), .005" (worn limit).

End Thrust:—Taken by thrust plate at rear of camshaft sprocket. Endplay .005-.015". Replace plate when endplay exceeds .015".

Timing Chain:—Morse #766 Duplex. Width 1½". Pitch .375". Length 41¼" or 110 links. See Mechanical Equipment Section for data on Morse automatic idler.

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.509-1.515"	.3392-.3397"	6.220-6.228"
Exhaust	1.384-1.390"	.3392-.3397"	6.220-6.228"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.3476"	.0015"
Exhaust	45°	.3476"	.0025"

Tappet Clearance:—None (automatic take-up).
See article in Mechanical Equipment Section for data.

Valve Guides:—Pressed in head with long stepped end up and finish reamed for correct clearance.

Valve Lifters:—Roller type in individual removable guides. Clearance in guide .001-.0025" (new), .005" (worn limit). Roller clearance on pin .0017-.003" (new), .004" (worn limit).

Valve Springs:—Double springs used on all valves.

	Inner Spring	Outer Spring
Valve Closed	19.5 lbs., 1.751"	50 lbs., 1.922"
Valve Open	51.5 lbs., 1.407"	115.5 lbs., 1.578"

NOTE—Whenever valves reconditioned, check spring pressure. Total for both springs should be 48-63 lbs. (measure with Tool No. J-444). Minor variations can be corrected by installing .040" spacers (Part No. 889407) under valve spring retainers. Each spacer increases pressure 11 lbs.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 39° BLDC. Close 5° ATDC.
To Check Valve Timing—#1 intake valve should open with piston on top dead center when flywheel mark '1C/11' or '1C/15' lines up with indicator.
Motor Gauge—Weidenhoff Adapter #113. Rod #33.

LUBRICATION:—Pressure system. Gear type oil pump mounted in crankcase. See 1936 data for all oil pump clearances.
Normal Oil Pressure—30 lbs. at 60 M.P.H.
Oil Pressure Regulator—Located under plug on front face of chain case cover. Opens at 14 lbs. Not adjustable.
Crankcase Capacity—9 qts. (85), 10 qts. (90).

CLUTCH (85):—Long Model 11CF-C. Semi-centrifugal, single plate, dry disc type. All specifications, Adjustment, and Removal instructions same as for Model 75 (see previous page for complete data).

CLUTCH (90):—Own make. Double plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 4 required. Inside Diameter 6½". Outside Diameter 11". Thickness .135-.145".

Adjustment:—Free movement of pedal should be 1¼-1½". To adjust, turn adjusting nut on pedal rod.

Removal:—Remove transmission (see Transmission Section below). Take off four nuts on studs on which center driving plate mounted on flywheel (nuts accessible through holes in rear driving plate), remove clutch assembly.

TRANSMISSION:—Own Make. Constant mesh, synchro-mesh, helical gears (second and high), sliding helical gear (85), spur gear (90) for low and reverse.
See article in Mechanical Equipment Section for data.

Removal (85):—Same as for Model 75 (see previous page).

Removal (90):—Disconnect universal joints and remove drive shaft, remove transmission rear support (as unit with cross-member), remove front propeller shaft and housing, disconnect clutch release mechanism, take out transmission mounting screws, pull transmission straight back (clutch housing integral with transmission case).

UNIVERSAL JOINTS:—Mechanics Model 3C (85), 4C (90). Needle bearing type, two used.
See article in Mechanical Equipment Section.

REAR AXLE:—Own make. Semi-floating (85), 3/4 floating (90), spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier Assembly be returned to factory for servicing.
Ratio—4.60-1 (Std. 85), 4.64-1 (Std. 90). 4.07-1, 4.31-1, 4.41-1 (Optl. 90 only).
Backlash—.004-.008". Screw adjustment.

Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on differential carrier flange, pull carrier assembly out without disturbing axle housing.
Axle Shaft Removal (85):—Jack up car, remove rear wheels, pull wheel hub and brake drum assembly, disconnect brake line and remove backing plates (bleed brake line when re-installed), use tool J-838 and pull shaft and bearing assembly out.
Axle Shaft Removal (90):—Jack up rear end, remove wheel, take out capscrews in driving hub flange, pull driving hub and axle shaft out as an assembly.

Wheel Bearing Adjustment:—None required.

SHOCK ABSORBERS:—Delco Hydraulic, double acting type.

	Front	Rear
85	1951D, C	2052A, B
90	1950D, C	2050C, D

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm and Double Roller type.
See article in Mechanical Equipment Section for data.

Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Steering Section for data.
Kingpin Inclination—5° 38' (85), 4° 30' (90).
Caster—0° plus or minus ¼°. Adjustable.
Camber—0° to ½°. Adjustable.
Toe In—0 to 1/16". Adjustable.
Steering Geometry—Inner wheel turned 22-23½°, outer wheel 20°.

BRAKES:—Service—Bendix hydraulic, single anchor type with vacuum power operation (90 only). Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—14".
Lining—Molded (all shoes 85, primary shoes 90), Woven (secondary shoes, 90 only).
Clearance—.010" for each shoe.

Hand Brake:—See Service Brakes above.

Power Unit (Series 90):—Bendix internal valve type Vacuum Power cylinder linked to brake pedal lever.
See article in Mechanical Equipment Section for data.

ENGINE HOOD & SIDE PANEL REMOVAL:—*See Cadillac Special Shop Notes for instructions.*

SERIAL NUMBER:—Same as engine number below.

ENGINE NUMBER:—First number (60) 8270001, (60S) 6270001, (65) 7270001, (75) 3270001. Stamped on left side of crankcase at rear of left cylinder block, and on left frame rail at rear of front engine support.

ENGINE SPECIFICATIONS:—Own. 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast Enbloc. **Bore**—3½". **Stroke**—4½".

Displacement—346 cu. ins. **Rated HP.**—39.20.

Developed Horsepower—135 (60, 60S, 65), 140 (75) at 3400 R.P.M.

Compression Ratio—6.25-1 (Std. 60, 60S, 65), 6.70-1 (Std. 75), 5.75-1 Optl. (all models).

See Cadillac Special Shop Notes for cylinder head identification and interchangeability data.

Compression Pressure—155 lbs. (60, 60S, 65), 170 lbs. (75) at 1000 R.P.M. or approximately 105-110 lbs. (60, 60S, 65), 110-115 lbs. (75) at cranking speed.

Vacuum Reading—Steady 20-21" at idle speed.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛".

Weight—18.30 oz. stripped. 25.13 oz. complete.

Removal:—Pistons and rods removed from above

Clearance—Skirt .0021". See Fitting New Pistons.

Replacement Pistons:—Finished anodized pistons furnished Std. (3.4979-3.4999"), .003" (3.5014-3.5029"), .005" (3.5034-3.5049"), .010" (3.5084-3.5099"), .015" (3.5135-3.5149") oversize.

NOTE—Hold all cylinders in same block within .002" size limits. Max. out-of-round .0005".

Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide) used, insert feeler next to T-slot. Piston should fall of own weight with .002" feeler, hold tight on .0025" feeler.

Installing Pistons:—Slot to left, for all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compression	1/8"	.007-.012"	.0015-.0028"
Oil Control	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits .025" (gap), .004" (side clear.).

Replacement Rings: .003", .005", .010", .015", .030" oversize.

PISTON PIN:—Diameter ⅞". **Length** 3 1/16". Pin floats in piston and rod. Held by locking rings.

See Cadillac Shop Notes for special pin removal and installation instructions.

Pin Fit in Piston—.0004" press fit (ribbed end), .0001" clearance or free fit at 70° F. (plain end).

Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0015" (worn limit).

CONNECTING ROD:—Weight 37.472 oz. **Length** 8¾".

Crankpin Journal Diameter—2.460".

Lower Bearing—Steel-backed, babbitt-lined.

Clearance—.0015" (new), .006" Max. (worn).

Sideplay—.003-.006".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

NOTE—Use new lockwashers under bearing cap bolts. Use only 12" wrench to tighten (Tool J-835).

Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—3 bearing. 6 counterweights.

Journal Diameters—2½" all bearings.

Bearing—Steel or bronze backed, babbitt-lined.

Clearance—.0015" (new), .004" (worn limit).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing shaft.

See Cadillac Special Shop Notes for Rear Main Bearing oil seal renewal (new type).

End Thrust:—Taken by center bearing. Endplay .001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearings. Non-adjustable chain drive.

Journal Diameters—#1 and 2, 2.4071-2.4078"; #3, 2.0009-2.0016".

Bearing Type—Steel-backed, babbitt-lined.

Clearance—.0027-.0037" (new), .005" (worn limit).

See Cadillac Special Shop Notes for Camshaft Bushing removal and installtion instructions.

End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.

Timing Chain:—Morse Type C #3682-R Side guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use tool J-836 to pilot camshaft sprocket

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with straightedge across centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.001-.0023"
Exhaust	45°	.345"	.002-.0033"

NOTE—Worn limit for valve stem-to-guide clearance .006" Intake, .005" Exhaust.

See Cadillac Special Shop Notes for valve removal and installation instructions.

Tappet Clearance:—None (automatic take-up used). **See article in Mechanical Equipment Section.**

Valve Guides:—Pressed in block with long stepped end down and reamed to correct size.

Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Lifters are mushroom type operating in removable guide brackets.

See article in Mechanical Equipment Section for data.

Clearance—.001-.0025" (new), .005" (worn).

Valve Springs:—	Pressure	Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open at TDC. Close at 42° ALDC.

Exhaust Valves—Open 52° BLDC. Close 10° ATDC.

To Check Timing—Intake valve for #1 cylinder opens with piston on top dead center when 'C.1/6' on crankshaft pulley lines up with pointer.

LUBRICATION:—Pressure system with gear type oil pump located in crankcase.

See Cadillac Special Shop Notes for oil pump data.

Normal Oil Pressure—25 lbs. at 30 M.P.H.

Oil Pressure Regulator—Located on oil pump. Operates at 30 lbs. Not adjustable.

Crankcase Capacity—7 qts. (refill).

COOLING SYSTEM:—Water Pump. Centrifugal type. Belt-driven in tandem with generator.

See article in Mechanical Equipment Section for data.

Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.

Setting—(Std. Type) Starts to open 148-153°F., fully open at 170°F. (High Reading Type—use with heaters). Starts to open 163-168°F. Fully open 185°F.

Shutter Adjustment—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.

CLUTCH:—Long Model 11CF-CI. Semi-centrifugal, single plate, dry disc type.

See article in Mechanical Equipment Section for data.

Facings—Woven joined type, 2 required. Inside Diam. 6½". Outside Diam. 11". Thickness .125".

Adjustment:—Free movement of pedal should be ⅞-1⅛". To adjust, turn nut on forward end of connector link in front of clutch fork.

Removal:—Remove transmission (see Transmission Section below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel to insure correct installation, take out mounting bolts in cover flange, remove clutch from below.

TRANSMISSION:—Own make. Constant-mesh helical gear (second), synchro-mesh (second and high), sliding helical gear (low and reverse).

Transmission Control—Own make. Remote control, type (shift lever mounted on steering column).

See article in Mechanical Equipment Section for data.

Removal:—Disconnect shifter rods at levers on left hand side of case, disconnect drive shaft at front universal joint, support engine with jack under oil pan (use wooden block to avoid damage to pan), free transmission extension at rear support crossmember, disconnect engine support stabilizer on right hand side (take out pin at forward end), disconnect exhaust pipe brace, disconnect speedometer cable. Take out transmission mounting capscrews, pull transmission straight back (plug clutch connection shaft bearing drain hole as soon as it is accessible to prevent lubricant loss).

UNIVERSAL JOINTS:—Mechanics Model 3-C. Needle bearing type, 2 used.

See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Make. Hypoid gear, semi-floating type with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

NOTE—Manufacturer recommend Differential Carrier Assembly be returned to factory for servicing.

Ratio—3.92-1 (60, 60S), 4.58-1 (65, 75).

Backlash—.004-.008". Screw adjustment.

Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.

Axle Shaft Removal—Jack up car, remove rear wheels, pull wheel hub and brake drum assembly, disconnect brake line and remove backing plates. Use tool J-838, pull shaft and bearing assembly out.

Wheel Bearing Adjustment:—None (sealed type).

SHOCK ABSORBERS:—Delco. Front—1946-E,F(60,60S), 1951-C, D (65, 75). Rear—1751-E, F (60), G, H (60S), 2052-A, D (65, 75). Double acting type.

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-roller type. *See data in Mechanical Equip. Section.*

Front Suspension:—Independent linked parallelogram type with coil springs.

See article in Mechanical Equipment Section for data.

Kingpin Inclination—4°51' (60, 60S), 5°38' (65, 75)

Caster—(60, 60S) Neg. ¼° to Neg. 1¼°, (65, 75) Neg. ¼° to Pos. ¼° at curb weight (gasoline tank full).

Camber—Neg. ¼° to Pos. ½° (all). Adjustable.

Toe In—1/32-3/32" (at rest), 0-1/16" (in motion).

Steering Geometry—Inner wheel turned 23½° (60, 75), 23¾° (60S, 65). Outer wheel 20° (all).

BRAKES:—Service—Bendix hydraulic, Duo-servo, Single Anchor type. Hand lever applies rear brakes.

See article in Mechanical Equipment Section for data.

Braking Power—54½% Front (60, 60S, 65), 58% Front (75), 45½% Rear (60, 60S, 65), 42% Rear (75).

Brake Drums—Diameter 11.995-12.005" (60, 60S, 65), 13.995-14.005" (75). Centrifuse type.

Lining—Moulded type. Width 2¼" (Front—all models, Rear—75 only), 2" (Rear—60, 60S), 2½" (Rear—65). Thickness 3/16" (60, 60S, 65), ¼" (75). Length per shoe 12 15/16" (60, 60S, 65), 12¼" (75—front primary shoe), 15" (75—all others).

Clearance—.010" for all models.

Hand Brake:—See Service Brakes above.

HOOD & SIDE PANEL REMOVAL:—*See Cadillac Special Shop Notes for complete instructions.*

SERIAL NUMBER:—Same as engine number below.

ENGINE NUMBER:—First number 5,270,001. Stamped on upper rear corner of left hand cylinder block and on left frame member ahead of steering gear.

ENGINE SPECIFICATIONS:—16 cylinder, 135° Vee, 'L' head. Cylinder banks and crankcase cast integral. NOTE—Install shorter cylinder head capscrews along lower edge of head. Coat all screws with white lead to prevent leaks.
Bore—3¼". Stroke—3¼". Displacement 431 cu. ins.
Rated Horsepower—67.6.
Developed Horsepower—185 at 3600 R.P.M.
Compression Ratio—6.75-1 Std. 6.08-1 Optl.
Compression Pressure—180 lbs. at 1000 R.P.M. or approximately 110-115 lbs. at cranking speed.
Vacuum Reading—Steady 20-21" idling at 8-9 MPH.

PISTONS:—Lynite & Bohn, Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length—3¾".**
Weight—15.28 oz. (stripped). 21.136 oz. (complete).
Removal—Pistons and rods removed from above.
Clearance—.019" top, .0015-.002" (bottom of skirt).
Replacement Pistons:—Finished replacement pistons furnished .005", .010", .015" oversize.
Fitting New Pistons:—If micrometer used, check piston skirt at largest diameter (adjacent to T slot) at two points, ½" from lower edge of skirt, and 1¼" down from head. If feeler gauge used, install ⅜-½" wide feeler next to T slot. Piston should fall through bore of own weight on .0015" feeler and hold on .002" feeler.
Installing Pistons:—Slot toward left (as viewed from drivers seat) for all pistons in both banks.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (top)	⅛"	.007-.015"	.0015-.0025"
Comp. (#2)	3/32"	.007-.015"	.0015-.0025"
Oil Cont.	3/16"	.007-.015"	.001-.002"

NOTE—Worn limits—.025" gap, .004" side clearance.
Replacement Rings:—Furnished .003", .005", .010", .015", .030" oversize.

PISTON PIN:—Diameter—13/16". Length—2 25/32". Pin is locked in rod by locking screw. Oil grooves broached for full length of pin hole in piston.
Pin Fit in Piston:—.00035" clearance.
See Cadillac Shop Notes for special pin removal and installation instructions.
Replacement Pins:—Undersizes not furnished.

CONNECTING RODS:—Weight 24.528 ozs. Length 6⅜".
Crankpin Journal Diameter—2".
Lower Bearing—Steel-backed, babbitt-lined.
Clearance—.001-.0025" (new), .006" (worn limit).
Sideplay—.004-.008".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file connecting rods or caps.
Installing Rods:—Numbers on rods and caps must correspond and point down toward pan, all rods.

CRANKSHAFT:—9 bearing. Integral counterweights.
See Cadillac Special Shop Notes for Rear Main Bearing Oil Seal renewal.
Journal Diameters—2½" all bearings.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015" (new), .004" Max. (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be rotated out without removing crankshaft. *See Cadillac Shop Notes for instructions.*
End Thrust:—Taken by #5 (center) bearing. Endplay .001-.005" (new), .010" (worn limit).

CAMSHAFT:—Five bearing. Non-adjustable chain drive.
See Cadillac Special Shop Notes for Camshaft removal and installation instructions.
Bearing Type—Steel-backed, babbitt bushings.
Bearing Clearance—.002-.003" (new), .005" (worn).
End Thrust:—Taken by thrust plate flange at front bearing. Endplay .005-.015" (new), .020" (worn limit).
Timing Chain:—Morse Type C #3682-R. Width 1¼". Pitch ⅜". Length 23¼" or 62 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across shafts.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.495-1.505"	.3415-.3425"	5 19/32"
Exhaust	1.370-1.380"	.3405-.3415"	5 39/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.290"	.0023"
Exhaust	45°	.302"	.0033"

NOTE—Worn limit for stem clearance .0033" (intake), .004" (exhaust).
Tappet Clearance:—None in service (hydraulic type lifter used). See Valve Lifter data below.
Valve Guides:—Pressed in block (taper end up).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Barrel type operating in reamed holes.
See article in Mechanical Equipment Section for data.
NOTE—Two sizes of lifter used, must be re-installed in same guide hole from which removed. Larger size lifter used in holes marked by yellow paint 'X' or stamped 'B' below valve spring. First lifters not marked for size, later larger lifter stamped 'B' in oil groove. Valves must be removed first.
Lifter Clearance—.0033" (new), .004" (worn limit).
Valve Springs:—Free length 2.130".

	Spring Pressure	Length
Valve Closed	49 lbs.	1.812"
Valve Open	95.5 lbs.	1.510"

Important—Valve Spring 'Howl' Correction—No dampener used on first cars and springs may develop howl similar to axle gear noise. Correct by installing new Spring and Dampener assemblies No. 1428284 and lower retainers No. 1428295 (32 of each required). These are latest type internal dampener. First type dampener (external type) is satisfactory but interferes with rapid valve removal.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 28° ALDC.
Exhaust Valves—Open 44° BLDC. Close 12° ATDC.
To Check Timing—No. 1 intake valve should open with piston 8° or .0208" before top dead center with the ignition mark 'IG/A' for this cylinder in line with the pointer on the chain case cover.

LUBRICATION:—Pressure system. Main oil header in left crankcase wall (feed from pump) for main, connecting rod, and camshaft bearings. Pipe from this header through filter feeds oil header above each line of valve lifters.
Oil Pump:—Helical gear type. In rear of crankcase.
Normal Oil Pressure:—25 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Piston type built in oil pump. Operates at 28 lbs. Not adjustable.
Crankcase Capacity:—11 quarts.

COOLING SYSTEM:—Water Pump. Centrifugal type. 2 used (one pump for each bank, driven in tandem with fan pulley by double Vee belt).
See article in Mechanical Equipment Section for data.
Pump Removal—Drain cooling system, back off belt adjustment, disconnect hose, take out mounting screws in pump flange.
Belt Adjustment:—Loosen two mounting bolts on fan bracket, lift fan pulley and bracket assembly up (right bolt hole slotted, pivots on left bolt), until all slack removed from belts, tighten bolts.
NOTE—Replace belts together as matched set.
Thermostat:—Mounted on rear of radiator top tank.
Setting—(Std. Type) Starts to open at 132-142°F., fully open at 154°F. (High reading type—for use with heaters). Starts 156-164°F. Fully open 176°.
Shutter Adjustment—Disconnect shutter rod at lever on front of radiator top tank, loosen locknut, turn clevis so that rod extends 1/16" past lever (provides slight tension with shutters closed).

CLUTCH:—Long Model 12CB-11½C. Single plate, dry disc type. No adjustment required.
See article in Mechanical Equipment Section for data.
Facings—Spiral wound type, 2 required. I.D. 7", .O.D. 11½". Thickness .125".
Adjustment—Clutch pedal free travel should be ⅞-1⅛". To adjust, turn nut at forward end of connecting rod at clutch fork.
Removal:—Remove transmission (see Transmission Removal below), take off clutch housing underpan, take out clutch mounting screws in cover flange, remove clutch through pan opening at bottom.
See Cadillac Shop Notes for special clutch housing note and clutch balancing.

TRANSMISSION:—Own make. All helical gear type. Constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse).
Transmission Control—Own make. Remote control, with gear shift lever mounted on steering column.
See article in Mechanical Equipment Section for data.
Removal:—*See preceding V8 page for data.*

UNIVERSAL JOINTS:—Mechanics Model 3C. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier assembly returned to factory for servicing
Ratio—4.31-1 Std. Backlash—.004-.008".
Removal:—*See preceding V8 page for data.*
Wheel Bearing Adjustment—None (sealed type).

SHOCK ABSORBERS:—Delco Model 1951-C, D (front), 2052-A, B (rear). Double-acting, hydraulic type. Front Shock Absorbers are part of front suspension assembly. Rear Shocks are Inertia Control type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm and Double Roller type with offset steering column and universal joint connection (Mechanics type—see Mechanical Equipment Section).
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5° 38' crosswise.
Caster—Neg. ¼° to Pos. ½° at curb weight (full gasoline tank). Adjustable.
Camber—Neg. ¼° to Pos. ½°. Adjustable.
Toe In—1/32-3/32" (at rest), 0-1/16" (in motion).
Steering Geometry (Toe-out on turns)—Inner wheel turned 23½°, outer wheel 20°.

BRAKES:—Service. Bendix hydraulic, Duo-servo, single anchor type with rigid wheel cylinders. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Braking Power—58% (front), 42% (rear).
Brake Drums—Diameter 14". Centrifuse type.
Lining—Moulded type. Width 2¼". Thickness ¼". Length 12¼" (front primary shoes), 15" (all others)
Clearance—.010" for heel and toe at each shoe.
Hand Brake:—See Service Brakes above.

ENGINE HOOD & SIDE PANEL REMOVAL:—*See Cadillac Shop Notes for instructions.*

SERIAL & ENGINE NUMBER:—First number (60S) 6290001, (61) 8290001, (75) 3290001. Stamped on left side of crankcase at rear of left cylinder block and on left frame side member opposite steering gear.

ENGINE SPECIFICATIONS:—**Own.** 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast Enbloc. **Bore**—3½". **Stroke**—4½"
Displacement—346 cu. ins. **Rated HP.**—39.20.
Developed Horsepower—135 (60S, 61), 140 (75) at 3400 R.P.M.
Compression Ratio—6.25-1 (Std. 60S, 61; Optl. 75), 6.70-1 (Std. 75; Optl. 60S, 61), 5.75-1 (Optl. all).
See Cadillac Shop Notes for Head installation, head gasket data, and changing compression ratios.
Compression Pressure—155 lbs. (60S, 61), 170 lbs. (75) at 1000 R.P.M. or approximately 105-110 lbs. (60S, 61), 110-115 lbs. (75) at cranking speed.
Vacuum Reading—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛".
Weight—18.30 ozs. (stripped. 25.13 ozs. (complete).
Removal—Pistons and rods removed from above.
Clearance—Skirt .0020-.0025". See Fitting Pistons.
Replacement Pistons:—*See Cadillac Shop Notes.*
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide, 7-10" long) used, insert feeler next to T-slot. Piston should fall through bore of own weight on .002" feeler, and hold on .0025" feeler. NOTE Cylinder bore out-of-round .0005" max., taper .0003".
Installing Pistons:—Slot to left, for all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.012"	.0023-.0041"
Comp. (#2)	⅛"	.007-.012"	.0013-.0026"
Oil Control	5/32"	.007-.015"	.0013-.0026"

Replacement Rings: .003",.005",.010",.015",.030" oversize.

PISTON PIN:—**Diameter**—⅞. **Length**—3 1/16". Pin floats in piston and rod. Held by locking rings. *See Cadillac Shop Notes for special pin removal and installation instructions.*
Pin Fit in Piston—.0004" press fit (ribbed end), .0000" clearance or free fit at 70° F. (plain end).
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0018" (worn limit).

CONNECTING ROD:—**Weight** 37.472 ozs. **Length** 8¾".
Crankpin Journal Diameter—2.4590-2.4595".
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.0015-.0025" (new), .0045" Max. (worn).
Sideplay—.008-.014".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rod or caps. *See Cadillac Shop Notes for connecting rod and bearing installation data.*
Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—3 bearing. 6 counterweights.
See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.
Journal Diameters—2½" all bearings.
Bearings—Steel or bronze backed, babbitt-lined.
Clearance—.0015-.0025" (new), .005" (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing crankshaft.
End Thrust:—Taken by center (#2) bearing.
Endplay—.001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearing, non-adjustable chain drive.
See Cadillac Shop Notes for camshaft bushing data.
Journal Diameters—#1 and #2, 2.4071-2.4078"; #3, 2.0009-2.0016".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0033" (new), .0045" (worn).
End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.
Timing Chain:—Morse Type C #3682-R Side Guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use Tool J-836 to pilot camshaft sprocket.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3515"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.0012-.0032"
Exhaust	45°	.345"	.0022-.0042"

NOTE—Worn limit for stem clearance .005" (all valves). Valve heads not slotted.
See Cadillac Shop Notes for valve servicing.
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Press in block (long step end down).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters (mushroom type) in removable brackets. *See article in Mechanical Equipment Section for data.*
Clearance—.0010-.0024" (new), .0035" (worn).
Valve Springs:—Free length 2.210".

	Spring Pressure	Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
To Check Timing—#1 cylinder (front—left bank) intake valve should open with piston at TDC and mark 'C.1/6' on crankshaft pulley aligned with chain case cover pointer.

LUBRICATION:—Pressure (gear type oil pump in crankcase). *See Cadillac Shop Notes for oil pump data.*
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 30 MPH.
Oil Pressure Indicator:—Opens at 30 lbs. On oil pump. Non-adjustable type.
Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—**Capacity**—24½ quarts.
See Cadillac Shop Notes for radiator core removal and fan pulley replacement instructions.
Water Pump:—Self-adjusting packing type.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove pump belt, pump hose and pump mounting screws. Lift pump out.
Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 148-153° F., fully open at 170° F. (High Reading Type—use with Heaters) Starts to open 163-168°F. Fully open 185°F.
Shutter Adjustment—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.
Temperature Gauge:—AC. Electric. #1510773 (dash unit), #1510774 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH:—**Long Model 11CF-CI.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven joined type, 2 required. Inside Diam. 6½". Outside Diam. 11". Thickness .123-.127".
Adjustment:—Free movement of pedal should be ⅞-1⅛" (adjusting nut on connector link at fork).
Removal:—Remove transmission (see below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel (re-install to these marks), remove 6 cover screws (release tension evenly).
See Cadillac Shop Notes for clutch balancing data.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh, all helical gear type (sliding gear, low & reverse).
Transmission Control:—Remote steering col. shift.
See articles in Mechanical Equipment Section for data.
Removal:—Support engine with jack under rear end of oil pan (use wooden block to avoid damage to pan), remove propeller shaft (disconnect front and rear universals), free transmission extension at engine rear support, remove crossmember with engine rear support, disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove

UNIVERSAL JOINTS:—**Mechanics Model 3C.** Needle bearing type. *See Mechanical Equipment Section.*

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier assembly be returned to factory for servicing.
Ratio—3.92-1 (60S, 61). 4.58-1 (75).
Backlash—.004-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Remove rear wheels, take off axle shaft nut, pull wheel hub and brake drum, disconnect brake line and remove backing plate. Pull shaft and bearing assembly out (use Tool J-838).
Wheel Bearing Adjustment—None.
See Cadillac Shop Notes for Rear Stabilizer Adjustment for Models 60S, 75.

SHOCK ABSORBERS:—**Delco.** Front—1946-E, F (60S), 1946-G, H (61), 1951-C, D (75). Rear—1751-G, H (60S), 1751-V, W (61), 2010-C, D (75). Double acting, hydraulic. *See Mechanical Equipment Section.*

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type. *See Mechanical Equipment Section.*
NOTE—New type steering linkage with idler arm attached to right frame sidemember on 61.
Front Suspension:—Independent linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5°44' (60S), 5°6' (61), 5°1' (75).
Caster—Pos. ¼° to Neg. 1¼° (60S), Neg. ¼° to Neg. 2¼° (61), 0° plus or minus ¼° (75).
Camber—Neg. ¼° to Pos. ½° (60S), Neg. ¼° to Pos. ¾° (61), 0° to Pos ½° (75). Equal within ½°.
Toe In—1/32-3/32" (at rest), 0-1/16" (in motion). NOTE—On Model 61, adjusting sleeve at wheel end of each tie rod provided for toe in adjustment.
Steering Geometry—Inner wheel turned 22¼-23¾° (61), 22¾-24¼° (60S, 75). Outer wheel turned 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type (no eccentric on 60S, 61). Hand lever applies rear serv. brakes. *See Mechanical Equip. Sect.*
Drums—Centrifuse. Diameter—11.995-12.005" (60S, 61), 13.995-14.005" (75).
Lining—Moulded. Length per shoe—Front 11 17/32" (60S, 61), 13 21/32" (75); Rear 12 31/32" (60S, 61), 15 1/32" (75). Width 2" (except 75 front wheel), 2¼" (75 front). Thickness 3/16" (60S, 61), ¼" (75).
Clearance—.015" both ends of secondary shoe (60S, 61), .010" (75).
Braking Power—45½% rear (60S, 61), 43-44% (75).
Hand Brake:—See Service Brakes.

ENGINE HOOD & SIDE PANEL REMOVAL:—*See Cadillac Shop Notes for instructions.*

SERIAL NUMBER & ENGINE NUMBER:—First number 5290001. Stamped on upper rear corner of left hand cylinder block and on left frame side member opposite steering gear.

ENGINE SPECIFICATIONS:—16 cylinder, 135° Vee, 'L' head. Cylinder banks and crankcase cast integral. *See Cadillac Shop Notes for head installation data.*
Bore—3¼". **Stroke** 3¼".
Displacement—431 cu. ins. **Rated HP.**—67.60.
Developed Horsepower—185 HP. at 3600 R.P.M.
Compression Ratio—6.75-1 Std. 6.08-1 Optl.
Compression Pressure—180 lbs. at 1000 R.P.M. or approximately 110-115 lbs. at cranking speed.
Vacuum Reading—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite & Bohn Lo-Ex aluminum alloy, 'T' slot, cam ground type with anodized finish (special hard oxide bearing surface). **Length**—3¾".
Weight—15.28 ozs. (stripped), 21.136 ozs. (complete).
Removal—Pistons and rods removed from above.
Clearance—.0020-.0025" skirt. See Fitting Pistons.
Replacement Pistons:—*See Cadillac Shop Notes.*
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide, 7-10" long) used, insert feeler next to T-slot. Piston should fall through bore of own weight on .0015" feeler and hold on .002" feeler. NOTE—Cylinder bore out-of-round .0005", taper .0003".
Installing Pistons:—Slot to left, for all pistons.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.015"	.0030-.0043"
Comp. (#2)	⅛"	.007-.015"	.0013-.0026"
Oil Control	3/16"	.007-.015"	.0013-.0026"

Replacement Rings: .003",.005",.010",.015",.030" oversize.

PISTON PIN:—**Diameter**—13/16". **Length**—2 25/32".
Pin is locked in rod by locking screw. Oil grooves broached for full length of pin hole in piston.
See Cadillac Shop Notes for special pin removal and installation instructions.
Pin Fit in Piston—.0001-.0006" clearance (new), .0018" (worn).
Replacement Pins:—Undersizes not furnished.

CONNECTING ROD:—**Weight** 24.528 ozs. **Length** 6⅜".
Crankpin Journal Diameter—1.9988-1.9993".
Lower Bearing—Steel-backed, babbitt-lined.
Clearance—.0015-.0025" (new), .0045" (worn).
Sideplay—.008-.014".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file connecting rods or caps.
Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—9 bearing, integral counterweights.
See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.
Journal Diameters—2½ all bearings.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0025" (new), .005" Max. (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing crankshaft.
End Thrust:—Taken by #5 (center) bearing.
Endplay—.001-.005" (new), .010" (worn).

CAMSHAFT:—5 bearing, non-adjustable chain drive.
See Cadillac Shop Notes for camshaft removal and installation instructions.
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0013-.0025" (new), .004" (worn).
End Thrust:—Taken by thrust plate flange at front bearing. **Endplay** .005-.015" (new), .020" (worn).
Timing Chain:—Morse Type C #3682-R. Width 1¼". Pitch ⅜". Length 23¼" or 62 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.495-1.505"	.3415-.3425"	5 19/32"
Exhaust	1.370-1.380"	.3405-.3415"	5 39/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.290"	.0010-.0030"
Exhaust	45°	.302"	.0020-.0040"

NOTE—Worn limit for stem clearance .005" (all valves). Valve heads not slotted.
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Pressed in block (taper end down).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Barrel type operating in reamed holes.
See article in Mechanical Equipment Section for data.
NOTE—Two sizes of lifter used, must be re-installed in same guide hole from which removed. Large lifter stamped 'B' in oil groove. Large guide hole stamped 'B' beside hole. Valves must be removed first.
Lifter Clearance—.0015-.0025" (new), .0035" (worn).

Valve Springs:—Damper used at bottom. Free length 2.074".

	Spring Pressure	Length
Valve Closed	50 lbs.	1 25/32"
Valve Open	100 lbs.	1 15/32"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 28° ALDC.
Exhaust Valves—Open 44° BLDC. Close 12° ATDC.
To Check Timing—#1 cylinder (front—left bank) intake valve should open with piston 6° or .0112" before top dead center with ignition mark 'IG/A' aligned with pointer on chain case cover. NOTE—Intake opening and ignition timing same point.

LUBRICATION:—Pressure system. Main oil header in left crankcase wall (feed from pump) for main, connecting rod, and camshaft bearings. Pipe from this header through filter feeds oil header above each line of valve lifters (non-adjustable auxiliary relief valve at rear of left line).
Oil Pump:—Helical gear type. In rear of crankcase.
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 30 MPH.
Oil Pressure Regulator:—Piston type built in oil pump. Opens at 30 lbs.
Crankcase Capacity:—11 quarts.

COOLING SYSTEM:—**Capacity**—30 quarts.
See Cadillac Shop Notes for radiator core removal.
Water Pump:—Packless type, sealed ball-bearing shaft (2 used—one pump for each bank, driven in tandem with fan pulley by double Vee belt).
See article in Mechanical Equipment Section for data.
Removal—Drain cooling system, back off belt adjustment, remove hose and pump mounting screws.
Belt Adjustment:—Loosen two mounting bolts on fan bracket, lift fan pulley and bracket assembly up (right bolt hole slotted, pivots on left bolt), until all slack removed from belt, tighten bolts.
NOTE—Replace belts together as matched sets.
Thermostat:—Harrison. In radiator top tank. Linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 148-153° F., fully open at 170° F. (High Reading Type—use with Heaters) Starts to open 163-168°F. Fully open 185°F.
Shutter Adjustment—Disconnect shutter rod at lever on front of radiator top tank, loosen locknut, turn clevis so that rod extends 1/16" past lever (provides slight tension with shutters closed).
Temperature Gauge:—AC. Electric. #1517703 (dash unit), #1517704 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH:—**Long Model 12CB-11½C.** Single plate, dry disc type. No adjustment required.
See article in Mechanical Equipment Section for data.
Facings—Woven-joined, 2 required. Inside Diam. 7". Outside Diam. 11½". Thickness .123-.127".
Adjustment:—Free movement of pedal should be ⅞-1⅛" (adjusting nut on connector link at fork).
Removal:—Remove transmission (see below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel (re-install to these marks), remove 12 cover screws (release tension evenly).
See Cadillac Shop Notes for special clutch housing note and clutch balancing data.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh, all helical gear type (sliding gear, low & reverse).
Transmission Control:—Remote steering col. shift.
See articles in Mechanical Equipment Section for data.
Removal:—Remove propeller shaft, free transmission extension at engine rear support, remove crossmember (with engine rear support), disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove from car.

UNIVERSAL JOINTS:—**Mechanics Model 3C.** Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier Assembly be returned to factory for servicing.
Ratio—4.31-1. **Backlash**—.004-.010". Screw adj.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Remove rear wheels, take off axle shaft nut, pull wheel hub and brake drum, disconnect brake line and remove backing plate. Pull shaft and bearing assembly out (use Tool J-838).
Wheel Bearing Adjustment—None.
See Cadillac Shop Notes for rear stabilizer data.

SHOCK ABSORBERS:—**Delco Model 1951-C, D (front), 2010-C, D (rear).** Double acting, hydraulic type. Front shock absorbers are part of front suspension assembly. Rear Shocks are Inertia Control type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type with offset steering column and universal joint connection (Mechanics type).
See articles in Mechanical Equipment Section for data.
Front Suspension:—Independent linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5°1' crosswise.
Caster—Neg. ¼° to Pos. ¼°. Adjustable.
Camber—0° to Pos. ½°. Shim adjustment.
Toe In—1/32-3/32" (at rest), 0-1/16" (in motion).
Steering Geometry (Toe-out on turns)—Inner wheel turned 22¾-24¼°, outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment and rigid wheel cylinders. Hand lever applies rear service brakes. *See Mechanical Equipment Section for data.*
Drums—Centrifuse. Diameter 13.995-14.005".
Lining—Moulded. Length per shoe 13 21/32" (primary), 15 1/32" (secondary). Width 2¼". ¼" thick.
Clearance—.010" at each end of secondary shoe.
Braking Power—43% rear, 57% front wheels.
Hand Brake:—See Service Brakes.

1939 MODELS

FRONT END REMOVAL:—Fenders and radiator grille assembly may be removed as a unit for work on front of engine or on Master Deluxe for Front Suspension Unit removal as follows: Remove hood, drain cooling system (one drain cock on lower left side of crankcase, radiator drain cock on rear at lower right side), disconnect headlamp wires at terminal blocks in engine compartment and free wiring loom along top of radiator support, take out fender bolts at running boards and body, remove 2 radiator support nuts. Lift off fenders and radiator grille assembly as a unit.

1939 MODELS

RADIATOR CORE REMOVAL:—To take out radiator core proceed as follows: Drain radiator, disconnect upper hose and remove lower hose, remove hood assembly and moulding, disconnect radiator brace rod at front end and at one side on dash (loosen opposite side at dash allowing brace rod to be turned up for core clearance), free wiring harness along top of radiator support, take out water pump and fan assembly, remove 2 core-to-radiator support bolts on each side (nuts crimped in support), take off front hood hinges and take out core by tilting slightly to rear and lifting upward.

1939 MODELS

ENGINE MOUNTINGS:—Adjustment—Tighten front engine mounting bolts (replace mountings if oil-soaked), tighten rear mounting bolts at transmission (studs must be tight in case), clearance between cross-member and 'U' section plate should be .005-.015" **(limits fore and aft engine movement)**, if clearance excessive, remove mounting and bend plate to obtain correct clearance. Tighten side engine mounting bracket bolts. Take out engine side mounting bolts, check clearance between mounting and bracket at each side, clearance must be 1/16" (if clearance excessive, use 3/8" plain washer to shim for proper clearance, if clearance less than 1/16", loosen bracket bolts and push mounting up or if necessary remove brackets and file holes with round file to give 1/16" clearance). Tension on side mountings must be equal at each side.

1934 (Mstr. only), 1935-38 MODELS

HARMONIC BALANCER:—Serviced as a complete unit only. New balancers furnished with two cap screws holding halves together. If Chevrolet Balancer Puller and Driver used, remove these two screws and with driver placed in starter cranking jaws, assemble puller body to balancer by means of two screws assembled in these tapped holes. With key and keyway aligned drive balancer into position using puller screw as driver.

IMPORTANT—If Chevrolet Puller and Driver not used, two screws must be left on balancer (to hold halves together) until installed on engine, then screws must be removed to allow proper functioning of balancer.

1939 MODELS

HARMONIC BALANCER:—Serviced as complete assembly only (component parts not serviced separately).

Removal—Remove Front End Assembly as a unit first (see directions above). Use Chevrolet Harmonic Balancer Puller and Driver (consists of puller body, puller screw and pinned driver head), attach puller body to balancer by means of 2 cap-screws in two tapped holes in balancer, pull balancer by turning up puller screw.

Installation—Place driver in starting crank jaws of balancer, install puller body (as above), line up keyway in balancer and key in crankshaft, turn puller screw down to contact driver, then use puller screw as driver and drive balancer in place.

1937-38-39 MODELS

MAIN BEARINGS:—Installation—Front intermediate bearing shell marked 'I' in oil groove and must be used in #2 bearing cap. Front intermediate (#2) and Rear intermediate (#3) bearing caps must be installed with mark 'FRONT' (#2 cap) toward front, 'REAR' (#3 cap) toward rear.

Line-Boring—Bearings must be line-bored with .008" shims (four .002" shims) under each end of bearing caps. After line-boring, Rear intermediate (#3 bearing must be faced to provide proper end-play. Adjust as directed below.

Endplay Adjustment—Crankshaft endplay and oil slinger clearance controlled by rear intermediate (#3) bearing. When installing new bearings, this bearing should be machined on front flange just enough to clean up face (amount of stock removed from front flange controls oil slinger clearance). Then machine rear flange of bearing to obtain end-play of .004-.007" (measure with feeler gauge inserted between rear side of #3 bearing and crankshaft with shaft in extreme rear position). Finally check oil slinger clearance by inserting feeler between rear face of slinger and oil groove (clearance should be .002-.032").

1938-39 MODELS

CAMSHAFT BEARINGS:—Installation. Oil groove extends 70° around bearing from oil hole. To insure proper alignment with oil hole in block, mark front of bore opposite oil hole. Align oil hole in bearing with mark (with groove toward bottom of engine away from oil hole in block), press bearings in place and stake to prevent movement. Finally line ream bushings.

1934-39 MODELS

TIMING GEARS:—Installation—With gears off, check Gear alignment (controlled by shims behind Crankcase Front End Plate). Using new Camshaft Thrust Plate, hold in place on End Plate (before assembling on camshaft). Lay straightedge across crankshaft shoulder and thrust plate. Add or remove shims to align these two surfaces. Set End Plate screws with punch. Camshaft gear is press fit on hub. Remove and install gear in arbor press with camshaft out of engine. Press gear on shaft until no perceptible clearance remains between gear and thrust plate but gear is free to turn. CAUTION—Use hub of gear only when pressing gear on shaft to avoid damaging gear. New thrust plate must be used whenever gear removed.

1935-37 MODELS

1938 VALVES:—Servicing for 1935-36-37 engines—New design (more metal under head) and serviced for 1935-36-37 engines. When used on these models 1938 exhaust valve guide (Part No. 602978) should be used or drill top of old guide down to head metal in valve port using 5/8" drill ground to 20° point. Remove burr from inside of guide.

1938-39 MODELS

VALVE GUIDES:—To Install. Starting with 1938 exhaust guides shorter than previous type, not counter-bored and installed with inner end flush with inside of valve port. Use special stop-collar drivers (J-1089 Int., J-1090 Exh.) to install new guides. These drivers position guides so that distance from head to top of guide is 1 1/16" Intake, 61/64" Exhaust. Rough ream guides to .341", finish ream to .343" inside diameter after installing.

1937-38-39 MODELS

ROCKER ARMS:—Two types of intake arms used. Install arms with slight angle toward front of engine for cylinders #1, 3, 5; angle toward rear for #2, 4, 6. All exhaust rocker arms straight. Replace worn rocker arms and worn shafts. Replacement arms furnished with finished bushings installed. Assemble rocker arm shafts with open end toward center of engine. Special bolt and washer used for rocker arm and shaft assembly (washer prevents oil leak around bolt). Assemble spring to brass coupling, place elbow pipe on coupling (press elbow back on spring), install coupling on rear shaft (elbow can then be assembled to front shaft), finally turn up coupling nut on end of oil pipe.

1937-38-39 MODELS

OIL LEAD TO VALVE ROCKER ARMS:—Installation—New assembly must be used (nipple and pipe assembly Part #838487 '37-38, #838914'39 whenever removed from engine. To install proceed as follows: insert pipe in block, coat threads of nipple with white lead and screw in block (on right side), install nipple and sleeve nut on lower end of pipe (left side of block) and secure in place, then bend pipe in upward loop and connect to oil distributor, bend pipe on right side of engine to clear push rod cover and also an additional bend (toward front of engine) to allow for expansion in pipe, finally connect pipe to valve rocker shaft coupling. Fill cooling system and check for leaks with engine running.

1937-38-39 MODELS

CHECK OILING SYSTEM:—Check troughs and nozzles whenever oil pan removed. Use Gauge No. J-969-3 to check oil nozzle height for connecting rod clearance (remove pan gasket, hook end of gauge over pan rail, position gauge in trough with word 'front' toward front of engine). Open end of nozzle must be directly below gauge. Use Gauge No. 969-2 to check oil trough height. Gauge stem should just touch edge of all troughs. Use Gauge No. J-969-1 to check nozzle aim (use water pressure, see that nozzle stream hits hole in target gauge). Use wrench J-793-2 to adjust nozzles. Recheck nozzle height.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1938-39 MODELS

REAR SPRING SEATS (PASSENGER CAR MODELS):—Bracket welded on front of housing at each spring. Spring seat attached to bracket by means of rubber bushed bolt (spacer sleeve through which bolt passes, used to prevent collapse of bracket through tightening bolts with too great pressure). Rubber washers used between bracket and each end of spring seat. Spring seat attached to springs through conventional U-bolts. IMPORTANT—When reassembling spring seat to bracket (when installing rear axle), eye bolt nut must not be tightened until all other connections made and car weight resting on all 4 wheels.

1938-39 MODELS

REAR SPRING SEATS (TRUCK MODELS):—Fitting. Whenever rear spring seats are adjusted, clearance between spring seat and rear axle housing must be checked as follows: Block up rear of car under frame side rails, drop rear of spring by disconnecting spring shackle, take out spring U-bolts, remove spring seats (lower spring cap secured by means of 2 screws). File face of each spring seat halve evenly (place in bench vise) until spring seat gives slight drag when placed on housing and rotated. CAUTION—File both halves evenly.

1938-39 MODELS

AXLE SHAFT (PASSENGER CARS):—To Install. Assemble new oil deflector, gasket (coat with shellac or paint on both sides), line up extra hole (center of three closest together) with notch in hub flange in axle shaft (also oil pocket in oil deflector with this notch), insert six new bolts and peen into place in counter-sink at bolt holes in flange.

Axle Spacers—Furnished in three sizes (1938), four sizes (1939) as follows: 1.0105", 1.0195", 1.0295", and 1.0345" (4th size 1939 only), across ground faces. Select spacer so that clearance between ends of axle shafts and spacer is Free fit to .014".

1938-39 MODELS

REAR WHEEL BEARING OIL SEAL (1½ Ton):—Rear wheel bearings are lubricated from differential. Soft stamped steel plate used under hub bolt heads and wheel bearing oil seal spring-backed to retain lubricant. Vellumoid gasket between axle flange and wheel hub should be replaced after every four removals. Oil slinger behind inner bearing must be installed with Oil Slinger Replacer J-973 to insure proper position to mate with slinger in wheel hub.

1939 CAB-OVER-ENGINE MODELS

ENGINE COVER REMOVAL:—To take off engine cover proceed as follows: Remove seat cushion and seat back, take out 4 bolts on cover at gear shift lever and raise assembly to rear, remove floor mats on each side, remove engine cover screws (at rear and at front on each side). Lift engine cover out by raising forward end and pulling out towards front.

NOTE—Right floor pan has hand hole for access to engine oil stick, crankcase oil filler pipe, and for lubrication of distributor and starter.

Left Floor Pan Note—Whenever floor pan removed, disconnect accelerator linkage by passing wire through accelerator spring and pull it upward exposing cotter pin retainer, then pull cotter pin out.

FRONT COWLING REMOVAL:—Take out 6 retaining screws on each side (2 top screws nuts accessible through side ventilators—not used on late models), remove 2 screws at top of cowling and take off radiator filler cap. Lift cowling up and forward. When replacing cowling, rubber insulators at upper screws must be installed between cowling and dash at each side. NOTE—With cowling removed, radiator may be taken out allowing access to water pump, fan belt, harmonic balancer, generator and front engine mountings.

SERIAL NUMBER:—First number ('33) CC-1001. ('34) DC-1001. On right front body sill in front of right seat.

ENGINE NUMBER:—Stamped on boss on right side of cylinder block.

ENGINE:—Six cylinder, overhead valve type.
Dimensions—Bore, 3 5/16". Stroke, 3½". Displacement, 181 cu. ins.
Horsepower—Rated, 26.3. Developed, 60 H.P. at 3000 R.P.M.
Compression—Ratio 5.2-1 (1933), 5.35-1 (1934). Pressure approximately 90-95 lbs. at cranking speed.
Vaccum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Cast-iron 'Cam' ground type with greatest clearance across pin bosses. Pistons furnished in standard oversizes of .003", .010", .020". Recondition cylinders to standard oversize (hone cylinders for .003" oversize or ream and hone for .010" or .020" oversize pistons). Reconditioned cylinders should not be out-of-round or tapered more than .001".
Clearance—.002-.003" (skirt)—see 'Installing New Pistons'.
Weight—Pistons of same size held to ⅛ ounce maximum weight variation.
Removal—Piston and rod assembly removed from top of engine.
Installing New Pistons—Use feeler gauge in cylinder bore at right angles to piston pin boss to gauge clearance. Piston should pass through bore with .002" feeler and should lock on .003" feeler. Finish hone cylinder bore to provide this clearance with standard oversize pistons.

Piston Rings:—Three rings per piston (all above pin), #1 and 2—compression rings, #3—oil control ring. Lower ring groove is drilled radially with oil return drain holes.

Ring	Width	End Gap	Side Clearance
Compression (#1, 2)	5/32"	.004-.014"	.0015-.003"
Oil Control (#3)	3/16"	.004-.014"	.0015-.0025"

Piston Pin:—Pin is clamped in connecting rod. Pin bosses in piston are bronze bushed. Service pistons furnished with bushings in and new pins fitted.
Pin Fit in Piston—Light thumb push fit.

NOTE:—In assembling piston and connecting rod, center pin in piston and rod between piston bosses before tightening pin clamp screw. End clearance between upper end of connecting rod and end of piston pin bosses must be not less than .025".

Connecting Rod:—Length, 6 17/32". Weight—Rods are held to satisfactory weight variation (⅛ ounce).
Big End Bearing—Spun babbitt type. Shims are used.
Clearance—Snap fit (see adjustment below). Sideplay .004-.010".
Adjusting Bearings—Remove shims, assemble bearing cap, check clearance by tapping rod from side to side with 8 oz. ball pein hammer. Bearing should move with light hammer tap but should not be movable by hand. If bearing can be moved by hand, clearance is too great. If bearing does not move under light hammer tap, clearance is too small.

NOTE:—Assemble rods with number on rod and cap together (this number indicates cylinder in which rod should be used). Install rods in engine with these numbers toward camshaft side (piston pin clamp bolt should also be toward camshaft side of engine). Assemble oil dipper on bearing cap (under bolts) with mouth of dipper toward camshaft side of engine. Check height of dipper with special gauge (Part Number K-438). End of dipper should just touch cross bar of gauge with gauge rods resting on crankcase flange. Center rod on gauge should be used to test depth of oil troughs in oil pan (rest cross bar on flange, center rod should touch bottom of oil trough).

Crankshaft:—Three main bearing type with integral counterweights.
Journal Sizes—#1, 2 1/16"; #2, 2⅛"; #3, 2 3/16".
Bearing Type—Steel-backed, babbitt-lined type. Shims used.
Clearance—.002".
Adjustment—Remove shims until there is a heavy drag on crankshaft, then replace one .002" shim. Use an equal number of shims on each side. If necessary to use unequal number to secure correct clearance, put extra shim on camshaft side of engine.
End Thrust—Taken by #2 (center bearing). Correct end play, .004-.007". Clearance between oil deflector on rear of crankshaft and oil groove in cylinder block back of rear main bearing also controlled by center main bearing. Clearance should be .002-.032" with crankshaft in extreme rear position.

NOTE:—Crankshaft alignment should be checked when shaft is taken out of engine. Maximum allowable run-out at center bearing, .002". If more than .002", shaft should be straightened. Check crankshaft journals for out-of-round or taper. If more than .001", replace shaft.

Camshaft:—Three bearing type. Camshaft drive—helical gear. Center main bearing on camshaft is removable steel-backed, babbitt-lined type and is staked in the block and reamed to clear distributor drive shaft (drive gear located in center).
Bearing Diameters—#1, 1 13/16"; #2, 1 25/32"; #3, 1⅝".
Clearance (Center Bearing)—.002-.0035".
Inspection Limits—Camshaft alignment should be checked when camshaft is removed from engine. Maximum allowable run-out at center bearing is .002". If more than .002", straighten shaft. Check camshaft journals for out-of-round. If more than .001", replace camshaft.
End Thrust—Taken by thrust plate in back of camshaft gear. End play should be Free to .003". Adjustable by changing position of gear on camshaft (gear is press fit on shaft).
Camshaft Gears—Gears should be checked for run-out or alignment when installed. Maximum allowable run-out is .003" (crankshaft gear), .004" (camshaft gear). Replace gears if run-out is excessive and cannot be corrected (when caused by burrs on shaft or gear, etc.). Backlash between gears should be .002-.004".
Camshaft Setting—Tooth on crankshaft gear and space between teeth on camshaft gear punch-marked. Mesh marked tooth opposite marked space.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 29/64"	5/16"	4 15/16"	45°	.314"
Exhaust	1 11/32"	5/16"	4 15/16"	45°	.314"

Stem Clearance in Guide—.001-.003" Intake, .002-.004" Exhaust.
Tappet Clearance—.006" Int., .008" Exh. (1933), .013" Exh. (1934), with engine hot.
Valve Timing—See Camshaft Setting above.
Intake Valves—Open 4° Before TDC. Close 34° After LDC.
Exhaust Valves—Open 47° Before LDC. Close 4° After TDC.
To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 4° or .0051" before top dead center when a point on the flywheel approximately 1.15 teeth before dead center mark lines up with indicator on housing.
Motor Gauge—Weldenhoff #113 Adapter with #151 Adapter, Rod #19.

LUBRICATION:—Pressure type (positive pressure to crankshaft and camshaft bearings and through oil distributor at left of engine to valve rocker arm bushings and connecting rod dipper troughs). Connecting rod bearings, piston pins, and cylinder walls lubricated by splash from troughs. Vane type oil pump located in crankcase.
Oil Pressure Relief Valve—Conventional pressure relief or by-pass valve not used. Oil distributor on left side of crankcase proportions oil between high-pressure points (crankshaft and camshaft bearings), and low-pressure points (oil troughs and rocker arm shafts). An overflow tube returns excess oil from rocker shafts to crankcase.
Oil Pump Clearances—Replace pump when clearance between shaft and oil pump body exceeds .009". Assemble taper end of oil pump blades in direction of rotation.
Capacity—4½ quarts (refill).

CLUTCH:—Own make. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Moulded type, two required. Thickness ⅛". Inside Diameter 6¼". Outside Diameter 9".
Adjustment—Clearance between pedal and toeboard should be ½". To adjust, loosen two nuts on bracket at right of pedal, adjust pedal stop, tighten nuts. Free movement of clutch pedal should be 1". To adjust, loosen locknut and turn adjusting nut on clutch fork connecting link.

STEERING:—Steering Gear—Saginaw Model, Worm-and-Sector type. See article in Steering Section for adjustments.
Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7°10' crosswise.
Caster—1¾° plus or minus ½°. Adjust by inserting shims between spring and spring pad on axle.
Camber—1° plus or minus ½°. Axle may be bent cold for minor corrections.
Toe In—5/64-⅛". Adjust by changing length of tie rod.

BRAKES:—Service—Own make. Internal expanding, two shoe type, mechanically operated. Hand lever applies all four service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—10".
Lining—Moulded type. Width 1½". Thickness 3/16". Length per wheel 15½" ('33), 20" ('34).
Clearance—Very slight drag should be evident with brakes in proper adjustment.
Hand Brake Adjustment:—See Service Brakes.

NOTE:—To remove oil pan for work on engine, drop right hand tie rod. On cars with conventional front axle it may be necessary to bend lip of front cross member or hoist engine so that oil pan will clear.

ENGINE NUMBER:—First number—1st serial number (CA) 3,367,317 (DA) 1001. Stamped on boss on right side of block back of fuel pump.

ENGINE:—Own Master Model. Six cylinder, 'I' or overhead valve type. Cylinders cast enbloc.
Bore—3 5/16". Stroke—4".
Piston Displacement—206.8 cubic inches.
Rated Horsepower—26.3 A.M.A.
Developed Horsepower—65 at 2800 R.P.M. (CA); 80 at 3300 R.P.M. (DA).
Compression Ratio—5.2-1 (CA), 5.4-1 (DA), Standard cast-iron head. No optional ratios.
Compression Pressure—Approximately 91 lbs. (5.2-1 hd.), 96 lbs. (5.4-1 hd.) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Cast-iron, cam ground type with greatest clearance across pin bosses. See Replacement Pistons below.
Weight—25 ozs. (CA), 27¼ ozs. (DA), Held to ⅛ oz. maximum variation.
Length—3 11/16".
Clearance—.011" (CA, DA) top, .0015-.003" skirt.
Replacement Pistons—Refinish cylinders to take standard replacement pistons furnished .003", .010", .020", .030", .040" oversize (hone cylinders for .003" oversize or ream and hone for larger pistons).
Removal—Pistons and rods removed from above.
Fitting New Pistons—Use feeler gauge between piston and cylinder at right angles to pin bosses to check clearance. Piston should pass through bore on .002" feeler and lock on .003" feeler.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with oil drain holes. Rings furnished .005", .010", .015", .020", .030", .040" oversize.

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.005-.015"	.0015-.003"
Oil Cont.	3/16"	.013-.021"	.0015-.0025"

Piston Pin: — Diameter .990-.9895". Length 2 29/32". Pin is locked in rod. Pin bosses in piston are bronze bushed. New pistons furnished with bushings installed and pins fitted. Pins furnished for service standard and .003", .005", .010" oversize.
Pin Fit in Piston Bushing—Tight thumb push fit (CA), Light thumb push fit (DA).

Connecting Rod:—Weight 31.68 ozs. Length 7½".
Crankpin Journal Diameter—2.1245-2.1250".
Lower Bearing Type—Spun babbitt. Solid shims.
Clearance—.0005-.002". Sideplay .004-.011".
Adjustment—Shims. Remove shims from each side equally to secure 'snap fit' (rod should snap from one side to the other with a light tap of 8 oz. ball pein hammer). Bearing is loose if rod can be moved by hand.
Installing Rods—Install rods in same numbered cylinders as indicated by numbers stamped on rod and cap with these numbers together and toward camshaft side of engine. Oil hole in cap should be away from camshaft. Assemble oil dippers on rod caps with mouth of dipper toward camshaft.

Crankshaft:—3 bearings. Integral counterweights.
Journal Diameters—#1, 2 1/16"; #2, 2⅛"; #3, 2 3/16".
Bearing Type—Removable steel-backed, babbitt-lined. **Clearance**—.001-.003".
Adjustment—Shims. Remove shims until there is a heavy drag on the crankshaft, then replace one .002" shim. If necessary to use unequal number, place extra shim on camshaft side.
End Thrust—Taken by center bearing. Endplay .004-.007". Flanges on center main bearing should be turned down for this clearance and clearance of .002-.032" between oil slinger on rear of crankshaft and groove in cylinder block.

Camshaft:—Three bearing. Gear driven.
Journal Diameters—#1, 1.808-1.809"; #2, 1.776-1.7777"; #3, 1.620-1.621".
Bearing Type—#2 and 3 are steel-backed, babbitt-lined. These bearings are pressed in crankcase and staked to prevent movement.
Clearance—.002-.004". Check at center bearing.
End Thrust—Taken by thrust plate in back of camshaft gear. Endplay should be Free to .003".
Camshaft Gears—Crankshaft gear steel. Camshaft gear Bakelite-Fabric composition. Backlash between gears .003-.004" (CA), .002-.005" (DA).
Camshaft Setting:—Mesh marked tooth on crankshaft gear opposite marked space between teeth on camshaft gear. Marked tooth on crankshaft gear is fifth (CA), third (DA) tooth counter-clockwise from space in line with keyway. Marked space on camshaft gear is 16th. (CA), 13th. (DA) space clockwise from space opposite keyway (15 CA, 12 (DA) teeth between these points).

Valves (CA):—	Head Diam.	Stem Diam.	Length
Intake	1 29/64"	5/16"	4 15/16"
Exhaust	1 11/32"	5/16"	4 15/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.314"	.001-.003"
Exhaust	45°	.314"	.002-.004"

Valves (DA)	Head Diameter	Stem Diameter	Length
Intake	1 45/64"	11/32"	5.986"
Exhaust	1 15/32"	11/32"	4.810"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.316"	.001-.003"
Exhaust	30°	.309"	.002-.004"

Installing New Guides—Use special tool to press out old guides and install new guides. On DA model assemble collars on guides with open face up (intake), down toward cylinder head (exhaust) before installing, finish ream new guides to .3125" (CA), .343" (DA).
Tappet Clearance—.006" minimum (.006-.008") Int., .008" Exh. (CA), .013" Exh. (DA).
Valve Springs (CA):—Painted yellow to distinguish from previous design.
Pressure—57 lbs. closed, 95 lbs. open.
Valve Springs (DA)—Have variable spaced coils Install springs with close-coil end toward cylinder head (down).

	Spring Pressure	Length
Valve Closed	45 lbs.	1⅞"
Valve Open	98 lbs.	1 9/16"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 4° BTDC. Close 34° ALDC.
Exhaust Valves—Open 47° BLDC. Close 4° ATDC.
To Check Valve Timing—No flywheel mark provided for valve timing check. With intake tappet clearance set at .006" (engine hot), #1 intake valve should open with piston 4° .0061") before top dead center when a point on the flywheel approximately 1⅛ (CA), 1½ (DA) teeth before the dead center point lines up with the indicator in the inspection hole.
Motor Gauge—Weidenhoff Adapter #113 (with #151 attachment for CA, #152 for DA), Rod #19 (CA), #33 (DA).

Lubrication:—Pressure and positive splash system (positive pressure to crankshaft and camshaft bearings, timing gears, and through oil distributor at left of engine to valve rocker arm bushings and connecting rod dipper troughs). Connecting rod bearings, piston pins and cylinder walls lubricated by splash from troughs at low speeds and by jet from oil nozzles striking rod dippers directly at high speeds. Vane type oil pump located in crankcase.
Normal Oil Pressure—14 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Conventional pressure relief or by-pass valve not used. Oil distributor on left side of crankcase proportions oil between high pressure points (crankshaft, camshaft bearings, timing gears) and low pressure points (oil troughs and rocker arm shafts). Excess oil is returned from rocker arm shafts to crankcase through overflow pipe. Distributor valve operates at 6½ lbs.
Checking Connecting Rod Oiling System—Use special gauge to check height of dippers assembled on connecting rod bearing cap and height of oil troughs (one gauge) when assembling rods. Use Target Gauge to check jet from oil nozzles in troughs (use water under pressure—jet should strike hole in target—use special tool to bend nozzle to correct position). Check nozzles after this adjustment with height gauge to make certain that rods will clear. These checks should be made whenever pan is taken off engine.
Crankcase Capacity—5 quarts.

CLUTCH:—Own make. Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment — Clearance between pedal and toeboard should be ½". To adjust, loosen two nuts on bracket at right of pedal adjust pedal stop, tighten nuts. Free movement of clutch pedal should be 1". To adjust, loosen locknut on pedal shaft stop below pedal (CA), loosen check nut, turn adjusting screw for 1" clearance. On DA model loosen locknut and turn adjusting nut on clutch fork connecting link.
NOTE—On CA, brakes must be adjusted whenever clutch pedal stop is moved.
Clutch Facings—Molded woven asbestos composition, 2 required, 6¼" I. D., 9" O. D., ⅛" thick.
NOTE—Propeller shaft must be disconnected at universal and transmission removed to remove clutch.

STEERING:—Steering Gear—Saginaw Worm-and-Sector (CA), Worm-and-Roller (DA).
See article in Mechanical Equipment Section for data.
Front Suspension CA, DA:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7°10' plus or minus 1°.
Caster—1¾° plus or minus ½°. Adjust by installing wedge shims between spring and spring pad on axle.
Camber—1° plus or minus ½°. Axle may be bent cold to correct camber.
Toe In—5/64-⅛". Adjust in usual manner by loosening clamps and turning tie rod.

CONTINUED ON PAGE M-73

OIL PAN REMOVAL:—To remove pan for work on engine on cars with conventional front axle factory advises that tie rod be dropped on right hand side and motor hoisted so that pan clears front cross member when removed. Pan can be removed without hoisting engine by bending lip of cross member.

FLEET MODEL NOTE:—A special engine is available for fleet use where maximum economy is desired. Engines are standard except for cylinder head (identified by letter 'F' cast above #1 exhaust port), carburetor with economy throttle stop, and vacuum spark control. Rear axle ratio with this engine is 3.82-1 (42-11 ring gear and pinion). All specifications are the same except:
Spark Plug Gap—Set at .040".
Intake Tappet Clearance—.010" Hot.
Exhaust Tappet Clearance—.016" Hot.
Ignition Setting—At TDC.
These models may be identified by special name plate on instrument panel and plate on valve push-rod cover listing these specifications.

ENGINE NUMBER:—First number 4,708,995 with prefix as follows: M—Passenger cars (EA, EC, ED), K—Commercial (EB), T—Trucks (Q). Stamped on boss on right side of cylinder block in back of fuel pump.

ENGINE: — Own Master Model. Six cylinder, 'I' or overhead valve type. Cylinders cast enbloc.
Bore—3 5/16". **Stroke**—4".
Displacement—206.8 cu. ins. **Rated HP.**—26.3.
Developed Horsepower—74 HP. (Std.), 80 HP. (Mstr.), 68.5 (Trucks) at 3200 R.P.M.
Compression Ratio—5.45-1 (Std. & Trucks), 5.6-1 (Mstr.).
Compression Pressure—Approximately 95 lbs. (5.45-1), or 97 lbs. (5.6-1) at cranking speed.
Vacuum Reading—18-20" at idling speed.

Pistons:—Cast-iron, tin-plated, cam ground type with greater clearance across pin bosses. Pistons are tin-plated to thickness of .0005-.001" after finishing and cannot be ground. Refinish cylinders to take standard replacement pistons furnished .003", .010", .020", .030", .040" oversize (hone cylinders for .003" oversize or ream and hone for larger pistons). Piston length 3 11/16".
Weight—28.8 ozs. stripped, 38.24 ozs. with rings, pin and bushings. Held to ⅛ oz. max. variation.
Removal—Pistons and rods removed from above.
Clearance—.0145" top, .0015-.003" skirt.
Fitting New Pistons—Use feeler gauge between piston and cylinder at right angles to pin bosses to check clearance. Piston should pass through bore on .002" feeler and lock on .003" feeler.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with oil drain holes. Rings furnished .005", .010", .015", .020", .030", .040" oversize.

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.005-.015"	.0015-.003"
Oil Cont.	3/16"	.013-.021"	.0015-.0025"

Piston Pin: — Diameter .990-.9895". Length 2 29/32". Pin is locked in rod. Pin bosses in piston are bronze bushed. New pistons furnished with bushings installed and pins fitted. Pins furnished for service standard and .003", .005", .010" oversize.
Pin Fit in Piston Bushing—Light thumb push fit.

Connecting Rod:—Weight 31.68 ozs. Length 7½".
Crankpin Journal Diameter—2.1245-2.1250".
Lower Bearing Type—Spun babbitt. Solid shims.
Clearance—.0005-.002". Sideplay .004-.011".
Adjustment—Shims. Remove shims from each side equally to secure 'snap fit' (rod should snap from side to side with light tap of 8 oz. hammer). Bearing is loose if rod can be moved by hand.
Installing Rods—Install rods in same numbered cylinders as indicated by numbers stamped on rod and cap with these numbers together and toward camshaft side of engine. Oil hole in cap should be away from camshaft. Assemble oil dippers on rod caps with mouth of dipper toward camshaft.

Crankshaft:—3 bearings. Integral counterweights.
Journal Diameters — #1, 2.058-2.059"; #2, 2.120-2.121"; #3, 2.183-2.184".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
Adjustment—Shims. Remove shims until there is a heavy drag on the crankshaft, then replace one .002" shim. If necessary to use unequal number, place extra shims on camshaft side.
End Thrust—Taken by center bearing. Endplay .004-.007". Flanges on center main bearing should be turned down for this clearance and clearance of .002-.032" between oil slinger on rear end of crankshaft and groove in cylinder block.

Camshaft:—Three bearing. Gear driven.
Bearing Type—#2 and 3 are steel-backed, babbitt-lined. These bearings are pressed in crankcase and staked to prevent movement.
Clearance—.002-.004". Check at center bearing.
End Thrust—Taken by thrust plate in back of camshaft gear. Endplay should be Free to .003".
Camshaft Gears—Crankshaft gear steel. Camshaft gear Bakelite-Fabric composition. Backlash between gears should be .002-.005".
Camshaft Setting—Mesh marked tooth on crankshaft gear opposite marked space between teeth on camshaft gear.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 45/64"	11/32"	5.986"
Exhaust	1 15/32"	11/32"	4.810"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.316"	.001-.003"
Exhaust	30°	.309"	.002-.004"

NOTE—On a few of the first cars valve head diameter was 1 41/64" (Int.), 1 15/32" (Exh.), and seat angle was 45° (all).
Installing New Guides—Use special tool to press out old guides and install new guides. Assemble collars on guides with open face up (intake), down toward cylinder head (exhaust) before installing. Finish ream new guides to inside diameter .343" (all). Check stem size with 'No-Go' gauges (stem sizes above merely nominal).
Tappet Clearance—.006" min. (.006-.008") Intake, .013" minimum (.013-.015") Exh. with engine hot.
Valve Springs—Springs have variable spaced coils. Install springs with close-coil end toward cylinder head (down).

	Spring Pressure	Length
Valve Closed	45 lbs.	1⅞"
Valve Open	98 lbs.	1 9/16"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 4° BTDC. Close 34° ALDC.
Exhaust Valves—Open 47° BLDC. Close 4° ATDC.
To Check Valve Timing—No flywheel mark provided for valve timing check. With intake tappet clearance set at .006" (engine hot), #1 intake valve should open with piston .0061" (4°) before top dead center when a point on the flywheel approximately 1½ teeth before dead center point lines up with the indicator in the inspection hole.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter), Rod #33.
Lubrication—Pressure and positive splash system.
Oil Pump—Vane Type in crankcase driven through tongue-and-slot coupling from camshaft gear.
Oil Distributor—On left side of crankcase. Proportions oil between high pressure points (crankshaft, camshaft bearings, timing gears) and low pressure points (oil trough, rocker arm shaft). Overflow pipe returns excess oil from rocker arm shaft.
Checking Connecting Rod Oiling System—Should be checked whenever oil pan removed. See 1934 model (previous page) for complete directions.
Normal Oil Pressure—12 lbs. at 50 M.P.H.
Crankcase Capacity—5 quarts.

CLUTCH:—Own make. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for complete data.
Clutch Pedal Adjustment — Clearance between pedal and toeboard should be ½". To adjust, loosen two nuts on bracket at right of pedal (EA, EB, EC, ED) or on pedal stop bracket below pedal (Q), adjust pedal stop, tighten nuts. Free movement of clutch pedal should be 1". To adjust, loosen locknut and turn adjusting nut on clutch fork connecting link (EA, EB, EC, ED), or loosen locknut on pedal shaft stop below pedal, loosen locknut on adjusting setscrew, turn setscrew.
Clutch Facings—(EA, EB, EC, ED) molded woven asbestos composition, 2 required, 6¼" I.D., 9" O.D., ⅛" thick. (Q) molded asbestos composition, 2 required, 6¼" I.D., 10" O.D., ⅛" thick.

STEERING:—**Steering Gear**—Saginaw Worm-and-Sector (Std. & Trucks), Worm-and-Roller (Mstr. EA, ED). See article in Steering Section for adjustmts.
Front Suspension Std. EC, Mstr. ED & Trucks:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7°10' plus or minus 1°.
Caster—1¾° plus or minus ½° (EB, EC), 3° (Mstr. ED), 2¾° (Q). Adjust by installing wedge shims between spring and spring pad on axle.
Camber—1° plus or minus ½°. Axle may be bent cold to correct camber.
Toe In—5/64-⅛". To adjust, turn tie rod.
Front Suspension Master Model EA:—Independent 'Knee Action' Type. See article in Steering Section for adjustment. Specifications below correct with car weight supported by horses at wheel spindle inner bearing cone.
Suspension Unit Height—Distance from bottom of kingpin support to bottom of brake flange plate should be 5⅝" (5-wheel cars), 4⅝" (6-wheel cars).
Kingpin Inclination—7¾°. Correct by bending kingpin support.
Camber—¼°. No adjustment provided. If spindle is bent, replace suspension unit. If kingpin bearings are worn, they should be replaced (special oversize rollers can be installed by reaming out kingpin support yoke ends).
Kingpin Caster—0°. Correct by bending kingpin support. Caster effect is secured by trailing wheel center behind center of kingpin.
Toe In—1/16-3/32" measured at hub height. Correct as usual by changing length of tie rod.

BRAKES:—**Service**—Own make. Internal expanding, self-energizing, mechanically operated brakes. Hand lever applies all four service brakes. See article in Brake Section for complete data.
Drum Diameter—10" (Std.), 12" (Mstr.).
Lining—Semi-moulded (Std.), moulded (Mstr.). Width 1¾". Thickness 3/16". Length per wheel 20.2" (Std.), 24 19/32" (Mstr.).
Clearance—Very slight drag should be evident when brakes in proper adjustment.
Hand Brake Adjustment:—See Service Brakes.

NOTE:—To remove oil pan for work on engine, drop right hand tie rod. On Master Model FD with conventional axle it may be necessary to bend lip of front cross member or hoist engine so that oil pan will clear.

FLEET 'ECONOMY' MODEL NOTE:—All models available with special economy engine which may be identified by prefix 'V' on engine number and plate on Valve Push Rod Cover listing special tune up specifications. Engine is standard except for these tune up specifications (see Tune up page), special carburetor (painted gray) which has stop pin designed to limit throttle to half-throttle opening, manifold cover, and passenger car intake manifold riser sleeve used on FB and R models.

ENGINE NUMBER:—First number—5500179. Prefixed by letter indicating model as follows: M—FC passenger cars. K—FB commercial cars. T—R Trucks. No prefix used on Master FA, FD passenger cars. Economy engines indicated by 'V' (V, VM, VK, VT). Number is stamped on boss on right side of block back of fuel pump.

ENGINE SPECIFICATIONS:—6 cylinder, 'I' head.
Bore—3 5/16". **Stroke**—4".
Displacement—206.8 cubic inches.
Rated Horsepower—26.3 (AMA).
Developed Horsepower—79 at 3200 R.P.M.
Compression Ratio & Pressure—6.0-1 Std. cast-iron head. Pressure 102 lbs. at cranking speed or 90 lbs. min. and equal within 5-10 lbs. for all cylinders.
Vacuum Gauge Reading—Should show steady reading of 20-22" with engine idling at 400 R.P.M.

PISTONS:—Cast iron, tin-plated, cam ground type with greater clearance across pin bosses. Pistons are tin-plated to thickness of .0005-.001" after finishing and cannot be ground. Use finished replacement pistons. **Weight**—28¾ ozs. (stripped). **Length**—3 11/16".
Removal—Pistons and rods removed from above.
Clearance—.0145" Top. .0015-.003" Skirt.
Replacement Pistons:—Finished pistons furnished .003", .010", .020", .030", .040" oversize.
Fitting New Pistons:—Use feeler gauge at right angles to pin bosses to check clearance. Piston should pass through bore on .002" feeler and lock on .003" feeler.

PISTON RINGS:—Two compression, one oil control ring per piston all above pin. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.005-.015"	.0015-.003"
Oil Cont.	3/16"	.013-.021"	.0015-.0025"

NOTE—Compression ring face tapered and marked 'Top' on upper side. Install rings with this mark toward top of piston. Rings furnished .005", .010", .015", .020", .030", .040", oversize.

PISTON PIN:—Diameter .990-.9895". **Length** 2 29/32". Pin is locked in rod. Pin bosses in piston bronze-bushed. New pistons furnished with bushings and pins fitted. Pins furnished standard and .003", .005", .010" oversize.
Pin Fit in Piston Bushing—Light thumb push fit.

CONNECTING ROD:—Weight 31⅝ ozs. **Length** 7½".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0005-.002". Sideplay .004-.011".
Bearing Adjustment:—Solid shims. Remove shims from each side equally to secure 'snap fit' (rod should snap from one side to the other with a light tap of 8 oz. ball pein hammer). Bearing loose if rod can be moved by hand.
Installing Rods:—Install rods in same numbered cylinders as indicated by numbers stamped on rod and cap with these numbers together and toward camshaft side of engine. Oil hole in cap should be away from camshaft. Assemble oil dippers on rod caps with mouth of dipper toward camshaft.
NOTE—Check dipper height with special gauge.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—#1, 2 1/16"; #2, 2⅛"; #3, 2 3/16".
Bearing Type—Steel-backed, babbitt-lined removable type.
Clearance—.001-.003".
Bearing Adjustment:—Shims. Remove shims until there is a heavy drag on the crankshaft, then replace one .002" shim.
End Thrust:—Taken by center bearing. Endplay .004-.007". Flanges on center main bearing should be turned down for this clearance and clearance of .002-.032" between oil slinger on rear end of crankshaft and edge of groove in cylinder block.

CAMSHAFT—Three bearing. Gear driven.
Journal Diameters—#1, 1 13/16"; #2, 1 25/32"; #3, 1⅝".
Bearing Type—#1 machined in crankcase. #2, 3 steel-backed, babbitt-lined type pressed in crankcase and staked to prevent movement.
Clearance—.002-.0035". Check at center bearing.
NOTE—When replacing center bearing manufacturer recommends use of special driver and alignment pin to align oil holes and distributor drive. Ream distributor hole and line-ream bearings. #1 bearing serviceable only by using special reamer to ream hole in crankcase and then installing bearing and new standard camshaft.
End Thrust:—Taken by thrust plate in back of camshaft bear. Endplay—Free to .003". Adjusted by changing gear position on shaft. See Timing Gear Note.
Timing Gears:—Steel (crankshaft), Bakelite-Fabric (camshaft). Backlash between gears .002-.005".
NOTE—Camshaft gear press fit on shaft. Remove and install gear in arbor press with camshaft out of engine using special sleeve to support hub. Use new thrust plate and press gear on shaft until no endplay (between gear and thrust plate) is perceptible but gear is free to turn.
Camshaft Setting:—Mesh marked tooth on crankshaft gear with marked space between teeth on camshaft gear. Marked tooth on crankshaft gear is third counter-clockwise from space in line with key way. Marked space on camshaft gear is thirteenth space clockwise from space in line with keyway. (12 teeth between these points.)

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 45/64"	11/32" (nom.)	5 7/32"
Exhaust	1 15/32"	11/32" (nom.)	4 1/32"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.316"	.001-.003"
Exhaust	30°	.319"	.002-.004"

NOTE—Stem sizes nominal. Check with special 'No-go' gauge.
Tappet Clearance (Std. Engine)—.006" Min. (.006-.008") Int., .013" Min (.013-.015") Exh. with eng. hot.
Tappet Clearance (Economy Engine)—.010" Int., .016" Exh. with engine hot.
Valve Guides:—Use special tool to press out old guides and install new guides. Assemble collars on guides with open face up (intake), down toward cylinder head (exhaust). Exhaust guides counter-bored ¼" on lower end. Rough-ream these guides to .341", counter-bore with special reamer (KMO-33). Finish ream all guides to .343" after installing.
Valve Springs:—Variable spaced coil type. Install with close-coil end toward cylinder head (down).

	Spring Pressure	Length
Valve Closed	45 lbs.	1 ⅞"
Valve Open	98 lbs.	1 9/16"

Valve Lifters:—Single piece cast-iron with ground contact face. Oversize lifters not furnished.
Pushrod Springs:—Spring mounted on each pushrod above valve lifter. To remove pushrods, take out three bolts in spring retainer to release spring tension, remove 'C' washer under spring, withdraw pushrod. Install in same manner.
Rocker Arms:—Intake arms have left and right hand angles. Intake arm with left hand angle must be installed on #2, 4, 6 cylinders, right hand angle on #1, 3, 5 cylinders.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 4° BTDC. Close 34° ALDC.
Exhaust Valves—Open 47° BLDC. Close 4° ATDC.
To Check Timing—No flywheel marks. With intake valve tappet clearance set at .006" (hot), #1 intake valve should begin to open with piston 4° or .0061" before top dead center when point on flywheel approximately 1½ teeth before dead center point lines up with pointer on inspection hole in right front face of flywheel housing.
Motor Gauge—Weidenhoff #113 Adapter with #152 Attachment. #33 Rod.

LUBRICATION:—Pressure and positive splash system used. Rifle-drilled passages in block to main bearings.
Oil Pump:—Vane type in crankcase driven through tongue-and-slot coupling from camshaft gear.
Normal Oil Pressure:—12 lbs. at 50 M.P.H.
Oil Distributor:—On left side of crankcase. Proportions oil between high pressure points (crankshaft, camshaft bearings, timing gears) and low pressure points (oil troughs, rocker arm shaft). Overflow pipe returns excess oil from rocker arm shaft.
NOTE—Oil pipe to rocker arm shaft passes through water jacket in center of block. When replacing check for water leaks at block connections.
Checking Connecting Rod Oiling System:—Check whenever oil pan taken off engine. Use special gauge to check dipper height (on connecting rod bearing cap) and oil trough height (same gauge). Use special target gauge to check oil nozzle jets (use water under pressure, bend nozzle with special tool until jet strikes hole in target gauge). Check nozzles with special height gauge after this adjustment to make certain that rods will clear.
Crankcase Capacity—5 qts. refill.
NOTE—SAE #10-W oil recommended for Economy engine. Oil heavier than #20 must not be used at any time in this engine.

CLUTCH:—Own make. Single plate, dry disc type. See article in Clutch Section for relining and assembly directions.
Facings—Molded-braided (FA, B, C, D), moulded (RA, B, C, D). Inside Diam. 6¼" (all), Outside Diam. 9" (FA, B, C, D), 10" (RA, B, C, D). Thickness ⅛".
Adjustment—Clearance between pedal and underside of floor board must be ½". To adjust, loosen two nuts at side of pedal, move pedal stop forward or backward. Free movement of pedal must be 1". To adjust, loosen checknut (upper), and turn adjusting nut (lower) on clutch fork connecting link.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal:—Disconnect universal (see Note for Std. Model), remove transmission underpan and transmission rear cross member, lift propeller shaft and slide transmission out using pilot studs to hold transmission. Disconnect clutch linkage, take out capscrew holding throwout fork in flywheel housing, take out fork, force springs holding sleeve to throw-out levers over ends of levers and remove sleeve. Take out nine capscrews mounting clutch cover on flywheel, turning out screws evenly until spring pressure is released.

NOTE—On Standard model, universal joint ring is riveted (On Master model universal joint is split by taking bolts out of this ring) and rear end must be freed and pulled back to disengage drive shaft at splined joint back of universal.

STEERING:—**Steering Gear**—Saginaw Worm-and-Sector (Std. FC) Worm-and-Roller (Mstr, FA, FD). See article in Steering Section for adjustments.

Front Suspension Std. FC., Mstr. FD:—Conventional 'I' beam front axle with semi-elliptic springs.
Kingpin Inclination—7°10′ plus or minus 1°. Angle on both wheels must be same within ½°.

Caster—2¾° (St.FC), 1¾° (FB), 2¾° (R), 3° (Mstr. FD) plus or minus ½°. Must be same within ¼° on both wheels. Adjusted by inserting wedge shims between spring and spring pad.

Camber—1° plus or minus ½°. Must be same within ¼° on both wheels. No adjustment. Axle may be bent cold for minor corrections.

Toe In—5/64-⅛″. Adjusted in usual manner by turning tie rod to increase or decrease length.

Steering Geometry—Inner wheel turned 23°, outer wheel 20°. Check tie rod ends and kingpin for looseness, replace steering arms.

Front Suspension Master Model FA:—Independent 'Knee Action' Type. See article in Steering Section for adjustments. Specifications below correct with car weight supported by horses at wheel spindle inner bearing cone (necessary for use of Chevrolet testing equipment).

Wheel Setting (Suspension Unit Height)—Should be 5⅜″ (Spare at rear), 4⅜″ (With fender wells) from bottom of kingpin support to bottom of brake flange plate.

Kingpin Inclination—7¾° crosswise.

Camber—¼°. No adjustment provided.

Kingpin Caster—0°. Caster effect secured by trailing wheel behind suspension unit.

Toe In—1/16-3/32″ measured at hub height on center of tire tread.

Steering Geometry—Inner wheel 23°, outer 20°

BRAKES:—Own design. Four-wheel hydraulic type. Hand brake lever applies rear wheel brakes. See article in Brake Section for complete adjustment instructions.

Wheel Cylinders—Diameters, (Mstr. FA, FD & FB) Front wheel 1¼″, Rear wheel 1 3/16″. (Std.FC) Front wheel 1⅛″, Rear wheel 1 1/16″. (R) Front wheel 1¼″, Rear wheel 1½″. Not interchangeable.

Brake Drum Diameter—11″.

Lining—Semi-moulded (Std.FC), Moulded (Mstr. FA, FD), (FB). Width 1¾″. Thickness 3/16″. Length 22⅝″ per wheel.

Brake Clearance—Adjusting cover backed off 4 notches from slight drag position.

Hand Brake Adjustment:—See Service Brake.

CHEVROLET MODELS (1933-34)

CONTINUED FROM PAGE M-70

Front Suspension DA:—Independent 'Knee-Action' type. See article in Steering Section for adjustments. Specifications below correct with car weight supported by horses at wheel spindle inner bearing cone (necessary for use of Chevrolet testing equipment).

Wheel Setting (Suspension Unit Height)—Should be 5½″ (Spare at rear), 4½″ (With fender wells) from bottom of kingpin support to bottom of brake flange plate.

Kingpin Inclination—7° crosswise.

Camber—1°. No adjustment provided.

Kingpin Caster—0°. Caster effect secured by trailing wheel behind suspension unit.

Toe In—1/16-3/32″ measured at hub height on center of tire tread.

Steering Geometry—Inner wheel 23°, outer 20°.

BRAKES:—**Service**—Own make. Internal expanding, self-energizing, mechanically operated brakes. Hand lever applies all four service brakes. See article in Brake Section for relining and complete adjustment procedure.

Drum Diameter—12″.

Lining—Molded (CA), Semi-molded (DA), Thickness ¼″ (CA), 3/16″ (DA). Width 1¾″. Length per wheel 18 11/32″ (CA), 24 9/32″ (DA).

Clearance—Very slight drag should be evident when brakes in proper adjustment.

Hand Brake Adjustment:—See Service Brakes.

NOTE:—Oil Pan Removal—To remove oil pan for work on engine on Master Deluxe and Master models, the Engine-Side-Support Tie-Bar (cross-member under engine) should be dropped first. This cross-member is bolted to bottom of frame side rails.

FLEET MODEL NOTE:—Special Economy engine available for all models. This engine may be identified by prefix 'V' on engine number and special service plate on Push Rod Cover listing special tune up specifications for this model. Engine is standard except for these specifications and Carburetor which has stop-pin designed to limit throttle opening to half-throttle. See article in Carburetion Section for complete data on this Carburetor.

ENGINE NUMBER:—First number—1. Prefixed by a letter indicating model: 'K' Commercial Model GC, 'T' Model S trucks. Economy engines indicated by 'V' (VK, VT). Engine number stamped on boss on right side of cylinder block back of fuel pump.

ENGINE SPECIFICATIONS:—Own. 6 cyl., 'I' head type.
NOTE—Cylinder head gasket marked 'This Side Up'. Install as directed.
Bore—3½". Stroke—3¾".
Displacement—216.5 cubic inches.
Rated Horsepower—29.4.
Developed Horsepower—85 at 3200 R.P.M. (GA, GB Master), 78 at 3200 R.P.M. (GC, SA, SB, SC, SD trucks).
Compression Ratio—6.25-1 Std. cast-iron head.
Compression Pressure—112 lbs. at 65 R.P.M. cranking speed, 159 lbs. max. at 2000 R.P.M.
Vacuum Reading—20-22" steady reading with engine idling at 400 R.P.M.

PISTONS:—New type Cast-iron, domed head, cam ground, tin-plated, with slipper type skirt. Recondition engines to take finished replacement pistons (hone for .003" oversize, bore and hone for other sizes). See Replacement Pistons.
Weight—22.7 ozs. (without rings or pin). NOTE—Special pistons (1½ ozs. heavier than Pass. car type) used on Trucks after April 1, 1937.
Length—3 59/64". Pistons balanced by grinding off bottom of skirt so that all pistons not equal (height above pin same for all pistons).
Removal—Pistons and rods removed from above.
Clearance—Top .006-.013". Skirt .0015-.003". See Fitting New Pistons.

Replacement Pistons:—Finished pistons with bushings and pins fitted furnished standard and .003", .010", .020", .030", .040" oversize.

Fitting New Pistons:—Use feeler gauges between piston and cylinder wall at right angles to pin bosses. Piston should pass through bore on .002" feeler and lock on .003" feeler.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring slotted or drilled type. Oil ring groove drilled with oil drain holes. Compression and slotted type oil ring furnished .005", .010", .015", .020", .030", .040" oversize; Drilled type oil ring .005", .010", .015", .020" oversize. Unit pkg. is 12 compression or 6 oil rings.
NOTE—Compression rings have tapered face. Install with word 'Top' up.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.004-.014"	.0015-.0035"
Oil Cont.	3/16"	.004-.014"	.0015-.0035"

NOTE—Use .002" feeler to check side clearance. Top ring should be very free, middle ring free, oil ring tight.

PISTON PIN:—Diameter—.8645-.8650". **Length—3 3/32".** Pin is locked in rod and pin bosses in piston are bronze bushed. New pistons furnished with bushings and pins fitted. Pins furnished standard and .003". .005", .010" oversize.
Pin Fit in Piston Bushings—Thumb push fit (not heated).

CONNECTING ROD:—Length 6 13/16". Weight 28 ozs.
Crankpin Journal Diameter—2.311-2.312".
Lower Bearing—Spun-babbitt lined type.
Clearance—.0005-.002". Sideplay .004-.011".
NOTE—Connecting rod bearings now diamond-bored and must not be fitted as tight as previously.

Bearing Adjustment:—Solid shims. Remove shims to secure 'snap fit' (bearing tight to hand but rod should snap from one side to other with light tap of 8 oz. hammer), **then replace .002" shim for clearance.** With correct adjustment, rod should move from side to side with two-finger pressure.

Installing Rods:—Install rods in same numbered cylinders indicated by numbers on rod and caps with these numbers together and toward camshaft side. Assemble oil dippers on rod caps with mouth of dipper toward camshaft.
NOTE—Check dipper heights with J-969-2 gauge.

CRANKSHAFT:—4 bearing. Integral counterweights. Harmonic Balancer mounted on forward end.
See Chevrolet Special Shop Notes for balancer data.
Journal Diameters—#1, 2.6835-2.6845"; #2, 2.7145-2.7155"; #3, 2.7455-2.7465"; #4, 2.7765-2.7775".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.002-.004".
See Chevrolet Special Shop Notes for main bearing line-boring and installation instructions.

Bearing Adjustment:—Solid shims. Remove shims until slight drag on crankshaft secured, then replace one .002" shim for clearance. If unequal number, install extra shim on camshaft side.

End Thrust:—Taken by #3 main bearing. Adjusted by replacing bearing. Endplay .004-.007".
See Chevrolet Shop Notes for Main Bearing End Play Adjustment instructions.
NOTE—Oil slinger clearance at rear end of crankshaft must be .002-.032".

CAMSHAFT:—Four bearing. Gear driven.
Journal Diameters—#1, 2.0282-2.0292"; #2, 1.9657-1.9667"; #3, 1.9032-1.9042"; #4, 1.8407-1.8417".
Bearing Type—Steel-backed, babbitt-lined bushings. Pressed in crankcase and staked to prevent movement.
NOTE—Line-ream new bushings
Clearance—.002-.004".

End Thrust:—Taken by thrust plate behind camshaft gear. Endplay Free to .003". Adjusted by changing gear position on shaft.

Timing Gears:—Crankshaft gear Steel. Camshaft gear Bakelite & Fabric composition. Gear run-out (maximum) .003" crankshaft gear, .004" camshaft gear.
Backlash—.002-.005".
See Chevrolet Special Shop Notes for timing gear installation instructions.

Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear with marked space between teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 41/64"	.3407-.3417"	6 5/64"
Exhaust	1 15/32"	.3397-.3407"	4 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.001-.003"
Exhaust	30°	5/16"	.002-.004"

NOTE—Exhaust valves marked 'GM37EXHAUST' and cup in head more shallow than in 1936. 1936 exhaust valves must not be used in 1937 engines may cause after-fire).
See Chevrolet Special Shop Notes for installing 1938 valves on these engines.

Tappet Clearance:—.006 Int. Min. (.006-.008"), .013" Exh. Min. (.013-.015") with engine hot.

Valve Guides:—New type without shoulder. Use special stop-collar drivers (J-1089 Int., J-1090 Exh.) to install new guides. These drivers position guides in head so that distance from head to top of guide is 1 1/16" Int., 61/64" Exh. Rough ream guides to .341", finish ream to .343" inside diameter after installing.

Valve Springs:—Check by compressing springs to 1½". Pressure should be 104-112 lbs.

	Spring Pressure	Spring Length
Valve Closed	42-48 lbs	1⅞"
Valve Open	94-102 lbs	1 9/16"

NOTE—Install spring with close-coil end toward cylinder head. Use round springs caps on intake valves, hexagonal caps on exhaust valves.

Valve Lifters:—Cast-iron type with ground contact face. Oversize lifters not furnished.

Pushrod Springs:—Spring mounted on each pushrod above valve lifter. To remove pushrods, take out three bolts in spring retainer, remove 'C' washer under spring, withdraw pushrod. Install in same manner.

Rocker Arms:—Two types of intake rocker arms used. Install arms with slight angle toward front of engine for cylinders #1, 3, 5; angle toward rear for #2, 4, 6. All exhaust rocker arms are straight. Assemble rocker arm shafts with open ends toward center of engine.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 29° ALDC.
Exhaust Valves—Open 52° BLDC. Close 1° BTDC.
To Check Timing—No flywheel marks provided. With intake tappet clearance set at .006", #1 intake valve should open with piston 9° or .0294" BTDC. when point on flywheel aproximately 3.475 teeth before top dead center lines up with indicator in inspection hole in right front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #113, Rod #33.

LUBRICATION:—Pressure and positive splash system similar to previous models except for oil pump.

Oil Pump:—New gear type located in crankcase. Install pump gears with ground face toward cover.

Normal Oil Pressure:—13.5 lbs. at 50 M.P.H.

Oil Pressure Regulator:—Located in oil pump cover. Operates at 75 lbs. Not adjustable. Pressure normally controlled by Oil Distributor.

Oil Distributor:—Mounted on left side of crankcase. Proportions oil between high pressure points (crankshaft bearings, camshaft bearings, timing gears) and low pressure points (connecting rod oil troughs and rocker arms). Overflow pipe returns excess oil from rocker arm shafts.
See Chevrolet Special Shop Notes for installing oil lead (through block) to valve rocker arms.

Checking Oil System:—Check troughs and nozzles whenever oil pan removed. Use Gauge No. J-969-3 to check oil nozzle height for connecting rod clearance (remove pan gasket, hook end of gauge over pan rail, position gauge in trough with word 'front' toward front of engine). Open end of nozzle must be directly below gauge. Use Gauge No. 969-2 to check oil trough height. Gauge stem should just touch edges of all troughs. Use Gauge No. J-969-1 to check nozzle aim (use water pressure, see that nozzle stream hits hole in target gauge). Use wrench J-793-2 to adjust nozzles.

Crankcase Capacity:—5 quarts.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CLUTCH:—Own make. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Adjustment (GA, GB)—Pedal free travel must be 1". To adjust, loosen locknut and turn adjusting nut on connecting link stud at clutch throw-out fork.
(GC, SA, SB, SC, SD)—Loosen locknut on lever at lower end of clutch pedal, back off locknut on adjusting screw on lower end of lever, turn adjusting screw for 1" free travel.
Facings—Asbestos Comp., 2 required. Inside Diam. 6". Outside Diam. 9" (GA, GB, GC) 10" (SA, SB, SC, SD). Thickness ⅛".
Removal:—Remove transmission (see Transmission Section). With flywheel underpan off, take out alternate clutch mounting screws, then turn remaining screws out evenly, remove clutch from below.
NOTE—On Model GC, block levers with 1/32" washers so levers will clear.

TRANSMISSION (GA, GB, GC):—Own make. Constant mesh, helical gear (second only), Synchro-mesh (second and high). Low and reverse—sliding spur gear.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect pull rods on brake cross-shaft, remove left hand cross-shaft bracket, remove shaft. Take out speedometer cable and gear assembly (screwed into universal joint retainer). Take out screws in ball collar flange, slide ball and collar back on propeller shaft, remove bolts in universal joint ring, split joint. Remove top mounting bolts in flywheel housing and install guide pins, remove flywheel underpan, take out lower mounting screws. Take out bolts holding transmission mounting and support to cross-member. Slide transmission straight back on guide pins and remove.
NOTE—On Model GC with 4 Spd. Transmission, remove transmission support cross-member and take out 2 screws on brake cylinder bracket on transmission case.

TRANSMISSION (SA, SB, SC, SD):—Own make. 4 speed, sliding spur gear type (all speeds). This transmission optional on Model GC.
See article in Mechanical Equipment Section for data.
Removal:—Same as for passenger cars (above) except that nuts holding front propellor shaft assembly to cross-member should be removed and front propellor shaft dropped down. Split universal joint by removing trunnion bearing lock springs and driving trunnion bearings out.

UNIVERSAL JOINTS:—Own make. Plain bushing type. One used (except SA, SB, SC, SD with additional intermediate universal on frame cross-member). Mounted in ball housing at rear of transmission.
See article in Mechanical Equipment Section.

REAR AXLE (GA, GB):—Own make. Semi-floating, Hypoid gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.22-1 (GA), 3.73-1 (GB). 3.73-1 axle marked by prefix 'C' on serial number on differential carrier. No prefix for 4.22-1 axle.
Backlash—.004-.008". Screw adjustment.
Removal:—Jack up rear end of car (or use chain hoist), remove rear wheels, disconnect hydraulic brake line and brake cables, disconnect shock absorber links at spring seats, disconnect nuts on 'U' bolts holding rear springs to spring seats. Disconnect spring shackles and drop springs, pull axle assembly back to free shaft at splined joint in rear of transmission.
Wheel Bearing Adjustment:—None (sealed type).
Axle Shaft Removal:—Wheel bolted directly to flange on outer end of shaft. Axle shaft retained by 'C' washer at inner end in differential case. To remove shaft, remove wheel, take out two machine screws in brake drum, remove drum, install clamp on wheel brake cylinder. Take off axle housing cover, remove differential pinion shaft screw, pull out pinion shaft, remove axle shaft spacer. Push axle shaft in, remove 'C' washer at inner end, pull shafts out. When installing new shaft, use new bolts in axle flange (pressed in flange), new oil deflector, and new gasket. Shellac or paint both sides of gasket for good oil seal and line up extra hole (center of three closest together) with notch in hub flange in axle shaft. Oil pocket in oil deflector should also be in line with this notch.
NOTE—Axle shaft spacers furnished in three sizes: 1.0105", 1.0195", 1.0295" across ground faces. Select spacer so that clearance between ends of axle shafts and spacer is Free to .014".

REAR AXLE (GC):—Own make. Semi-floating, spiral bevel gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.11-1 or 3.82-1 Std. 3.82-1 axle identified by prefix 'F" in front of serial number on differential carrier (no prefix for 4.11-1 axle).
Backlash—.004-.006". Screw adjustment.
Removal:—Same as for passenger car models above.

REAR AXLE (SA, SB, SC, SD):—Own make. Full floating, Spiral bevel gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—5.428-1 or 6.166-1 Std. 6.166-1 axle identified by prefix 'H' in front of serial number on differential carrier (no prefix for 5.428-1 axle).
Backlash—.008-.010". Screw adjustment.
Removal:—Remove two nuts holding front propellor shaft to cross-member, drop unit, remove capscrews holding ball collar to housing, slide ball back on rear axle shaft housing, remove trunnion bearing lock rings, drive trunnion bearings from place, split universal joint and drop rear axle propeller shaft. Remove rear yoke from end of rear axle propeller shaft and ball and collar from housing. Remove axle shafts (see below), remove nuts holding differential carrier in housing, pull third member assembly (differential carrier and shaft assembly) from housing.
Axle Shaft Removal—Remove capscrews which attach axle shaft flange to wheel hub. Install two screws in holes located between regular mounting screw holes, turn screws in to start axle shaft, remove shaft. Wheel bearing adjustment not disturbed by axle removal.
Wheel Bearing Adjustment:—With axle shaft removed, tighten adjusting nut (within wheel hub on outer end of axle housing) moderately tight while rotating hub, install star lock on adjusting nut, note alignment of lock tangs with notches in outer edge of adjusting nut, bend lock tang into notch on adjusting nut. Rotate wheel hub by hand to note that bearings seated and that wheel turns freely. Install locknut and draw up tight, bend lock tang into notch in locknut.
NOTE—Wheel bearings now lubricated from differential case (no oil seal used at differential side bearing). Soft stamped steel plate used under hub bolt heads, and wheel bearing oil seal is spring-backed to retain lubricant. When replacing axle shaft, see that new type .020" vellumoid gasket is in place between axle flange and wheel hub.

SHOCK ABSORBERS:—Delco Hydraulic single-acting type std. on all models except GA (GA has double acting shock absorber built in the Knee Action unit). Double-acting type optional.
See article in Mechanical Equipment Section for data.

Model	Front	Rear
GA	1068386, 7	1431V, W
GB	1200P, N	1200M, L

STEERING:—Steering Gear (GA)—Saginaw Worm-and-Roller type. **(GB, GC, SA, SB, SC, SD)**—Saginaw Worm-and-Sector type.
See article in Mechanical Equipment Section for data.
Front Suspension (GA):—Chevrolet Knee-Action type Independent suspension. Similar to type used on previous models except that kingpins now mounted on floating type plain bushings.
See article in Mechanical Equipment Section for data.
NOTE—Specifications below correct with car weight supported on horses at inner bearing cone (wheels removed for use of special test equipment).
Height (Suspension Unit Setting)—4⅞" from bottom of kingpin support to bottom of brake flange plate.
Kingpin Inclination—7° 45' crosswise.
Caster—0° (kingpin). Caster effect secured by trailing wheel center.
Camber—¼° (¼-¾°). No adjustment.
Toe In—1/16-3/32". Adjustable.
Steering Geometry—Inner wheel 23°. Outer 20°.
Front Suspension (GB, GC, SA, SB, SC, SD):—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.
NOTE—Kingpin bushings are new 'floating' type.
Kingpin Inclination—7° 10' crosswise.
Caster—2¼° (GB), 1¾° (GC), 2¾° (SA, B, C, D) plus or minus ½° and equal for both wheels within ¼°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1° plus or minus ½° and equal within ¼° for both wheels. Axle may be bent cold for minor corrections.
Toe In—5/64-⅛". Adjusted in usual manner by turning tie rod to increase or decrease length.
Steering Geometry—Inner wheel 23°. Outer 20°.

BRAKES:—Service—Own design, hydraulic type. Hand brake lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameters—1¼" (front—all), 1 3/16" (rear—GA, GB, GC), 1½" (rear—SA, SB, SC, SD). Not interchangeable.
Drum Diameter—11" (GA, GB, GC), 12" (SA, B, C, D—front), 14" (SA, B, C, D,—rear).
Lining—Moulded type. Special lining on SA, B, C, D.

Model	Width	Thickness	Length
GA, GB, GC	1¾"	3/16"	22⅝"
SA, B, C, D Frt.	2"	.243-.250"	28⅞"
" Rear	3"	.250"	35 13/16"

NOTE—Lengths as given are per wheel.
Clearance—Adjusting cover backed off 4 notches (GA, GB, GC all wheels), 5 notches (SA, SB, SC, SD front wheels), adjusting pinion shaft backed off ¾ turn (SA, SB, SC, SD rear wheels) from slight drag position.
Hand Brake:—See Service Brakes above.

NOTE:—Oil Pan Removal—On passenger car models, the Engine-Side-Support Tie-Bar (cross-member under engine) should be dropped first. This cross-member bolted to bottom of frame side rails.

FLEET MODEL NOTE:—Special economy engine available for all models. Engine identified by code letter 'V' stamped ahead of engine number and special service plate on Push Rod Cover listing special tune-up specifications for this model. Engine standard except for these specifications and Carburetor which has stop-pin designed to limit throttle opening to half-throttle. See article in Carburetor Section for complete data on this carburetor.

SERIAL NUMBER:—Prefixes 1-HA-01, indicate assembly plant (1-21), model (HA Mstr. Del., HB Mtsr., HC ½ Ton, HD ¾ Ton, HE 1 Ton, TA TB TC TD 1½ Ton) and month (01-12). Located on right front side of body under hood (front of dash—Trucks).

ENGINE NUMBER:—First engine number Flint—1,187,-822. Buffalo—1. Prefixes as follows: Flint—passenger cars (none), ½ Ton Commercial (K), all others (T). Buffalo—passenger cars (B), ½ Ton Commercial (KB), all others (TB). Economy engines indicated by (V) thus (VK, VKB, etc.). Engine number stamped on boss on right side of block to rear of distributor.

ENGINE SPECIFICATIONS:—Own. 6 cyl., 'I' head type.
Bore—3½". **Stroke**—3¾".
Displacement—216.5 cubic inches.
Rated Horsepower—29.4 (S.A.E.).
Developed Horsepower—85 at 3200 (passenger cars), 78 at 3200 (all others).
Compression Ratio—6.25-1 Std. cast-iron head.
Compression Pressure—112 lbs. at 65 R.P.M. (cranking speed). 90 lbs. min. All cyls. within 5-10 lbs.
Vacuum Reading—20-22" steady reading with engine idling at 400 R.P.M.

PISTONS:—Cast-iron, domed head, cam ground, tin-plated, with slipper type skirt. Recondition engines to take finished replacement pistons (hone for .003" oversize, bore and hone for larger sizes). See Replacement Pistons. **Length**—4 11/64".
Weight—30.72 ozs. (including bushing—passenger cars). 32.96 ozs. (including bushing—trucks).
TRUCK PISTON NOTE—Marked by two ¼"x3/16" bosses on bottom of pin bosses at piston side wall. Must not be interchanged with Pass. car type (heavier).
Removal—Pistons and rods removed from above.
Clearance—Top .006-.013". Skirt .0015-.003". See Fitting New Pistons (below).

Replacement Pistons:—Finished pistons with bushings and pins fitted furnished standard and .003", .010", .020", .030", and .040" oversize.

Fitting New Pistons:—Use feeler gauges between piston and cylinder wall at right angles to pin bosses. Piston should pass through bore on .002" feeler (with light pressure) and lock on .003" feeler.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring slotted or drilled type. Oil ring groove drilled with oil drain holes. Rings furnished standard and .005", .010", .015", .020", .030" and .040" oversize.
NOTE—Compression rings have tapered face. Install with word "TOP" toward top of piston.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.004-.014"	.0015-.003"
Oil Cont.	3/16"	.004-.014"	.002-.0035"

NOTE—Use .002" feeler to check side clearance. #1 ring very free, #2 just free, #3 light drag.

PISTON PIN:—Diameter—.865". **Length**—3 9/64". Pin locked in rod, pin bosses in piston bronze bushed. New pistons have bushings and pins fitted. Pins furnished std. and .003", .005", .010" oversize.
Pin Fit in Piston—Thumb push fit (room temp.).

CONNECTING ROD:—Length 6 13/16". **Weight** 28.3 oz.
Crankpin Journal Diameter—2.311-2.312".
Lower Bearing—Spun-babbit lined type.
Clearance—.0005-.002". **Sideplay**—.004-.011".

Bearing Adjustment:—Solid shims. Remove shims (equally from both sides) to secure 'snap fit' (bearing tight to hand but rod should snap from one side to other with light tap of 8 oz. hammer), **then replace .002" shim for clearance.** If unequal number, install extra shim on camshaft side. With correct adjustment, rod should move from side to side with two finger pressure.

Installing Rods:—Install rods in same numbered cylinders indicated by numbers on rod and caps with these numbers together and toward camshaft side. Assemble oil dippers on rod caps with mouth of dipper toward camshaft.
NOTE—Check dipper heights with J-969-2 gauge.

CRANKSHAFT:—4 bearing. Integral counter weights with harmonic balancer mounted on forward end.
See Chevrolet Shop Notes for balancer data.
Journal Diameters—#1, 2.6835-2.6845"; #2, 2.7145-2.7155"; #3, 2.7455-2.7465"; #4, 2.7765-2.7775".
Bearing Type—Steel-backed, babbitt lined.
Clearance—.002".
See Chevrolet Special Shop Notes for main bearing line-boring and installation instructions.

Bearing Adjustment:—Solid shims. Remove shims until slight drag on crankshaft secured, then **replace one .002" shim for clearance.** If unequal in number, install extra shim on same side for all bearings.

End Thrust:—Taken by #3 main bearing. Adjusted by replacing bearing. **Endplay**—.004-.007".
See Chevrolet Shop Notes for Main Bearing End Play Adjustment instructions.
NOTE—Oil slinger clearance at rear end of crankshaft must be .002-.032".

CAMSHAFT:—Four bearing. Gear driven.
Journal Diameters—#1, 2.0282-2.0292"; #2, 1.9657-1.9667"; #3, 1.9032-1.9042"; #4, 1.8407-1.8417".
Bearing Type—New type steel-backed, babbitt-lined with oil grooves.
See Chevrolet Special Shop Notes for camshaft bushing installation instructions.
Clearance—.002-.0035".

End Thrust:—Taken by thrust plate behind camshaft gear. Endplay—Free fit to .003" max. Adjusted by changing gear position on shaft.

Timing Gears:—Crankshaft gear Steel. Camshaft gear Bakelite & fabric composition. Gear run-out (maximum) .003" crankshaft, .004" camshaft.
Backlash—.002-.005".
See Chevrolet Special Shop Notes for timing gear installation instructions.

Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear with marked space between teeth on camshaft gear.

VALVES:—Marked 38 on head. 1938 exhaust valve new design (more metal under head).
See Chevrolet Special Shop Notes for installing 1938 valves on 1935-36-37 engines.

	Head Diameter	Stem Diameter	Length
Intake	1 23/32"	.3407-.3417"	6 1/16"
Exhaust	1 15/32"	.3397-.3407"	4 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.305"	.001-.003"
Exhaust	30°	.3195"	.002-.004"

Tappet Clearance:—.006-.008" Intake, .013-.015" Exhaust (hot). Idle engine for 20 minutes at 600 RPM. Fast idle to insure proper operating temperature.

Valve Guides:—Straight type (no shoulder).
See Chevrolet Special Shop Notes for valve guide installation instructions.

Valve Springs:—New 9 coil springs used. Cannot be used on previous models. Free length 2 7/32". Check spring compressed to 1½". Pressure should be 125-133 lbs.

	Spring Pressure	Spring Length
Valve Closed	42- 48 lbs.	1.821"
Valve Open	111-119 lbs.	1.505"

NOTE—Install spring with close-coiled end toward cylinder head. Use round spring caps on intake valves, hexagonal caps on exhaust valves.

Valve Lifters:—Cast-iron type with ground contact face. Oversize lifters not furnished.

Pushrod Springs:—Not used on 1938 models due to increased valve spring tension.

Rocker Arms:—***See Chevrolet Shop Notes for data.***

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 29° ALDC.
Exhaust Valves—Open 52° BLDC. Close 1° BTDC.
To Check Timing—No flywheel marks provided. With intake tappet clearance set at .006", #1 intake valve should open with piston 9° or .0294" BTDC. when a point on the flywheel approximately 3.475 teeth before top dead center lines up with indicator in inspection hole in right front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #113, Rod #33.

LUBRICATION:—Pressure and positive splash system. Gear type oil pump in crankcase.
Oil Pump Installation—Assemble ground side of driven gear toward cover. Oil Pump assembly mounted to crankcase by tapered set screw and lock nut. Screw must be firmly seated in tapered hole in pump body and set with lock nut.

Normal Oil Pressure:—13.5 lbs. at 50 M.P.H.

Oil Pressure Regulator:—Located in oil pump cover. Operates at 75 lbs. Not adjustable. Pressure normally controlled by Oil Distributor.

Oil Distributor:—Mounted on left side of crankcase. Proportions oil between high pressure points (crankshaft bearings, camshaft bearings, timing gears) and low pressure points (connecting rod oil troughs and rocker arms). Overflow pipe returns excess oil from rocker arm shafts.
See Chevrolet Shop Notes for installing oil lead (through block) to valve rocker arms.

Checking Oiling System:—***See Chevrolet Shop Notes.***

Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, with self-adjusting type packing.
See article in Mechanical Equipment Section for data.
Removal—Remove lower hose connection, mounting screws and lift assembly off.

Thermostat:—Mounted in cylinder head water outlet.
Setting—Start to open 142°F (#3108572—Standard), 150°F (#985127—non-permanent anti-freeze used with overflow return tank #985319), 162°F. (#985128 permanent anti-freeze), 170° F. (Econ. Engines).

Water Capacity:—14 quarts (Standard). 15½ quarts (Trucks with heavy duty radiators).

CLUTCH:—Own Make. Entirely new design, single plate, dry disc type with diaphragm spring serving as clutch spring and release levers, and ball throwout bearing. Two sizes, with larger pressure plate and cover used on HD, HE and T models. Diaphragm spring interchangeable on either clutch.
See article in Mechanical Equipment Section for data.
Adjustment (HA, HB)—Pedal free travel must be ¾-1". To adjust loosen locknut and turn adjusting nut on connecting link stud at clutch throwout fork.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

All others—Loosen locknut on lever at lower end of clutch pedal, back off locknut on adjusting screw on lower end of lever, turn adjusting screw for ¾-1" free travel.

Facings—9" disc (HA, HB, HC), 11" (HD, HE, T). Woven and formed asbestos. 2 required.

Removal:—Remove transmission (see Transmission Section). With flywheel underpan off, take out throwout bearing from fork, fork mounting (using ⅞" and ¾" wrench) and fork. Support clutch with Clutch Pilot Tool K-411, loosen cover mounting bolts (one turn at a time) until spring pressure released and remove assembly from below. NOTE—When reassembling turn flywheel to place 'X' mark at bottom, install cover assembly with 'X' mark on cover in line with 'X' mark on flywheel.

TRANSMISSION (HA, HB, HC, HD, HE):—Own Make. Constant mesh, helical gear (second only), Synchro-mesh (second and high). Low and reverse—sliding spur gear. NOTE—HC transmission same as HA, HB except that case longer permitting interchange-ability with 4 spd. transmission. HD, HE transmis-sion same as HC except that carburized gears used (identified by prefixes 'Y' or 'Z' before assembly number on boss at rear of transmission case cover).

See article in Mechanical Equipment Section for data.

Removal (HA, HB, HC):—Disconnect pull rods on brake cross-shaft, remove left hand cross-shaft bracket, remove shaft. On HC remove hand brake lever from transmission case. Take out speedometer cable and gear assembly (screwed in universal joint ball retainer). Use jack under front end of torque tube. Take out screws in ball collar flange, slide ball and collar back on propeller shaft, remove bolts in universal joint ring, split joint. Lower jack until propeller shaft clears transmission. Remove top mounting bolts in flywheel housing and install guide pins, remove flywheel underpan, take out lower mounting screws. Take out bolts holding transmission mounting and support to cross-mem-ber. Slide transmission straight back on guide pins and remove. NOTE—On Model HC with 4 Spd. Transmission, remove transmission support cross-member and take out two screws on brake cylinder bracket on transmission case.

Removal (HD, HE):—Remove hand brake lever from transmission case. Take out speedometer cable and gear assembly (screwed in front universal joint ball retainer). Remove capscrews on front universal joint, remove bolts on frame cross-member freeing propeller shaft, slide ball back, split front joint by removing trunnion bearing lock rings and driving trunnion bearings out. Disconnect cross-member at frame ends and lower assembly to floor. Remove transmission using guide pins as directed for HA, HB, HC.

TRANSMISSION (TA, TB, TC, TD):—Own Make. 4 speed, sliding spur gear type (all speeds). This transmission optional on Models HC, HD, HE.

See article in Mechanical Equipment Section for data.

Removal:—Same as for HD, HE (above) except that two nuts holding front propeller shaft assembly should be removed and front propeller shaft dropped down.

UNIVERSAL JOINTS:—Own Make. Plain bushing type. One used (except HD, HE, TA, TB, TC, TD with additional intermediate universal on frame-cross-member).

See article in Mechanical Equipment Section for data.

REAR AXLE (HA, HB):—Own Make. Semi-floating, Hypoid gear type with Torque tube drive.

See article in Mechanical Equipment Section for data.

Ratio—4.22-1 (HA), 3.73-1 (HB). 3.73-1 axle marked by prefix 'C' or 'CB' on serial number on differential carrier. Straight number or prefix 'B' on 4.22-1 axle.

Backlash—.004-.008". Screw adjustment.

See Chevrolet Shop Notes for data on new type spring seats on 1938 models.

Removal:—Jack up rear end of car (use chain hoist), remove rear wheels, disconnect hydraulic brake line and brake cables, disconnect shock absorber links at axle, remove 'I' bolt nut and withdraw bolt free-ing spring seat from housing bracket (not necessary to disturb 'U' bolts). Disconnect spring shackles and drop springs (with spring seats attached), pull axle assembly back to free shaft at splined joint in rear of transmission.

Wheel Bearing Adjustment—None.

Axle Shaft Removal:—Wheel bolted directly to flange on outer end of shaft. Axle shaft retained by 'C' washer at inner end of differential case (shafts unequal length—use long shaft on right side). To remove shaft, remove wheel, take out two machine screws in brake drum, remove drum, install clamp on wheel brake cylinder. Take off axle housing cover, remove differential pinion shaft screw, pull out pinion shaft, remove axle shaft spacer. Push axle shaft in, remove 'C' washer at inner end, pull shafts out.

See Chevrolet Shop Notes for axle shaft installation instructions and axle shaft spacer sizes.

REAR AXLE (HC, HD, HE):—Own Make. Semi-floating, spiral bevel gear type with Torque Tube drive.

See article in Mechanical Equipment Section for data.

Ratio—4.11-1 (standard). 3.82-1 (optional HC only). Axles identified by prefixes stamped on carrier as follows: 4.11-1—straight number or 'B' on HC, HD; 'T' or 'TB' on HE. 3.82-1—'F' or 'FB'.

Backlash—.004-.006". Screw adjustment.

Removal:—Same as for passenger cars except that new type spring seat not used and spring 'U' bolts must be disconnected instead.

NOTE—Axle shaft spacers furnished in three sizes: 1.1485", 1.1575", 1.1675". Fit as directed for passenger car models above.

REAR AXLE (TA, TB, TC, TD):—Own Make. Full float-ing, spiral bevel gear type with Torque Tube drive.

See article in Mechanical Equipment Section for data.

Ratio—5.43-1 or 6.16-1 standard. Identified by first letter in serial number on top right hand side of differential housing as follows: 5.43-1—'T'; 6.16-1 —'H.'

Backlash—.008-.010". Screw adjustment.

Removal:—Remove two nuts holding front propeller shaft to cross-member, drop unit, remove capscrews holding ball collar to housing, slide ball back on rear axle shaft housing, remove trunnion bearing lock rings, drive trunnion bearings from place, split universal joint and drop rear propeller shaft. Re-move rear yoke from end of rear propeller shaft and ball and collar from housing. Remove axle shafts (see below), remove nuts holding differential carrier in housing, pull third member assembly (differential carrier and shaft assembly) from housing.

Axle Shaft Removal—Remove 8 capscrews which attach axle shaft flange to wheel hub and capscrew lock. Install two screw in holes located between regular mounting screw holes, turn screws in to start axle shaft, remove shaft. Use new steel lock when replacing capscrews. Wheel bearing adjust-ment not disturbed by axle shaft removal.

Wheel Bearing Adjustment:—With axle shaft re-moved, tighten adjusting nut (within wheel hub on outer end of axle housing) moderately tight while rotating hub, install star lock on adjusting nut, note alignment of lock tangs with notches in outer edge of adjusting nut, bend back tang into notch on adjusting nut. Rotate wheel hub by hand to note that bearings seated and that wheel turns freely. Install locknut and draw up tight, bend lock tang into notch in locknut.

See Chevrolet Shop Notes for wheel bearing oil seal and gasket data.

SHOCK ABSORBERS:—Delco—Hydraulic single-acting type standard on all models except HA (HA has double acting shock absorber built in Knee Action unit). Double acting type optional.

See article in Mechanical Equipment Section for data.

Model	Front	Rear
HA	10688388, 9	1431-V, W
HB, HC, HD	1201-A, B	1201-C, D
HE	1201-A, B	None

STEERING:—Steering Gear (Passenger Cars)—Saginaw Worm-and-Roller type. **Trucks**—Saginaw Worm-and-Sector type.

See article in Mechanical Equipment Section for data.

Front Suspension (HA):—Chevrolet Knee-Action type independent suspension with kingpins mounted on floating type plain bushings.

See article in Mechanical Equipment Section for data.

NOTE—Specifications below correct with car weight supported on horses at inner bearing cone (wheels removed for use of special test equipment).

Height (Suspension Unit Setting)—4⅞" (plus or minus ⅛") from bottom of kingpin support to bot-tom of brake flange plate.

Kingpin Inclination—7¾° crosswise.

Caster—0° (kingpin). Caster effect secured by trail-ing wheel center.

Camber—¼°. No adjustment.

Toe In—1/16-3/32". Adjustable.

Steering Geometry—Inner wheel 23°, outer 20°.

Front Suspension (All models except HA):—Conven-tional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

NOTE—'Floating' type kingpin bushings on HB.

Kingpin Inclination—7°10' plus or minus 1° cross-wise.

Caster—2¼° (HB), 1¾° (HC, HD, HE), 2¾° (TA, B, C, D), plus or minus ½°. Controlled by a caster shim ('I' beam spacer) inserted between spring and spring pad on axle.

Camber—1° plus or minus ½°. Axle may be bent cold for minor corrections.

Toe In—5/64-⅛". Adjusted in usual manner by turning tie rod to increase or decrease length.

Steering Geometry—Inner wheel 23°. Outer 20°.

BRAKES:—Service—Own design, hydraulic type. Hand brake lever applies rear wheel service brakes.

See article in Mechanical Equipment Section for data.

Wheel Cylinders—Diameters—1¼" (front—all), 1 3/16" (rear—HA, HB, HC, HD), 1⅜" (rear—HE), 1½" (rear—TA, B, C, D). Not interchangeable.

Drum Diameter—11" (all—HA, HB, HC, HD; front —HE). 14" (front—TA, B, C, D; rear—HE). 16" (rear —TA, B, C, D).

Lining—Moulded type. Semi-moulded (TA, B, C, D).

Model	Width	Thickness
HA, B, C, D (HE—front)	1¾"	.187-.194"
HE (rear)	2"	.265-.272"
TA, B, C, D (front)	2"	.243-.250"
TA, B, C, D (rear)	3"	.243-.250"

Clearance—Adjusting cover backed off 4 notches (HA, B, C, D, E all wheels), 5 notches (TA, B, C, D front wheels), adjusting pinion shaft backed off ¾ turn (TA, B, C, D rear wheels) from slight drag position.

Hand Brake:—See Service Brakes above.

FRONT END ASSEMBLY REMOVAL:—Should be removed as a unit for work on front of engine. *See Chevrolet Shop Notes for directions.*

NOTE:—Oil Pan Removal—On passenger car models, the Engine-Side-Support Tie-Bar (frame cross-member for engine side mountings) must be unbolted from frame for oil pan removal. *See Chevrolet Shop Notes for Engine Mounting adjustment.*

FLEET MODEL NOTE:—Special Economy engine available for all models. Identified by code letter 'V' stamped ahead of engine number and special tune-up specification plate on Push Rod Cover listing special settings. Special carburetor has stop pin to limit throttle opening to half-throttle.

CAB-OVER-ENGINE TRUCK NOTE:—*See Chevrolet Shop Notes for Engine Cover Removal & Front Cowling Removal (for work on engine).*

SERIAL NUMBER:—First number 1001 with model prefix as follows: JA (Master Deluxe), JB (Master), JC (Half ton), JD (¾ ton), JE (¾ ton Special), VA, VB, VC, VD (1½ ton), VE, VF, VG, VH (Cab-Over-Eng). On plate on right side of cowl under hood.

ENGINE NUMBER:—First number 1915447 (Flint), B10503 (Buffalo) with prefix letter for each model as follows: Pass. Cars—B (Buffalo—no prefix for Flint), Comm'l. ½ Ton—K (Flint). KB (Buffalo). All other Trucks—T (Flint), TB (Buffalo). Stamped on boss on right side of block at rear of distributor.

ENGINE SPECIFICATIONS:—Own. 6 cyl., 'I' head type.
Bore—3½". **Stroke**—3¾".
Displacement—216.5 cu. ins. **Rated HP.**—29.4.
Developed Horsepower—85 HP. at 3200 R.P.M. (passenger cars). 78 HP. at 3200 R.P.M. (all others).
Compression Ratio—6.25-1 Std. cast-iron head.
Compression Pressure—112 lbs. at 65 R.P.M. (cranking speed). 90 lbs. min. Cylinders even within 5-10 lbs. NOTE—Engine must be at normal operating temperature (idle at 600 RPM. for 20 minutes).
Vacuum Reading—Steady 20-22" with engine idling.

ENGINE MOUNTING:—*See Chevrolet Shop Notes for Adjustment directions.*

PISTONS:—Passenger Cars. Cast-iron, domed head, cam ground, tin-plated, with slipper type skirt. If oversize pistons to be installed, hone for .003" oversize, rebore and hone for larger oversizes.
Trucks—Same as for Passenger Cars except 1½ ozs. heavier and two ¼"x3/16" bosses on bottom of pin bosses at piston side wall.
Length—4 11/16".
Weight—25½ oz. stripped (Pass.), 27 (Trucks).
Removal—Pistons and rods removed from above.
Clearance—Top .0145-.019". Skirt .0015-.003".
Replacement Pistons:—Finished pistons with bushings and pins fitted furnished standard and .003", .010", .020", .030" and .040" oversize.
Fitting New Pistons:—Use feeler gauges between piston and cylinder wall at right angles to pin bosses. Piston should pass through bore on .002" feeler (with light push only) and lock on .003" feeler. NOTE—Bore taper or out-of-round not to exceed .001".

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring slotted or drilled type. Oil ring groove drilled with oil drain holes. NOTE—Compression ring face tapered for 'break-in'. Install side marked 'TOP' toward top

Ring	Width	End Gap	Side Clearance
Comp.	.1235-.1240"	.004-.014"	.0015-.0035"
Oil Contr.	.1860-.1865"	.004-.014"	.0015-.0035"

NOTE—Use .002" feeler to check side clearance. #1 ring very free, #2 ring just free, #3 light drag.
Replacement Rings: .005",.010",.015",.020",.030",.040" OS.

PISTON PIN:—Diameter .8645-.8650". **Length** 3.135-3.165". Pin locked in rod, pin bosses in piston bronze bushed. New pistons fitted with bushings and pins.
Pin Fit in Piston—Thumb push fit (room temp.).
Replacement Pins:—Std. & .003", .005", .010" oversize.

CONNECTING ROD:—Length 6 13/16". **Weight** 28.3 oz.
Crankpin Journal Diameters—2.311-2.312".
Lower Bearing—Spun-babbitt lined type.
Clearance—.001-.0025". **Sideplay**—.004-.011" (side clearance between rod and pin bosses .025").
Bearing Adjustment:—Solid shims used. Remove shims (equally from both sides) to secure 'snap fit' (bearing tight to hand but should snap from one side to other with light tap of 8 oz. hammer), **then replace .002" shim for clearance.** If unequal number of shims, install extra shim on camshaft side. With correct adjustment, rod should move from side to side with two finger pressure.
Installing Rods:—Install rods in same numbered cylinders indicated by numbers on rods and caps with these numbers together and toward camshaft side. Assemble oil dippers on rod caps with mouth to camshaft. NOTE—Check dipper heights, Gauge J969-2.

CRANKSHAFT:—4 bearing, integral counterweights with new rubber type balancer on front end.
See Chevrolet Shop Notes for Balancer data.
Journal Diameters—#1, 2.6835-2.6845"; #2, 2.7145-2.7155"; #3, 2.7455-2.7465; #4, 2.7765-2.7775" (same as for 1937, 1938).
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.002-.004". *See Chevrolet Shop Notes for Main Bearing line-boring and installation data.*
Bearing Adjustment:—Solid shims. Remove shims until slight drag on crankshaft secured when turned by hand, **then replace one .002" shim for clearance.** If unequal in number, install extra shim on same side for all bearings.
End Thrust:—Taken by #3 main bearing. Replace if clearance exceeds .011". **Endplay**—.004-.007" (new). *See Chevrolet Shop Notes for Main Bearing Endplay adjustment instructions.*

CAMSHAFT:—Four bearing. Gear driven.
Journal Diameters—#1, 2.082-2.0292"; #2, 1.9657-1.9667"; #3, 1.9032-1.9042"; #4, 1.8407-1.8417".
Bearing Type—New type steel-backed, babbitt-lined bearings with oil grooves (same as 1938).
See Chevrolet Shop Notes for Camshaft Bearing data.
Clearance—.002-.004".
End Thrust:—Taken by thrust plate behind camshaft gear. **Endplay**—Free fit to .003" max. Adjusted by changing gear position on shaft.
Timing Gears:—Crankshaft gear Steel. Camshaft gear Bakelite & fabric composition. Maximum gear run-out .003" crankshaft. .004" camshaft.
Backlash—.002-.005". *See Chevrolet Shop Notes for Timing Gear installation instructions.*
Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear with marked space between teeth on camshaft gear.

VALVES:—New type (no slot in head).

	Head Diameter	Stem Diameter	Length
Intake	1 41/64"	.3407-.3417"	6 5/64"
Exhaust	1 15/32"	.3397-.3407"	4 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.305"	.001-.003"
Exhaust	30°	.3195"	.002-.004"

Tappet Clearance:—.006-.008" Int., .013-.015 Exh. hot.
Fleet Econ. Models—.010" Int., .016" Exh. hot.
NOTE—Run engine at 600 R.P.M. for 20 minutes before adjusting. Set at Max. figure for heavy duty.
Valve Guides:—Straight cut type on cylinder head.
See Chevrolet Shop Notes for valve guide data.
Valve Springs:—9 coil type spring used. Free length 2 7/32". Using Valve Spring Tester Tool U15 spring tension should be 125-133 lbs. compressed to 1½".

	Spring Pressure	Spring Length
Valve Closed	49-56 lbs.	1 13/16"
Valve Open	121-133 lbs.	1½"

NOTE—Install spring with closed-coil end toward cylinder head. Use round spring caps on intake valves, hexagonal caps on exhaust valves.
Valve Lifters:—Cast-iron type with ground contact face. Oversize lifters not furnished.
Clearance—.001". Free fit in guide holes.
Rocker Arms:—*See Chevrolet Shop Notes for data.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 29° ALDC.
Exhaust Valves—Open 52° BLDC. Close 1° BTDC.
To Check Timing—With #1 intake valve tappet clearance set at .006", valve should open with piston 9° or .0294" BTDC. with point on flywheel 3.475 teeth before 'U/C' mark in line with indicator in hole in right front face of flywheel housing.

LUBRICATION:—Pressure and positive splash system. Gear type oil pump in crankcase.
Oil Pump Installation—Assemble ground side of driven gear toward cover. Oil pump assembly mounted on crankcase by tapered set screw and lock nut (must seat firmly in tapered hole in pump).
Normal Oil Pressure:—13.5 lbs. at 50 M.P.H.
Oil Pressure Regulator:—Located on oil pump cover. Opens at 75 lbs. Non-adjustable type. Pressure normally controlled by Oil Distributor.
Oil Distributor:—Same design as used on previous models except that by-pass channel and metering restriction added on high pressure side of valve so that rocker arms and other low pressure points oiled immediately when engine started.
See Chevrolet Shop Notes for instructions on installing oil lead (through block) to Valve Rocker Arms.
Checking Oiling System:—*See Chevrolet Shop Notes.*
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—Capacity. 14 qts. (all except Cab-Over-Engine). 16½ qts. (Cab-Over-Engine Trucks).
See Chevrolet Shop Notes for Radiator Core Removal
Water Pump:—Packless, ball-bearing shaft type.
See article in Mechanical Equipment Section for data.
Removal—Remove lower hose connection and pump mounting screws. Lift assembly out.
Thermostat:—Harrison. In cyl. head water outlet.
Setting—Starts to open 140°F (Std. #3108572), 148° (#985127 for non-permanent anti-freeze), 160° (#985128 Fleet Economy models and others with perm. anti-freeze or overflow tank #985319).
Temperature Gauge:—AC. #1510759 (Master Deluxe), #1510163 (Commercial and Truck models).
See article in Mechanical Equipment Section for data.

CLUTCH:—Own Make. Diaphragm spring type. Single plate, dry disc type. 9" disc used on pass. cars and ½ ton trucks, 11" disc on all others.
See article in Mechanical Equipment Section for data.
Facings—Moulded, 2 required. Inside Diam. 6¼" (pass. cars, ½ ton), 7" (others). Outside Diam. 9" (pass. cars, ½ ton), 10¾" (others). Thick. ⅛".
Adjustment:—Pedal free travel must be ¾-1". To adjust, loosen check nut and turn adjusting nut on connecting link stud at clutch throwout fork.
Removal:—Remove transmission (see below) and flywheel underpan. Take out throwout bearing from fork, pry fork loose from ball, remove fork mounting (use a ⅞" and ¾" wrench). Support clutch with Clutch Pilot Tool K-411, loosen 6 cover bolts (one turn at a time) until spring pressure released and remove assembly from below. NOTE—When assembling plate on cover, line up '0' marks on pressure plate lug and cover. Line up 'X' marks on cover and flywheel when installing clutch assembly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

TRANSMISSION (JA, JB, JC, JD, JE):—Own Make. Constant mesh, synchro-mesh with helical gears (second), sliding spur gear (low & reverse).

JC Transmission—Same as JA, JB except that case longer (to interchange with 4 spd. transmission).

JE, JD Transmission—Same as JC transmission except that carburized gears used (identifed by prefixes 'Y' or 'Z' before assembly number.

See article in Mechanical Equipment Section for data.

Transmission Control (Pass. Cars):—Remote control steering column shift, vacuum assistor type. Optl.

See article in Mechanical Equipment Section for data.

Removal (JA, JB, JC):—Remove floor-and-toeboard plate, disconnect 3 pull rods at brake cross shaft bracket, remove shaft. On JC take off hand brake lever at transmission case. Take out speedometer cable and gear assembly (screwed in universal joint ball retainer). Use jack under front end of torque tube. Take out screws in ball collar flange, slide ball and collar back on propeller shaft, remove bolts in universal joint ring, split joint. Lower jack until propeller shaft clears transmission. Take out rear transmission mounting bolts. Remove 2 top mounting capscrews and install guide pins, take out lower flywheel mounting capscrews and flywheel underpan. Slide transmission to rear on guide pins until free of clutch disc and remove assembly.

NOTE—On passenger car models with remote control shift, disconnect air and vacuum lines, selector rod at bell crank, and control rod at protective boot (replace clevis pin). On Model JC with 4 sp. transmission, remove frame cross member (to lower propeller shaft housing) and take out 2 brake cylinder mounting bracket screws from case.

Removal (JD, JE):—Remove hand brake lever from transmission case. Take out speedometer cable and gear assembly (in front universal joint ball retainer). Remove front propeller shaft (remove mounting screws at rear universal, unbolt frame cross member at frame and lower shaft assembly, take out rear universal ball collar capscrews, slide ball and collar to rear, split rear joint by removing trunnion bearing lock rings and driving bearings out, pull front propeller shaft with ball-bearing and housing out to rear as an assembly, then remove front universal joint ball housing by removing ball collar capscrews and sliding housing out to rear exposing rear yoke of front joint). Remove transmission using guide pins as directed for JA, JB, JC

TRANSMISSION (VA, B, C, D, E, F, G, H):—Own Make. 4 speed sliding spur gear type (all speeds). Optional equipment on Models JC, JD, JE.

See article in Mechanical Equipment Section for data.

Transmission Control (Cab-Over-Engine):—Remote control type. *See Chevrolet Shop Notes for data.*

Removal:—Same as for JD, JE (above) except that rear universal joint support mounted on underside of frame cross member.

NOTE—Models VE and VF (Cab-Over-Engine) use only one propeller shaft (with Hotchkiss drive). To free propeller shaft, remove 4 flange mounting bolts at front universal flange and lower propeller shaft to floor. Then proceed as outlined for JA, JB, JC.

UNIVERSAL JOINTS:—Own Make. Plain bushing type. One used (Pass. cars and ½ ton truck), two used (all others). Models VE and VF used sealed type joints with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

REAR AXLE (Pass. Cars):—Own Make. Semi-floating, hypoid gear type with Torque tube drive.

See article in Mechanical Equipment Section for data.

Ratio—4.222-1 (JA), 3.727-1 (JB). 3.727-1 axle marked by prefix 'C' or 'CB' on serial number on carrier. Straight number or prefix 'B' on 4.222-1.

Backlash—.004-.008". Screw adjustment.

Removal:—Raise rear end of car. Remove rear wheels and brake drums, clamp brake wheel cylinders, free hand brake cables at pull rods and clamps on frame, disconnect brake line at axle housing, and shock absorber 'I' bolts at spring seats. Remove spring 'U' bolts and disconnect spring shackles to drop springs, pull axle back to free front end of shaft.

See Chevrolet Shop Notes for rear spring seat data.

Wheel Bearing Adjustment—None.

Axle Shaft Removal:—Wheel bolted directly to flange on outer end of shaft. Axle shaft retained by 'C' washer at inner end in differential case (shafts unequal in length—use long shaft on right side). To remove shaft, remove wheel, two machine screws in drum, remove drum, clamp wheel cylinder. Take off axle housing cover, remove differential pinion shaft screw, pull out pinion shaft, remove axle shaft spacer. Push axle shaft in, remove 'C' washer (on inner end of shaft), pull axle shaft out. *See Chevrolet Shop Notes for axle shaft installation data and spacer sizes.*

REAR AXLE (½ & ¾ Ton):—Own Make. Semi-floating, spiral bevel gear type with Torque tube drive.

See article in Mechanical Equipment Section for data.

Ratio—4.11-1 (standard). 3.82-1 (optional JC only). Axles identified by prefixes stamped on carrier as follows: 4.11-1—straight number or 'B' on JC, JD; 'T' or 'TB' on JE. 3.82-1—prefix 'F' or 'FB'.

Backlash—.006-.010". Screw adjustment.

Removal:—Same as for passenger cars (above).

REAR AXLE (1½ Ton Trucks):—Own Make. Full floating, spiral bevel gear type with Torque tube drive (except VE, VF), Hotchkiss drive (VE, VF).

See article in Mechanical Equipment Section for data.

Ratio—5.43-1 or 6.17-1 standard. Identified by first letter in serial number on top right side of differential housing as follows: 5.43-1—'T', 6.17-1—'H'.

Backlash—.006-.010". Screw adjustment.

Removal:—On Models VE, VF with Hotchkiss drive, propeller shaft can be lowered by taking out bolts in driving flange at rear universal (bolted directly to rear axle pinion shaft). On all other models rear universal joint must be split as follows: remove 2 mounting nuts at frame cross member, lower propeller shafts, take out rear universal ball collar capscrews, slide ball back on housing, take out trunnion bearing lock rings and drive bearings out, split universal joint and lower rear propeller shaft, remove rear yoke from rear propeller shaft and ball and collar from housing. Then take out axle shafts (see below) and carrier mounting screws. Pull carrier assembly out (on all Models except VE, VF, propeller shaft assembly withdrawn with carrier).

See Chevrolet Shop Notes for rear spring seat data.

Axle Shaft Removal:—Take out 8 capscrews in axle shaft flange at outer end and capscrew lock, install 2 screws in tapped holes in flange (between regular screw holes) and turn these screws up evenly to loosen shaft, remove shaft. NOTE—Replace Vellumoid axle shaft flange gasket every fourth time, new steel capscrew lock under capscrew every time and turn up tangs on lock plate at screws. Wheel bearing adjustment not disturbed for shaft removal.

Wheel Bearing Adjustment:—With axle shaft removed, tighten adjusting nut (within wheel hub on outer end of axle housing) moderately tight while rotating hub, install star lock on adjusting nut, note alignment of lock tangs with notches in outer edge of adjusting nut, bend back tang into notch on adjusting nut. Rotate wheel hub by hand to note that bearings seated and that wheel turns freely. Install locknut and draw up tight, bend lock tang into notch in locknut. *See Chevrolet Shop Notes for wheel bearing oil seal and gasket data.*

REAR AXLE (TWO-SPEED TYPE):—Optl. on trucks.

See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS:—Delco. Hydraulic single acting type standard except JA (new parallel cylinder double acting type), JB (direct acting type on front only). Double acting optl. on trucks.

See articles in Mechanical Equipment Section for data.

Model	Front	Rear
JA (Mstr. Deluxe)	2200-A, B	2100
JB (Master)	1116-M	1201-C, D
JC (½ Ton Truck)	1430-CA, DA	1430-LA, MA
JD (¾ Ton), JE (Spec.)	1430-CA, DA	1431-X, Y

STEERING:—Steering Gear. Saginaw Worm-and-Roller (Pass. cars), Worm-and-Sector (Trucks).

See article in Mechanical Equipment Section for data.

Front Suspension (JA):—New design 'S.L.A.' (short & long arm) or parallelogram type with coil springs.

NOTE—Entire suspension unit assembly may be removed from the car as a unit.

See article in Mechanical Equipment Section for data.

NOTE—Make all checks with car weight on wheels (curb weight—car ready for road but no load).

Frame Height—Install special gauges at front and rear ends of car to level frame when checking. Clearance between top of rear axle housing and lower face of frame side rail is 7 7/32". This adjustment must be made first to check specifications.

Kingpin Inclination—4¾° plus or minus ½°.

Caster—0° plus or minus ½°. Adjustable.

Camber—Neg. ¼° (wheel tilts in at top), + or —½°

Toe In—0-1/16". Adjust left tie rod (right non-adj.).

Steering Geometry (Toe out on turns)—Outer wheel turned 20°. Inner wheel 24° + or — 2°. Non-adj.

Front Suspension (All models except JA):—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.

NOTE—Floating type kingpin bushings used on JB.

Kingpin Inclination—7°10' + or — 1° crosswise.

Caster—2¼° (JB), 1¾° (JC, JD, JE), 2¾° (VA, B, C, D), 3° (VE, F, G, H), plus or minus ½°. Adjust by use of caster shims between spring and spring pad on axle for 2° variation. Over 2° use tools.

Camber—1° plus or minus ½°. Axle may be bent cold for minor corrections.

Toe In—5/64-⅛". Adjust by turning tie rod.

Steering Geometry (Toe out on turns)—Outer wheel turned 20°. Inner wheel turned 23° + or — 2°.

BRAKES:—Service. Own design, hydraulic type. Hand brake lever applies rear service brakes.

See article in Mechanical Equipment Section for data.

Wheel Cylinders—Diameters 1¼" (front wheel), 1 3/16" (rear—JA, B, C, D), 1⅜" (rear—JE), 1½" (rear—1½ Ton).

Drums—Cast-iron, steel web. Pressed steel (1½ Ton). Diameters—11" (all—JA, B, C, D; front—JE), 14" (rear—JE, front—1½ Ton), 16" (rear—1½ Ton).

Lining—Moulded type used.

Model	Width	Thickness	Length
JA, B, C, D; JE (front)	1¾"	3/16"	22⅝"
JE (rear only)	2"	3/16"	38½"
1½ Ton (front)	2"	¼"	28⅞"
1½ Ton (rear only)	3"	¼"	35 13/16"

Clearance—Adjusting cover backed off 4 notches (JA, B, C, D, E all wheels), 5 notches (1½ Ton, front wheels), adjusting pinion shaft backed off ¾ turn (1½ Ton, rear wheels) from slight drag position.

Braking Power—47½% rear (JA, B, C, D) 54¾% (JE), 59% (V).

Hand Brake:—See Service Brakes above.

1933-39 MODELS

ENGINE NUMBER LETTERING:—Letters immediately following engine number (not in circular pads) denote following 'special standard' sizes: 'A'—.020" larger standard cylinder bore. 'B'—.010" smaller standard main and connecting rod bearings. 'AB'—cylinder bore, main and connecting rod bearings 'special standard'.

1939 MODELS

FRONT END ASSEMBLY (UNIT) REMOVAL:—For work on front of engine, remove radiator and fender assembly as a unit as follows: remove hood and side panel assembly, front bumper assembly, and radiator lower splash pan. Disconnect headlamp wiring at junction block on left fender lower shield. Remove front wheels and drain cooling system. Disconnect radiator support studs and radiator hoses. Disconnect fenders at running board and body. Lift radiator shell, core and fenders off in an assembly.

1939 MODELS

ORIGINAL PISTON & CYLINDER BORE SIZES:—Original production (new engine) piston and bore sizes indicated by letter located as follows:

Piston Size—Letter stamped on piston head (number following letter on Dodge pistons is weight).

Bore Size—Letter stamped on pad at top of block on distributor side.

.020" Oversize Pistons and Bores—Graded in same steps as for standard sizes except .020" larger and marked P, Q, R, S, and T.

CHRYSLER C22, DE SOTO S6

Piston & Engine Mark	Piston Diameter	Cylinder Diameter
A	3.37425-3.37475"	3.37475-3.37525"
B	3.37475-3.37525"	3.37525-3.37575"
C	3.37525-3.37575"	3.37575-3.37625"

E	3.12615-3.12665"	3.12675-3.12725"

Additional Piston Sizes—AA pistons .0005" smaller than A pistons, EE pistons .005" larger than E

Dodge Steel Strut Piston Weight—All 6 pistons in one block must be alike (same number on head).

DODGE D11—PISTON WEIGHTS

Piston Mark	Weight (in lbs.)
8	.91-.92
9	.92-.93
10	.93-.94
11	.94-.95
12	.95-.96
13	.96-.97
14	.97-.98

1937-38-39 MODELS

REPLACEMENT PISTONS:—Finished Pistons—Furnished standard and .003", .005", .010", .015", .023", .025", .030", .040", .050" and .060" oversize.

Semi-finished Pistons—Furnished in two sizes: (1) for bores standard to .023" oversize, (2) .025-.050" oversize. Pistons slotted and finished except for skirt. Skirts must be cam ground.

1937-38 MODELS

ENGINE ASSEMBLY REMOVAL:—Drain radiator, remove hood and side panels (if used), disconnect tie rods at radiator (if used). Remove fan blades and radiator core (disconnect radiator hoses, remove water pump—C14, 15 only, fan pulley—except C14, 15, 17, remove core-to-shell bolts and lift core out, on Chrysler Airflow C17, radiator shell and grille assembly and fan shield must also be removed). Remove bolts at each side of front engine support. Disconnect starter cable, generator and distributor wires, fuel pump lines, throttle controls, oil gauge line at engine, heat indicator tube and bulb at cylinder head. Remove front floor boards and disconnect hand brake cable, overdrive control cable (if used), propeller shaft (see removal instructions below for cars equipped with two shafts and center bearing), clutch release fork, intermediate clutch linkage shaft at engine (on 1938 cars). Remove transmission (see car model 'M' page for directions). Disconnect exhaust pipe and remove rear engine mounting bolts. Lift engine assembly out of car.

Installation:—Reverse procedure listed above. IMPORTANT—In order to secure proper engine alignment when installing engine assembly, loosen exhaust pipe support brackets and run engine a few seconds with engine mounting bolts loose. Then tighten mounting bolts and exhaust pipe brackets.

1939 MODELS

ENGINE ASSEMBLY REMOVAL:—Remove Front End Assembly (see above). Remove front floor boards and propeller shaft (see removal instructions below for cars equipped with two shafts and center bearing). Disconnect: hand brake cable, starter cable, battery ground cable, speedometer cable and gear-shifter rod and cable at transmission (on cars with overdrive remove solenoid coil and control cable), feed line at fuel pump, oil gauge line at engine, coil wires, heat indicator tube and bulb at head, exhaust pipe at manifold, throttle controls and clutch linkage. Attach hoist to engine (remove air cleaner and horns if necessary). Remove front and rear engine support bolts. Loosen engine side splash aprons and lift engine assembly out of car. NOTE—On Plymouth P7, remove transmission cover.

Installation:—Reverse procedure listed above. IMPORTANT—In order to secure proper engine alignment when installing engine assembly, loosen exhaust pipe support brackets and run engine a few seconds with engine mounting bolts loose. Then tighten mounting bolts and exhaust pipe brackets.

1932-39 MODELS

REPLACEMENT MAIN BEARING CAPS:—Available for service. Identical with original cap except for stud holes which are 1/64" larger and bearing cap length which is 1/16" shorter. This allows for filing or shimming to obtain proper bearing fit.

1937-38-39 MODELS

MAIN BEARINGS:—Removal—Car manufacturer recommends that Engine Assembly be removed on Chrysler and De Soto 1937-38-39 models for removing and installing main bearings. See separate Engine Assembly Removal paragraphs (above) for directions.

1932-38 MODELS

Front Main Bearing Cap Removal for Six Cylinder Engines (Chrysler & De Soto 1937-38, Dodge 1932 to 1938, Plymouth 1933 to 1938):—Remove oil pan, oil suction pipe and fan drive pulley (using Puller Tool No. CM-57). Take off timing chain cover. Remove flat head screw from timing case cover plate to oil pan front gasket oil seal plate (located on front face of cover plate just below and to the left of chain). Remove oil pan front gasket oil seal plate which will permit access to front main bearing cap.

1939 MODELS

Front Main Bearing Cap Removal for Six Cylinder Engines (All 1939 Models):—With oil pan removed, oil pan front gasket oil seal plate can be removed by taking out 2 screws on lower edge of timing chain cover (not necessary to remove cover) permitting access to front main bearing cap.

1933-39 MODELS

Adjustment:—Replace bearings. Do not shim or file bearing caps (see Replacement Main Bearing Caps above). With caps removed, the bearing upper halves may be rotated out without removing crankshaft by using pin installed in oil hole in shaft.

1933-39 MODELS

Replacement Bearings:—Finished bearings furnished in following sizes for years as indicated: 1933-36—Standard and .010" undersize. 1937—Standard and .0015" and .010" undersize. 1938-39—Standard and .002", .010", .012" undersize.

1933-39 MODELS

Fitting Bearings:—Check crankshaft for scoring. To check bearing fit, use .002" feeler, ½" wide, 1" long. With cap removed, place feeler along center of bearing, tighten cap. Bearing fit correct when slight drag perceptible when turning crankshaft by hand. Remove feeler, tighten cap. Renew oil seals.

1938-39 MODELS

CRANKSHAFT OIL SEALS:—Servicing—Car manufacturer recommends that new oil seals be installed if chain cover or rear bearing cap removed.

Front Oil Seal:—Leather oil seal mounted in timing chain cover. When installing seal, leather should be soft and pliable, soaked in thin oil for approximately thirty minutes, then rolled with smooth bar.

Rear Oil Seal:—Located at rear bearing. Consists of three separate seals as follows: 1—Bearing oil seal formed in two halves. Lower half mounted on rear of bearing cap and held by retainer screwed (3 screws with lockwashers) to rear face of cap. Upper half retained in same manner with retainer screwed in place on rear face of crankcase. 2—Bearing cap seal. Groove on each side of cap (immediately to rear of stud holes) fitted with seal. Seal assembled in groove with doubled-over end in toward bearing. 3—Bearing cap gaskets. L-shaped cap gaskets assembled around oil slinger groove (at rear of cap). Install gaskets (one on each side).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1933-39 MODELS

EXHAUST VALVE SEAT INSERTS:—Refacing—Exhaust valve seat inserts must be reground (cannot be recut due to hardness) with high speed grinding stones (Tool C-372) used dry. Roughing stone—to obtain full contact; Finishing stone—to obtain proper finish. Stones must first be dressed for concentricity. Grinding tool centers on expanding pilot inserted in clean valve guide (upper end must be cleaned and chamfered with reamer to provide 60° seat 1/16" wide for this pilot). Lubricate pilot with few drops of oil. All carbon or grease must be removed from valve seat before grinding. Finished seat allowable runout .0005". Check with indicator.

Replacement Inserts—Furnished .010" oversize. Use special tool set C-386 (includes grinding and replacement tools). Inserts removed with special puller to avoid damage to engine block. Special cutters (allowing press fit for new insert) and peening tools (securing insert in place) used with pilot in valve guide (as above) for proper alignment. After installing, finish guide (see Refacing).

1938 MODELS

TIMING CHAIN REMOVAL:—With hood and side panels removed, take off radiator shell and radiator as a unit, support engine under front end and remove front engine support. Remove fan drive pulley and balancer (if used) with Puller Tool No. CM-57. Take off chain cover and chain.

1938 MODELS

OIL PUMP REMOVAL AND INSTALLATION:—Chrysler & DeSoto only). Disconnect oil gauge and fuel pump lines, exhaust pipe, starter pedal (DeSoto only), drain radiator and disconnect hoses. Remove floor boards, loosen engine mountings and tilt engine by placing jack under oil pan. Remove pump body capscrews, remove pump. To install, reverse procedure.

1939 MODELS

RADIATOR CORE REMOVAL:—Chrysler C22, De Soto S6, Dodge D11, Plymouth P7, P8. Remove hood and side panels. Drain cooling system. Remove water pump (Chrysler and Dodge only). Disconnect radiator hoses and take fan blades off pulley (De Soto and Plymouth only). Disconnect headlamp wires at junction block on left fender lower shield and push forward through radiator core side flange. Remove three radiator core-to-support capscrews at each side. Lift core out. NOTE—Loosen lower front screws of fender shield if necessary.

Installation—Reverse procedure listed above. Headlamp wires should be tied together at terminals with a long piece of string, pass string through core flange hole (toward the rear), assemble core and pull wires through hole.

Chrysler C23, C24:—Remove complete hood assembly and side panels. Drain cooling system. Remove screws and bolts securing lower splash pan (at front of car) to shell cross member (below grille) and to side shields, front wheels and front bumper from frame. Free front end of fenders by removing 5 capscrews (fender-to-grille shell) and 2 capscrews in fender bracket-to-radiator support. Remove radiator hoses. Take out fan shroud bolts and lift shroud out. Free radiator shell from support by removing two capscrews at each side (just above top end of outside grille bars). Pull radiator shell forward off car with fenders moved apart. Remove radiator core support capscrews and lift core out. NOTE—When reassembling, secure bolts and screws which hold shell and fenders in a half tight position, tighten only after hood alignment obtained.

1937 MODELS

CLUTCH CHANGE TO CORRECT HARD SHIFTING:—Shifting trouble caused by driven member not releasing properly can be corrected by installing new type driven disc or by cutting twenty-seven spiral grooves 3/32" wide and 1/32" deep spaced equally around facing. Grooves must not exceed these dimensions or facing will be weakened and wear will be excessive.

1935-39 MODELS

PROPELLER SHAFT CENTER BEARING REMOVAL AND INSTALLATION:—Used on all passenger car models with two propeller shafts. To remove, take out rear propeller shaft, disconnect front universal (at rear of transmission), remove center bearing-to-frame mounting screws, slide front propeller shaft (with bearing) out through frame opening in X-member. To install, reverse procedure taking care to replace bearing-to-frame spacer (if used).

1938-39 MODELS

HAND BRAKE ADJUSTMENT:—Fully release hand lever (cable length adjusted by means of clevis at lower end). Remove lock wire on anchor screw (on right lower side), adjust for .015-.020" band to drum clearance for lower portion of band, lock in place. Back off large adjusting bolt nut at top until free. Loosen guide bolt lock nut (on mounting bracket), turn adjusting nut (under locknut) for .015-.020" band to drum clearance, tighten locknut. Tighten large nut at top until tension on either side of guide bolt is just relieved (groove in nut must align with ridge in lockwasher).

NOTE—Clearance between side of anchor & bracket must not exceed .005". To correct, clamp anchor bracket in vise and tap lightly with hammer.

SERIAL NUMBER:—First number 6,756,001. Stamped on right front door hinge piller post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and #2 cylinders.
NOTE—Letter 'A' following engine number indicates that bore .020" larger than standard. Letter 'B' indicates main and connecting rod bearings .010" smaller than standard. Letters 'AB' indicate bore and bearing sizes as above.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. Floating power engine mounting.
Bore—3¼". **Stroke**—4½".
Displacement—223.98 cu. ins.
Horsepower—Rated—25.35, **Developed**—83 at 3400 R.P.M., 100 at 3400 R.P.M. (Optl. H.C. 6.2-1 head).
Compression Ratio—6.35-1 (Std.), 6.2-1 (Optl. Al. head).
Compression Pressure—Approximately 90-95 lbs. (std. head), 100-105 lbs. (Optl. head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" at idling speed.
NOTE—Special cylinder head gaskets, head studs and spark plugs (long thread) used with optional aluminum heads. Aluminum heads must be tightened cold.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type. Pistons cannot be ground and cylinders should be reconditioned to take standard oversize pistons.
Weight—¼ oz. maximum variation.
Removal—Pistons and rods removed from above.

Clearance:—.025" (top), .0015" skirt. See Fitting Pistons.

Replacement Pistons:—Finished pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. Install same oversize in all cylinders to maintain balance.

Fitting New Pistons:—Use micrometer gauge to check piston diameter and cylinder bore. Finish bore to size for correct clearance. Feeler gauge .0015" thick can be used to check clearance on side opposite slot.

Installing Pistons:—Slot should be toward left (away from valves).

PISTON RINGS:—Four special tongue-and-groove type compression rings, one oil control ring per piston, all above slot. Clearance between rings in tongue-and-groove pair should be .003-.005".

Ring	Width	End Gap	Side Clearance
Comp. (all)	9/64"	.005-.010"	.003" Max.
Oil Control	5/32"	.007-.015"	.003" Max.

PISTON PIN:—Diameter 55/64". Length 2¾". Pin floats in piston and rod. Pin hole in rod is bronze-bushed.
Pin Fit in Piston—Tight thumb push fit with piston at room temperature.
Pin Fit in Rod Bushing—Tight thumb push fit at room temperature (70°F.).
NOTE—Pins furnished .003", .005", .008" oversize.

CONNECTING ROD:—Length—8¾". **Weight**—Held to ¼ oz. maximum variation.
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Babbitt lined integral with rod and cap. No shims used.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment:—None. (no shims). Replace rods. Do not file rods or caps.
Installing Rods:—Lower bearings offset. Install rods with widest half of bearing toward rear of engine (cylinders #1, 3, 5) or toward front of engine (cylinders #2, 4, 6). Oil hole in upper half of lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¼".
Bearing Type—Removable babbitt-lined, bronze-backed.
Clearance—.001-.002".
Adjustment:—None (no shims). Replace bearings. Do not file caps.
End Thrust:—Taken by #4 (rear) main bearing. Endplay .004-.005".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type except #4 which is machined in crankcase.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at front bearing.
Timing Chain:—Morse. Width 1¼". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	11/32"	5¼"
Exhaust	1 15/32"	11/32"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.005" Int., .007" Exh. engine hot.

Valve Springs:—Do not compress springs to over-all length of less than 1¾".

	Spring Pressure	Spring Length
Valve Closed	40-44 lbs.	2 1/16"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Use regular timing gauge installed in timing hole over #6 piston. Set tappet clearance #6 intake valve at .011". This valve should open with piston .013" past top dead center. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weidenhoff Adapted #103. Rod #12.

LUBRICATION:—Pressure type. Gear type oil pump located at right of crankcase.
Normal Oil Pressure—15 lbs. idling, 30-40 lbs. at 20 M.P.H.
Oil Pressure Relief Valve—Under cap on left hand side of crankcase. To adjust, remove cap, take out locking wire, turn slotted plug clockwise to increase, or counter-clockwise to decrease oil pressure, replace locking wire.
Crankcase Capacity—6 qts.

CLUTCH:—Borg and Beck Model 10A1. Marked 611 on cover. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Moulded type, 2 required. Thickness ⅛". Inside diameter 6¾". Outside diameter 9⅞".
Adjustment—Adjust pedal stopscrew (at rear of pedal below pedal shaft) for highest position of pedal without interference with floor. Pedal free movement must be 1⅛". To adjust, loosen locknut and turn clutch fork adjusting screw in front of pedal shaft.

STEERING:—Steering Gear—Gemmer Worm - and - Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—1-3°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1¼°. No adjustment. Must be equal for both wheels.
Toe In—1/16" measured 9" up on wheels. Adjusted in usual manner by loosening tie rod ends and turning tie rod.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies separate brake at rear of transmission. See article in Brake Section for complete adjustment directions.
Drum Diameter—11".
Lining—Moulded type. Width 1½". Thickness 3/16". Length 20 7/32" per wheel.
Clearance—.012" toe, .006" heel for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—Place lever in released position, remove locking wire and turn anchor adjusting screw to give 1/16" clearance between lining and drum at this point. Turn adjusting nut at top of adjusting bolt to give 1/16" clearance around band. If necessary, loosen locknut and turn guide bolt nut so that clearance is uniform around band.
Drum Diameter—7".
Lining—Width 2". Thickness 5/32". Length 21 13/32".

SERIAL NUMBER:—First number (CT) 7,000,001, (CQ) 7,529,001. Stamped on right hand front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of engine block between #1 and #2 cylinders.
NOTE—Letter 'A' following engine number indicates that cylinder bore .020" larger than standard. Letter 'B' indicates that main and connecting bearings .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above.

ENGINE:—Model CT Royal Eight. Eight cylinder, 'L' head type. Floating power engine mounting.
Bore—3¼". Stroke—4⅛".
Displacement—273.8 cubic inches.
Horsepower—Rated—33.80. **Developed**—90 at 3400 R.P.M.
Compression Ratio—5.20-1 Std. head, 6.20-1 Optl. aluminum head.
Compression Pressure—Approximately 90 lbs. (5.2-1 head), 105 lbs. (6.2-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

ENGINE:—Model CQ Imperial Eight. Eight cylinder, 'L' head type. Floating power engine mounting.
Bore—3¼". Stroke 4½".
Displacement—298.6 cubic inches.
Horsepower—Rated—33.80. **Developed**—108 at 3400 R.P.M.
Compression Ratio—6.20-1 Std. head, 5.20-1 Optl. low compression head.
Compression Pressure and Vacuum Reading—Same as for Royal Eight above.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type. Pistons can not be ground and cylinders should be reconditioned to take standard oversizes. Piston length 3⅞".
Weight—Held to ¼ oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—.025" (top), .0015" skirt. See Fitting Pistons.

Replacement Pistons:—Finished pistons furnished .003", .005", .010", .015", .020", .023",. .025", .030", .040", .050", .060" oversize. Install same oversize in all cylinders to maintain balance.

Fitting New Pistons:—Use micrometer gauge to check piston diameter and cylinder bore. Finish bore to size for correct clearance. Feeler gauge .0015" thick can be used to check clearance on side opposite slot.

Installing Pistons:—Slot should be toward left (away from valves).

PISTON RINGS:—Four special tongue-and-grove type compression rings, one oil control ring per piston, all above pin. Clearance between rings in tongue-and-groove pair should be .003-.005".

Ring	Width	End Gap	Side Clearance
Comp. (all)	9/64"	.005-.010"	.003" Max.
Oil Control	5/32"	.007-.015"	.003" Max.

PISTON PIN:—Diameter—55/64". Length—2¾". Pin floats in piston and rod. Pin hole in upper end of connecting rod is bronze bushed.
Pin Fit in Piston—Tight thumb push fit with piston at room temperature (70°F.).
Pin Fit in Rod Bushing—Tight thumb push fit at room temperature (70°F.).

CONNECTING ROD:—Length 9". Weight—Held to ¼ oz. maximum variation.
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods:—Lower bearings offset. Install rods with widest half of bearing toward rear of engine (cylinders #1, 3, 5, 7) or toward front (cylinders #2, 4, 6, 8). Oil hole in lower bearing upper half should be toward camshaft side on all rods.

CRANKSHAFT:—Five bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable bronze-backed, babbitt-lined.
Clearance—.001-.002".
Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by #5 rear main bearing. Endplay .002-.005".

CAMSHAFT:—Six bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined except #6 which is machined in crankcase.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at front bearing.
Timing Chain:—Morse. Width 1¼". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off hub.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5½"
Exhaust	1 13/32"	11/32"	5½"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.005" Int., .007" Exh. engine hot.
Valve Springs:—Do not compress springs to over-all length of less than 1¾".

	Spring Pressure	Spring Length
Valve Closed	40-44 lbs.	2 1/16"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Use regular timing gauge installed in timing hole over #8 piston. Set tappet clearance #8 intake valve at .011". This valve should open with piston .013" past top dead center. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weidenhoff Adapter #103. Rod #12.

LUBRICATION:—Pressure type. Gear type oil pump located at right of crankcase.
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Under cap on left hand side of crankcase. To adjust, remove cap, take out locking wire, turn slotted plug clockwise to increase, or counter-clockwise to decrease oil pressure, replace locking wire.
Crankcase Capacity—6 quarts.

CLUTCH:—Borg and Beck Model 10A1. Marked 615-630 on cover. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Moulded type, 2 required. Thickness ⅛". Inside diameter 6¾" (CT), 6⅛" (CQ). Outside diameter 9⅞" (both models).
Adjustment—Adjust pedal stopscrew at rear of pedal shaft for highest possible position of pedal without interference with floor board. Pedal free movement must be 1¼" (CT), 1⅛" (CQ). To adjust, loosen locknut and turn clutch release fork lever adjusting screw at lower end of pedal in front of pedal shaft.

STEERING:—Steering Gear—(CT) Gemmer Worm-and Sector type. (CQ) Gemmer Worm-and-Double Roller type. See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—1-3°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1¼° (CT), ¼-¾° (CQ). No adjustment. Must be equal for both wheels.
Toe In—1/16" measured 9" up on wheel. Adjusted in usual manner by loosening tie rod end clamps and rotating tie rod.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand lever applies separate brake at rear of transmission. See article in Brake Section for complete adjustment directions.
Drum Diameter—12" (CT), 13" (CQ).
Lining (CT)—Moulded type. Width 1¾". Thickness 3/16". Length 21 23/32" per wheel.
Lining (CQ)—Moulded type. Width 2". Thickness 3/16". Length 23 9/16" per wheel.
Clearance (all models)—.012" toe, .006" heel each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment:—Place lever in released position, remove locking wire and turn anchor adjusting screw to give 1/16" clearance at this point. Turn adjusting nut at top of adjusting bolt to give 1/16" clearance around band. If necessary, loosen locknut and turn guide bolt nut so that clearance is uniform around band.
Drum Diameter—7".
Lining—Width 2". Thickness 5/32". Length 21 13/32".

SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and #2 pistons.

ENGINE SPECIFICATIONS:—Eight cylinder, 'L' head type. Floating power engine mounting.
Bore—3½". **Stroke**—5".
Displacement—384.8 cubic inches.
Rated Horsepower—39.20.
Developed Horsepower—125 at 3200 R.P.M. (CH, CL), 135 at 3200 R.P.M. (CL*).
Compression Ratio—5.20-1 Std. (CH, CL), Optl. (CL*), 5.80-1 Std. (CL*).
Compression Pressure—Approximately 90 lbs. (5.20-1 head), 100 lbs. (5.80-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" at idling speed.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar Strut, split skirt type. Piston length—4⅛".
Weight—Pistons of same size held to ¼ oz. maximum variation. Can be used interchangeably.
Removal—Pistons and rods removed from above.
Clearance—.017-.022" top, .0015" skirt.

Fitting New Pistons:—Use .0015 feeler stock ½" wide to check clearance. Cylinders should be reconditioned when taper or out-of-round exceeds .0015". Reconditioned cylinders must not be tapered or out-of-round more than .0005".

Installing Pistons:—Slot should be toward right or camshaft side of engine.

PISTON RINGS:—Four compression, one oil control ring per piston, all above pin. Compression rings are tongue-and-groove type. Clearance between rings in tongue-and-groove pair should be .003-.005".

Ring	Width	End Gap	Side Clearance
Comp. (all)	5/32"	.0035-.010"	.003" Max.
Oil Control	5/32"	.007-.015"	.003" Max.

PISTON PIN:—Diameter—55/64". **Length**—3". Pin floats in piston and rod. Held by retaining ring at each end. Heat piston in boiling water to remove or install pins. Pin hole in rod is bronze-bushed (2 bushings used).

Pin Fit in Piston—.0001-.0005" or tight thumb push fit with piston heated to boiling water temperature (212°F.).

Pin Fit in Rod Bushing—.0001-.0005" or tight thumb push fit at room temperature (70°F.).

CONNECTING ROD:—Length 10". **Weight**—Held to ¼ oz. maximum variation.
Crankpin Journal Diameter—2 3/16".

Lower Bearing—Spun babbitt ('32), removable steel-backed, babbitt-lined type (CL* '33). No shims
Clearance—.001-.00275". Sideplay .003-.009".

Adjustment:—None (no shims). Replace rods ('32) or bearings ('33). Do not file rods or caps. Install new bearings with small boss registering with groove in rod and cap.

Installing Rods:—Oil hole in lower bearing upper half must be toward camshaft on all rods.

CRANKSHAFT:—9 bearing. Integral counterweights.
Journal Diameters—2¾" all bearings.
Bearing Type—Removable bronze-backed, babbitt-lined. No shims.
Clearance—.001-.002".

Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by #9 rear main bearing. Endplay .0015-.0045".

CAMSHAFT:—Six bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2¼"; #2, 2 7/32"; #3, 2 3/16"; #4, 2 5/32"; #5, 2⅛"; #6 1⅝".
Bearing Type—#1 bronze-backed, babbitt-lined. All others steel-backed, babbitt-lined.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate assembled behind camshaft sprocket hub.

Timing Chain:—Morse. Width 1½". Pitch .500". Length 26½" or 53 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 23/32"	.340-.341"	6 9/16"
Exhaust	1 21/32"	.340-.341"	6 9/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.002-.004"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.

Tappet Clearance—.005" Int., .007" Exh. engine hot.

Valve Springs:—Do not compress springs to over-all length of less than 2⅛".

	Spring Pressure	Spring Length
Valve Closed	50-55 lbs.	2¾"
Valve Open	80-85 lbs.	2 7/16"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Use regular timing gauge installed in timing hole over #8 piston. Set tappet clearance #8 intake valve at .008". This valve should open with the piston .017" past top dead center. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weidenhoff Adapter #103. Rod #12.

LUBRICATION:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Under cap on left hand side of crankcase. To adjust, remove cap, take out locking wire, turn slotted plug clockwise to increase, or counter-clockwise to decrease oil pressure, replace locking wire.
Crankcase Capacity—8½ quarts.

CLUTCH:—Borg & Beck Model 11A2. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions. Bendix vacuum power 'automatic clutch' control used on all models.

Facings—Moulded type, 2 required. Thickness ⅛". Inside diameter 6⅛". Outside diameter 11 1/16".

Adjustment—Adjust pedal stopscrew at lower end of pedal under shaft for highest possible position of the pedal without interference with the floor board. Free movement of pedal must be 1⅛". To adjust, loosen locknut and turn adjusting screw on clutch release fork lever on clutch housing.

STEERING:—Steering Gear—Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Caster—1-3°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—¼-¾°. No adjustment. Must be equal for both wheels.

Toe In—⅛" measured 9" up on wheel. Adjusted in usual manner by loosening clamp bolts and rotating tie rod.

BRAKES:—Lockheed Hydraulic, Double anchor type with vacuum power application. See article in Brake Section for complete adjustm't instructions.
Drum Diameter—15".
Lining—Moulded type. Width 2". Thickness 3/16". Length 28 23/32" per wheel.
Clearance—.012" toe, .006" heel each shoe.

Power Unit:—Bendix self-contained type vacuum cylinder connected to brake linkage. See article in Brake Section for complete data.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—Place lever in released position, remove locking wire, turn anchor screw adjusting nut until clearance between lining and drum is 1/16" at this point. Loosen clamp bolt, turn adjusting sleeve until clearance at lower end of band is 1/16", tighten clamp bolt. Turn adjusting nut on upper end of adjusting bolt (in adjusting sleeve) until clearance at upper end of band is 1/16". Clearance should be uniform around drum.
Drum Diameter—8".
Lining—Width 2". Thickness 5/32". Length 24⅝".

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates that cylinder bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above.

ENGINE:—Six cylinder, 'L' head type. Floating power.
Bore—3⅜". **Stroke**—4½".
Piston Displacement—241.5 cubic inches.
Rated Horsepower—27.34 A.M.A.
Developed Horsepower—93 at 3400 R.P.M., 100 at 3400 R.P.M. with optl. head.
Compression Ratio—5.4-1 Std. (CA, CB), 6.0-1 Std. (C-6) heads. 6.5-1 optl. aluminum head.
Compression Pressure—(5.4-1 hd.) 90-95 lbs., (6.0-1 hd.) 100-105 lbs., (6.5-1 hd.) 110-115 lbs. at cranking speed.

Pistons:—Aluminum alloy, "T" slot, Cam ground type. Semi-finished pistons (head and ring grooves completely finished, skirt semi-finished) furnished for service where 'cam' grinding equipment is available in two sizes: (1) standard to .023" oversize, (2) .025" to .050" oversize. If cam grinding equipment not available, use finished replacement pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize and finish cylinder bores to provide correct clearance. Piston length 3⅞.
Removal—Pistons and rods removed from above.
Weight—Held to 7 grams or ¼ oz. variation.
Clearance—Top .024". Bottom .0015" (CA, CB), .002" (C-6).
Fitting New Pistons—Use micrometer gauges to check cylinder bore and piston diameter.
Installing Pistons—Slot at left (away from valve).

Piston Rings:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Lower ring grooves drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clearance
Comp all	⅛"	.007-.015"	.003"
Oil Wiper '34	⅛"	.007-.015"	.003"
Oil Control '34	3/16"	.007-.015"	.003"
Oil Control '35	5/32"	.007-.015"	.003"

Piston Pin:—Diameter 55/64". Length 2⅞". Pin floats in piston and rod. Held by retaining rings. Piston should be heated in boiling water to remove or install pins. Pins furnished .003", .005", .008" oversize.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120°F.
Pin Fit in Rod Bushing—Tight thumb push fit with piston at room temperature (70°F).

Connecting Rod:—Weight—maximum variation held to 7 grams or ¼ oz. Length 8¾".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small boss registering with groove (both halves). Furnished .010" undersize and standard.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearing toward rear of engine (#1, 3, 5), or toward front of engine (#2, 4, 6). Oil hole in upper half of bearing must be toward valve side on all rods.

Crankshaft:—4 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Special Shop Notes for replacement bearing and bearing cap data.*
End Thrust—Taken by rear bearing. Endplay .003-.007".

Camshaft:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type (except #4, machined in crankcase).
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at rear of sprocket hub.
Timing Chain—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.340-.341"	5 5/16"
Exhaust	1 15/32"	.340-.341"	5 5/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—Use special tool to remove and install guides. Intake guides installed with taper end up. exhaust guides with taper end down. Top of guide must be 13/16" below top of block. Finish ream new guides to inside diameter of .342-.343" intake, .344-.345" exhaust after installing.
Tappet Clearance—.006" Int., .008" Exh.. with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Valves accesible by removing right front wheel and housing cover.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress springs to length of less than 1 11/16".

	Spring Pressure	Length '34	Length '35
Valve Closed	46-50 lbs.	2 1/16"	2 1/32"
Valve Open	104-110 lbs.	1 23/32"	1 22/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open At TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake and exhaust valves at .010". Intake valve should open at top dead center when 'O' mark on impulse neutralizer at front of engine lines up with pointer on chain case. Reset tappet clearance at .006" with engine hot.

Lubrication:—Pressure. Gear type oil pump located at right of crankcase.
Normal Oil Pressure—30-60 lbs. ('34), 40-50 lbs. ('35) at driving speeds.
Oil Pressure Relief Valve—Under plug on left hand side of crankcase. Operates at 40-45 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Capacity & Oil—6 qts. Use SAE. #30 (summer—or #40 for high speed driving or above 100°F), #20-W (winter 32° to 0°F), #10-W (0° to —15F°).

CLUTCH:—**Borg & Beck Model 10A3 ('34), 10A6 ('35).** Single plate. dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Clutch pedal should just clear under side of toeboard with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1⅛" ('34), 1 1/16" ('35). To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Clutch Facings—Woven asbestos, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.
NOTE—To remove clutch first remove clutch fork and pivot by taking out pivot capscrew. Mark clutch cover and flywheel before disassembling and reassemble in same position. Install driven plate assembly with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—**Front Suspension**—Independent, linked parallelogram type with coil springs. All specifications and service adjustments same as for Model CZ (following) except kingpin inclination 10° plus or minus ½° (including camber angle), or 8¾-10¼° from vertical (without camber angle).
See article in Mechanical Equipment Section for data.
Steering Gear:—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for relining and complete brake adjustment.
Wheel Cylinders—Diameters—Front wheel (front end 1¼", rear 1⅜"), Rear wheel (front end 1⅛", rear 1¼").
NOTE—Wheel cylinder mark 'R'—for right brakes, 'L'—for left brakes and are not interchangeable.
Drum Diameter—11" ('34), 10" ('35).
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 22 5/32" ('34), 19 13/16" ('35).
Clearance—.012" toe, .006" heel, for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment ('34)—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Then adjust hand brake adjusting bolt nut to give 1/16" clearance at each end of brake band.
Adjustment ('35)—With lever in released position, (on some cars, adjustment is provided for hand brake rod length; where this is found adjust hand brake rod nut to take up all slack or free play), remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Adjust brake band guide bolt nut to give 1/16" clearance (as above), for lower portion of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/16" clearance (as above) for upper portion of brake band.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32" ('34), 3/16" ('35). Length 18 13/32".
NOTE—When relining, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" maximum.

ENGINE NUMBER:—First Number, CZ-1001. Stamped on boss on left side of cylinder block between #1 and 2 cylinders.
See Chrysler Special Shop Note for Engine Number lettering data.

ENGINE:—Own. Eight cylinder, In line, 'L' head type. Floating power engine mounting.
Bore—3¼". Stroke—4⅛".
Piston Displacement—273.8 cubic inches.
Rated Horsepower—33.80 A.M.A.
Developed Horsepower—105 at 3400 R.P.M.
Compression Ratio—6.2-1 Std. cast-iron head, 7.0-1 special aluminum head.
Compression Pressure—125-135 lbs. (6.2-1 cast-iron head), 130-140 lbs. (7.0-1 al. head) at 1000 R.P.M. or approx. 105 lbs. (6.2-1), 117 lbs. (7.0-1) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

Pistons:—Aluminum alloy, 'T' slot, cam ground type. Semi-finished pistons (head and ring grooves completely finished, skirt semi-finished) furnished for service where 'cam' grinding equipment is available in two sizes: (1) standard to .023" oversize, (2) .025" to .050" oversize. If cam grinding equipment is not available, use finished replacement pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize and finish cylinder bores to provide correct clearance. Piston length 3⅞".
Removal—Pistons and rods removed from above.
Weight—Held to 7 grams or ¼ oz. variation.
Clearance—Top .024". Skirt .002".
Fitting New Pistons—Use micrometer gauges to check cylinder bore and piston diameters.
Installing Pistons—Slot should be at left or away from valve side of engine.

Piston Rings:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Oil ring grooves are drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.007-.015"	.003"
Oil Cont. All	5/32"	.007-.015"	.003"

Piston Pin:—Diameter 55/64". Length 2¾". Pin floats in piston and rod. Held by retaining rings. Piston should be heated in boiling water to remove or install pins. Pins furnished .003", .005", .008" oversize for service.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120°F.
Pin Fit in Rod Bushing—Light thumb push fit with both parts at room temperature (70°F.).

Connecting Rod:—Weight held to 7 grams or ¼ oz. maximum variation. Length 9 3/16".
Crankpin Journal Diameter—2 3/16".
Lower Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay, .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. Install new bearings with small boss registering with groove in rod and cap. Bearings furnished for service .010" undersize and standard.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7) or toward front (#2, 4, 6, 8). Oil hole in upper half of bearing must be toward valve side of engine on all rods.

Crankshaft:—Five bearing. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".
Adjustment—None (no shims). Replace bearings. Do not file caps. *See Chrysler Special Shop Notes for replacement bearings and bearing cap data.*
End Thrust—Taken by rear bearing. Endplay, .002-.005"

Camshaft:—Six bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed babbitt-lined type (except #6 which is machined in crankcase).
Clearance—.0015-.0025". Endplay, .003-.005".
End Thrust—Taken by thrust plate between sprocket hub and front main bearing.
Timing Chain—Morse. Width 1¼". Pitch, .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5⅜"
Exhaust	1 13/32"	.340-.341"	5⅜"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—See Model C6 for complete instructions.
Tappet Clearance—.006" intake, .008" exhaust. running clearance with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Valves accessible by removing right front wheel and wheel housing cover under fender.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress springs to length of less than 1 11/16".

	Spring Pressure	Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 22/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Valve Timing—Set tappet clearance #1 valves at .011" intake, .012" exhaust. Intake valve should open with piston 2° BTDC when 2° line on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" (engine hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Lubrication:—Pressure. Gear type oil pump located on right hand side of crankcase.
Normal Oil Pressure—40-50 lbs. at driving speeds.
Oil Pressure Relief Valve—Located under cap on left hand side of crankcase. Operates at 40-45 lbs. See Model C-1 (following) for adjustments.
Capacity & Oil—6 qts. Use SAE. #30 (summer—#40 for sustained high speed driving or temperatures above 100°F), #20-W (winter 32° to 0°F), #10-W (winter 0° to —15°F.).

CLUTCH:—Borg and Beck Model 10A6. Single plate, dry disc type. No adjustment required for wear. *See article in Mechanical Equipment Section for data.*
Clutch Pedal Adjustment—Clutch pedal should just clear under side of toeboard with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1 1/16". To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Clutch Facings—Woven asbestos, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.
NOTE—To remove clutch first remove clutch fork and pivot by taking out pivot capscrew. Mark clutch cover and flywheel before disassembling and reassemble in same position. Install driven plate assembly with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—Front Suspension—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Check spring heights first and make following checks with car weight on wheels.
Kingpin Inclination—4°30' (4¼-5¾° depending upon camber angle) alone, or 5°30' plus or minus ½° including camber angle.
Caster—1½° (½-2½°). To adjust, loosen upper and lower control arm yoke nuts, remove lubricant fitting in upper control arm yoke pin, loosen clamp bolts on upper yoke and upper end of knuckle support, insert special wrench in lubricant fitting hole, turn upper control arm yoke pin so as to move upper end of knuckle toward rear of car to increase caster angle, or toward front of car to decrease caster angle. Tighten yoke nuts and clamp bolts, replace lubricant fitting.
Camber—½° (¼-1°). Camber affected by caster adjustment and must be checked when caster angle is changed. Before changing camber, see that king pin pivot angle is correct and that loaded heights of front springs are equal (see paragraph below). To adjust camber, jack up car with jack placed under lower control arm or spring seat, so that weight of car is on springs but not on wheel, disconnect tie rod at wheel end. Remove upper control arm yoke nut, pull yoke out of control arm, add spacers between yoke and control arm to increase camber, or remove spacers to decrease camber (place spacers removed in this manner on inner face of control arm under yoke nut).
Toe In—1/16-⅛" measured at hub height on center of tread. Adjust by changing length of each tie rod equally. Measure tie rods to be certain that lengths between ends are equal.
Spring Heights—Distance from center line of lower control arm yoke pin to top of frame cross member (flat section) should be 7¼ to 7⅜" with car weight on wheels but no load in car. Heights must be equal on both sides within ⅛".

Steering Gear:—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission or rear wheel service brakes (on cars with overdrive). See article in Brake Section for complete adjustment procedure.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear 1⅜"), Rear Wheel (Front end 1⅛", Rear 1¼").
NOTE—Wheel cylinders marked 'R'—right side of car, 'L'—left side of car and not interchangeable.
Drum Diameter—11".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 22 5/32".
Clearance—.012" toe, .006" heel, for each shoe.

Hand Brakes:—External type on drum at rear of transmission. See Chrysler Model C6 (preceding page) for adjustments.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".

ENGINE NUMBER:—First number, CU-1001, CV-1001, C1-1001. Stamped on boss on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates that cylinder bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above.

ENGINE SPECIFICATIONS CV, C1:—8 cyl., 'L' head.
Bore—3¼". **Stroke**—4⅞".
Displacement—323.5 cubic inches.
Rated Horsepower—33.80 (AMA).
Developed Horsepower—130 (CV), 115 (C1) at 3400 R.P.M.
Compression Ratio—Std. (C1) 6.2-1 cast-iron hd., 6.5-1 Std. (CV), Optl (C1) aluminum head.
Compression Pressure—(6.2-1 hd.) 105-110 lbs., (6.5-1 hd) 110-115 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

ENGINE SPECIFICATIONS CU:—8 cylinder, 'L' head.
Bore—3¼". **Stroke** 4½".
Displacement—298.6 cubic inches.
Rated Horsepower—33.80 (AMA).
Developed Horsepower—130 at 3400 R.P.M.
Compression Ratio—6.5-1 Std. aluminum head.
Compression Pressure—Approximately 110-115 lbs. at cranking speed.
Vacuum Reading—See above.
NOTE—Aluminum heads must be tightened cold.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). **Length**—3⅞". **Weight**—held to 7 grams or 1/10 oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—Top .024-.025". Skirt .0015" (CU, CV), .002" (C1). See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished: (1) standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be sloted and then finished on cam grinding equipment.
Fitting New Pistons—Use micrometer gauges to check cylinder bore and piston diameters.
Installing Pistons—Slot should be at left or away from valve side of engine.
Piston Rings:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Oil ring grooves are drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.007-.015"	.003"
Oil Cont. All	5/32"	.007-.015"	.003"

Piston Pin:—Diameter 55/64". Length 2¾". Pin floats in piston and rod. Held by retaining rings. Piston should be heated in boiling water to remove or install pins. Pins furnished .003", .005", .008" oversize for service.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120°F.
Pin Fit in Rod Bushing—Tight thumb push fit with both parts at room temperature (70°F).
Connecting Rod:—Weight held to 7 grams or ¼ oz. maximum variation. Length 9".
Crankpin Journal Diameter—2 3/16".
Lower Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. Install new bearings with small boss registering with groove in rod and cap. Bearings furnished for service .010" undersize and standard.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7) or toward front (#2, 4, 6, 8). Oil hole in upper half of bearing must be toward valve side of engine on all rods.

Crankshaft:—Five bearing. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Special Shop Notes for replacement bearing and bearing cap data.*
End Thrust—Taken by rear bearing. Endplay .002-.005".

Camshaft:—Six bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type (except #6 which is machined in crankcase).
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate between sprocket hub and front main bearing.
Timing Chain—Morse. Width 1¼". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diam.	Stem Diam.	Length
Intake	1 15/32"	.340-.341"	5 9/16"
Exhaust	1 13/32"	.340-.341"	5 9/16"

NOTE—On model CU only valve length for all valves 5½".

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—See Model C-6 for instructions.
Tappet Clearance—.006" Int., .008" Exh. running clearance with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Valves accessible by removing right front wheel and housing cover under fender.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress springs to length of less than 1 11/16".

	Spring Pressure	Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Valve Timing—Set tappet clearance #1 valves at .011" Int., .012" Exh. Intake valve should open with piston 2° BTDC when 2° line on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" Int., .008" Exh. (engine hot).

Lubrication:—Pressure. Gear type oil pump located on right hand side of crankcase.
Normal Oil Pressure—40-50 lbs. at driving speeds.
Oil Pressure Relief Valve—Located under cap on left hand side of crankcase. Operates at 40-45 lbs. Adjustable. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase pressure, or counter-clockwise to decrease pressure, replace locking wire and cap.
Crankcase Capacity—6 quarts.

CLUTCH:—**Borg & Beck Models 11A5 (CU, CV), 11A6 (C1).** Single plate, dry disc type. No adjustment required for wear. 11A5 marked 861, 11A6 marked 871 on cover.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Clutch pedal should just clear underside of toeboard with clutch engaged. To adjust, turn pedal stopscrew located above clutch pedal shaft. Free movement of clutch pedal must be 1" (CU, CV), 1 1/16" (C1). To adjust, C1—turn clutch shaft collar adjusting screw at right hand end of clutch pedal shaft; CU, CV—turn clutch release fork lever adjusting screw (with locknut released) at left end of clutch release fork lever.
Clutch Facings—Woven asbestos, 2 required, 6⅛" I.D., 11" O.D., .133" thick.
NOTE—Mark flywheel and clutch cover before disassembling clutch and replace in same position. Install driven plate assembly with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—**Front Suspension**—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—(CU, CV) 9°, (C1) 4° crosswise.
Caster—2° plus or minus 1°. Adjust by inserting wedge shims between spring and axle pad on axle. Shims or angle plates furnished ½, 1, 2°.
Camber—½° plus or minus ¼°. No adjustment provided. Manufacturer recommends that no attempt be made to correct camber by bending tubular axle centers. Replace axle.
Toe In—1/16"-⅛" measured at hub height on center of tire tread. Adjust in usual manner by changing length of tie rod.
Steering Gear:—Gemmer Worm-and-Roller type.
See article in Mechanical Equipment Section for data.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for relining and complete adjustment procedure. For cars with Bendix Vacuum Power unit see separate article in Brake Section.
NOTE—Wheel cylinders marked 'R'—right brakes, 'L'—left brakes and are not interchangeable.
Drum Diameter—13".
Lining—Moulded type. Width 2". Thickness ¼". Length 24 27/32" per wheel.
Clearance—.006" heel, .012" toe, for each shoe.
Hand Brake:—External at rear of transmission.
Adjustment—With lever in released position remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/32", lock anchor screw with wire. Turn adjusting nut at top of adjusting bolt so that clearance around drum is 1/32". Loosen locknut and turn guide bolt, if necessary, to secure uniform clearance around drum.
Drum Diameter—6" (CU, CV); 7" (C1).
Lining—Woven type. Width 2" (CU, CV), 2¼" (C1). Thickness ¼" (CU, CV), 3/16" (C1). Length 18¼" (CU,CV), 21 13/16" (C1).
NOTE—When relining band, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" max.
Power Unit:—Bendix Internal Valve type.
See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number, C2-1001, C3-1001. Stamped on boss on left side of cylinder block between #1 and 2 cylinders.
NOTE—Letter 'A' following numer indicates that bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above.

ENGINE:—Own. Eight cylinder, In line, 'L' head type. Floating power engine mounting.
Bore—3¼". **Stroke**—4⅞".
Piston Displacement—323.5 cubic inches.
Rated Horsepower—33.80 A.M.A.
Developed Horsepower—130 at 3400 R.P.M. Std. 6.5-1 head, 138 at 3400 R.P.M. Optl. 7.45-1 head.
Compression Ratio—6.5-1 Std., 7.45-1 Optl.
Compression Pressure—(6.5-1 hd.) 145-155 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed (7.45-1 hd.).
NOTE—Both the 6.5 and 7.45 heads are aluminum. Aluminum heads must be tightened cold.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

Pistons:—Aluminum alloy, 'T' slot, Cam ground type. Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished in two sizes: (1) Standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be slotted and finished on cam grinding equipment.
Removal—Pistons and rods removed from above.
Weight—Held to 7 grams or ¼ oz. variation.
Clearance—Top .024". Skirt .002".
Fitting New Pistons—Use micrometer gauges to check cylinder bore and piston diameter.
Installing Pistons—Slot should be at left or away from valve side of engine.

Piston Rings:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Oil ring grooves are drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.007-.015"	.003"
Oil Cont. All	5/32"	.007-.015"	.003"

Piston Pin:—Diameter 55/64". Length 2¾". Pin floats in piston and rod. Held by retaining rings. Piston should be heated in boiling water to remove or install pins. Pins furnished .003", .005", .008" oversize for service.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120°F.
Pin Fit in Rod Bushing—Light thumb push fit with both parts at room temperature (70°F).

Connecting Rod:—Weight held to 7 grams or ¼ oz. maximum variation. Length 9".
Upper Bearing—Bronze bushing.
Crankpin Journal Diameter—2 3/16".
Lower Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Side play .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. Install new bearings with small boss registering with groove in rod and cap. Bearings furnished for service .010" undersize and standard.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7) or toward front (#2, 4, 6, 8). Oil hole in upper half of bearing must be toward valve side of engine on all rods.

Crankshaft:—Five bearings. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Special Shop Notes for replacement bearing and bearing cap data.*
End Thrust—Taken by rear bearing. Endplay .002-.005".

Camshaft:—Six bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type (except #6 which is machined in crankcase).
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate between sprocket hub and front main bearing.
Timing Chain—Morse. Width 1¼". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diam.	Stem Diam.	Length
Intake	1 15/32"	.340-.341"	5 9/16"
Exhaust	1 13/32"	.340-.431"	5 9/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—Use special tool to remove and install guides. Intake guides installed with taper end up, exhaust guides with taper end down. Top of guide must be 13/16" below top of block. Finish ream new guides to inside diameter of .342-.343" (intake), .344-.345 (exhaust) after installing.
Tappet Clearance—.006" Int., .008" Exh. running clearance with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Valves accessible by removing right front wheel and wheel housing cover under fender.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress springs to over-all length of less than 1 11/16".

	Spring Pressure	Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 22/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4°ATDC.
To Check Valve Timing—Set tappet clearance #1 valves at .011" Int., .012" Exh. Intake valve should open with piston 2° BTDC when 2° line on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" Int., .008" Exh. with engine hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Lubrication:—Pressure. Gear type oil pump located on right hand side of crankcase.
Normal Oil Pressure—40-50 lbs. at driving speeds.
Oil Pressure Relief Valve—Located under cap on left hand side of crankcase. Operates at 40-45 lbs. Adjustable. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase pressure, or counter-clockwise to decrease pressure, replace locking wire and cap.
Capacity & Oil—6 qts. Use SAE. #30 (summer—#40 for sustained high speed driving or temperatures above 100°F), #20-W (winter 32° to 0°F), #10-W (winter 0° to —15°F).

CLUTCH:—Borg and Beck Model 11A6. Single plate, dry disc type. No adjustment required for wear. ***See article in Mechanical Equipment Section for data.***
Clutch Pedal Adjustment—Clutch pedal should just clear underside of toeboard with clutch engaged. To adjust, turn pedal stopscrew located above clutch pedal shaft. Free movement of clutch pedal must be 1 1/16". To adjust, turn clutch shaft collar adjusting screw at right hand end of clutch pedal shaft.
Clutch Facings—Woven asbestos, 2 required, 6⅛" I.D., 11" O.D., .133" thick.
NOTE—Mark flywheel and clutch cover before diassembling clutch and replace in same position. Install driven plate with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—Front Suspension—Coventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—4° crosswise.
Caster—2° plus or minus 1°. Adjust by inserting wedge shims between spring and axle pad on axle. Shims or angle plates furnished, ½, 1, 2°.
Camber—½° plus or minus ¼°. No adjustment provided. Manufacturer recommends that no attempt be made to correct camber by bending tubular axle centers. Replace axle.
Toe In—1/16"-⅛" measured at hub height on center of tire tread. Adjust in usual manner by changing length of tie rod.
Steering Gear:—Gemmer Model Worm-and-Roller Type. See article in Steering Section for adjustments.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for relining and complete adjustment procedure. For cars with Bendix Vacuum Power unit see separate article in Brake Section.
Wheel Cylinders—Diameters—Front wheel (front end 1¼", rear end 1⅜"), Rear wheel (front end 1", rear end 1⅛").
NOTE—Wheel cylinders marked 'R'—right brakes, 'L'—left brakes and are not interchangeable.
Drum Diameter—13".
Lining—Moulded type. Width 2". Thickness ¼". Length 24 27/32" per wheel.
Clearance—.006" heel, .012" toe, for each shoe.
Hand Brake:—External at rear of transmission.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/32", lock anchor screw with wire. Turn adjusting nut at top of adjusting bolt so that clearance around drum is 1/32". Loosen locknut and turn guide bolt, if necessary, to secure uniform clearance around drum.
Drum Diameter—7".
Lining—Woven type. Width 2¼". Thickness 3/16". Length 21 13/16" per wheel.
NOTE—When relining band, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" max.
Power Brake Unit:—Bendix Internal Valve type. See article in Brake Section.

ENGINE NUMBER:—Stamped on boss on left hand side of cylinder block between #1 and 2 cylinders.

ENGINE:—**Own.** Eight cylinder, In Line, 'L' head type. Floating Power engine mounting.
Bore—3½". **Stroke**—5".
Piston Displacement—384.8 cubic inches.
Rated Horsepower—39.20.
Developed Horsepower—150 at 3200 R.P.M.
Compression Ratio—6.5-1. No optional ratios.
Compression Pressure—135-140 lbs. at 1000 R.P.M.

NOTE—Cylinder head is aluminum. Washers are used under head nuts. Tighten head cold.

Pistons:—Nelson Bohnalite, aluminum alloy, Invar Strut, split skirt type. Piston length 4⅛".
Weight—Pistons of same size held to 2 gr. (1/10 oz.) maximum variation. Used interchangeably.
Removal—Pistons and rods removed from above.
Clearance—.002" at top of skirt.
Fitting New Pistons—Use .002" feeler stock ½" wide to check clearance. Cylinders should be reconditioned when taper or out-of-round exceeds .0015". Reconditioned cylinders must not be tapered or out-of-round more than .0005".
Installing Pistons—Slot should be toward right or camshaft side of engine.

Piston Rings:—Four compression, one oil control ring per piston, all above pin. Compression rings are 'Tungtite' tongue and groove type. Oil control ring is slotted.

Ring	Width	End Gap
Comp. All	5/32"	.007-.015"
Oil Cont. (#5)	3/16"	.007-.015"

Piston Pin:—Diameter 55/64". Length 3". Pin floats in piston and rod. Held by retaining ring at each end. Heat piston in boiling water to remove or install pins. Pin hole in rod is bronze bushed.
Pin Fit in Piston—Tight thumb push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Light thumb push fit at room temperature (70°F).

Connecting Rod:—Length 10". Weight held to 2 gr. (1/10 oz.) maximum variation.
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small boss registering with groove in rod and cap.
Installing Rods—Oil hole in upper half of lower bearing should be toward camshaft side on all rods.

Crankshaft:—Nine bearing. Integral counterweights.
Journal Diameters—2¾" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined. No shims.
Clearance—.001-.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Special Shop Notes for replacement bearing and bearing cap data.*
End Thrust—Taken by rear bearing. Endplay 0015-.0045".

Camshaft:—Six bearings. Non-adjustable chain drive.
Bearing Type—#1 bronze-backed, babbitt-lined. All others steel-backed, babbitt-lined.
End Thrust—Taken by thrust plate assembled behind camshaft sprocket hub.
Timing Chain—Morse. Width 1½". Pitch .500". Length 26½" or 53 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 23/32"	.340-.341"	6 9/16"
Exhaust	1 21/32"	.340-.341"	6 9/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.002-.004"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.

Installing New Guides—Top of guides must be ⅞" below top of block. Finish ream new guides after installing to inside diameter of .342-.343" (intake), .344-.345" (exhaust).
Tappet Clearance—.006" Int., .008" Exh. with engine warm. Set exhaust clearance at .010" for sustained high speed driving. Valves accessible by removing right front wheel and cover plate under fender.
Valve Springs—Do not compress springs to overall length of less than 2⅛".

	Spring Pressure	Length
Valve Closed	50-55 lbs.	2¾"
Valve Open	80-85 lbs.	2 13/32"

Valve Timing—See Camshaft Setting above.
Intake Valves Open—2° BTDC. Close—44° ALDC.
Exhaust Valves Open—46° BLDC. Close 4° ATDC.
To Check Valve Timing—Use regular timing gauge installed over #1 piston. Set tappet clearance #1 intake valve at .008". This valve should open with piston 2° or .002" before top dead center. Reset tappet clearance at .006" with engine warm.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—30-60 lbs. at normal driving speeds.
Oil Pressure Relief Valve—Located under plug on left hand side of crankcase. Adjustable type. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase, or counterclockwise to decrease oil pressure, replace locking wire and cap.
Capacity and Oil—8 qts. (refill). Use SAE #30 (summer—normal conditions), #40 (summer—high speed driving or temperatures above 100°F.), #20-W (winter—down to 0°F.), #10-W (winter—0° to —15°F.).

CLUTCH:—**Long Model 12CB.** Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for complete data.
Clutch Pedal Adjustment—Clutch pedal should just clear under side of toeboard. Adjust by loosening locknut and turning stopscrew at rear of pedal above shaft. Free movement of pedal should be 1 5/32". Adjust by loosening locknut and turning clutch release fork lever setscrew.
Clutch Facings—Woven rubber or asbestos composition, 2 required, 6⅛" I.D., 11" O.D., .133" thick.

NOTE—Transmission should be removed before removing clutch. Mark clutch cover and flywheel and reassemble in same position.

STEERING:—**Front Suspension**—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—10° crosswise.
Caster—1°. Adjust by inserting angle shims between spring and spring pad on axle.
Camber—½° (¼-¾°). No adjustment. Manufacturer recommends that no attempt be made to bend axle.
Toe In—1/16-⅛" measured at hub height on center of tread. Adjust in usual manner by loosening clamp bolts and turning tie rod.

Steering Gear:—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type with Bendix Vacuum Power Unit. See separate articles in Brake Section for relining and complete adjustment of brakes, and power unit.
NOTE—Wheel cylinders are marked 'R' for right brakes, 'L' for left brakes, and are not interchangeable.
Drum Diameter—15".
Lining—Moulded type. Width 2½". Thickness ¼". Length 30¼" per wheel.
Clearance—.006" heel, .012" toe, for each shoe.

Hand Brake:—External at rear of transmission.
Adjustment—Adjust brake band to give 1/16" clearance.
Drum Diameter—8".
Lining—Woven type. Width 2⅜". Thickness ¼".

Power Brake Unit:—Bendix Internal Valve type. See article in Brake Section.

ENGINE NUMBER:—First number—Chrysler C-7-1001, Number is stamped on boss on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates that cylinder bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above.

ENGINE SPECIFICATIONS:—6 cylinder 'L' head.
Bore—3⅜". Stroke—4½".
Displacement—241.5 cubic inches.
Rated Horsepower—27.34 (AMA).
Developed Horsepower—93 HP. (Std. 6.0-1 Head), 100 HP. (Optl. 6.5-1 head) at 3400 R.P.M.
Compression Ratio—6.0-1 Std. Cast-iron head, 6.5-1 Optl. Aluminum head.
Compression Pressure—6.0-1 Std. Head 120-130 lbs. at 1000 R.P.M. or approx. 103 lbs. at cranking speed. **6.5-1 Optl. Head** 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.
NOTE—Aluminum heads should be tightened cold.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). **Length—3⅞". Weight**—Held to two gram max. variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished: (1) standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be slotted and then finished on cam grinding equipment.
Fitting New Pistons:—Micrometer gauge recommended. Using feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler must be 3-4 lbs.
Installing Pistons:—Slot should be toward left.

PISTON RINGS:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Lower ring grooves drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. all	⅛"	.007-.015"	.002-.003"
Oil (both)	5/32"	.007-.015"	.002-.003"

Replacement Rings:—Furnished in standard and .003", .010", .020", .030", .040" .050", .060" oversizes.
NOTE—Install undercut compression and oil wiper ring with step down.

PISTON PIN:—Diameter 55/64". Length 2⅞".
Pin floats in piston and rod. Held by locking rings at each end. Pin hole in rod is bronze bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120° F.
Pin Fit in Rod Bushing—Tight thumb push fit with pin and rod at 70° F.
Replacement Pins:—Pins furnished in standard and .003", .005", .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING ROD:—Weight—Held within limits.
Length—8¾" (center-to-center).
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, copper-lead lined. Furnished standard and .010" undersize.
Clearance—.0005-.0025". Sideplay .0055-.0115".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings so small bosses engage grooves in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) or toward front (#2, 4, 6). Oil hole in lower bearing upper half must be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Special Shop Notes for replacement bearings and bearing cap data.*
End Thrust:—Taken by flange faces on rear (#4) bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #4, machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—New bearings require no line-reaming.
End Thrust:—Taken by thrust plate at rear of sprocket hub. Endplay .003-.005".
Timing Chain:—Morse. Width 1". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES—	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5 5/8"
Exhaust	1 15/32"	.340-.341"	5 5/8"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh., (hot). .010" Exh. recommended for sustained high speed.
Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) and down (exhaust). Top of guide must be 13/16" below top of block. After installing finish ream new guides to inside diam. of .342-.343" (Int.), .344-.345" (Exh.).
Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1½".

	Spring Pressure	Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #6 intake valve at .010". Intake valve should open at top dead center when 'O' mark on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006".
Motor Gauge—Weidenhoff Adapter #103, Rod #12. Gauge plug hole over #6 cylinder.

LUBRICATION:—Pressure. Gear type oil pump located at right of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left hand side of crankcase. Operates at 40 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Crankcase Capacity:—6 qts. (refill).

CLUTCH:—Borg & Beck Model 10A6. Single plate, dry disc type. See article in Clutch Section.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Clutch pedal should just clear underside of toe board with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1 1/16". To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Removal—Disconnect clutch pedal linkage, remove fork pivot screw, take out clutch fork. Remove transmission (release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension and avoid distortion of clutch cover. Remove clutch from below. Use pilot studs when removeing and installing transmission to avoid springing clutch plate.
Automatic Clutch:—See article in Clutch Section.

STEERING:—Steering Gear—Gemmer Model Worm-and-Roller type. See article in Steering Section.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section. Following specifications apply with car weight on wheels (check suspension unit height first).
Wheel Setting (Front Suspension Height)—Distance from center line of lower control arm yoke pin to top of frame cross member should be 7¼-7 3/8" with car weight on wheels but no load in car.
Kingpin Inclination—10° plus or minus ½° (including camber angle), 8¾-10¼° (without camber).
Camber—¼°. Limits minus ¼°-plus ½°.
Caster—1½°. Toe In—0-⅛".

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission or rear wheel service brakes (on cars with overdrive). See article in Brake Section.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear 1⅜"), Rear Wheel (Front end 1⅛", Rear 1¼").
NOTE—Wheel cylinders marked 'R'—right side of car, 'L'—left side of car and not interchangeable.
Drum Diameter—11".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 22 5/32".
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—External type on drum at rear of transmission (cars without overdrive). See Service Brake for hand brake adjustment on cars with overdrive.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Adjust brake band guide bolt nut to give 1/16" clearance (as above) for lower portion of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/16" clearance (as above).
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".
NOTE—When relining, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" maximum.

ENGINE NUMBER:—First number—C8-1001. Stamped on left side of block between #1 and 2 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke** 4⅛".
Displacement—273.8 cubic inches.
Rated Horsepower—33.80 (AMA).
Developed Horsepower—105 HP. at 3400 R.P.M. (Std. 6.2-1 head.)
Compression Ratio—6.2-1 Std. Cast-iron head, 7.0-1 Optl. aluminum head.
Compression Pressure—6.2-1 Std. Head 125-135 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed. **7.0-1 Optl. Head** 130-140 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.
NOTE—Aluminum heads should be tightened cold. Special head studs, head gaskets and spark plugs used with aluminum heads.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface. **Length**—3⅞".
Weight—Held to two gram maximum variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. Semi-finished pistons furnished in two sizes: (1) standard to .023" oversize; (2) .025-.050" oversize (not interchangeable). Pistons should be slotted and then finished on cam grinding equipment.
Fitting New Pistons:—Micrometer gauge recommended. Using feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler must be 3-4 lbs.
Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression, one undercut oil wiper (#3), one oil control ring per piston, all above pin. Lower ring grooves drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.015"	.002-.003"
Oil (both)	.5/32"	.007-.015"	.002-.003"

Replacement Rings:—Rings furnished standard and .003", .010", .020", .030", .040", .050", .060" oversize.
NOTE—Install undercut compression and oil wiper ring with step down.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾".
Pin floats in piston and rod. Held by locking rings at each end. Pin hole in rod is bronze bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120° F.
Pin Fit in Rod Bushing—Tight thumb push fit with pin and rod at 70° F.
Replacement Pins:—Pins furnished in standard and .003", .005" and .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING ROD:—**Weight**—All rods held within limits.
Length—9 3/16" (center-to-center).
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, copper-lead lined. Furnished standard and .010" undersize.
Clearance—.001-.003". Sideplay—.006-.011".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings so small bosses engage grooves in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7) or toward front (#2, 4, 6, 8). Oil hole in lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Special Shop Notes for replacement bearings and bearing cap data.*
End Thrust:—Taken by flange faces on rear (#5) bearing. Endplay .003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #6 which is machined in crankcase). **Clearance**—.0015-.0025" all bearings.
End Thrust:—Taken between the face of the removable cast-iron sleeve which carries the front bearing and the face of the camshaft sprocket. Adjusted by replacing sleeve. Endplay .003-.005".
Timing Chain:—Morse. Width 1¼". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5½"
Exhaust	1 13/32"	.340-.341"	5½"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" int., .008" exh., (hot). .010" exh., recommended for sustained high speed.
Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) and down (exhaust). Top of guide must be 13/16" below top of block. Finish ream guides after installation to inside diameter of .342-.343" Int., .344-.345" Exh.
Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1½".

	Spring Pressure	Spring Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Valve Timing—Install timing gauge in timing plug hole over #8 piston. Set tappet clearance #8 intake valve at .011" (cold). This valve should open with piston 2° or .0015" BTDC. when 2° line BTDC. on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Pressure. Gear type oil pump on right side of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Located under cap at left side of crankcase. Operates at 40-45 lbs. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase pressure, counter-clockwise to decrease, replace locking wire and cap.
Crankcase Capacity:—6 qts. (refill).

CLUTCH:—**Borg & Beck Model 10A6.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Clutch pedal should just clear underside of toe board with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1/16". To adjust, lossen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Removal—Disconnect clutch pedal linkage, remove fork pivot screw, take out clutch fork. Remove transmission (release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension and avoid distortion of clutch cover. Remove clutch from below. Use pilot studs when removing and installing transmission to avoid springing clutch plate.
Automatic Clutch:—See article in Clutch Section.

STEERING:—**Steering Gear**—Gemmer Model Worm-and-Roller type. See article in Steering Section.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section. Following specifications apply with car weight on wheels (check suspension unit height first).
Wheel Setting (Front Suspension Height)—Distance from center line of lower control arm yoke pin to top of frame cross member should be 7¼-7⅜" with car weight on wheels but no load in car. Heights must be equal on both sides within ⅛".
Kingpin Inclination—4¾-6° (incl. camber angle). **Camber**—Minus ¼°. Limits minus ¼ to plus ½°. **Caster**—1½°. **Toe In**—0-⅛".

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand lever applies brake at rear of transmission or rear wheel service brakes (on cars with overdrive). See article in Brake Section for complete adjustment procedure.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear 1⅜"), Rear Wheel (Front end 1⅛", Rear 1¼").
NOTE—Wheel cylinders marked 'R'—right side of car, 'L'—left side of car and not interchangeable.
Drum Diameter—11".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 22 5/32".
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brakes:—External type on drum at rear of transmission. See Service Brake for Hand Brake on cars with overdrive.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Adjust brake band guide bolt nut to give 1/16" clearance (as above) for lower portion of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/16" clearance (as above), making sure that groove in bolt nut is lined up with ridge on lockwasher.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".
NOTE—Clearance at anchor and saddle .005" max.

ENGINE NUMBER:—First number—C9, C10, or C11-1001. Stamped on boss back of water pump.
See Chrysler Special Shop Notes for engine number lettering data.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". Stroke—4⅞".
Piston Displacement—323.5 cubic inches.
Rated Horsepower—33.80 (AMA).
Developed Horsepower—For each model as follows:

Model	Comp. Ratio	HP. and R.P.M.
C9 Std.	6.2-1	105 at 3400
C9 Optl.	6.5-1	110 at 3400
C10, 11 Std.	6.5-1	130 at 3400
C10, 11 Optl.	7.45-1	138 at 3400

Compression Ratio—See above.
Compression Pressure—6.2-1 Cast-iron head 120-130 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed. **6.5-1 Al. head** 145-155 lbs. at 1000 R. P. M. or approx. 117 lbs. at cranking speed, **7.45-1 Al head** 160-170 lbs. at 1000 R.P.M. or approx. 124 lbs at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.
NOTE—Aluminum heads should be tightened cold.

PISTONS:—Aluminum alloy, "T" slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). **Length—3⅞".**
Weight—Held to two grams maximum variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished in two sizes: (1) Standard to .023" oversize, (2) .025"-.050" oversize, not interchangeable. Pistons should be slotted and finished on cam grinding equipment.
Fitting New Pistons:—Micrometer gauge recommended. Using feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler must be 3-4 lbs.
Installing Pistons:—Slot should be toward left

PISTON RINGS:—Two compression, one undercut oil wiper (#3), one oil control ring per piston, all above pin. Lower ring groove drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. all	⅛"	.007-.015"	.002-.003"
Oil cont. all	.5/32"	.007-.015"	.002-.003"

Replacement Rings:—Rings furnished in standard and .003", .010", .020", .030", .040", .050", .060" oversize.
NOTE—Install undercut compression and oil wiper ring with step down.

PISTON PIN:—Diameter—55/64". Length—2¾".
Pin floats in piston and rod. Held by locking rings at each end. Pin hole in rod is bronze bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120° F.
Pin Fit in Rod Bushing—Tight thumb push fit with pin and rod at 70° F.
Replacement Pins:—Pins furnished in standard and .003", .005", and .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING RODS:—Weight—Held within limits.
Length—9". (center-to-center).
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, copper-lead lined. Furnished standard and .010" undersize.
Clearance—.001-.003". Sideplay .006-.011".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings so small bosses engage grooves in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), or toward front (#2, 4, 6, 8). Oil hole in lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Special Shop Notes for replacement bearings and bearing cap data.*
End Thrust:—Taken by flange faces on rear (#5) bearing. Endplay .003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #6 which is machined in crankcase). **Clearance**—.0015-0025" all bearings.
NOTE—New bearings need not be line-reamed.
End Thrust:—Taken between the face of the removable cast-iron sleeve which carries the front bearing and the face of the camshaft sprocket. Adjusted by replacing sleeve. Endplay .003-.005".
Timing Chain:—Morse. Width 1¼". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5½"
Exhaust	1 13/32"	.340-.341"	5½"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh. (hot). .010" Exh. recommended for sustained high speed.
Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) or down (exhaust). Top of guide must be 13/16" below top of block. Finish ream guides after installing to inside diameter of .342-.343" Int., .344-.345" Exh.
Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1½".

	Spring Pressure	Spring Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060"
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Valve Timing—Install timing gauge in timing plug hole over #1 piston. Set tappet clearance #1 intake valve at .011" (cold). This valve should open with piston 2° or .0019" before top dead center when 2° line BTDC on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.
NOTE—Right front wheel and cover plate under fender should be removed for work on valves.

LUBRICATION:—Pressure. Gear type oil pump on right side of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Located under cap at left side of crankcase. Operates at 40-45 lbs. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase pressure, counter-clockwise to decrease, replace locking wire and cap.
Crankcase Capacity:—6 qts. (refill).

CLUTCH:—Borg & Beck Model 11A6. Single plate, dry disc type. See article in Clutch Section.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 11". Thickness ⅛".
Adjustment—Clutch pedal should just clear underside of toeboard with clutch engaged. To adjust, turn pedal stopscrew located above clutch pedal shaft. Free movement of clutch pedal must be 1 1/16". To adjust, turn clutch shaft collar adjusting screw at right hand end of clutch pedal shaft.
Removal—Disconnect clutch linkage, remove transmission (rotating clutch release fork shaft so that release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly. Remove clutch from below.
Automatic Clutch:—See article in Clutch Section.

STEERING:—Steering Gear—Gemmer Model Worm-and-Roller type. See article in Steering Section.
Front Suspension:—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—4½-5½° crosswise.
Caster—2° plus or minus 1°. Adjust by inserting wedge shims between spring and axle pad on axle. Shims or angle plates furnished ½, 1, 2°.
Camber—½° plus or minus ¼°. No adjustment. Manufacturer recommends that no attempt be made to correct camber by bending tubular axle.
Toe In—0-5/16" measured at hub height on center of tire tread. Adjust in usual manner by changing length of tie rod.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Bendix Vacuum Power unit optional on Model C9 and standard on Models C10, C11. See article in Brake Section.
Wheel Cylinder—Diameters—Front Wheel (Front end 1¼", Rear end 1⅜"), Rear wheel (Front end 1", Rear end 1⅛").
NOTE—Wheel cylinders marked 'R'—right side of car, 'L'—left side of car and not interchangeable.
Drum Diameter—13".
Lining—Moulded type. Width 2". Thickness ¼". Length 24 27/32" per wheel.
Clearance—.012" toe, .006" heel for each shoe.
Hand Brake:—External at rear of transmission.
Adjustment—With lever in released position remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/32", lock anchor screw with wire. Back off adjusting bolt nut until free. Adjust bracket bolt nuts for each end of brake band to 1/32" clearance (as above), secure with locknuts. Finally tighten adjusting bolt nut until tension on bracket bolt nuts is just relieved at either end.
Drum Diameter—7".
Lining—Woven type. Width 2½". Thickness 3/16". Length 21 5/8".
NOTE—Clearance at anchor and saddle .005" max.
Power Brake Unit:—Bendix Internal Valve type. See article in Brake Section.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Turn radiator ornament counter-clockwise, raise hood about 1", push back safety catch at front under lower edge of hood releasing catch and raise hood. Side panels removed by freeing latches on inside lower edges of panels.

ENGINE NUMBER:—First number C-16-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4¼".
Displacement—228.1 cubic inches.
Rated Horsepower—27.34 (AMA).
Developed Horsepower—93 HP. (std. 6.5-1 head), 100 HP. (optl. 7.0-1 head) at 3600 R.P.M.
Compression Ratio—Al. hds. (6.5-1 std., 7.0-1 optl.).
Compression Pressure—6.5-1 hd. (150-160 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed). **7.0-1 hd.** (160-170 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed).
Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—17.46 ounces (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002".
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check pistons at right angles to pin bosses at bottom of skirt) and cylinder bore with micrometer gauge. With feeler (.002") inserted between cylinder wall and piston (side opposite slot), pull required to withdraw feeler must be 5-7 lbs.
Installing Pistons:—Slot away from valves.

PISTON RINGS:—Two undercut compression, two oil control rings per piston, all above pin. Lower ring grooves drilled with ten ⅛" oil drain holes (#3), five (#4 groove).

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—Diameter—55/64". **Length**—2⅞".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit at 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished standard and .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—Weight 31.91 ozs. **Length** 8".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished standard & .0015", .010" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Oil hole in lower bearing upper half must be toward camshaft, all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. Furnished standard & .0015", .010" undersize.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Front Main Bearing Cap Removal, Adjustment directions, and Replacement Bearing Cap data.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in crankcase).
Clearance—.0015-.003".
End Thrust:—Taken by thrust plate at rear of camshaft sprocket. **Endplay**—.002-.006".
Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES—	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.008" Int., .010 Exh. (hot). Remove right fr. wheel and wheel housing to adjust.
NOTE—Exh. valve seat inserts furn. .010" oversize.
Valve Guides:—Must be ⅞" below top of block. Ream guides after installing .342-.343" (all).
Valve Springs:—1⅜" limit of compression.

	Spring Pressure	Spring Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	101-109 lbs.	1 13/32"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Timing:—Set tappet clearance #1 intake valve at .014". Intake valve should open at top dead center when '0' mark on crankshaft pulley at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .008" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on right of engine.
NOTE—Check ignition timing whenever oil pump installed on engine. Tilt engine (with jack under pan) for pump removal.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of engine. Operates at 40 lbs. Adjustable. Heavy (green) spring to increase pressure, lighter (red) spring to decrease pressure.
Crankcase Capacity:—5 quarts (refill).

CLUTCH:—Borg & Beck Mod. 10A7. Mod. #899 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 6". O.D. 10". Thickness ⅛". *See Chrysler Special Shop Notes.*
Adjustment—Adjust stopscrew (just above clutch pedal shaft) so that pedal arm just clears floor board. Free movement of pedal should be 1 1/16" (adjust by turning release fork rod adjusting nut).
Removal:—Remove floor board, remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts evenly, remove assembly from below.

TRANSMISSION:—Own—All helical gear type with synchronizing shift on second and high gears. Warner Mod. AS25-T86 overdrive transmission optl.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear U-joints, disconnect hand brake, remove nuts from studs at clutch housing, disconnect release fork pull-back spring and rod, pull release fork out of clutch housing, remove transmission cover assembly, remove unit with two pilot studs in upper stud holes.
NOTE—Run-out of clutch housing .003" maximum.

UNIVERSAL JOINTS:—Detroit-Universal. Series 4200. Ball and trunion type with roller bearings. 2 used.
NOTE—Three U-joints used on 7 pass. sedan.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on 7 Pass. models. *See Chrysler Shop Notes for data.*

REAR AXLE:—Own—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 (std.). 4.3-1 (with overdrive and 7 pass. sedans).
Backlash—.006-.010". Shim adjustment.
Removal:—Remove axle shaft nut, hub and drum assembly (use hub puller, do not hammer out or bearing damage may result), disconnect brake line at wheel cylinder, remove backing plate (with oil seal). Use shaft puller to remove axle shaft and bearing. With axle shafts removed, differential carrier may be removed by disconnecting rear U-joint at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims between brake backing plates and flanged ends of housing. Remove brake backing plates (see above) and add or remove shims (equally on both sides) to give proper clearance. **Endplay**—.003-.008".
NOTE—Shims supplied .010", .0125", .030" thick.

SHOCK ABSORBERS:—Monroe—Direct acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Mod. 300. Worm-and-Roller.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with no passenger load.
Kingpin Inclination—4¾-6°.
Camber—¼°. Limits minus ¼° to plus ½°.
Caster—1½°. Adjustable.
Toe In—0-⅛". 1/16" preferred. Set long tie rod to 31 7/32" (between ball centers). Adjust short rod for proper toe-in.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°40', 22°50' (7 pass.).

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheel—Front cyl. 1¼". Rear 1⅜".
Rear Wheel—Front cyl. 1⅛", Rear 1¼".
Drum Diameter—10".
Lining—Moulded. Width 2". Thickness .200". Length (rear wh.-rear shoe) 7 25/64", (all others) 9 29/32".
Clearance—.012 toe, .006" heel for each shoe.
Braking Power—55% front wheels, 45% rear.
Hand Brake:—On drum at rear of transmission.
Adjustment—Fully release hand brake lever. Remove anchor screw locking wire (left side), adjust anchor screw for .025" clearance between band and drum, set anchor screw with lock wire. Free large adjusting bolt nut (upper end of band), loosen locknut, adjust guide bolt nut to .025" clearance between band and drum, set with locknut. Tighten adjusting bolt nut until tension on either side of guide bolt is just relieved (groove in nut must align with ridge in lockwasher).
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 16 15/16".
NOTE—Clearance at anchor and saddle .005" max.

NOTE:—Engine Hood and Side Panel Removal—See Chrysler Model C16 Engine Note.

ENGINE NUMBER:—First number C-14-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅛".
Displacement—273.8 cubic inches.
Rated Horsepower—33.80 (AMA).
Developed Horsepower—110 HP. at 3600 R.P.M.
Compression Ratio & Pressure—As follows:

Ratio	Pressure at 1000 R.P.M.	At 100 R.P.M.
6.7-1 std. head	150-160 lbs.	Approx. 118 lbs.
7.4-1 optl. head	165-175 lbs.	Approx. 125 lbs.

Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—16.33 ounces (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002".
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check pistons (at right angles to pin bosses at bottom of skirt) and cylinder bore with micrometer gauge. With feeler (.002") inserted between cylinder wall and piston (side opposite slot), pull required to withdraw feeler must be 5-7 pounds.
Installing Pistons:—Slot away from valves.

PISTON RINGS:—Two undercut compression, two oil control rings per piston, all above pin. Lower ring grooves drilled with ten ⅛" oil drain holes (#3), five (#4 groove).

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—Diameter—55/64. **Length**—2¾".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit at 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished standard and .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—Weight—36.8 ounces.
Length—9 3/16".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished standard and .0015", .010" undersize.
Clearance—.001-.003". **Sideplay**—.006-.011".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rods and caps.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7) or toward front (#2, 4, 6, 8). Oil hole in lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. Furnished standard and .0015", .010" undersize. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Adjustment directions, and Replacement Bearing Cap data.*
End Thrust:—Taken by flange faces on rear (#5) bearing. **Endplay**—.003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #6 machined in crankcase).
Clearance—.0015-.0035".
End Thrust:—Taken between face of removable cast-iron sleeve (carries front bearing) and face of camshaft sprocket. Replace if worn. **Endplay**—.001-.008".
Timing Chain:—Morse. Width 1¼". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5 5/16"
Exhaust	1 13/32"	.340-.341"	5 5/16"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .010" Exh. (hot). Remove right front wheel and housing to adjust.
Valve Guides:—Must be 13/16" below top of block. Ream guides after installing .342-.343" (all).
Valve Springs:—1½" limit of compression.

	Spring Pressure	Spring Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Timing:—Set tappet clearance #1 intake valve at .011". This valve should open with #1 piston 2° or .0015" BTDC. when 2° line BTDC. on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on rt. of engine.
NOTE—To remove oil pump, take out floor boards, loosen engine mountings and tilt engine (jack under oil pan). Check ignition timing whenever oil pump installed on engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under cap on left side of crankcase. Adjust by turning slotted plug (with cap and locking wire removed) clockwise to increase counter-clockwise to decrease.
Crankcase Capacity:—6 quarts (refill).

CLUTCH:—Borg & Beck Mod. 10A6. Mod. #874 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required, I.D. 9⅞". O.D. 6⅛". Thickness ⅛". *See Chrysler Special Shop Notes.*
Adjustment—Adjust stopscrew (just above clutch pedal shaft) so that pedal arm just clears floor board. Free movement of pedal should be 1 1/16" (adjust by turning release fork rod adjusting rod).
Removal:—Remove floor board, remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts evenly, remove assembly from below.

TRANSMISSION:—Own—All helical gear type with synchronizing shift on second and high gears. Warner Model AS25-T86 overdrive transmission optional.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear U-joints, disconnect hand brake, remove nuts from studs at clutch housing, disconnect release fork pull-back spring and rod, pull release fork out of clutch housing, remove trans. cover assembly, remove unit with two pilot studs in upper stud holes.
NOTE—Run-out of clutch housing .003" maximum.

UNIVERSAL JOINTS:—Detroit Universal. Series 5150. Cross type with roller bearings. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE (C-14, C-15):—Own—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio (C-14)—4.1-1 (sedans), 3.91-1 (coupes), 4.3-1 (with overdrive).
Ratio (C-15)—4.55-1.
Backlash—.006-.010". Shim adjustment.
Removal:—Remove axle shaft nut, hub and drum assembly (use hub puller, do not hammer out or bearing damage may result), disconnect brake line at wheel cylinder, remove backing plates with oil seal). Use shaft puller to remove axle shaft and bearing. With axle shafts removed, differential carrier may be removed by disconnecting rear U-joint at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims between brake backing plates and flanged ends of housing. Remove brake backing plates (see above) and add or remove shims (equally on both sides) to give proper clearance. **Endplay**—.003-.008".
NOTE—Shims supplied .010", .0125", .030" thick.

SHOCK ABSORBERS:—Monroe—Direct acting type.
See article in Mechanical Equipment Section for data.

STEERING (C-14, C-15):—Steering Gear—Gemmer Models 330 (C-14), 370 (C-15).
See article in Mechanical Equipment Section for data.
Front Suspension (C-14, C-15):—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with no passenger load.
Kingpin Inclination—4¾-6°.
Camber—¼°. Limits minus ¼° to plus ½°.
Caster—1½° (C-14). 2° (C-15). Adjustable.
Toe In—0-⅛". 1/16" preferred. **C-14**—Adjust short tie rod (long rod 30 15/16" non-adjustable). **C-15**—Adjust tie rods equally in usual manner.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°0' (C-14), 22°15' (C-15).

BRAKES (C-14, C-15):—Service—Lockheed hydraulic, double anchor type. Hand lever applies brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheel—Front cyl. 1¼", Rear 1⅜".
Rear Wheel—Front cyl. 1⅛", Rear 1¼".
Drum Diameter—11" (C-14), 13" (C-15).
Lining—Moulded. Width 2". Thickness .200" (C-14), .262" (C-15). Length 22 5/32" (C-14), 24 27/32" (C-15).
Clearance—.012" toe, .006" heel, for each shoe.
Braking Power—55% front wheels, 45% rear.
Hand Brake:—On drum at rear of transmission.
Adjustment—Fully release hand brake lever. Remove anchor screw locking wire (left side), adjust anchor screw for .025" clearance between band and drum, set anchor screw with lock wire. Free large adjusting bolt nut (upper end of band), loosen locknut, adjust guide bolt nut to .025" clearance between band and drum, set with locknut. Tighten adjusting bolt nut until tension on either side of guide bolt is just relieved (groove in nut must align with ridge in lockwasher).
Drum Diamter—6" (C-14), 7" (C-15).
Lining—Width 2". Thickness 5/32" (C-14), 3/16" (C-15). Length 16 15/16" (C-14), 21½" (C-15).
NOTE—Clearance at anchor and saddle .005" max.

NOTE:—C-15 Oil Pan Removal. With steering wheel in extreme left position and #1 piston half way down on stroke, pan may be removed or installed.

C-15 Hood Side Panel Removal—See Chrysler C-16 Engine Note.

ENGINE NUMBER:—First number (C-15) C-15-1001. Stamped on left side of block between #1 and #2 cylinders. (C-17) C-17-1001. Stamped on boss back of water pump.

See Chrysler Special Shop Notes for engine number lettering data.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅞".
Piston Displacement—323.5 cubic inches.
Rated Horsepower—33.80 (AMA).
Developed Horsepower—130 at 3400 R.P.M.
Compression Ratio & Pressure—As follows:

Ratio	Pressure at 1000 R.P.M.	At 100 R.P.M.
6.50-1 std. head	145-155 lbs.	Approx. 117 lbs.
7.45-1 optl. head	160-170 lbs.	Approx. 124 lbs.

Vacuum Reading—18-21" steady at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—16.33 ounces (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002".
Replacement Pistons:—*See Chrysler Special Shop Notes.*
Fitting New Pistons:—Check pistons (at right angles to pin bosses at bottom of skirt) and cylinder bore with micrometer gauge. With feeler (.002") inserted between cylinder wall and piston (side opposite slot), pull to withdraw feeler 5-7 lbs.
Installing Pistons:—Slot away from valves.

PISTON RINGS:—Two undercut compression, two oil control rings per piston, all above pin. Lower ring grooves drilled with ten ⅛" oil drain holes (#3), five (#4 groove).

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—Diameter—55/64". **Length**—2¾".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit at 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished standard and .003", .005", .008" oversize. Ream bushing and pin hole.

CONNECTING ROD:—Weight 36.1 ozs. **Length** 9".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished standard and .0015", .010 undersize.
Clearance—.001-.003". **Sideplay**—.006-.011".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rods and caps.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7) or toward front (#2, 4, 6, 8). Oil hole in lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Adjustment directions, Replacement Bearings & Bearing Cap data.*
End Thrust:—Taken by flange faces on rear (#5) bearing. **Endplay**—.003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #6 machined in crankcase).
Clearance—.0015-.0035".
End Thrust:—Taken between face of removable cast-iron sleeve (carries front bearing) and face of camshaft sprocket. Replace if worn. **Endplay**—.001-.008"
Timing Chain—Morse. Width 1¼". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5 5/16"
Exhaust	1 13/32"	.340-.341"	5 5/16"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .010" Exh. (hot). Remove right front wheel & housing to adjust.
Valve Guides:—Must be 13/16" below top of block. Ream guides after installing .342-.343" (all).
Valve Springs:—1½" limit of compression.

	Spring Pressure	Spring Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Timing:—Set tappet clearance #1 intake valve at .011". This valve should open with #1 piston 2° or .002" BTDC. when 2° line BTDC. on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet cl. .006" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on right of engine.
NOTE—Check ignition timing whenever oil pump removed. On C-15 oil pump removal as follows: take out floor boards, loosen engine mountings and tilt engine (jack under oil pan).
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under cap on left side of crankcase. Adjust by turning slotted plug (with cap and locking wire removed) clockwise to increase pressure, counter-clockwise to decrease.
Crankcase Capacity:—6 quarts (refill).

CLUTCH:—Borg & Beck Model 11A6. Model #871 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 6⅛", O.D. 11". Thickness ⅛". *See Chrysler Special Shop Notes.*
Adjustment—Adjust pedal stopscrew so that pedal arm just clears floor board. Free movement of pedal should be 1 1/16". Adjust by turning release fork rod adjusting nut (C-15) or pedal shaft collar adjusting nut on (C-17), at right of brake pedal stopscrew.
Removal:—Remove floor board, transmission, see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts evenly, remove assembly from below.

TRANSMISSION:—Own—All helical gear type with synchronizing shift on second and high gears. Warner Model AS15-T85 overdrive standard on C-17, optional on C-15.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear U-joints, disconnect hand brake, remove nuts from studs at clutch housing, disconnect release fork pull-back spring and release rod, remove transmission cover assembly, remove unit with two pilot studs in upper stud holes.

UNIVERSAL JOINTS:—Detroit Universal—Series 5350. Cross type with roller bearings.
See article in Mechanical Equipment Section for data.

REAR AXLE (C-15):—See C-14 previous page for data.

REAR AXLE (C-17):—Own—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio 4.3-1. **Backlash** .006-.010". Shim adjustment.
Removal:—Remove axle shaft nut, hub and assembly (use hub puller, do not hammer out or bearing damage may result), disconnect brake line at wheel cylinder, remove backing plate (with oil seal). Use shaft puller to remove axle shaft and bearing. With axle shafts removed, differential carrier may be removed by disconnecting rear U-joint at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims between inner bearing outer race and flanged end of housing. Remove axle shafts and bearings. Add or remove shims (equally on both sides).
Endplay—.0025-.005".
NOTE—Shims supplied .010", .0125", .030" thick.

SHOCK ABSORBERS:—(C-15) Monroe. Direct acting type. **(C-17) Delco.** Double acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 370. Worm-and-Roller.
See article in Mechanical Equipment Section for data.

Front Suspension (C-15):—See previous page on Model C-14 for specifications.

Front Suspension (C-17):—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—4½-5½° crosswise.
Caster—2° plus or minus 1°. Adjust by inserting wedge shims between spring and axle pad on axle. Shims or angle plates furnished ½, 2°.
Camber—½° plus or minus ¼°. No adjustment. Manufacturer recommends that no attempt be made to correct camber by bending tubular axle.
Toe In—0-⅛". 1/16" preferred. Adjust by changing length of tie rod.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°10'.

BRAKES (C-15):—See C-14 previous page for data.

BRAKES (C-17):—Service—Lockheed hydraulic, double anchor type with Bendix Vacuum Power unit. Hand lever applies brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type: Front wheel: Front cyl. 1¼", Rear 1⅜".
Rear wheel: Front cyl. 1", Rear 1⅛".
Drum Diameter—13".
Lining—Moulded type. Width 2". Thickness ¼". Length 24 27/32" per wheel.
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—60% front wheels, 40% rear.
Hand Brake:—External at rear of transmission.
Adjustment—With lever in released position remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is .025", lock anchor screw with wire. Back off adjusting bolt nut until free. Adjust bracket bolt nuts for each end of brake band to .025" clearance (as above), secure with locknuts. Finally tighten adjusting bolt nut until tension on bracket bolt nuts is just relieved at either end.
Drum Diameter—7".
Lining—Woven type. Width 2½". Thickness 3/16". Length 21⅝".
NOTE—Clearance at anchor & saddle .005" max.
Power Brake Unit:—Bendix Internal Valve type. See article in Brake Section.

SERIAL NUMBER:—First number 7,532,801 (Detroit), 9,709,266 (Canada). On right front door hinge post.
ENGINE NUMBER:—First number C-18-1001. Stamped on left side of block between #1 and #2 cylinders.
See Chrysler Shop Notes for engine number lettering ('Special Standard' bore and bearing sizes).
ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4½".
Displacement—241.5 cubic inches.
Rated Horsepower—27.34 (A.M.A.).
Developed Horsepower—95 HP. (Std. 6.2-1 head), 102 HP. (Optl. 7.0-1 head) at 3600 R.P.M.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM.	At100 RPM.
6.2-1 Std. C.I. hd.	140-150 lbs.	Approx. 115 lbs.
7.0-1 Optl. Al. hd.	155-165 lbs.	Approx. 120 lbs.

Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.
PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—17.45 ozs. (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". See Fitting New Pistons.
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" feeler between cylinder wall and piston (pin removed) on side opposite slot. With piston and block at 70°F. pull to withdraw feeler must be 5-7 lbs.
Installing Pistons:—Slot away from camshaft.
PISTON RINGS:—2 undercut compression, 2 slotted oil rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.002-.0035"
Oil	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished std. and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.
PISTON PIN:—Diameter—55/64". **Length**—2⅞".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Furnished std., and .003", .005", .008" oversize. Ream bushing and pin hole to size.
CONNECTING ROD:—Weight 31.70 ozs. **Length** 7⅞".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished std. and .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Oil spit hole toward camshaft.
CRANKSHAFT:—4 bearing, 9 counterweights (center bolted). Impulse neutralizer mounted on front end.
Journal Diameters—2½" all bearings.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Front Main Bearing Cap Removal, Adjustment directions, and Replacement Bearings and Bearing Caps, Crankshaft Oil Seals.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".
CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—Replacement bushings finish reamed.
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse #1866 (restricted bend). Width 1". Pitch .500". Length 24" or 48 links.
See Chrysler Special Shop Notes for front end removal for work on timing chain.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.
VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

Tappet Clearance—.008" Intake, .010" Exhaust (hot). .012" Exh. setting recommended for sustained high speed driving. Valves excessible by removing right front wheel and fender panel.
NOTE—Self-locking tappet screws used.
See Chrysler Special Shop Notes for Exhaust Valve seat insert removal and installation.
Valve Guides:—Install with taper end up to ⅞" below top of block, then ream to .342-.343".
Valve Springs:—Free length approx. 2". Limit of compression 1⅜".

	Spring Pressure	Spring Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	101-109 lbs.	1 13/32"

Valve Lifters:—Mushroom type. Ream guides from above for following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 42° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .014". This valve should open with piston 8° (.0281") before top dead center with 8° BTDC. mark on impulse neutralizer at front of engine lined up with pointer on chain case cover. Reset tappet clearance at .008" (hot).
Motor Gauge—Weldenhoff Adapter #103, Rod #12.
LUBRICATION:—Gear type oil pump, right of engine.
See Chrysler Special Shop Notes for oil pump removal and installation instructions.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of engine. Operates at 40 lbs. Adjustable. Change to heavy (green) spring to increase pressure, light (red) spring to decrease.
Crankcase Capacity:—5 quarts (refill).
COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, remove fan blades and pulley (attached by 4 capscrews), disconnect pump hoses, remove nuts from pump mounting studs and lift assembly out.
Thermostat:—Fulton. In water outlet on head.
NOTE—Install thermostat with bellows down.
Setting—Start to open 150-155°F. Fully open 176°F.
Water Capacity:—20 quarts.
Drain Valves:—At lower left corner of radiator and on left side of block in front of distributor.
CLUTCH:—Borg & Beck Model 10A7, 11A6 (Taxi). Model #913, 917 (Taxi) stamped on cover. Single plate, dry disc type with new spiral groove type facings and clutch pressure plate oil baffle.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven (spiral grooved), 2 required. Thickness ⅛". Inside diameter 6", 6½" (Taxi). Outside diameter 10", 11" (Taxi).
Adjustment—Adjust stopscrew (to rear of pedal) so that pedal arm just clears floor board. Pedal free movement must be 1". Adjusting nut on fork rod next to release fork.
Removal:—Remove floor board, release fork pull-back spring, free clevis pin on release fork rod. Remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts, take out assembly from below.
TRANSMISSION:—Own make. All helical gear type with synchro-mesh for second and high speeds. Warner Mod. AS1-T86A overdrive transmission optl.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, propeller shaft (see Propeller Shaft Center Bearing below for 7 pass. models), disconnect hand brake cable (remove brake band on cars with overdrive). Remove two front cover screws, take off nuts on mounting studs (remove two upper mounting studs by installing 2 nuts on outer end of stud and turning studs out), install two pilot studs and withdraw transmission.
UNIVERSAL JOINTS:—Detroit-Universal. Series 4200. Ball and trunnion type with roller bearings. 2 used.
NOTE—Three universals used on 7-pass. sedan.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. *See Chrysler Shop Notes for data.*
REAR AXLE:—Own make. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—Standard 4.1-1 (Sedans), 3.9-1 (Coupes), 4.3-1 (7 pass. sedan—all cars with overdrive).
Backlash—.006-.010". Screw adjustment.
Removal:—Remove wheel, hub, and drum assembly (using screw type hub puller). Place block under brake pedal, disconnect brake line, remove backing plate and oil seal, pull axle shaft and bearing (Tool C-158). With shafts removed, carrier may be removed by disconnecting rear universal at flange, and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims at flanged ends of axle housing. With wheel and hub removed measure endplay with dial indicator. To adjust remove backing plate (see above) and add or remove shims (equally at both sides) to proper clearance. **Endplay**—.003-.008".
NOTE—Shims supplied .010", .015", .030" thick.
SHOCK ABSORBERS:—Monroe—Front #676739, Rear #682604. Direct acting, hydraulic type.
NOTE—Delco Direct acting used for export.
See article in Mechanical Equipment Section for data.
STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with 'Push-Pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with no passenger load.
Kingpin Inclination—4¾-6°.
Camber—Plus ¼°. Limits minus ¼° to plus ½°.
Toe In—1/16" (0-⅛"). Set long tie rod to 31⅝" (between ball centers). Adjust short rod.
Steering Geometry—Outer wheel 20°. Inner wheel 22°40', 22°50' (7 passenger sedans).
BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheel—Front cylinder 1¼". Rear 1⅜".
Rear Wheel—Front cylinder 1⅛", Rear 1¼".
Drum—Centrifuse. Diameter—11".
Lining—Moulded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—External at rear of transmission.
Adjustment—*See Chrysler Special Shop Notes.*
Drum—Cast-Iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

SERIAL NUMBER:—First number 6,734,001. Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number C-19-1001. Stamped on left side of block between #2 and #3 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4½".
Displacement—298.6 cubic inches.
Rated Horsepower—33.80 (A.M.A.).
Developed Horsepower—110 HP. (std. 6.2-1 hd.), 115 HP. (optl. 6.5-1 hd.) 122 HP. (optl. 7.4-1 hd.). at 3400 R.P.M.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.2-1 std. C.I. hd.	140-150 lbs.	Approx. 115 lbs.
6.5-1 optl. AL. hd.	150-160 lbs.	Approx. 117 lbs.
7.4-1 optl. AL. hd.	160-170 lbs.	Approx. 124 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—16.33 ozs. (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .021". See Fitting New Pistons.
Replacement Pistons:—*See Chrysler Special Shop Notes.*
Fitting New Pistons:—Check piston size with micrometer at right angles to pin bosses at bottom of skirt. Insert .002" feeler between cylinder wall and piston on side opposite slot. With piston and block at 70°F. pull to withdraw feeler 5-7 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 undercut compression, 2 slotted oil rings per piston, above pin.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	⅛"	.007-.015"	.002-.0035"
Comp. (#2)	⅛"	.007-.015"	.0015-.003"
Oil	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Furnished std. and .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—**Weight** 35.38 ozs. **Length** 9 3/16".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.005-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rods and caps.
Installing Rods:—Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil spit hole toward camshaft.

CRANKSHAFT:—5 bearing, 8 counterweights, with impulse neutralizer mounted on forward end.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Adjustment directions, Replacement Bearings and Bearing Caps, Crankshaft Oil Seals.*
End Thrust:—Taken by flange faces on rear (#5) bearing. **Endplay**—.003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #6 machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken between face of removable cast-iron sleeve (carries front bearing) and face of camshaft sprocket. Replace if worn. **Endplay**—.001-.008".
Timing Chain:—Morse #1866 (restricted bend). Width 1¼". Pitch .500". Length 47 links or 23½". NOTE—Whitney #CLG-205 optional (same specifications). *See Chrysler Special Shop Notes for front end removal for work on timing chain.*
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5½"
Exhaust	1 13/32"	.340-.341"	5½"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust Valve seat insert removal and installation.
Tappet Clearance—.006" Intake, .010" Exhaust (hot). .012" Exh. setting recommended for sustained high speed driving. Valves accessible by removing right front wheel and fender panel.
NOTE—Self-locking tappet screws used.
Valve Guides:—Install with taper end up 13/16" below top of block, then ream to .342-.343".
Valve Springs:—Constant pitch type. Free length approx. 2 19/64". Limit of compression 1 29/64".

	Spring Pressure	Spring Length
Valve Closed	52-58 lbs.	2 1/32"
Valve Open	122-130 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides from above for following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .011". This valve should open with #1 piston 2° (.0017") before top dead center with 2° line BTDC. on impulse neutralizer at front of engine lined up with pointer on chain case cover. Reset tappet clearance at .006" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump, right of engine. *See Chrysler Special Shop Notes for oil pump removal and installation instructions.*
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under cap on left side of engine. Adjust by turning slotted plug (with cap and lock wire removed) clockwise to increase pressure, counter-clockwise to decrease pressure.
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—**Water Pump**—Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section.
Removal—With water drained and fan belt removed, remove fan blades and pulley (attached by 4 capscrews), disconnect pump hoses, remove nuts from pump mounting studs and lift assembly out.
Thermostat:—Fulton. In water outlet on cyl. head.
NOTE—Install thermostat with bellows down.
Setting—Start to open 150-155°F. Fully open 176°F.
Water Capacity:—20 quarts.
Drain Valves:—At lower left corner of radiator and on left side of block in front of distributor.

CLUTCH:—**Borg & Beck Model 11A6.** Model #916 stamped on cover. New clutch pressure plate oil baffle and spiral grooved type facings used.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven (spiral grooved) type, 2 required. Inside Diam. 6½". Outside Diam. 11". Thickness ⅛".
Adjustment—Adjust stopscrew (to rear of pedal) so that pedal arm just clears floor board. Pedal free movement must be 1". Adjusting nut on fork rod next to release fork.
Removal:—Remove floor board, release fork pull-back spring, free clevis pin on release fork rod. Remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts, lower assembly out.

TRANSMISSION:—**Own make**—All helical gear type with synchro-mesh for second and high speeds. Warner Mod. AS2-T85A overdrive transmission optl.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, propeller shaft, disconnect hand brake cable (remove brake band and drum on cars with overdrive). Place jack under engine, remove engine rear supports. Remove two front cover screws, nuts on mounting studs, install two pilot studs and withdraw transmission.

UNIVERSAL JOINTS:—**Detroit Universal.** Series 4400. Ball and trunnion type with roller bearings. 2 used. NOTE—Design identical with 4200 except larger.
See article in Mechanical Equipment Section.

REAR AXLE:—**Own make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—3.91-1 (std.). 4.3-1 (with overdrive).
Backlash—.006-.010". Screw adjustment.
Removal:—Remove wheel, hub, and drum assembly (use screw type hub puller). Place block under brake pedal, disconnect brake line, remove backing plate and oil seal, pull axle shaft and bearing (Tool C-158). With shafts removed, carrier may be removed by disconnecting rear universal at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims at flanged ends of axle housing. With wheel and hub removed measure endplay with dial indicator. To adjust, remove backing plate (see above) and add or remove shims (equally at both sides) to proper clearance. **Endplay**—.003-.008".
NOTE—Shims supplied .010", .015", .030" thick.

SHOCK ABSORBERS:—**Monroe**—Front #683091. Rear #682604. Direct acting hydraulic type.
See article in Mechanical Equipment Section.

STEERING:—**Steering Gear**—Gemmer Mod. 335 Worm-and-Roller type with 'Push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with no passenger load.
Kingpin Inclination—4¾-6° crosswise.
Camber—Plus ¼°. Limits minus ¼° to plus ½°.
Caster—Limits ½-2½°.
Toe In—1/16" (0-⅛"). Set long tie rod to 30 25/32" (between ball centers). Adjust short rod.
Steering Geometry—Outer wheel turned 20°. Inner wheel 22°0'.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type: Front wheel—Front cylinder 1¼". Rear 1⅜". Rear Wheel—Front cylinder 1⅛". Rear 1¼".
Drum—Centrifuse. Diameter—12".
Lining—Moulded. Width 2". Thickness 13/64". Length per shoe 12 9/16".
Clearance—.012" toe, .006" heel, for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—External at rear of transmission.
Adjustment:—*See Chrysler Shop Notes.*
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

SERIAL NUMBER:—First number 7,850,501. On plate on right front door hinge pillar post.

ENGINE NUMBER:—First number C-20-1001. Stamped on left side of block between #2 and #3 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅞".
Displacement—323.5 cu. ins. **Rated HP.**—33.80.
Developed Horsepower—130 (Std. 6.5-1 hd), 138 (Optl. 7.45-1 hd.) at 3400 R.P.M.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.5-1 std. head	150-160 lbs.	Approx. 118 lbs.
7.45-1 optl. head	160-170 lbs.	Approx. 124 lbs.

Vacuum Reading—18-21" steady at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—16.33 ozs. (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .021". See Fitting New Pistons.
Replacement Pistons:—*See Chrysler Special Shop Notes.*
Fitting New Pistons:—Check piston size with micrometer at right angles to pin bosses at bottom of skirt. Insert .002" feeler between cylinder wall and piston on side opposite slot. With piston and block at 70°F. pull to withdraw feeler 5-7 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 undercut compression, 2 slotted oil rings per piston, above pin.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	⅛"	.007-.015"	.002-.0035"
Comp. (#2)	⅛"	.007-.015"	.0015-.003"
Oil	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—Diameter—55/64". **Length**—2¾".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Furnished std. and .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—Weight 34.37 ozs. **Length** 9".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.005-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rods and caps.
Installing Rods:—Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil spit hole toward camshaft.

CRANKSHAFT:—5 bearing, 8 counterweights, with impulse neutralizer mounted on forward end.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Adjustment directions, Replacement Bearings and Bearing Caps, Crankshaft Oil Seals.*
End Thrust:—Taken by flange faces on rear (#5) bearing. **Endplay**—.003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #6 machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others). NOTE—Replacement bushings finish reamed.
End Thrust:—Taken between face of removable cast-iron sleeve (carries front bearing) and face of camshaft sprocket. Replace if worn. **Endplay**—.001-.008".
Timing Chain:—Morse #1866 (restricted bend). Width 1¼". Pitch .500". Length 47 links or 23½". NOTE—Whitney #CLG-205 optional (same specifications). *See Chrysler Special Shop Notes for front end removal for work on timing chain.*
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.340-.341"	5½"
Exhaust	1 13/32"	.340-.341"	5½"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust Valve seat insert removal and installation.
Tappet Clearance—.006" Intake, .010" Exhaust (hot). .012" Exh. setting recommended for sustained high speed driving. Valves accessible by removing right front wheel and fender panel.
NOTE—Self-locking tappet screws used.
Valve Guides:—Install with taper end up 13/16" below top of block, then ream to .342-.343".
Valve Springs:—Constant pitch type. Free length approx. 2 19/64". Limit of compression 1 29/64".

	Spring Pressure	Spring Length
Valve Closed	52-58 lbs.	2 1/32"
Valve Open	122-130 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides from above for following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 44° ALDC.
Exhaust Valves—Open 46° BLDC. Close 4° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .011". This valve should open with #1 piston 2° (.0019") BTDC. when 2° BTDC. line on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance .006" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump, right of engine. *See Chrysler Special Shop Notes for oil pump removal and installation instructions.*
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under cap on left side of engine. Adjust by turning slotted plug (with cap and lock wire removed) clockwise to increase pressure, counter-clockwise to decrease pressure.
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—Water Pump—Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section.
Removal—With water drained and fan belt removed, remove fan blades and pulley (attached by 4 capscrews), disconnect pump hoses, remove nuts from pump mounting studs and lift assembly out.
Thermostat:—Fulton. In water outlet on cyl. head. NOTE—Install thermostat with bellows down.
Setting—Start to open 150-155°F. Fully open 176°F.
Water Capacity:—20 quarts.
Drain Valves:—At lower left corner of radiator and on left side of block in front of distributor.

CLUTCH:—Borg & Beck Model 11A6. Model #915 stamped on cover. Single plate dry disc type with new spiral grooved type facings and clutch pressure plate oil baffle.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven (spiral grooved type). 2 required. I.D. 6½". O.D. 11". Thickness ⅛".
Adjustment—Adjust pedal stopscrew so that pedal just clears floor board. Free movement of pedal should be 1". To adjust, turn adjusting nut on upper end of throwout shaft connecting rod.
Removal:—Remove transmission (see Transmission Removal following), remove housing underpan, mark cover and flywheel, remove cover bolts evenly, take out assembly from below.

TRANSMISSION:—Warner Model AS18-T85. Helical gear type with synchro-mesh on second and high speeds, overdrive transmission.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, disconnect hand brake cable, remove propeller shaft. Disconnect clutch release fork pull rod (at clevis pin) and spring (release bearing assembly attached to transmission and withdraw with it). Place jack under rear of engine, remove rear engine supports. Remove two front cover screws, take off nuts on mounting studs, install two pilot studs in upper holes and withdraw transmission. NOTE—When installing, release fork fingers must align with groove in release bearing sleeve.

UNIVERSAL JOINTS:—Detroit Universal. Series 5350. Cross type with roller bearing. Two used.
See article in Mechanical Equipment Section.

REAR AXLE:—Own. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
***Ratio**—4.55-1. **Backlash**—.006-.010". Screw adj'mt.*
Removal:—Remove wheel, hub, and drum assembly (use screw type hub puller). Place block under brake pedal, disconnect brake line, remove backing plate and oil seal, pull axle shaft and bearing (Tool C-158). With shafts removed, carrier may be removed by disconnecting rear universal at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims at flanged ends of axle housing. With wheel and hub removed measure endplay with dial indicator. To adjust, remove backing plate (see above) and add or remove shims (equally at both sides) to proper clearance. **Endplay**—.003-.008".

SHOCK ABSORBERS:—Monroe—Front #683091. Rear #682604. Direct acting hydraulic type.
See article in Mechanical Equipment Section.

STEERING:—Steering Gear. Gemmer Mod. 375. Worm-and-Roller type with 'Push-Pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with no passenger load.
Kingpin Inclination—4¾-6°.
Camber—¼° preferred. Minus ¼° to plus ½°.
Caster—Limits 1-3°.
Toe In—1/16" (0-⅛"). Adjust rods equally.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°15'.

BRAKES:—Service—Lockheed hydraulic, double anchor type with Bendix Vacuum Power unit. Hand lever applies brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type.
Drum—14". Centrifuse.
Lining—Molded. Width 2½". Thickness ¼". Length per shoe 14 21/32".
Clearance—Toe .012", Heel .006", for each shoe.
Braking Power—55% Front wheels, 45% Rear.
Hand Brake:—External at rear of transmission.
Adjustment—*See Chrysler Shop Notes.*
Drum—7". Cast-iron.
Lining—Width 2½". Thick. 3/16". Length 21½".
Power Brake Unit:—Bendix Internal Valve type.
See article in Mechanical Equipment Section for data.

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—7,574,001 (Royal), 6,948,301 (Royal Windsor). Canada—9,712,121 (All models).

ENGINE NUMBER:—First number C-22-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4½".
Displacement—241.5 cu. ins. **Rated HP.**—27.34.
Developed Horsepower—100 (Std. 6.5-1 hd.), 107 HP. (Optl. 7.0-1 hd.—Std. 7 pass) at 3600 RPM.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM.	At 100 RPM.
6.5-1 cast-iron hd.	140-150 lbs.	Approx. 115 lbs.
7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH. *See Chrysler Shop Notes for engine removal instructions.*

PISTONS:—Aluminum alloy, U-slot, Cam-ground, with Anodic finish. **Length**—3⅞". **Weight**—17.45 ozs.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .0005-.0010".
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" feeler between cylinder wall and piston (pin removed) on side opposite slot. With piston and block at 70° F. pull to withdraw feeler 5-7 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .025", .030", 040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅞". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight** 31.70 ozs. **Length** 7⅞".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable, steel-backed, babbitt-lined. Furnished std. & .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.
Installing Rods:—Oil spit hole toward camshaft.

CRANKSHAFT:—4 bearing type with 9 counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Journal Diameters—2½" all bearings.
Bearing Type—Removable, precision type steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), front main bearing cap removal, replacement bearings and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1866-N, No. 2661. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned to that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.003"

See Chrysler Shop Notes for Exh. Valve Seat Insert data.
Tappet Clearance:—.008" Int., .010" Exh. (hot). .002" additional exhaust clearance recommended for sustained high speed driving. NOTE—Tappet screws self-locking type (no locknuts). Remove right front wheel and housing panel for access to valves.
Valve Guides:—Remove from above. Press new guides in (tapered end up) so upper end ⅞" below top of block, then finish ream to .342-.343".
Valve Springs:—Free length approx. 2". Limit of compression 1⅜".

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	101-109 lbs.	1 13/32"

Valve Lifters:—Mushroom type. Stem diam. ⅝". Ream holes from above (pilot in valve stem guide) for lifters furnished .001", .008", .030", .060" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 42° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
Valve Timing Check—Set tappet clearance #6 intake valve at .014". This valve should open with piston 8° (.0281") before top dead center with 8° BTDC. mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet cl. at .008" hot.

LUBRICATION:—Gear type pump, right of engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Under cap below starter. Opens at 40-45 lbs. To increase pressure use heavy (green) spring, to decrease use light (red) spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—17 quarts.
Radiator Core Removal—*See Chrysler Shop Notes.*
Water Pump:—Packless type, belt-driven. *See article in Mechanical Equipment Section for data.*
Removal—Drain water, remove hood side panels, fan blade assembly, pulley, radiator outlet hose at pump, by-pass (with small hose), pump mounting stud nuts, fan belt adjusting strap at generator.
Thermostat:—Fulton. In water outlet on cyl. head.
Setting—Start to open 157-162° F. Fully open 183°F.
Temperature Gauge:—Motometer (Auto-Lite) Vapor tension type. Part No. H-9063. *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi).** #930 (10A7), #931 (11A6) stamped on cover. Single plate, dry disc type with spiral groove facings, pressure plate oil baffle and new Over-center return spring *See article in Mechanical Equipment Section for data.*
Facings—Woven & compressed, 2 required. Inside Diam. 7" (10A7), 6½" (11A6). Outside Diam. 10" (10A7), 11" (11A6). Thickness .125" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove floorboard, unhook clutch fork pull-back spring and take out clevis pin in connecting link. Remove transmission (see below) and housing underpan, mark cover and flywheel, remove clutch cover screws evenly, lower assembly out.

TRANSMISSION:—**Warner.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse). Model AS3-T86A overdrive transmission with electrical 'kick-down' control optl.
Transmission Control:—Remote control type. *See articles in Mechanical Equipment Section for data.*
Removal:—Remove floor boards, battery ground cable, disconnect front and rear U-joints (see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.), hand brake cable at clevis, speedometer cable, and gearshifter rod and cable at lever on case. Remove mounting stud nuts, cover assembly and 2 upper mounting studs (insert pilot studs).
Overdrive Transmission Removal—Same as above, plus the following: Remove hand brake assembly (U-joint flange, brake drum, band, and support). Disconnect solenoid wires (remove coil) and overdrive cable at case. To remove, turn assembly over on left side while withdrawing until shaft free at release bearing, then push up at forward end (shaft just above bearing), then forward (shaft between clutch fingers). Lower assembly at rear, pull out.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200.** Ball and trunnion type with roller bearings. *See article in Mechanical Equipment Section for data.*
Propeller Shaft Center Bearing:—On 7 pass. sedans. *See Chrysler Shop Notes for service data.*

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
Ratio—3.9-1 (Coupe), 4.1-1 (5 pass. sedan), 4.3-1 (7 pass.—others with OD.), 4.56-1 (7 pass. with OD.).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158).
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims equally (both wheels). **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco.** Direct acting type. Domestic—Front 1110-C. Rear 1111-T. Exp.—1114-C & 1115-T, or 1134-E & 1130-W. *See articles in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear.** Gemmer Model 305 Worm-and-Roller type with 'Push-pull' adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4¾-6°.
Camber—Plus ¼°. Limits minus ¼° to plus ¾°.
Caster—Limits ½-2½°.
Toe In—1/16" (0-⅛"). Set long tie rod to 31⅝" (between ball centers). Adjust short tie rod.
Steering Geometry—Inner wheel 22°40'. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Cast-iron. Diameter 11".
Lining—Molded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32"; rear shoe (7 31/32").
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for data.*
Drum—Cast-iron. Diameter 6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—Stamped on plate on right front door hinge pillar post. First number for each model

C-23	Saratoga	NewYorker	C-24
6,742,201	6,672,701	6,609,901	7,806,201

ENGINE NUMBER:—First number C-23—C-23-1001, C-24—C-24-1001. Stamped on left side of engine between #2 and #3 cylinders.
See Chrysler Shop Notes for Engine Number Lettering ('Special Standard' bore and bearing sizes).

ENGINE SPECIFICATIONS: Own. Eight cylinder, 'L' head type.
Bore—3¼". **Stroke**—4⅞".
Displacement—323.5 cubic inches.
Rated Horsepower—33.80 (A.M.A.).
Developed Horsepower—130 HP. (C23—6.8-1 Hd.), 132 HP. (C24—6.8-1 Hd.), 138 HP. (All—7.45-1 AL. Hd.) at 3400 R.P.M.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM.	At 100 RPM.
6.8-1 hd. (see Note)	150-160 lbs.	Approx. 118 lbs.
7.45-1 aluminum hd.	160-170 lbs.	Approx. 124 lbs.

NOTE—Cast-iron head (C23), Aluminum (C24).
Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.
See Chrysler Shop Notes for Engine Removal data.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodic finish.
Length—3⅞".
Weight—16.33 ounces (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .021". Skirt .0005-.0010". See Fitting New Pistons (following).
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer at bottom of skirt with gauge at right angles to pin bosses. Insert .002" feeler between cylinder wall and piston (with pin removed) opposite piston slot. Pull to withdraw feeler should be 5 to 7 lbs. Cylinders should be reconditioned when taper exceeds .0015" or out-of-round .002". Reconditioned cylinder bores should be within limits of .0005".
Installing Pistons:—U-slot away from camshaft.

PISTON RINGS:—Four rings, all above pin. #1 Compression ring (upper inner edge beveled), #2 Compression (lower outer edge stepped), #3 and #4 oil rings (slotted type).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", and .060" oversize.

PISTON PIN:—Diameter—55/64". **Length**—2¾".
Pin floats in piston and rod. Held by retaining ring at each end. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished in standard and .003", .005", and .008" oversizes. Ream bushing and pin hole to size.

CONNECTING ROD:—Weight—34.37 oz. **Length**—9".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Removable, precision type, steel-backed, babbitt-lined. Furnished in standard and .002", .010", and .012" undersizes.
Clearance—.001-.003". **Sideplay**—.006-.011".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with boss engaging groove in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest portion of bearing toward the rear on #1, #3, #5, and #7, toward the front on #2, #4, #6, and #8. Oil hole in upper bearing half must be toward camshaft side of engine on all rods.

CRANKSHAFT:—Five bearing type with eight integral counterweights. Impulse neutralizer mounted on forward end.
See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.
Journal Diameters—2 45/64" all bearings.
Bearing Type—Interchangeable precision type, steel-backed, babbitt-lined.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), replacement bearings and adjustment data.*
End Thrust:—Taken by flange faces on rear (#5) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—Six bearing type with non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #6 machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—Replacement bushings are furnished finish reamed.
End Thrust:—Taken by thrust plate assembled behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Whitney #668983 Center link guide type. Width 1¼". Pitch .500" (½"). Length 47 links or 23½".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5⅞"
Exhaust	1 11/32"	.340-.341"	5⅞"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.001-.003"

See Chrysler Shop Notes for Exhaust Valve Seat Insert Removal and Installation Instructions.
Tappet Clearance:—.008" Intake, .010" Exhaust (with engine hot). .002" additional exhaust tappet clearance recommended by car manufacturer for cars driven at sustained high speeds. NOTE—Tappet screws are self-locking type (no lock nuts used). Remove right front wheel and housing panel for access to valves.
Valve Guides:—Remove from above. Press new guides in place so upper end 13/16" below top of cylinder block. Install exhaust guide with counterbored end up, intake guide with tapered end up. Ream guides to inside diameter of .342-.343" (intake and exhaust) and counterbore exhaust guides at top to diameter of .365-.375" and depth of ⅜" after installing.
Valve Springs:—Free length approximately 2 19/64". Limit of compression 1 29/64".

	Spring Pressure	Spring Length
Valve Closed	52-58 lbs.	2 1/32"
Valve Open	129-137 lbs.	1 21/32"

NOTE—Spring #685616 used on first C23 cars same as above except: Pressure (valve open) 122-130 lbs. at 1 11/16". Spring #699190 (C23 later cars, all C24 cars) specifications shown above.
Valve Lifters:—Mushroom type. Remove from below with camshaft and valves out. Stem diameter ⅝". Ream guide holes from above (with reamer piloted in valve guide to insure alignment of lifter). Lifters furnished for service in standard and .001", .008", .030", and .060" oversizes.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 50° ALDC.
Exhaust Valves—Open 44° BLDC. Close 12° ATDC.
Valve Timing Check—Set tappet clearance for #8 intake valve at .011" (remove right front wheel and wheel housing for access to valves). This valve should open with piston 6° (.0170") before top dead center with 6° BTDC. mark (sixth graduation to left of '0' mark) on impulse neutralizer opposite pointer on chain case cover at front of engine. Reset tappet clearance at .008" (engine hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12. Separate timing hole over #8 piston (remove plug).

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of crankcase.
Normal Oil Pressure—30-45 lbs. at car speed of 30 M.P.H. 15 lbs. idling.
Oil Pressure Regulator:—Located under plug on left hand side of crankcase. Adjustable type. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase pressure, or counter-clockwise to decrease pressure.
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—Capacity—24 quarts.
Radiator Core Removal—*See Chrysler Shop Notes.*
Water Pump:—Packless type with factory-lubricated and sealed ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain cooling system, remove hood side panels and fan shroud-to-radiator core bolts. Rotate fan shroud around radiator inlet hose (to free shroud) and lift out. Take out fan blade-to-pulley screws and remove blades. Remove pulley and free fan belt by pushing pulley and belt off pump shaft. Take out by-pass elbow-to-pump body capscrews. Free large water pump inlet hose and remove pump body capscrews and nut (on lower edge of pump body) pushing pump off stud and block. NOTE—Back-plate assembled between cylinder block and pump. When removing pump take care to remove proper nut at lower edge of pump. Nut below pump body secures back plate to cylinder block. Also, pump body to cylinder block stud may have to be removed in order to take out pump.
Water Pump Back-plate Removal—Remove water pump as directed above. Take off fan belt adjusting strap by removing bolt at generator and strap stud nut. Remove flat headed screw on face of back-plate (this screw flush on forward face of plate). Then remove stud nut on lower right hand corner of back-plate. Plate can then be removed.
Thermostat:—Fulton. In cylinder head water outlet elbow. Install thermostat with bellows down.
Setting—Starts to open at 157° F. to 162° F. Fully open at 183° F.
Temperature Gauge:—Motometer (Auto-Lite) Vapor tension type. Part No. H-9063.
See article in Mechanical Equipment Section for data.
Drain Valves:—Two drain valves used. Radiator drain valve located at lower left rear corner of radiator. Cylinder block drain valve located on lower left side of block near distributor.

CLUTCH (C-23):—Borg & Beck Model 11A6. #929 stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and new Over-center return spring (hooked in clutch pedal).
See article in Mechanical Equipment Section for data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Facings—Woven and compressed (spiral grooved type), 2 required. Inside Diameter 6½". Outside Diameter 11". Thickness .125".

Adjustment:—Clutch pedal should just clear under side of toeboard. To adjust, loosen locknut and turn stopscrew located at rear of pedal above shaft. Free movement of pedal should be 1". To adjust, turn clutch release fork adjusting nut on connector link

Removal:—Remove floorboard. Take out clutch release fork pull-back spring, and cotter pin and clevis pin in clutch release fork rod. Pull clutch release fork out. Remove transmission (see Transmission Removal following for instructions) and clutch housing underpan. Mark cover and flywheel with punch mark (assemble to these marks when re-installing assembly). Remove clutch cover screws and washers (release spring tension evenly by turning each screw a few turns at a time). Assembly can then be lowered out through pan opening.

CLUTCH (C-24):—Borg & Beck Model 10A6. #933 stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and new Over-center return spring (hooked to pedal).

See article in Mechanical Equipment Section for data.

Facings—Woven and compressed (spiral grooved type), 2 required. Inside Diameter 6". Outside Diameter 10". Thickness .125".

Adjustment and Removal:—Same as for Model C-23 (above) except that frame cross member under clutch housing must be removed after transmission taken out. Clutch assembly mounted on clutch driving plate which is secured at rear of fluid drive unit.

FLUID DRIVE (USED ON MODEL C-24 ONLY):—Consists of fluid coupling assembled to rear of engine in place of conventional flywheel.

See article in Mechanical Equipment Section for data.

Removal:—Remove floorboard, clutch release fork pull-back spring, and cotter pin and clevis pin from end of clutch release fork rod. Pull out clutch release fork. Remove transmission (see Transmission Removal for Model C24 following). Take off frame cross-member (see Note below) and clutch housing underpan. Mark clutch cover and clutch driving plate with punch (assemble to these marks when re-installing assembly). Remove clutch cover mounting screws and lower assembly out through pan opening. Turn fluid drive unit to place one filler plug at bottom, remove plug with Allen type wrench and allow unit to drain. Remove engine oil pan and rear main bearing cap. Remove crankshaft-to-fluid drive bolt nuts (secures fluid drive unit to crankshaft flange), pull drive unit to rear until free from crankshaft flange. Then entire assembly (with clutch driving plate attached) may be lowered out through pan opening.

NOTE—On first cars this cross-member riveted in place. Remove by drilling out rivets and use bolts and lockwashers when re-installing—make certain that bolts securely tightened. On later cars, this cross-member held by bolts and can be removed by taking out bolts.

TRANSMISSION (C-23):—Warner. All helical gear type with constant-mesh, synchro-mesh (second and high), sliding gears (low and reverse).

See article in Mechanical Equipment Section for data.

Overdrive Transmission:—Warner Model AS5-T85A overdrive transmission with electrical kick-down control, optional equipment.

See article in Mechanical Equipment Section for data.

Transmission Control:—Own design steering column mounted remote control shift.

See article in Mechanical Equipment Section for data.

Removal—Remove floorboard. Disconnect battery ground cable at transmission. Disconnect front and rear universal joints. Remove hand brake cable clevis pin at rear of transmission. Take off speedometer cable. Disconnect gearshifter rod and cable at lever on transmission case. Remove transmission cover capscrews and lift cover assembly out. Block up rear of engine until load on transmission supports just relieved (CAUTION—Car must be level so that engine alignment maintained. If front of car raised, engine will set toward rear due to rocking on front rubber support, this in turn may prevent transmission from being withdrawn). Then loosen transmission side supports at frame, place jack under transmission to support weight, and remove support bracket frame bolts. Remove transmission-to-clutch housing stud nuts and two upper studs (install two nuts on end of stud and turn stud out), install two pilot studs. Take off transmission supports from frame and transmission case. Pull transmission out.

Overdrive Transmission Removal—Same instructions as listed below for Model C-24 except that one propeller shaft only used. Remove shaft in conventional manner by disconnecting front and rear universal joints.

TRANSMISSION (C-24):—Warner Model AS5-T85A. All helical gear type with constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) overdrive transmission with electrical kick-down control.

See article in Mechanical Equipment Section for data.

Transmission Control:—Own design steering column mounted remote control shift.

See article in Mechanical Equipment Section for data.

Removal—Remove floorboards. Disconnect battery ground cable at case. Remove rear propeller shaft, four front companion flange nuts, four frame-to-center bearing mounting screws, slide bearing and front shaft back through frame X-member opening (If spacer used between frame and bearing mounting, replace spacer when re-installing). Remove universal joint flange and brake drum from shaft, and clevis pin from brake cable. Take off brake assembly from overdrive case. Disconnect solenoid wires and remove coil. Remove speedometer cable at case. Disconnect gearshifter rod and cable at lever on case and overdrive control cable. Remove cover capscrews and lift cover out. Block up rear of engine until load on transmission supports just relieved (CAUTION—Car must be level so that engine alignment maintained. If front of car only raised, engine will set toward rear due to rocking on front rubber support, this in turn may prevent transmission from being withdrawn). Loosen transmission side supports at frame, place jack under transmission and overdrive assembly to support weight, and remove support bracket frame bolts. Remove mounting stud nuts at clutch housing and two upper studs (install two nuts on end of stud and turn stud out), install two pilot studs. Remove transmission supports from frame and case. To remove, turn assembly over on left side while withdrawing until shaft free of release bearing, then push up on forward end until shaft above bearing, then push assembly forward with shaft extending between two clutch fingers. Assembly can then be lowered at rear and withdrawn.

UNIVERSAL JOINTS:—Detroit-Universal Series 4400 (C-23), Series 5350 (C-24). Ball and trunnion type with roller bearings (C-23). Cross type with roller bearings (C-24). Three joints used on C-24.

See article in Mechanical Equipment Section for data.

Propeller Shaft Center Bearing (C-24):—*See Chrysler Shop Notes for removal and installation data.*

REAR AXLE:—Own. Semi-floating, hypoid gear type with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

Ratio (C-23)—3.91-1 (standard). 4.1-1 (special). 4.3-1 (cars with overdrive).

Ratio (C-24)—4.9-1.

Backlash—.006-.010". Screw adjustment.

Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Lift carrier assembly out.

Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158).

Wheel Bearing Adjustment:—Shims between backing remove backing plate (see above), add or remove plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, shims equally (at both wheels). **Endplay**—.003-.008".

SHOCK ABSORBERS:—Delco or Monroe. Direct acting, hydraulic types. Delco types are adjustable except on Model C-23 (Domestic).

Model	Make	Front	Rear
C-23 (Domestic)	Delco	1110-C	1111-T
" (Domestic)	Monroe	696240	696242
" (Export)	Delco	1114-C	1115-T
" (Export)	Delco	1134-E	1130-W
C-24 (Dom. & Exp.)	Delco	1134-E	1130-W
" (Domestic)	Monroe	696241	696242

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear. Gemmer Model 335 (C-23), 375 (C-24) Worm-and-Roller type with 'Push-pull' adjustment.

See articles in Mechanical Equipment Section for data.

Front Suspension:—Independent, linked parallelogram type with coil springs.

See article in Mechanical Equipment Section for data.

Specifications below apply with no passenger load.

Kingpin Inclination—5¾-7° (C-23), 4¾-6° (C-24).

Camber—0° preferred (C-23), ¼° preferred (C-24). Limits minus ¼° to plus ½°.

Caster—Minus ½° to plus 1½° (C-23). 1-3° (C-24).

Toe In (C-23)—1/16" preferred, limits 0-⅛". Set long tie rod to 30 25/32" (between ball centers) and adjust short rod only for toe-in adjustment.

Toe In (C-24)—1/16" preferred, limits 0-⅛". Adjust both tie rods equally.

Steering Geometry (Toe-out on Turns)—Inner wheel turned 22°0' (C-23), 22°15' (C-24). Outer wheel 20°.

BRAKES:—Service. Lockheed hydraulic, double anchor type. Bendix vacuum power unit used on Model C-24. Hand lever applies independent shaft brake.

See article in Mechanical Equipment Section for data.

Wheel Cylinders—Stepped or two-stage bore type. Front Wheel—Front cylinder 1¼". Rear 1⅜".
Rear Wheel—Front cylinder 1⅛". Rear 1¼".

Drums—Centrifuse. Diameter 12" (C23), 14" (C24).

Lining (C-23)—Molded. Width 2". Thickness 13/64". Length per shoe 12 9/16".

Lining (C-24)—Molded. Width 2¼". Thickness ¼". Length per shoe 14 21/32".

Clearance—.012" toe, .006" heel, for each shoe.

Braking Power—55% front, 45% rear.

Hand Brake:—On drum at rear of transmission.

Adjustment—*See Chrysler Shop Notes.*

Drum—Cast-iron. Diameter—6".

Lining—Width 2". Thickness 5/32". Length 17 1/16".

Power Brake Unit:—Bendix Internal Valve type.

See article in Mechanical Equipment Section for data.

NOTE:—Engine hood is hinged at the cowl and is held down by latch under top louvre of radiator grill at center in front. To free hood, place hand on latch and lift. See that hood is latched in place when down. Complete engine and drive unit (including steering gear) mounted on separate assembly which is bolted to main body side members in front of cowl.

ENGINE NUMBER:—First number—FB-100. Stamped on left side at front of engine block.

ENGINE SPECIFICATIONS:—Lycoming Model FB. Eight cylinder, 90° Vee, 'L' head type.
NOTE—Engine is reversed in chassis with flywheel and clutch at forward end and timing chain at rear. Crankshaft rotation is clockwise at timing chain end (rear) so that rotation as viewed from front of car is counter-clockwise.
Bore—3½". Stroke—3¾".
Piston Displacement—288.6 cubic inches.
Rated Horsepower—39.2 (AMA).
Developed Horsepower—125 at 3500 R.P.M.
Compression Ratio—6.5-1 Std. aluminum head.
Compression Pressure—Approximately 110 lbs. at cranking speed of 130 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 6 M.P.H.
NOTE—Capscrews used to hold down the aluminum cylinder head are of unequal length and must be installed in correct position. 6 long screws (2 1/32") used in top or inner row on head, fourteen medium screws (1 21/32") in two rows across middle of head, four short screws (1 5/16") in lower or outer row on head.

PISTONS:—Ray Day, aluminum alloy, Expansion type with Dome head.
Weight—1.65 lbs. with rings and pin.
Removal—Pistons and rods removed from above.
Clearance—.002-.0025" skirt. See Fitting Pistons.
Replacement Pistons:—Pistons furnished 005", .010", .015" oversize.
Fitting New Pistons:—Check piston diameter and cylinder bore with micrometers. Clearance must be .002-.0025". If .002" feeler gauge ½" wide used, pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be within 6-11 lbs.
Installing Pistons:—Slot should be toward camshaft for pistons in both banks.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Lower ring grooves drilled with eight 1/16" oil drain holes (#3), eight ⅛" oil drain holes and holes to pin bosses (#4).

Ring	Width	End Gap	Side Clear.
Comp. (top)	3/32"	.0075-.0155"	.002"
Comp. (2nd)	3/32"	.0075-.0155"	.0015-.002"
Oil (top)	⅛"	.0075-.0155"	.0015-.003"
Oil (2nd)	3/16"	.0075-.0155"	.0015-.003"

PISTON PIN:—Diameter ⅞". Length 2 19/32". Pin floats in piston and rod. Held by locking ring at each end. Pin hole in connecting rod bronze bushed.
Pin Fit in Piston—Tight palm push fit at 70° F.
Pin Fit in Rod Bushing—.0003-.0005" clearance.

CONNECTING ROD:—Weight 30¾ ozs. Length 7⅝".
Crankpin Journal Diameter—2".
Lower Bearing—Spun babbitt. No shims.
Clearance—.001-.0025". Sideplay .006-.010" (total).
Bearing Adjustment:—No shims. Rods serviced on exchange basis. Cap faces can be filed to reduce clearance.
Installing Rods:—Rods mounted side-by-side on crankpin with right hand rods to front and left hand rods to rear. Install rods with large chamfer on counterbore against shaft (toward crankshaft cheek) and oil jet hole toward top of block for all rods.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable bronze-backed, babbitt-lined. No shims.
Clearance—.0015-.00375".
Bearing Adjustment:—None (no shims). Replace bearings. Bearing caps can be filed to reduce clearance. Check clearance by assembling .0015" shim ½" wide between shaft and cap. Shaft should turn freely with shim in place and bearing cap tight.
End Thrust:—Taken by #2 (center) bearing. Endplay .004-.009". Serviced by replacing bearing.

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushings.
Clearance—.002-.003".
Adjustment—Replace bushings.
End Thrust:—Taken by flange on front bushing. Endplay .003-.007". Serviced by replacing bushing.
Timing Chain:—Whitney. Width 1¼". Pitch ½". Length 29" or 58 links.
Camshaft Setting:—Sprockets are punch-marked. Camshaft sprocket located by dowel and bolted on camshaft flange. Turn engine to #4L top dead center position with punch mark on camshaft sprocket approximately 100° from vertical. Mesh chain so that there are 15 chain teeth between marks.

VALVES:—Valves actuated by rocker arm which contacts cam through roller mounted on arm. Rocker arms carried on twin rocker shafts.

	Head Diameter	Stem Diameter	Length
Intake	1 23/32"	.3420-.3425"	5 17/64"
Exhaust	1 33/64"	.3420-.3425"	5 9/32"

	Seat Angle	Lift	Stem Clear.
Intake	30°	11/32"	.0025-.001"
Exhaust	45°	11/32"	.0025-.001"

NOTE—Stem clearance measured at bottom of guide.
Tappet Clearance—.008" all valves, engine cold. Adjusting screw located on end of rocker arm.
Valve Guides:—Press fit in block.
Valve Rockers:—Shaft hole in rocker arm bronze-bushed. Rockers mounted vertically on tubular shaft. Shaft held in place by setscrew at forward end. See that drilled holes in shafts line up with setscrew holes in bosses and setscrews fully engage lock holes to insure oil holes lining up (rocker arms oiled through hollow shaft). Install rocker arm assembly (first cars) between each pair of crankcase ribs, from front to rear as follows: Right bank—Rocker Arm, Spacer, Rocker Arm, Spring. Left bank—Rocker Arm, Spring, Rocker Arm (front cylinder), Spring, Rocker Arm, Spacer, Rocker Arm (all others). *For assembly after Engine No. FB-1310 see 1937 data (next page).*
Clearance—.0005-.0025".
Rocker Arm Roller—Mounted on pin at middle of rocker arm. Clearance on pin .002-.003". Sideplay .005-.008".
Valve Springs:—Single spring type.

	Spring Pressure
Valve Closed	42-47 lbs.
Valve Open	88-94 lbs.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 7½° BTDC. Close 37½° ALDC.
Exhaust Valves—Open 50° BLDC. Close 5° ATDC.
To Check Valve Timing—Set tappet clearance #4L (rear cylinder—left bank) intake valve at .016". This valve should be about to open (with clearance not yet taken up) with piston 7½° or .0200" before top dead center when point on flywheel approximately 3 teeth before mark '4L' lines up with pointer in inspection hole in right hand side of clutch housing. Reset tappet clearance at .008".

LUBRICATION:—Pressure system with gear type oil pump mounted in crankcase.
NOTE—Ignition timing not disturbed by oil pump removal.
Normal Oil Pressure:—30-40 lbs. with warm oil.
Oil Pressure Regulator:—Mounted on oil pump. Operates at 40 lbs. Adjustable by turning screw.
Crankcase Capacity—7 qts.

CLUTCH:—Long Mod. 10CF-CI. Semi-centrifugal, single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.
Facings—Woven type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .137".
Adjustment:—Pedal free movement should be 1¼". To adjust, remove clevis pin in clutch throw-out lever at forward end of connecting rod, loosen locknut at rear end of rod, turn rod in or out of rear clevis. Check operation of Transmission Control clutch pedal circuit breaker (Master Shift Switch) whenever clutch adjusted (see article in Mechanical Equipment Section for directions).
NOTE—Linkage changed after Serial No. 810-1544 to insure softer action by bolting extension on clutch throw-out shaft lever. Clutch pedal must have 7" travel (pedal 7" above floor when engaged). Adjust by changing position of stop clamp on pedal shaft under floor.
Removal—Remove kingpins, remove drive shaft at inner universal by knocking out taper pin in shaft, remove both inner universals attached to side of transmission case, then remove driving unit. Remove clutch bell housing, take out capscrews mounting clutch on flywheel (turning all screws out evenly), lift clutch out.

DRIVING UNIT:—Transimission and differential assembly mounted in single case bolted to forward (flywheel) end of engine.
See article in Mechanical Equipment Section for data.
Removal:—Procedure same as outlined for Model 812. *See Cord Model 812 'M' page (following).*

STEERING:—Steering Gear—Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment procedure.
Front Suspension:—Independent type. Each front wheel carried on rear end of longitudinal arm pivoted at front and linked to end of transverse spring.
Kingpin Inclination—6° crosswise.
Caster—1-2½° positive. Adjusted by changing length of suspension bolts on longitudinal arm at end of spring. Tighten nut to increase caster.
Camber—1°. No adjustment provided.
Toe In—0-⅛" **toe out** (wheels point out at front). Adjusted by changing length of each tie rod equally (loosen clamp bolts and turn tie rod).

BRAKES:—Lockheed Hydraulic, Two shoe, Single anchor type. Hand lever applies rear wheel brakes. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two stage bore type. Installed with large end of cylinder toward front of car and not interchangeable
Drum Diameter—11".
Lining—Moulded type. Width 2¼". Thickness 3/16". Length 19" per wheel (front), 11" (rear).
Clearance—.010" toe, .005" heel on each shoe.
Hand Brake Adjustment:—See Service Brakes.

NOTE:—Complete engine and drive unit (including steering gear) mounted on separate assembly which is bolted to main body side members in front of cowl.

Rotation:—Counter-clockwise viewed from front (engine reversed in chassis).

Engine Hood:—Hinged at cowl, lifts from forward end. To free latch, lift up at point under top radiator louvre at center in front.

ENGINE NUMBER:—Stamped on left side of engine block at front end.

ENGINE SPECIFICATIONS:—Lycoming, Model FB (Std. 812), FC (Schgd. 812) Eight cylinder, 90° Vee.
Bore—3½". **Stroke**—3¾".
Piston Displacement—288.6 cubic inches.
Rated Horsepower—39.2 A.M.A.
Developed Horsepower—125 at 3500 RPM. (Std. 812), 175 at 4200 RPM. (Schgd. 812).
Compression Ratio—6.5-1.
Compression Pressure—Approx. 110 lbs., 130 R.P.M.
Vacuum Reading—18-20" idling at 6 M.P.H.

PISTONS:—Ray Day, aluminum alloy, strut type with domed head. **Length**—3 15/16".
Weight—1.65 lbs. with rings and pin.
Clearance—.002-.0025" skirt. See Fitting Pistons.
Removal—Pistons and rods removed from above.
Replacement Pistons:—.005", .010", .015" oversize.
Fitting New Pistons:—Check piston skirt and cylinder bore with micrometers or use .002" feeler ½" wide between piston and wall on side opposite slot. Tension to withdraw feeler must be 6-11 lbs.
Installing Pistons:—Slot toward camshaft (all pist.).

PISTON RINGS:—Two compression, two oil control rings, all above pin. Oil ring grooves drilled with eight 1/16" oil drain holes (#3), eight ⅛" holes and oil holes to pin bosses (#4).

Ring	Width	End Gap	Side Clearance
Comp. (#1)	3/32"	.0075-.0155"	.002"
Comp. (#2)	3/32"	.0075-.0155"	.0015-.002"
Oil (#3)	⅛"	.0075-.0155"	.0015-.003"
Oil (#4)	3/16"	.0075-.0155"	.0015-.003"

PISTON PIN:—Diameter—⅞". **Length**—2 19/32". Pin floats in piston and rod. Held by locking ring at each end. Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—Tight palm push fit at 70° F.
Pin Fit in Rod Bushing—.0003-.0005" clearance.

CONNECTING ROD:—Weight—30¾ ozs. **Length**—7⅝".
Crankpin Journal Diameter—2".
Lower Bearing—Spun babbitt type. No shims.
Clearance—.001-.0015". Sideplay .006-.010" total.
Bearing Adjustment:—None (no shims). Rods serviced on exchange basis. Bearing caps can be filed.
Installing Rods:—Rods for right bank toward front, left bank toward rear (side-by-side mounting) with large chamfer on counter-bore toward crankshaft cheek and oil jet hole toward top of block.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Bronze-backed, babbitt-lined.
Clearance—.0015-.00375".
Bearing Adjustment:—No shims. Bearing caps can be filed or bearings replaced. Use .0015" shim ½" square assembled in cap to check clearance.
End Thrust:—Taken by center main bearing. Endplay .004-.009". Adjusted by replacing bearing.

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushings.
Clearance—.002-.003". **Endplay**—.003-.007".
Camshaft Removal:—Remove from front (flywheel) end. Take out 5/16" setscrew behind water pump drive pulley which holds oil pump and distributor drive assembly, lift drive assembly out of crankcase.
Timing Chain:—Whitney. Width 1¼". Pitch .500". Length 29" or 58 links.

NOTE—Chains with master link can be split at this link. On chains without master link, remove and install chain 'endless' with sprocket off engine.
Camshaft Setting:—Sprockets are marked. Turn crankshaft until piston #4L on top dead center with timing mark '4L' at indicator. Turn camshaft until intake valve in this cylinder about to open. Mesh chain so that there are exactly 15 chain teeth or links between marks.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 23/32"	3405-.3425"	5 17/64"
Exhaust	1 33/64"	3405-.3425"	5 9/32"

	Seat Angle	Lift	Stem Clearance
Intake	30°	11/32"	.001-.0025"
Exhaust	45°	11/32"	.0015-.003"

NOTE—Measure stem clearance at bottom of guide.
Tappet Clearance:—.008" (Std. 812), .008-.010" (Schgd. 812) all valves with engine cold.
Valve Rockers:—Mounted vertically on tubular shaft at lower end and contact valve stem directly at upper end. Rocker arm shaft hole is bronze-bushed.
Clearance on Shaft—.0005-.0025".
Rocker Arm Roller—Clearances on rocker arm pin .002-.003". Sideplay .005-.008".
Rocker Arm Assembly—Tubular shafts held by setscrew at forward end. Rocker arms pressure-oiled through the hollow shaft. See that drilled holes in forward ends line up with setscrews in bosses and that setscrews fully engage lock holes to insure oil holes lining up. To remove shafts, remove ½" pipe plugs at forward end (flywheel off engine), take out setscrews, pull shafts out. To install rocker arms, assemble as follows: Right bank (front to rear)—rocker arm, spring, rocker arm, large spacer, small spacer (for each cylinder—between crankcase ribs); Left bank (front to rear)—small spacer, large spacer, rocker arm, spring, rocker arm (except for front cylinder where no spacers used).

Valve Springs:—	Pressure	Length
Valve Closed	59½ lbs.	2 3/16"
Valve Open	122 lbs.	1 27/32"

Valve Timing:—See Camshaft Setting above.

Standard 812
Intake Valves—Open 7½° BTDC. Close 37½° ALDC.
Exhaust Valves—Open 50° BLDC. Close 5° ATDC.

Supercharged 812
Intake Valves—Open 9° BTDC. Close 44° ALDC.
Exhaust Valves—Open 50° BLDC. Close 10° ATDC.
To Check Timing—Set tappet clearance #4L piston (rear piston, left bank) at .016". This valve should begin to open with piston 7½° or .0200" (Std. 812), 9° or .0287" (Schgd. 812) before top dead center when point on flywheel 3 teeth (Std. 812), 3½ teeth (Schgd. 812) before dead center mark '#4L' lines up with indicator in inspection hole in right side of housing. Reset tappet clearance.

LUBRICATION:—Pressure system with gear type oil pump mounted in crankcase. Oil pump or distributor may be removed without disturbing drive.
Normal Oil Pressure—30-40 lbs. with warm oil.
Oil Pressure Regulator—Located on oil pump cover. Operates at 40 lbs. **Crankcase Capacity**—7 quarts.

CLUTCH:—Long, Model 10CF-CI. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. Inside Diam. 6", Outside Diam. 10". Thickness .137".
Adjustment:—Free movement of clutch pedal must be 1¼". To adjust, remove clevis pin in clutch throw-out lever at forward end of connecting rod, loosen locknut at rear end of rod, turn rod.

NOTE—See that pedal has 7" travel (pedal 7" above carpet when clutch engaged). Adjust by changing position of stop clamp on pedal shaft under floor.
NOTE—Check operation of Transmission Control clutch pedal circuit breaker (Master Shift Switch) whenever clutch adjusted. See article in Mechanical Equipment Section.
Removal:—Remove Driving Unit (see section below), remove clutch bell housing, take out mounting screws in clutch cover flange on flywheel.

DRIVING UNIT:—Transmission and differential assembly mounted in single case bolted to forward (flywheel) end of engine.
See article in Mechanical Equipment Section for data.
Removal:—Remove louvre assembly, radiator, and sheet metal cover over drive unit. Raise front end of car with jacks under support arms so that wheels just clear floor. Remove front wheels, top and bottom kingpins, rubber bumper on frame siderail above drive shaft, disconnect tie rod at spindle arms. Drive groove pins out of outer end of inner universal assemblies, remove outer universal and shaft (pull out to clear at splined joint), place these assemblies on floor so as to not strain front brake tubes. Remove capscrews in inner universal housing flange, remove inner universal assemblies. Take out bolts in engine mounting bracket on front cross-member, support engine at forward end, take out mounting bolts on driving unit flange on clutch bell housing.

TRANSMISSION:—Own Make. 4 speed (over-drive on fourth). Constant mesh, helical gears, synchromesh (except low and reverse), sliding spur gears low and reverse). No direct drive.
Removal—See Driving Unit section above.

DIFFERENTIAL ASSEMBLY:—Own Make. Spiral bevel gear type (in Driving Unit). Drives to front wheels through individual shafts with universal joints at inner and outer ends.
Backlash—.004-.008". Screw adjustment.
Removal—See Driving Unit Section above.

UNIVERSAL JOINTS:—Bendix, Constant-velocity Ball type, 4 used (one at each end of each shaft).

SHOCK ABSORBERS:—Delco Model 1741-U, T (front), 1748-C, D (rear). Double acting hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 330. Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Own design, independent type. Each front wheel mounted on rear end of suspension arm which is pivoted on frame at forward end. Transverse front spring linked to suspension arm by special suspension bolt at outer ends.
Kingpin Inclination—6° crosswise.
Caster—2½°. Suspension arm built with 1° caster. To adjust, turn nut at upper end of suspension bolt (tighten nut to increase caster).
Camber—1°. No adjustment provided.
Toe In—0-⅛" **toe out** (wheels must point out at front). To check, see that intermediate steering arm centered (forward ends equal distances from frame), loosen tie rod clamps, turn rods equally.

BRAKES:—Service—Lockheed Hydraulic, Two shoe, Single Anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped bore type. Install with large end of cylinder forward. Not interchangeable.
Drum Diameter—11".
Lining—Molded & Woven type. Width 2¼". Thickness 3/16". Length 19" per wheel (front), 11" (rear).
Clearance—.010" toe, .005" heel on each shoe.
Hand Brake:—See Service Brakes above.

ENGINE REMOVAL NOTE:—Engine removal from chassis required for all service work. *See Crosley Special Shop Notes for removal directions.*

SERIAL NUMBER:—First number 390-10000. Stamped on front face of cowl below battery shelf (in engine compartment).

ENGINE NUMBER:—First number C-10000. Stamped on top center of engine block at rear of carburetor.

ENGINE SPECIFICATIONS:—**Waukesha.** Two cylinder, 'L' head, horizontal opposed, air-cooled type with shrouded cylinders and air circulating fan built in flywheel.

Bore—3". **Stroke**—2¾". **Rated Horsepower**—7.2.

Displacement—38.87 cubic inches.

Developed Horsepower—13.5 at 4000 R.P.M.

Compression Ratio—5.5-1.

Compression Pressure—90 lbs. at cranking speed.

Vacuum Reading—No means of connecting gauge.

PISTONS:—Electric furnace cast iron. Matched for equal weight within ⅛ oz.

Weight—18.5 ozs. (with pin). **Length** 2⅝".

Removal—Pistons & rods removed from above with engine out of chassis. *See Crosley Special Shop Notes for engine removal instructions.*

Clearance—.004-.0055". See Fitting Pistons.

Fitting New Pistons:—Use feeler gauges installed between piston and cylinder wall at right angles to pin hole. Piston should pass through bore on .004" feeler and lock on .0055" feeler.

Replacement Pistons:—Finished pistons furnished Standard and .010", .020", .040" oversize.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr. #1	⅛"	.010-.015"	.002-.0035"
Compr. #2	⅛"	.010-.015"	.0015-.003"
Oil Contr.	3/16"	.010-.018"	.001-.0025"

NOTE—Install oil ring with scraper edge down.

Replacement Rings:—Furnished Standard and .010", .020", .040" oversize.

PISTON PIN:—**Diameter** ⅝". Pin floats in piston and rod, held by locking ring at each end.

Pin Fit in Piston—.0002" clearance or thumb push fit at normal temperature.

Pin Fit in Rod Bushing—.0003" clearance. Ream new bushings with ⅝" reamer for this clearance.

Replacement Pins:—Std. and .005", .010" oversize.

CONNECTING ROD:—**Weight** 12.5 ozs. **Length** 4⅝".

Lower Bearing—Removable steel-backed, babbitt lined type.

Crankpin Journal Diameters—1½".

Clearance—.0025". **Sideplay**—.008".

Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

Replacement Bearings:—Furnished Std. and .003" undersize. Install bearings with locating lugs fitted in notches in rod and cap. NOTE—Bearings can be renewed through pan opening without removing engine from chassis.

CRANKSHAFT:—Two bearing, counterweighted type. *See Crosley Special Shop Notes for Engine Removal directions for main bearing and crankshaft oil seal servicing.*

Journal Diameters—Front 1⅝". Rear 2¼".

Bearing Type—Steel-backed, babbitt-lined bushings (not split). Front bearing mounted in timing gear housing cover.

Clearance—.001-.003" (frt.), .0015-.003" (rear).

Adjustment:—None. Replace bearings. *See Crosley Special Shop Notes for Crankshaft Removal directions.*

End Thrust:—Taken by rear bearing. Adjustable by replacing fiber thrust washer. **Endplay**—.003-.005".

CAMSHAFT:—Proferal (alloy iron). Two bearing, gear driven.

Bearing Type—Removable bushing in rear cover (front), machined in crankcase (rear).

Clearance—.001-.003".

Endplay—.006-.009". Controlled by timing gear. *See Crosley Special Shop Notes for Camshaft Removal and front bushing servicing data.*

Timing Gears:—Allowable runout .001". To renew gears, remove camshaft (see Crosley Shop Notes for data), use puller to remove old gears.

Camshaft Setting:—Mesh gears so that 'C' mark on camshaft gear and punchmark on crankshaft gear line up (install gears with these marks forward).

VALVES:—

	Head Diameter	Stem Diameter
Intake	1⅜"	5/16"
Exhaust	1 5/32"	5/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.300"	.002-.003"
Exhaust	45°	.300"	.003-.004"

Tappet Clearance—.006-.0065" Intake, .007-.0075" Exhaust, Cold. Not adjustable. NOTE—After grinding valves, check tappet clearance with feeler gauge. Grind off end of valve stem if clearance less than minimum above.

Valve Guides:—Guides can be removed and renewed with engine out of car and dismantled (See Shop Notes for engine removal directions). Ream new guides with 5/16" reamer for correct stem clearance (above).

Valve Lifters:—Mushroom type. Remove from below with camshaft out of engine (see Shop Notes for Camshaft removal directions).

Lifter Clearance—.0005-.0015".

Valve Timing:—See Camshaft Setting above. Intake Valves—Open 20° BTDC. Close 60° ALDC. Exhaust Valves—Open 60° BLDC. Close 20° ATDC.

To Check Valve Timing—Intake valve should open when point on flywheel 5.5 teeth before TDC mark (half round notch on rim of flywheel) lines up with small ribcast on top center of crankcase. Exhaust closing point is 5.5 teeth past TDC point.

LUBRICATION:—Pressure to crankshaft, connecting rod and camshaft bearings.

Oil Pump:—Rotary vane type mounted on timing gear cover and driven directly from camshaft.

Removal—Take out 4 screws mounting pump on timing gear cover, remove pump. Serviced by replacement. Use new gasket when installing pump.

Normal Oil Pressure:—30-45 lbs. with warm oil.

Oil Pressure Regulator:—On timing gear case cover. Adjustable by varying valve spring tension (increase tension to increase oil pressure).

Crankcase Capacity—2 quarts.

COOLING:—Air-cooled by suction fan built in flywheel which draws air past cylinder barrel and head fins through ducts formed by shroud bolted over cylinders.

Cooling Fan Capacity—700 cu. ft. of air per minute at 3600 R.P.M.

CLUTCH:—**Rockford.** Single plate dry disc type. *See article in Mechanical Equipment Section for data.*

Facings—Not furnished separately (each facing consists of 4 segments).

Adjustment:—Clutch pedal free travel should be 1.5". To adjust, loosen locknut and turn clevis on connector cable at lower end of throw-out yoke.

Removal:—Remove transmission (see Transmission Removal below) and rear axle as an assembly (do not disconnect drive shaft at rear of transmission case as for transmission removal only). Disconnect clevis at bottom of clutch yoke, remove throw-out bearing from top of yoke, take out six capscrews mounting clutch lever brackets on flywheel, remove clutch assembly.

TRANSMISSION:—**Warner Model AS1-T92.** Sliding spur gear type (all speeds). *See article in Mechanical Equipment Section for data.*

Removal:—Hoist rear of car to remove weight from springs, disconnect springs at rear axle, disconnect brake cables and conduits at backing plates, shock absorber links, exhaust pipe and muffler at torque tube. Block up rear of engine, disconnect speedometer cable and clutch cable clamp on bottom of transmission case, take off control housing and remove shift lever assembly. Take out capscrews in torque tube flange on rear face of transmission case, pull rear axle and propeller shaft assembly to rear **being careful not to lose spring and two washers on shaft at rear of speedometer gear.** Take out four capscrews mounting transmission on flywheel housing, pull transmission straight back and remove.

UNIVERSAL JOINTS:—None used.

REAR AXLE:—**Spicer (Salisbury) Model 11.** Semi-floating spiral bevel gear type with Torque Tube drive. *See article in Mechanical Equipment Section for data.*

Ratio—5.14-1 or 5.57-1.

Backlash—.004-.008". Shim adjustment.

Removal:—Disconnect shock absorber links, brake cables and conduits at backing plate. Hoist rear end of car to remove weight from springs, disconnect springs at axle. Free exhaust pipe and muffler from torque tube, block up rear end of transmission (supported by torque tube). Take out capscrews in torque tube flange on rear of transmission case, pull torque tube and rear axle assembly to rear and remove **being careful not to lose spring and two washers on front end of propeller shaft at rear of speedometer gear.**

Axle Shaft Removal—Remove hub cap, wheel, axle nut, pull hub (use puller No. 202318). Disconnect brake cable and conduit on backing plate, take out four capscrews and remove backing plate being careful not to lose bearing adjusting shims (between backing plate and axle housing flange). Pull axle and bearing out.

Wheel Bearing Adjustment:—Check endplay with dial indicator. Adjust by removing backing plate (see Axle Shaft Removal above) and adding or removing shims between backing plate and axle housing.

Endplay—.002-.007" between shaft and thrust block (total for both shafts).

TORQUE TUBE & PROPELLER SHAFT ASSEMBLY:—Spicer No. 98-1107X. Shaft is supported by bearing at center of torque tube and has splined joint at each end to engage transmission mainshaft (front), rear axle pinion shaft (rear). Torque tube has flanged ends which bolt directly to transmission case and rear axle housing.

Propeller Shaft Removal—Remove rear axle and torque tube as a unit (see Rear Axle Removal above), withdraw propeller shaft through forward end of torque tube.
CAUTION—When installing assembly in car make certain that spring and washers assembled on forward end of propeller shaft (necessary to prevent endplay in shaft).

SHOCK ABSORBERS:—Delco Model 1201G, H (front), 1201J, K (rear). Single acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Ross Model S-12. Cam-and-Lever type.
See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with reverse Elliott ends and semi-elliptic springs.

Kingpin Inclination—6°30' crosswise.

Camber—2°. No adjustment provided.

Caster—9°. No adjustment provided.

Toe In—3/64-1/16". Adjust in usual manner by loosening tie rod clamp bolts and turning rod.

BRAKES:—Service—Hawley. Four wheel, mechanical type with 'floating' lining. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.

Drum Diameter—6".

Lining—Width 1". Thickness 5/32". Length 18⅜" per wheel. NOTE—Lining furnished in correct length to fit loosely around shoe assembly with 1/16-⅛" gap at ends (not riveted on shoes).

Clearance—Just clear of drag.

Hand Brake:—See Service Brakes above.

CROSLEY SPECIAL SHOP NOTES

ENGINE REMOVAL (FOR SERVICING):—Engine should be removed from chassis for all major service work as follows: Disconnect battery ground cable, distributor cables, choke and throttle connections, oil gauge tube line at engine. Close shut-off valve at gasoline tank, disconnect gas line at sediment bulb. Remove exhaust pipe (connecting manifold and muffler), accelerator bracket, generator, starting motor (accessible by removing plate in driver's compartment). Disconnect clutch cable bracket on transmission case, clutch cable clevis at clutch yoke, speedometer cable at transmission. Block up front end of car and remove front axle assembly and wheels. Drain oil, remove oil pan and oil suction tube (pan retained by Phillips type screws). Remove hold-down bolts in front motor support, block engine and transmission up, take out capscrews mounting transmission on flywheel housing, pull engine forward. Take out capscrews mounting torque tube on rear face of transmission case, remove transmission. Lower engine to floor, raise front end of car, remove engine from below.
Installation—Install engine in same manner. Check ignition timing if distributor disturbed.

PISTON & CONNECTING ROD REMOVAL:—With engine removed from chassis (above), take out 7 Phillips screws in each shroud, remove shrouds from cylinders. Remove cylinder heads and oil pan (pan retained by 9 Phillips screws). Take out connecting rod bearing cap screws, push piston and rod assembly out through cylinder barrel.

CAMSHAFT REMOVAL:—With engine removed from chassis (above), remove intake and exhaust manifold assembly, cylinder shrouds (retained by 7 Phillips screws in each shroud), cylinder heads, and oil pan (retained by 9 Phillips screws). Remove connecting rod and piston assemblies, gear housing cover (with oil pump), and valve cover. Block up valves by placing 5/16"x¾" capscrew between crankcase and spring washer on each valve, pull camshaft and timing gear assembly out through front of crankcase.

CRANKSHAFT REMOVAL:—For Main Bearing & Crankshaft Oil Seal Servicing. With engine removed from chassis (above), dismantle engine and remove camshaft (see Camshaft Removal above). Take out 4 capscrews mounting flywheel on crankshaft flange, pull flywheel. Pull crankshaft out through front end of crankcase by hand.

Main Bearing Renewal—Drive old bearings out (rear bearing in crankcase, front bearing in gear housing cover), drive new bearing bushings in place. Bearings are precision type and need not be reamed.

Oil Seal Renewal—Drive old oil seals out of crankcase (rear), gear housing cover (front) with drift pin. Use mandril or hardwood block to drive new seals in place. CAUTION—When installing crankshaft use care not to damage leather oil seals.

CAMSHAFT BUSHING RENEWAL:—Take out 8 capscrews in gear housing cover and Phillips screws in oil pan which enter gear cover, remove gear cover. Drive or press camshaft bushing out of timing gear cover and install new bushing in same manner.

NOTE—Rear camshaft bushing is integral with crankcase and cannot be serviced.

FRONT WHEEL & AXLE ASSEMBLY REMOVAL: For Engine Removal from chassis. Raise front end of car until front wheels clear floor, disconnect brake cables at levers on backing plates and cable conduit from backing plate clamps. Disconnect drag link at pitman arm, disconnect shock absorber links at axle. Remove front spring 'U' bolts at axle. Hoist front end of car and roll wheel and axle assembly out from under car.

SERIAL NUMBER:—First number (SC Std) 5,040,001, (SC Cust.) 6,005,001. (SD Std.) 5,056,001, (SD Cust.) 6,013,001. On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and #2 cylinders.
NOTE—Letter 'A' following engine number indicates that bore .020" larger than standard. Letter 'B' indicates main and connecting rod bearings .010" smaller than standard. Letters 'AB' indicate bore and bearing sizes as above.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. Floating Power engine mounting (SD 1933).
Bore—3¼". **Stroke**—4¼" (SC), 4⅜" (SD).
Displacement—211.5 cu.ins. (SC), 217.7 cu.ins. (SD).
Horsepower—Rated 25.35. Developed 75 at 3400 R.P.M. (SC), 79 at 3400 R.P.M. (SD Std. 5.35-1 head), 86 at 3400 R.P.M. (SD Optl. 6.2-1 head).
Compression Ratio—5.35-1 (Std. head SC, SD), 6.2-1 (Optl. head SD).
Compression Pressure—Approximately 90-95 lbs. (std. head), 100-105 lbs. (Optl head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" at idling speed.
NOTE—Special cylinder head gaskets, head studs and spark plugs (long thread) used with optional aluminum heads. Aluminum heads must be tightened cold.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type. Recondition cylinders when taper exceeds .0015" or out-of-round exceeds .002". Reconditioning limits .0005". Use finished replacement pistons.
Weight—Held to ¼ oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—.022" top, .0015-.002" skirt. See Fitting Pistons.

Replacement Pistons:—Finished pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. Install same oversize in all cylinders to maintain balance.

Fitting New Pistons:—Use micrometer gauge to check piston diameter and cylinder bore. Finish bore to size for correct clearance. Feeler gauge .0015" thick can be used on side opposite slot.

Installing Pistons:—Slot should be to left or away from valves.

PISTON RINGS:—Two special tongue-and-groove type compression rings, one oil wiper ring, one oil control ring per piston, all above slot. Clearance between rings in tongue-and-groove pair should be .003-.005".

Ring	Width	End Gap	Side Clearance
Compression	9/64"	.005-.010"	.003" max.
Oil Wiper (#3)	⅛"	.007-.015"	.003" max.
Oil Cont. (#4)	5/32"	.007-.015"	.003" max.

PISTON PIN:—Diameter 55/64". Length 2¾". Pin floats in piston and rod. Held by locking rings. Pin hole in rod is bronze bushed.
Pin Fit in Piston—Tight thumb push fit with piston heated to temperature of boiling water (212°F.).
Pin Fit in Rod Bushing—Tight thumb push fit at temperature of (70° F.).

CONNECTING ROD:—Length 8 13/16". Weight held to ¼ oz. maximum variation.
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun babbitt-lined type integral with rod and cap.
Clearance—.001-.00275. Sideplay .003-.009".
Adjustment:—None (no shims). Replace rods. Do not file rods or caps.
Installing Rods:—Lower bearings offset. Install rods with widest half of bearing toward rear of engine (cylinders #1, 3, 5) or toward front of engine (cylinders #2, 4, 6). Oil hole in upper half of lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—Four bearing. Integral counterwghts.
Journal Diameters—2¼" all bearings.
Bearing Type—Removable bronze-backed, babbitt-lined.
Clearance—.001-.002".
Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by #4 rear main bearing. Endplay .004-.005".

CAMSHAFT:—Four bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 1/16"; #2, 1 31/32"; #3 1 15/16"; #4, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined type except #4 which is machined in crankcase.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate, front bearing.
Timing Chain:—Morse. Width 1¼". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off hub.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	11/32"	5¼"
Exhaust	1 15/32"	11/32"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.005" Int., .007" Exh. engine hot.
Valve Springs:—Do not compress springs to over-all length of less than 1¾".

	Spring Pressure	Spring Length
Valve Closed	40-44 lbs.	2 1/16"

Intake Valves—Open 6° BTDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Use regular timing gauge installed in timing hole over #6 piston. Set tappet clearance #6 intake valve at .011". This valve should open with piston .014" past top dead center. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weldenhoff Adapter #103. Rod #12.

LUBRICATION:—Pressure type. Gear type oil pump located at right of crankcase.
Normal Oil Pressure—15 lbs. idling, 30-40 lbs. at 20 M.P.H.
Oil Pressure Relief Valve—Under cap on left hand side of crankcase. To adjust, remove cap, take out locking wire, turn slotted plug clockwise to increase, or counter-clockwise to decrease oil pressure, replace locking wire.
Crankcase Capacity—6 qts.

CLUTCH:—Borg and Beck. (SC) Model 9A1 marked 514 on cover, (SD) Model 10A1 marked 611 on cover. Single plate, dry disc type. See article in Clutch Section for complete relining and asembling directions.
Facings (SC-9A1)—Moulded type, 2 required. Thickness ⅛". Inside Diameter 6⅛". Outside Diameter 8⅞".
Facings (SD—10A1)—Moulded type, 2 required. Thickness ⅛". Inside Diameter 6¾". Outside Diameter 9⅞".
Adjustment—Adjust pedal stopscrew (at rear of pedal below pedal shaft) for highest position of pedal without interference with floor. Pedal free movement must be 1¼". To adjust, loosen locknut and turn clutch fork adjusting screw in front of pedal shaft.

STEERING:—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section for compelte adjustment directions.
Front Suspension—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—1-3°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1¼°. No adjustment. Must be equal for both wheels.
Toe In—1/16" measured 9" up on wheels. Adjusted in usual manner by loosening tie rod ends and turning tie rod.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies separate brake at rear of transmission. See article in Brake Section for complete adjustment directions.
Drum Diameter—11".
Lining—Moulded type. Width 1½". Thickness 3/16". Length 20 7/32" per wheel.
Clearance—.012" toe, .006" heel for each shoe.
Hand Brake:—External type on drum at rear of transmission.
Adjustment—Place lever in released position, remove locking wire and turn anchor adjusting screw to give 1/16" clearance between lining and drum at this point. Turn adjusting nut at top of adjusting bolt to give 1/16" clearance around band. If necessary, loosen locknut and turn guide bolt nut so that clearance is uniform around band.
Drum Diameter—7".
Lining—Width 2". Thickness 5/32". Lgth., 21 13/32".

ENGINE NUMBER:—Stamped on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates that bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letter 'AB' indicates that bore and bearing sizes are as above.

SERIAL NUMBER:—First number (SE) 5,068,501; (SG) 5,082,501 (Detroit), 9,603,436 (Windsor, Canada). Located on right front door hinge pillar post.

ENGINE:—Own. 6 cylinder, 'L' head. Floating power.
Bore—3⅜". **Stroke**—4½".
Piston Displacement—241.5 cubic inches.
Rated Horsepower—27.34 A.M.A.
Developed Horsepower—100 at 3400 R.P.M. with standard heads.
Compression Ratio—(SE) 6.2-1 Std. aluminum hd. No Optl. (SG) 6.5-1 Std. aluminum head, 7.0-1 optl.
Compression Pressure—Approximately 105 lbs. (6.2-1 hd.), 110 lbs. (6.5-1 hd.), 117 lbs. (7.0-1 hd.) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.
NOTE—Aluminum heads should be tightened cold.

Pistons:—Aluminum alloy, 'T' slot, cam ground type. Semi-finished pistons (head and ring grooves completely finished, skirt semi-finished) furnished for service where 'cam' grinding equipment is available in two sizes: (1) standard to .023" oversize, (2) .025" to .050" oversize. If cam grinding equipment is not available, use finished replacement pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040"," .050", .060" oversize and finish cylinder bores to provide correct clearance. Piston length 3⅞".
Removal—Pistons and rods removed from above.
Weight—Held to 7 grams or ¼ oz. variation.
Clearance—Top .022". Skirt .002".
Fitting New Pistons—Use micrometer gauges to check cylinder bore and piston diameter.
Installing Pistons—Slot at left (away from valves).

Piston Rings:—Two compression, one undercut oil wiper, ring (#3), one oil control ring per piston, all above pin. Lower ring grooves drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.007-.015"	.003"
Oil Cont. All	5/32"	.007-.015"	.003"

Piston Pin:—Diameter 55/64". Length 2⅞". Pin floats in piston and rod. Held by retaining rings. Piston should be heated in boiling water to remove or install pins. Pins furnished .003", .005", .008" oversize.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120°F.
Pin Fit in Rod Bushing—Light thumb push fit with piston at room temperature (70°F).

Connecting Rod:—Weight, maximum variation held to 7 grams or ¼ oz. Length 8¾".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small boss registering with groove (both halves). Furnished .010" undersize and standard.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear of engine (#1, 3, 5), or toward front of engine (#2, 4, 6). Oil hole in upper half of bearing must be toward valve side on all rods.

Crankshaft:—Four bearing. Integral counterwgts.
Journal Diameter—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Special Shop Notes for Replacement Bearings and Bearing Caps.*
End Thrust—Taken by rear bearing. Endplay .003-.007".

Camshaft:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type (except #4, machined in crankcase).
Clearance—.0015-.0025" radial, .003-.005" endplay.
End Thrust—Taken by thrust plate at rear of sprocket hub.
Timing Chain—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5 5/16"
Exhaust	1 15/32"	.340-.341"	5 5/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—Use special tool to remove and install guides. Intake guides installed with taper end up, exhaust guides with taper end down. Top of guide must be 13/16" below top of block. Finish ream new guides to inside diameter of .342-.343" intake, .344-.345" exhaust after installing.
Tappet Clearance—.006" Int., .008" Exh. with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Tappet adjustment accessible by removing right front wheel and cover plate under front fender.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress springs to over-all length of less than 1 11/16".

	Spring Pressure	Spring Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Timing:—See Camshaft Seting above.
Intake Valves—Open at TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake and exhaust valves at .010". Intake valve should open at top dead center when 'O' mark on impulse neutralizer at front of engine lines up with pointer on chain case. Reset tappet clearance at .006" Int., .008" Exh. (engine hot).

Lubrication:—Pressure. Gear type oil pump located at right of crankcase.
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Under plug on left hand side of crankcase. Operates at 40-45 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Capacity & Oil—6 qts. Use SAE. #30 (summer—#40 for high speed driving or temperatures above 100°F), #20-W (winter 32° to 0°F), #10-W (winter 0° to —15°F).

CLUTCH:—Borg & Beck Model 10A3 (SE), 10A6 (SG). Model No. stamped on cover (SE) 855, (SG) 883. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembly directions.
Clutch Pedal Adjustment—Clutch pedal should just clear underside of toeboard with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1" (SE), 1 1/16" (SG). To adjust, SE—turn clutch release fork lever adjusting screw (with locknut released) at left end of clutch release fork lever; (SG)—turn clutch shaft adjusting screw at right hand end of clutch pedal shaft.
Clutch Facings—Woven asbestos, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.
NOTE—To remove clutch first remove clutch fork and pivot by taking out pivot capscrew. Mark clutch cover and flywheel before disassembling and install in same position. Install driven plate assembly with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal with in .005".

STEERING:—Front Suspension—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—9° (SE), 4° (SG) crosswise.
Caster—2° plus or minus 1°. Adjust by wedge shims inserted betwen springs and spring pad on axle. Shims or angle plates furnished ½, 1, 2°.
Camber—½° plus or minus ¼°. No adjustment provided. Manufacturer recommends that no attempt be made to correct camber by bending tubular axle centers.
Toe In—1/16-⅛" measured at hub height. Adjust as usual by changing length of tie rod.
Steering Gear:—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustmts.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand lever applies brakes at rear of transmission. See article in Brake Section for relining and complete adjustment procedure.
Wheel Cylinders—Diameters—Front Wheel (front shoe 1¼", rear shoe 1⅜"); Rear Wheel (SE—front shoe 1⅛", rear shoe 1¼"), (SG—front shoe 1", rear shoe 1⅛").
NOTE—Wheel cylinders marked 'R' right side of car, 'L' left side of car, and are not interchangeable.
Drum Diameter—11".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 22 5/32".
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—External type at rear of transmission.
Adjustment—With lever in released position remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/32", lock anchor screw with wire. Turn adjusting nut at top of adjusting bolt so that clearance around drum is 1/32". Loosen locknut and turn guide bolt, if necessary, to secure uniform clearance around drum.
Drum Diameter—6" (SE), 7" (SG).
Lining—Woven type. Width 2½". Thickness ¼" (SE), 3/16" (SG). Length 18¼" (SE), 21 13/32" (SG).
NOTE—When relining, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" maximum.

SERIAL NUMBER:—First number, 6,023,501 (Detroit), 9,664,001 (Windsor, Canada). On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates that bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letters 'AB' indicates that bore and bearing sizes are as above.

ENGINE:—Own. Six cylinder, 'L' head type.
Bore—3⅜". Stroke, 4½".
Displacement 241.5 cu. ins. **Rated HP.** 27.34.
Developed Horsepower—91 at 3400 R.P.M.
Compression Ratio—6.0-1 Std. cast-iron head, 6.5-1 special aluminum head.
Compression Pressure—120-130 lbs. (6.0-1 head), 125-135 lbs. (6.5-1 head) at 1000 R.P.M. or approx. 103 lbs. (6.0-1), 110 lbs. (6.5-1) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

Pistons:—Aluminum alloy, 'T' slot, Cam ground type. Semi-finished pistons (head and ring grooves completely finished, skirt semi-finished) furnished for service where 'cam' grinding equipment is available in two sizes: (1) standard to .023" oversize, (2) .025" to .050" oversize. If cam grinding equipment is not available, use finished replacement pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize and finish cylinder bores to provide correct clearance. Piston length 3⅞".
Removal—Pistons and rods removed from above.
Weight—Held to 7 grams or ¼ oz. variation.
Clearance—Top .025", Skirt .002".
Fitting New Pistons—Use micrometer gauges to check cylinder bore and piston diameter.
Installing Pistons—Slot at left (away from valves).

Piston Rings:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Lower ring grooves drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clearance
Comp. All	⅛"	.007-.015"	.003"
Oil Cont. All	5/32"	.007-.015"	.003"

Piston Pin:—Diameter 55/64". Length 2⅞". Pin floats in piston and rod. Held by retaining rings. Piston should be heated in boiling water to remove or install pins. Furnished .003", .005", .008" oversize.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120°F.
Pin Fit in Rod Bushing—Tight thumb push fit with piston at room temperature (70°F.).

Connecting Rod:—Weight—maximum variation held to 7 grams or ¼ oz. Length, 8¾".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small boss registering with groove (both halves). Bearings furnished .010" undersize and standard.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearing toward rear of engine (#1, 3, 5), or toward front of engine (#2, 4, 6). Oil hole in upper half of bearing must be toward valve side on all rods.

Crankshaft:—Four bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Special Shop Notes for Replacement Bearings and Bearing Caps.*
End Thrust — Taken by rear bearing. Endplay .003-.007".

Camshaft:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type (except #4 machined in crankcase).
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at rear of sprocket hub.
Timing Chain—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5 5/16"
Exhaust	1 15/32"	.340-.341"	5 5/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—Use special tool to remove and install guides. Intake guides installed with taper end up, exhaust guides with taper end down. Top of guide must be 13/16" below top of block. Finish ream new guides to inside diameter of .342-.343" intake, .344-.345" exhaust after installing.
Tappet Clearance—.006 Int., .008" Exh. with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Valves accessible by removing right front wheel and housing cover under fender.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress springs to over-all length of less than 1 11/16".

	Spring Pressure	Spring Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 22/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake and exhaust valves at .010". Intake valve should open at top dead center when '0' mark on impulse neutralizer at front of engine lines up with pointer on chain case. Reset tappet clearance at .006" Int., .008" Exh., with engine hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Lubrication:—Pressure. Gear type oil pump located at right of crankcase.
Normal Oil Pressure—40-45 lbs. at driving speeds.
Oil Pressure Relief Valve—Under plug on left hand side of crankcase. Operates at 40-45 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease) red.
Crankcase Capacity—6 quarts.

CLUTCH:—Borg & Beck, Model 10A6. Single plate, dry disc type. No adjustment required for wear. *See article in Mechanical Equipment Section for data.*
Clutch Pedal Adjustment—Clutch pedal should just clear underside of toeboard with clutch engaged. To adjust, turn stopscrew located just above cutch pedal shaft. Free movement of pedal should be 11/16". To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Clutch Facings—Woven asbestos, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.
NOTE—To remove clutch first remove clutch fork and pivot by taking out pivot capscrew. Mark clutch cover and flywheel before disassembling and install in same position. Install driven plate assembly with mark "Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—Front Suspension—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
King Pin Angle—10° plus or minus ½° (including camber angle) or 8¾-10¼° from vertical (without camber angle).
NOTE—Following specifications apply with car weight on wheels (check spring height first).
Caster—1½° (½-2½°). To adjust, jack up car with jack placed under lower control arm or spring seat so that weight of car is not on wheels. Loosen upper and lower control arm yoke nuts, remove lubricant fitting at front end of upper control arm yoke pin, loosen clamp bolts on upper yoke and upper end of knuckle support, insert special caster adjusting wrench in lubricant fitting hole in front end of upper yoke, turn upper control arm yoke pin so as to move upper end of knuckle support toward rear to increase caster angle, or toward front to decrease caster angle. Tighten clamp bolts and yoke nuts.
Camber—½° (¼—1°). Camber affected by caster adjustment and must be checked when caster angle is changed. Before changing camber, see that king pin pivot angle is correct and that loaded heights of front springs are equal (see paragraph below). To adjust camber, jack up car with jack placed under lower control arm so that weight of car is on spring but not on wheel, disconnect tie rod at wheel end, remove upper control arm yoke nut, pull yoke out of control arm, add spacers between yoke and control arm to increase camber, or remove spacers to decrease camber (place spacers removed in this manner on inner face of control arm under yoke nut).
Toe In—1/16-⅛" measured at hub height on center of tire tread. Adjust by changing length of each tie rod equally. Measure tie rods to be certain that lengths are equal after adjusting).
Spring Heights—Distance from center line of lower control arm yoke pin to top of frame cross member (flat section) should be 7¼" to 7⅜" with car weight on wheels but no load in car). Heights on each side of car must be equal within ⅛".

Steering Gear:—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustmts.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for relining and complete adjustment procedure.
Wheel Cylinders—Diameters—Front Wheel (front shoe 1¼", rear shoe 1⅜"); Rear Wheel (front shoe 1⅛", rear shoe 1¼").
NOTE—Wheel cylinders not interchangeable.
Drum Diameter—10".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 19 13/16".
Clearance—.012" toe, .006" heel, for each shoe.

Hand Brake:—External type at rear of transmission.
Adjustment—Place lever in released position, remove locking wire and turn anchor adjusting screw until clearance between lining and drum is 1/16" at this point. Turn adjusting nut at upper end of adjusting bolt until clearance around drum is 1/16". If necessary, loosen locknut and turn guide bolt nut to secure uniform clearance around drum.

ENGINE NUMBER:—First number—S1-1001. Stamped on boss on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates that cylinder bore is .020" larger than standard. Letter 'B' indicates that main and connecting rod bearings are .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above.

ENGINE SPECIFICATIONS:—6 cylinder 'L' head.
Bore—3⅜". **Stroke**—4½".
Displacement—241.5 cubic inches.
Rated Horsepower—27.34 (AMA).
Developed Horsepower—93 HP. (Std. 6.0-1 Head), 100 HP. (Optl. 6.5-1 head) at 3400 R.P.M.
Compression Ratio—6.0-1 Std. Cast-iron head, 6.5-1 Optl. Aluminum head.
Compression Pressure—6.0-1 Std. Head 120-130 lbs. at 1000 R.P.M. or approx. 103 lbs. at cranking speed. **6.5-1 Optl. Head** 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.
NOTE—Aluminum heads should be tightened cold.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). **Length**—3⅞". **Weight**—Held to two gram max. variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished: (1) standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be slotted and then finished on cam granding equipment.
Fitting New Pistons:—Micrometer gauge recommended. Using feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler must be 3-4 lbs.
Installing Pistons:—Slot should be toward left.

PISTON RINGS:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Lower ring groves drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. all	⅛"	.007-.015"	.002-.003"
Oil (both)	5/32"	.007-.015"	.002-.003"

Replacement Rings:—Furnished in standard and .003", .010", .020", .030", .040", .050",. 060" oversizes. NOTE—Install undercut compression and oil wiper ring with step down.

PISTON PIN:—Diameter 55/64". **Length** 2⅞".
Pin flots in piston and rod. Held by locking rings at each end. Pin hole in rod is bronze bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 120° F.
Pin Fit in Rod Bushing—Tight thumb push fit with pin and rod at 70° F.
Replacement Pins:—Pins furnished in standard and .003", .005", .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING ROD:—Weight—Held within limits.
Length—8¾" (center-to-center).
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, copper-lead lined. Furnished standard and .010" undersize.
Clearance—.0005-.0025". Sideplay .0055-.0115".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings so small bosses engage grooves in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) or toward front (#2, 4, 6). Oil hole in lower bearing upper half must be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. Furnished standard and .010" undersize.
Clearance—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Special Shop Notes for Replacement Bearings and Bearing Caps.*
End Thrust:—Taken by flange faces on rear (#4) bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #4, machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—New bearings require no line-reaming.
End Thrust:—Taken by thrust plate at rear of sprocket hub. Endplay .003-.005".
Timing Chain:—Morse. Width 1". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5⅝"
Exhaust	1 15/32"	.340-.341"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh., (hot). .010" Exh. recommended for sustained high speed.
Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) and down (exhaust). Top of guide must be 13/16" below top of block. After installing finish ream new guides to inside diam. of .342-.343" (Int.), .344-.345" (Exh.).
Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1½".

	Spring Pressure	Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #6 intake valve at .010". Intake valve should open at top dead center when 'O' mark on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006".
Motor Gauge—Weidenhoff Adapter #103, Rod #12. Gauge plug hole over #6 cylinder.

LUBRICATION:—Pressure. Gear type oil pump located at right of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left hand side of crankcase. Operates at 40 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Crankcase Capacity:—6 qts. (refill).

CLUTCH:—Borg & Beck Model 10A6. Single plate, dry disc type. See article in Clutch Section.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Clutch pedal should just clear underside of toe board with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement fo pedal should be 1 1/16". To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Removal—Disconnect clutch pedal linkage, remove fork pivot screw, take out clutch fork. Remove transmission (release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension and avoid distortion of clutch cover. Remove clutch from below. Use pilot studs when removing and installing transmission to avoid springing clutch plate.
Automatic Clutch:—See article in Clutch Section.

STEERING:—Steering Gear—Gemmer Model Worm-and-Roller type. See article in Steering Section.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section. Following specifications apply with car weight on wheels (check suspension unit height first).
Wheel Setting (Front Suspension Height)—Distance from center line of lower control arm yoke pin to top of frame cross member should be 7¼-7⅜" with car weight on wheels but no load in car.
Kingpin Inclination—10° plus or minus ½° (including camber angle), 8¾-10¼° (without camber).
Camber—¼°. Limits minus ¼°-plus ½°.
Caster—1½°. **Toe In**—0-⅛".

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission or rear wheel service brakes (on cars with overdrive). See article in Brake Section.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear 1⅜"), Rear Wheel (Front end 1⅛", Rear 1¼").
NOTE—Wheel cylinders marked 'R'—right side of car. 'L'—left side of car and not interchangeable.
Drum Diameter—10" (Del.), 11" (Cst.).
Lining—Moulded type. Width 2". Thickness 13/64" (Del.), 3/16" (Cst.). Length per wheel 19 13/16" (Del.), 22 5/32" (Cst.).
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—External type on drum at rear of transmission (cars without overdrive). See Service Brake for hand brake adjustment on cars with overdrive.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Adjust brake band guide bolt nut to give 1/16" clearance (as above) for lower portion of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/16" clearance (as above).
Drum Diameter—7 13/16".
Lining—Width 2". Thickness ¼". Length 24 3/16".
NOTE—When relining, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" maximum.

ENGINE NUMBER:—First number—S2-1001. Stamped on boss above water pump. Letter 'A' following number indicates bore .020" larger than standard. 'B' indicates main and connecting rod bearings .010" smaller than standard. 'AB' indicates that bore and bearing sizes are as above.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4½".
Displacement—241.5 cubic inches.
Rated Horsepower—27.34(AMA).
Developed Horsepower—100 HP. (Std. 6.5-1 head), 105 HP. (Optl. 7.0-1 head) at 3400 R.P.M.
Compression Ratio—6.5-1 Std. aluminum head, 7.0-1 Optl. aluminum head.
Compression Pressure—6.5-1 Std. head, 125-135 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed. **7.0-1 Optl. head** 130-140 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.
NOTE—Aluminum heads should be tightened cold. Special head studs, head gaskets and spark plugs used on aluminum head engines.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). **Length**—3⅞".
Weight—Held to two gram max. variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished: (1) standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be slotted and then finished on cam-grinding equipment.
Fitting New Pistons:—Micrometer gauge recommended. Using ½" feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler must be 3-4 lbs.
Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression, one undercut oil wiper ring (#3), one oil control ring per piston, all above pin. Lower ring grooves drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. all	⅛"	.007-.015"	.002-.003"
Oil (both)	5/32"	.007-.015"	.002-.005"

Replacement Rings:—Furnished in standard and .003", .010", .020", .030", .040", .050", .060" oversizes.
NOTE—Install undercut compression and oil wiper ring with step down.

PISTON PIN:—**Diameter** 55/64". **Length** 2⅞". Pin floats in piston and rod. Held by locking rings at each end. Pin hole in rod is bronze bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 130° F.
Pin Fit in Rod Bushing—Tight thumb push fit with pin and rod at 70° F.
Replacement Pins:—Pins furnished in standard and .003", .005", .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING ROD:—**Weight**—All rods held within limits.
Length—8¾" (center-to-center).
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, copper-lead lined. Furnished standard and .010" undersize.
Clearance—.0005-.0025". **Sideplay** .0055-.0115".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small bosses engaging grooves in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) or toward front (#2, 4, 6). Oil hole in lower bearing upper half must be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. Furnished standard and .010" undersize.
Clearance—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Special Shop Notes for Replacement Bearings and Bearing Caps.*
End Thrust:—Taken by flange faces on rear (#4) bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3 1 15/16"; #4, 1⅜".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—New bearings require no line-reaming.
End Thrust:—Taken by thrust plate at rear of sprocket hub. Endplay .003-.005".
Timing Chain:—Morse. Width 1". Pitch ½". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5⅝"
Exhaust	1 15/32"	.340-.341"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh., (hot). .010" Exh. recommended for sustained high speed.
Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) and down (exhaust). Top of guide must be 13/16" below top of block. After installing finish ream new guides to inside diameter of .342-.343" (Int.) .344-.345" (Ex.)
Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1½".

	Spring Pressure	Length
Valve Closed	46-50 lbs.	2 1/32"
Valve Open	104-110 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". Intake valve should open at top dead center when 'O' mark on impulse neutralizer at front of engine lines up with jointer on chain case cover. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12. Gauge plug hole over #1 cylinder.

LUBRICATION:—Pressure. Gear type oil pump located at right of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left hand side of crankcase. Operates at 40 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Crankcase Capacity:—6 qts. (refill).

CLUTCH:—**Borg & Beck Model 10A6.** Single plate, dry disc type. See article in Clutch Section for relining and assembly directions.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Clutch pedal should just clear under side of toeboard. To adjust, turn stopscrew located above clutch pedal shaft. Free movement of clutch pedal should be 1 1/16". To adjust, turn clutch shaft collar adjusting screw at right hand end of clutch pedal shaft.
Removal—Disconnect clutch linkage, remove transmission (rotating clutch release fork shaft so that release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension and avoid distortion of clutch cover. Remove clutch from below. Use pilot studs when removing and installing transmission to avoid springing clutch plate.
Automatic Clutch:—See article in Clutch Section.

STEERING:—**Steering Gear**—Gemmer Model. Worm-and-Roller type. See article in Steering Section for adjustments.
Front Suspension:—Conventional tubular section front axle with Reverse-Ellittt ends and semi-elliptic springs.
Kingpin Inclination—9½° plus or minus ½°. Crosswise.
Caster—2°. Limits 1-3°. Adjust by wedge shims inserted between springs and spring pad on axle. Shims or angle plates furnished ½, 1, 2°.
Camber—½°. Limits ¼-¾°. No adjustment. Manufacturer recommends that no attempt be made to correct camber by bending tubular axle centers.
Toe In—0-⅛" measured at hub height. Adjust as usual by changing length of tie rod.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See artcle in Brake Section for complete adjustment procedure.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear end 1 3/8"). Rear Wheel (Front end 1", Rear end 1⅛").
NOTE—Wheel cylinders marked 'R' right side of car, 'L' left side of car. Not interchangeable.
Drum Diameter—11".
Lining—Moulded type. Width 2". Thickness 3/16". Length 22 5/32" per wheel.
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—External type on drum at rear of transmission.
Adjustment—With lever in released position remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/32", lock anchor screw with wire. Back off adjusting bolt nut until free. Adjust bracket bolt nuts for each end of brake band to 1/32" clearance (as above), secure with locknuts. Finally, tighten adjusting bolt nut until tension on bracket bolt nuts is just relieved at either end.
Drum Diameter—7".
Lining—Width 2½". Thickness 3/32". Length 21⅝".
NOTE—Clearance at anchor and saddle .005" max.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Turn radiator ornament counter-clockwise, raise hood about 1", push safety catch at front under lower edge of hood releasing catch and raise hood. Side panels removed by freeing latches on inside lower edge of panels.

ENGINE NUMBER:—First number S-3-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4¼".
Displacement—228.1 cubic inches.
Rated Horsepower—27.34 (AMA).
Developed Horsepower—93 HP. (std 6.5-1 head) 100 HP. (optl. 7.0-1 head) at 3600 R.P.M.
Compression Ratio—al. hds. (6.5-1 std., 7.0-1 optl.).
Compression Pressure—**6.5-1 hd.** (150-160 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed). **7.0-1 hd.** (160-170 lbs. at 1000 R.P.M. or approx. 117 lbs. at cranking speed).
Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—17.46 ounces (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .002".
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check pistons (at right angles to pin bosses at bottom of skirt) and cylinder bore with micrometer gauge. With feeler (.002") inserted between cylinder wall and pistons (side opposite slot), pull required to withdraw feeler must be 5-7 pounds.
Installing Pistons:—Slot away from valves.

PISTON RINGS:—Two undercut compression, two oil control rings per piston, all above pin. Lower ring grooves drilled with ten ⅛" oil drain holes (#3), five (#4 groove).

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—Diameter—55/64. **Length**—2⅞". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit at 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished standard and .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—Weight 31.91 ozs. **Length** 8".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished stand. and .0015", .010" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Oil hole in lower bearing upper half must be toward camshaft, all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. Furnished stand. and .0015", .010" undersize.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Front Main Bearing Cap Removal, Adjustment directions, and Replacement Bearing Cap data.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in crankcase).
Clearance—.0015-.0035".
End Thrust:—Taken by thrust plate at rear of camshaft sprocket. **Endplay**—.002-.006".
Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.010" Int. and Exh. Engine hot. Remove right fr. wheel & wheel housing to adjust. NOTE—Exh. valve seat inserts furn. .010" oversize.
Valve Guides:—Must be ⅞" below top of block. Ream guides after installing .342-.343" (all).
Valve Springs:—1⅜" limit of compression.

	Spring Pressure	Spring Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	101-109 lbs.	1 13/32"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Timing:—Set tappet clearance #1 intake valve at .014". Intake valve should open at top dead center when '0' mark on crankshaft pulley at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .010" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on r't. of engine. NOTE—Check ignition timing whenever oil pump installed on engine. Tilt engine (with jack under pan) for pump removal.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of engine. Operates at 40 lbs. Adjustable. Heavy (green) spring to increase pressure, lighter (red) spring to decrease pressure. Std. spring unpainted.
Crankcase Capacity:—5 quarts (refill).

CLUTCH:—Borg & Beck Mod. 10A7. Mod. #899 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 6". O.D. 10". Thickness ⅛". *See Chrysler Special Shop Notes.*
Adjustment—Adjust stopscrew (just above clutch pedal shaft) so that pedal arm just clears floor board. Free movement of pedal should be 1 1/16" (adjust by turning release fork rod adjusting nut).
Removal:—Remove floor board, remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts evenly, remove assembly from below.

TRANSMISSION:—Own—All helical gear type with synchronizing shift on second and high gears. Warner Mod. AS25-T86 overdrive transmission optl.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear U-joints, disconnect hand brake, remove nuts from studs at clutch housing, disconnect release fork pull-back spring and rod, pull release fork out of clutch housing, remove transmission cover assembly, remove unit with two pilot studs in upper stud holes. NOTE—Run-out of clutch housing .003" maximum.

UNIVERSAL JOINTS:—Detroit-Universal. Series 4200. Ball and trunnion type with roller bearings. 2 used. NOTE—Three U-joints used on 7 pass. sedan.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on 7 Pass. models. *See Chrysler Shop Notes for data.*

REAR AXLE:—Own—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 (std.). 4.3-1 (with overdrive and 7 pass. sedans).
Backlash—.006-.010". Shim adjustment.
Removal:—Remove axle shaft nut, hub and drum assembly (use hub puller, do not hammer out or bearing damage may result), disconnect brake line at wheel cylinder, remove backing plate (with oil seal). Use shaft puller to remove axle shaft and bearing. With axle shafts removed differential carrier may be removed by disconnecting rear U-joint at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims between brake backing plates and flanged ends of housing. Remove brake backing plates (see above) and add or remove shims (equally on both sides) to give proper clearance. **Endplay**—.003-.008". NOTE—Shims supplied .010", .0125", .030" thick.

SHOCK ABSORBERS:—Delco—Model 1162-G (front), 1163-U (rear). Direct acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Mod. 300. Worm-and-roller.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data. Specifications below apply with no pass. load.
Kingpin Inclination—4¾-6°.
Camber—¼°. Limits minus ¼° to plus ½°.
Caster—1½°. Adjustable.
Toe In—0-⅛". 1/16" preferred. Set long tie rod to 31 7/32" (between ball centers). Adjust short rod for proper toe-in.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°40', 22°50' (7 pass.).

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type: Front Wheel—Front cyl. 1¼", Rear 1⅜". Rear Wheel—Front cyl. 1⅛", Rear 1¼".
Drum Diameter—10".
Lining—Moulded. Width 2". Thickness .200". Length (Rear wh.-rear shoe) 7 25/64", (all others) 9 29/32".
Clearance—.012" toe, .060" heel for each shoe.
Braking Power—55% front wheels, 45% rear.
Hand Brake:—On drum at rear of transmission.
Adjustment—Fully release hand brake lever. Remove anchor screw locking wire (left side), adjust anchor screw for .025" clearance bet. band & drum, set anchor screw with lock wire. Free large adjusting bolt nut (upper end of band), loosen locknut, adjust guide bolt nut to .025" cl. bet. band & drum, set with locknut. Tighten adjusting bolt nut until tension on either side of guide bolt is just relieved (groove in nut must align with ridge in lockwash'r).
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Lgth. 16 15/16".
NOTE—Clearance at anchor and saddle .005" max.

SERIAL NUMBER:—First number 5,598,301 (Detroit), 9,666,936 (Canada). On right front door hinge post.

ENGINE NUMBER:—First number S-5-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Special Shop Notes for engine number lettering data.*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4¼".
Displacement—228.1 cubic inches.
Rated Horsepower—27.34 (A.M.A.).
Developed Horsepower—93 HP. (Std. 6.5-1 head), 100 HP. (Optl. 7.0-1 head) at 3600 R.P.M.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM.	At 100 RPM.
6.5-1 Std. C.I. hd.	140-150 lbs.	Approx. 115 lbs.
7.0-1 Optl. Al. hd.	150-160 lbs.	Approx. 117 lbs.

Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3⅞".
Weight—17.45 ozs. (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". See Fitting New Pistons.
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" feeler between cylinder wall and piston (with pin removed) on side opposite slot. With piston and block at 70°F. pull to withdraw feeler 5-7 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 undercut compression, 2 slotted oil rings per piston, above pin. Lower ring grooves drilled with ten ⅛" oil drain holes (#3), five (#4).

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.002-.0035"
Oil	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished std., .003", .005", .010", .015", .020", .025", .030",. 040", .050", .060" oversize.

PISTON PIN:—Diameter—55/64". **Length**—2⅞". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130°F.
Pit Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Furnished std. & .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—Weight—32.80 ozs. **Length**—8".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished std. & .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Oil spit hole toward camshaft.

CRANKSHAFT:—4 bearing, 7 counterweights with impulse neutralizer mounted on forward end.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), Front Main Bearing Cap Removal, Adjustment directions, and Replacement Bearings and Bearing Caps, Crankshaft Oil Seals.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-ned bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse #1866 (restricted bend). Width 1". Pitch .500". Length 24" or 48 links.
See Chrysler Special Shop Notes for front end removal for work on timing chain.
Camshaft Setting:—Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation.
NOTE—Self-locking tappet adjusting screws used.
Tappet Clearance—.008" Intake, .010" Exhaust (hot). .012" Exh. setting recommended for sustained high speed driving. Valves accessible by removing right front wheel and fender panel.
Valve Guides:—Install with taper end up to ⅞" below top of block, then ream to .342-.343".

Valve Springs:—Free length approx. 2". Limit of compression 1⅜".

	Spring Pressure	Spring Length
Valve Closed	40- 45 lbs.	1 3/4"
Valve Open	101-109 lbs.	1 13/32"

Valve Lifters:—Mushroom type. Ream guides from above for following oversizes: .001",.008",.030",.060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 42° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .014". This valve should open with piston 8° (.0260") before top dead center with 8° BTDC. mark on impulse neutralizer at front of engine lined up with pointer on chain case cover. Reset tappet clearance at .008" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump right of engine.
See Chrysler Special Shop Notes for oil pump removal and installation instructions.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of engine. Operates at 40 lbs. Adjustable. Change to heavy (green) spring to increase pressure, light (red) spring to decrease pressure.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—Water Pump—Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section.
Removal—With water drained and fan belt removed, remove fan blades and pulley (attached by 4 capscrews), disconnect pump hoses, remove nuts on pump mounting studs and lift assembly out.
Thermostat:—Fulton. In water outlet on cyl. head.
NOTE—Install thermostat with bellows down.
Setting—Start to open 150-155°F. Fully open 176°F.
Water Capacity:—20 quarts.
Drain Valves:—At lower left corner of radiator and on left side of block in front of distributor.

CLUTCH:—Borg & Beck Model 10A7, 11A6 (Taxi). Model #913, 917 (Taxi) stamped on cover. Single plate, dry disc type with new spiral grooved type facings and clutch pressure plate oil baffle.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven (spiral grooved), 2 required. Thickness ⅛". Inside diameter 6", 6½" (Taxi). Outside diameter 10", 11" (Taxi).
Adjustment—Adjust stopscrew (to rear of pedal) so that pedal arm just clears floor board. Pedal free movement must be 1". Adjusting nut on fork rod next to release fork.
Removal:—Remove floor board, release fork pull-back spring, free clevis pin on release fork rod. Remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts, lower assembly out.

TRANSMISSION:—Own make. All helical gear type with synchro-mesh for second and high speeds. Warner Model AS1-T86A overdrive optional.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, propeller shaft (see Propeller Shaft Center Bearing below for 7 pass. models), disconnect hand brake cable (remove brake band on cars with Gas Saver). Remove two front cover screws, take off nuts on mounting studs (remove two upper mounting studs by installing 2 nuts on outer end of stud and turning studs out), install two pilot studs and withdraw transmission.

UNIVERSAL JOINTS:—Detroit-Universal. Series 4200. Ball and trunnion type with roller bearings, 2 used.
NOTE—Three universals used on 7-pass. sedan.
See article in Mechanical Equipment Section.
Propeller Shaft Center Bearing:—Used on 7 pass. sedans. *See Chrysler Special Shop Notes for removal and installation instructions.*

REAR AXLE:—Own make. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 (std.). 4.3-1 (7 pass. & Gas. Saver tr.).
Backlash—.006-.010". Screw adjustment.
Removal:—Remove wheel, hub, and drum assembly (using screw type hub puller). Place block under brake pedal, disconnect brake line, remove backing plate and oil seal, pull axle shaft and bearing (Tool C-158). With shafts removed, carrier may be removed by disconnecting rear universal at flange, and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims at flanged ends of axle housing. With wheel and hub removed measure endplay with dial indicator. To adjust remove backing plate (see above) and add or remove shims (equally at both sides) to proper clearance. **Endplay**—.003-.008".

SHOCK ABSORBERS:—Delco. Model 1162D (front), 1163U (rear). Direct acting, hydraulic type.
See article in Mechanical Equipment Section.

STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with 'Push-Pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with no passenger load.
Kingpin Inclination—4¾-6°.
Camber—Plus ¼°. Limits minus ¼° to plus ½°.
Caster—Limits ½-2½°.
Toe In—1/16" (0-⅛"). Set long tie rod to 31⅝" (between ball centers). Adjust short rod.
Steering Geometry—Outer wheel 20°. Inner wheel 22°40', 22°50' (7 passenger sedans).

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type.
Front Wheel—Front cylinder 1¼". Rear 1⅜".
Rear Wheel—Front cylinder 1⅛". Rear 1¼".
Drum—Cast-iron. Diameter—11".
Lining—Moulded. Width 2". Thickness 13/64" Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—External at rear of transmission.
Adjustment—*See Chrysler Shop Notes.*
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—First number 5,634,001 (Detroit), 9,668,606 (Canada). On right front door hinge post.

ENGINE NUMBER:—First number S-6-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅜". **Stroke**—4¼".
Displacement—228.1 cu. ins. **Rated HP.**—27.34.
Developed Horsepower—93 HP. (Std. 6.5-1 hd.), 100 HP. (Optl. 7.0-1 hd.—Std. 7 pass) at 3600 RPM.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM.	At 100 RPM.
6.5-1 cast-iron hd.	140-150 lbs.	Approx. 115 lbs.
7.0-1 aluminum hd	150-160 lbs.	Approx. 117 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH. *See Chrysler Shop Notes for engine removal instructions.*

PISTONS:—Aluminum alloy, U-slot, Cam-ground, with Anodic finish. **Length** 3⅞". **Weight** 17.45 ozs.
Removal—Pistons and rods removed from above.
Clearance—Top .021". Skirt .0005-.0010".
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" feeler between cylinder wall and piston (pin removed) on side opposite slot. With piston and block at 70°F. pull to withdraw feeler 5-7 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅞".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—32.80 ozs. **Length**—8".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable, steel-backed, babbitt-lined. Furnished std. & .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115"
Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.
Installing Rods:—Oil spit hole toward camshaft.

CRANKSHAFT:—4 bearing type with 7 counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Journal Diameters—2½" all bearings.
Bearing Type—Removable, precision type steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Engine Removal (recommended), front main bearing cap removal, replacement bearings and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1866-N, No. 2661. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.003"

See Chrysler Shop Notes for Exh. Valve Seat Insert data.
Tappet Clearance:—.008" Int., .010" Exh. (hot). .002" additional exhaust clearance recommended for sustained high speed driving. NOTE—Tappet screws self-locking type (no locknuts). Remove right front wheel and housing panel for access to valves.
Valve Guides:—Remove from above. Press new guides in (tapered end up) so upper end ⅞" below top of block, then finish ream to .342-.343".

Valve Springs:—Free length approx. 2". Limit of compression 1⅜".

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1 3/4"
Valve Open	101-109 lbs.	1 13/32"

Valve Lifters:—Mushroom type. Stem diam. ⅝". Furnished .001", .008", .030", .060" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 42° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
These figures correct with .014. tappet clearance.
Valve Timing Check—Set tappet clearance #6 intake valve at .014". This valve should open with piston 8° (.0260") before top dead center with 8° BTDC. mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet cl. at .008" hot.

LUBRICATION:—Gear type pump, right of engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under cap below starter. Opens at 40-45 lbs. To increase pressure use heavy (green) spring, to decrease use light (red) spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—19 quarts.
Radiator Core Removal—*See Chrysler Shop Notes.*
Water Pump:—Packless type, belt-driven.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove hood side panels, fan blade assembly, pulley, radiator outlet hose at pump, by-pass (with small hose), pump mounting stud nuts, fan belt adjusting strap at generator.
Thermostat:—Fulton. In water outlet on cyl. head.
Setting—Start to open 157-162°F. Fully open 183°F.
Temperature Gauge:—Motometer (Auto-Lite) Vapor tension type. Part No. H-9039.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi).** #928 (10A7), #931 (11A6) stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and new Over-center return spring *See article in Mechanical Equipment Section for data.*
Facings—Woven & compressed, 2 required. Inside Diam. 7" (10A7), 6½" (11A6). Outside Diam. 10" (10A7), 11" (11A6). Thickness .125" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove floorboard, unhook clutch fork pull-back spring and take out clevis pin on connecting link. Remove transmission (see below) and housing underpan, mark cover and flywheel, remove clutch cover bolts evenly, lower assembly out.

TRANSMISSION:—**Warner.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse). Model AS3-T86A overdrive transmission with electrical kick-down control optl.
Transmission Control:—Remote control type.
See articles in Mechanical Equipment Section for data.
Removal:—Remove floor boards, battery ground cable, disconnect front and rear U-joints (see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.), hand brake cable at clevis, speedometer cable, and gearshifter rod and cable at lever on case. Remove mounting stud nuts, cover assembly, and 2 upper mounting studs (insert pilot studs). Withdraw transmission assembly.
Overdrive Transmission Removal—Same as above except: Remove hand brake assembly (U-joint flange, brake drum, band, and support), disconnect solenoid wires and remove coil and control cable at case. Turn transmission assembly over on left side while it is being withdrawn until shaft clears release bearing, then push up at forward end (shaft just above bearing) and forward with shaft between clutch fingers until rear end can be lowered.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200.** Ball and trunnion type with roller bearings.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—On 7 pass. sedans.
See Chrysler Shop Notes for service data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 (Std. 5 pass.). 4.3-1 (5 pass. with overdrive, Std. 7 pass.). 4.56-1 (7 pass. with Ov-Dr.).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158).
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims equally (at both ends). **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco.** Direct acting type. Domestic—Front 1110-C. Rear 1111-T. Exp.—1114-C & 1115-T, or 1134-E & 1130-W.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Gemmer Model 305 'push-pull' adjustment. Worm-and-roller.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4¾-6°.
Camber—Plus ¼°. Limits minus ¼° to plus ¾°.
Caster—Limits ½-2½°.
Toe In—1/16" (0-⅛"). Set long tie rod to 31⅝" (between ball centers). Adjust short tie rod.
Steering Geometry—Inner wheel 22°40'. Outer 20°.

BRAKES:—Service. Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Cast-iron. Diameter 11".
Lining—Molded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32"; (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for data.*
Drum—Cast-iron. Diameter 6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

SERIAL NUMBER:—First number (DL) 3,558,101, (DP) 3,579,001. On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and #2 cylinders.

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head type. Floating power engine mountings.
Bore—(DL) 3¼", (DP) 3⅛". **Stroke**—4⅜".
Displacement—217.7 cu. ins. (DL), 201.31 cu. ins. (DP).
Rated Horsepower—25.34 (DL), 23.43 (DP).
Developed Horsepower—79 at 3400 R.P.M. (DL), 75 at 3600 R.P.M. (DP Std. Head), 83 at 3600 R.P.M. (DP Optl. head).
Compression Ratio—5.35-1 (DL), 5.5-1 (DP Std. head), 6.5-1 (DP Optl. aluminum head).
Compression Pressure—Approximately 90-95 lbs. (5.35 and 5.5 heads), 110 lbs. (6.5-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" at idling speed.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar strut, Slit skirt type. Length—3 11/16".
Weight—Held to ¼ oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—.022" head, .0015-.002" skirt.
.003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. Install same size in all cylinders to maintain balance.

Fitting New Pistons:—Use .002" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot should be 7-14 lbs.

Installing Pistons:—Slot should be toward left or away from valves.

PISTON PIN:—Diameter—55/64". **Length**—2¾" (DL), 2⅝" (DP). Pin floats in piston and rod. Pin hole in rod bronze-bushed.
Pin Fit in Piston—Tight thumb push fit with piston heated to temperature of boiling water (212F.).
Pin Fit in Rod Bushing—Tight thumb push fit at room temperature (70°F.).

PISTON RINGS:—Two tongue-and-groove compression rings, one undercut oil wiper ring, one oil control ring per piston all above pin. Clearance between tongue-and-groove ring pairs should be .003-.005".

Ring	Width	End Gap	Side Clearance
Comp. (DL)	9/64"	.005-.010"	.003" Max.
Comp (DP)	⅛"	.005-.010"	.003" Max.
Oil Wiper	⅛"	.007-.015"	.003" Max.
Oil Control	5/32"	.007-.015"	.003" Max.

CONNECTING ROD:—Length—8 13/16" (DL), 7 15/16" (DP).
Weight—Held to ¼ oz. maximum variation.
Crankpin Journal Diameter—1 15/16".
Lower Bearing Type—Spun babbitt (DL), removable steel-backed, babbitt-lined (DP).
Clearance—.001-.00275". Sideplay .003-.009".

Adjustment:—None (no shims). Replace rods (DL), or bearings (DP). Do not file rods or caps.

Installing rods:—Lower bearings offset. Install rods with widest half of bearing toward rear (cylinders #1, 3, 5) or toward front (cylinders #2, 4, 6). Oil hole in upper half of lower bearing should be toward camshaft on all rods.

CRANKSHAFT:—4 bearing, integral counterweights.
Journal Diameters—2¼" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. No shims.
Clearance—.001-.002".
Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Shop Notes for Front Main Bearing Cap removal, and installation and adjustment of Replacement Bearing caps.*
End Thrust:—Taken by #4 rear main bearing. Endplay .004-.005".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Steel-backed, babbitt-lined except #4 which is machined in crankcase.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at front bearing.

Timing Chain:—Morse. Width 1¼" (DL), 1" (DP). Pitch .500". Length 24" or 48 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off hub.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake (DL)	1 17/32"	11/32"	5¼"
Intake (DP)	1 15/32"	11/32"	5¼"
Exhaust	1 15/32"	11/32"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.002-.004"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.005" Int., .007" Exh. engine hot.

Valve Springs:—Do not compress springs to over-all length of less than 1¾".

	Spring Pressure	Spring Length
Valve Closed	40-44 lbs.	2 1/16"
Valve Open	75-81 lbs.	1¾"

Valve Timing:—See camshaft setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Use regular timing gauge installed in timing hole over #6 piston. Set tappet clearance #6 intake valve at .011". This valve should open with piston .015" past top dead center. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weidenhoff Adapter #103. Rod #12.

LUBRICATION:—Pressure type. Gear type oil pump mounted on right side of crankcase.
Normal Oil Pressure—15 lbs. idling, 30-40 lbs. at 20 M.P.H.
Oil Pressure Relief Valve—Located under cap on left side of crankcase. To adjust, remove cap, take out locking wire, turn slotted screw clockwise to increase or counter-clockwise to decrease pressure, replace locking wire.
Model DP—Relief valve in oil pump cover at right of crankcase. No adjustment provided.

CLUTCH:—Borg and Beck Model 10A1 (DL), 9A1 (DP). Single plate dry disc type. See article in Clutch Section for relining and assembling directions.
Facings (DL)—Moulded type, 2 required. Thickness ⅛". Inside diameter 6⅛". Outside diameter 8⅞".
Facings (DP)—Moulded type, 2 required. Thickness ⅛". Inside diameter 5¾". Outside diameter 9".
Adjustment (DL)—Adjust clutch stopscrew so that front face of release bearing is exactly 5/32" from clutch release levers. Then adjust clutch fork adjusting collar setscrews (2) to locate clutch pedal as high as possible without interference with floor boards. Free movement of pedal should be 1 7/16"-1 9/16" and will be correct if above adjustments correctly made.
Adjustment (DP)—Adjust clutch pedal stopscrew at lower end of pedal at rear of pedal shaft for highest possible pedal position without interference with the floor board. Free movement of pedal should be 1¼". To adjust, loosen locknut and turn clutch fork release lever setscrew.

STEERING—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends (DL), tubular section with Reverse Elliott type ends (DP). Semi-elliptic springs on both models.
Kingpin Inclination—7° (DL), 9° (DP) crosswise.
Caster—1½-2° (DL), 1-2° (DP). Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—½-2° (DL), 0-1¼° (DP). No adjustment. Camber must be equal for both wheels.
Toe In—1/16" measured 9" up on wheels. Adjusted in usual manner by loosening clamp bolts and rotating tie rod.

BRAKES:—Service—Lockheed Hydraulic, double anchor chor type. See article in Brake Section for complete adjustment instructions.
Drum Diameter—12" (DL), 10" (DP).
Lining (DL)—Moulded type. Width 1¾". Thickness 3/16". Length 21 23/32" per wheel.
Lining (DP)—Moulded type. Width 1½". Thickness 3/16". Length 18 5/16" per wheel.
Clearance—.012" toe, .006" heel each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—Place lever in released position, remove locking wire and turn anchor adjusting screw until clearance between lining and drum is 1/16" at this point. Turn adjusting nut at upper end of adjusting bolt until clearance around drum is 1/16". If necessary, loosen locknut and turn guide bolt nut to secure uniform clearance around drum.
Drum Diameter—7" (DL), 6" (DP).
Lining—Width 2". Thickness 5/32". Length 21 13/32" (DL), 18 13/32" (DP).

SERIAL NUMBER:—First number, (DR '34) 3,680,001, (DS '34) 4,528,651, (DU '35) 3,756,501 (Detroit), 9,403,286 (Canada). On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering (denoting special bore and bearing sizes).*

ENGINE:—Own. Six cylinder, 'L' head type. Floating power engine mounting.
Bore—3¼". **Stroke**—4⅜".
Displacement 217.8 cu. ins. **Rated HP.** 25.35.
Developed Horsepower—(DR, DS)—82 HP., (std. hd.), 87 HP. (Optl. hd.), at 3600 R.P.M. (DU)—85 HP. at 3600 R.P.M.
Compression Ratio—(DR, DS)—5.6-1 std. cast-iron head, optl. 6.5-1 aluminum head. (DU)—Std. 6.5-1 alloy iron head.
Compression Pressure—Approximately 97 lbs. (5.6-1 head), 110 lbs. (6.5-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

PISTONS:—Aluminum alloy, Invar strut, slotted skirt type. **Length**—3 11/16".
Replacement Pistons:—Semi-finish pistons furnished for service in two sizes (1) standard to .023" oversize, (2) .025" to .050" oversize. Pistons should be slotted and then finished to size (.001" smaller diameter at bottom of skirt than at top). If piston finishing equipment not available, use finished replacement pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize and recondition cylinders to standard oversize.
Weight—Maximum allowable variation ¼ oz.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Bottom .0015-.002".
Fitting New Pistons—Use .002" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot should be 7-14 lbs.
Installing Pistons—Slot should be at left or away from valves.

Piston Rings:—Four rings per piston, all above pin; (DR, DS '34)—#1 plain compression ring, #2 and #3 tongue and groove type with lower ring undercut to act as an oil wiper, #4 oil control ring. (DU '35)—Two undercut compression rings, two oil control rings, lower ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.002-.003"
(#2 & 3—DR, DS)	9/64"	.007-.015"	.002-.003"
Oil Control—all	5/32"	.007-.015"	.002-.003"

Replacement Rings—Furnished in same oversizes as pistons.

Piston Pin:—Diameter 55/64". Pin floats in piston and rod. Held by retaining rings. Piston can be heated in boiling water to remove or install pins. Pins furnished .003", .005", .008" oversize.
Pin Fit in Piston—Tight thumb push fit with piston at 160° F.
Pin Fit in Rod Bushing—Tight thumb push fit with piston at room temperature (70°F.).

Connecting Rod:—Weight maximum variation allowable ¼ oz. Length 7 15/16".
Crankpin Journal Diameters—2 1/16".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None. Replace bearings. Do not file bearing caps. Install new bearings with small boss registering with groove (both halves). Bearings furnished .010" undersize and standard size.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearing toward rear of engine (#1, 3, 5) or toward front (#2, 4, 6). Oil hole in upper half of bearing must be toward camshaft on all bearings.

Crankshaft:—Four bearings. Integral counterweights.
Journal Diameters—2½". all bearings.
Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".
Adjustment—None. Replace bearings. Do not file bearing caps. *See Chrysler Shop Notes for Front Main Bearing Cap Removal, and installation and adjustment of Replacement Bearings and Bearing Caps.*
End Thrust—Taken by #4 (rear) bearing. Endplay .003-.007".

Camshaft:—Four bearings. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type (except #4 machined in crankcase).
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at rear of sprocket hub.
Timing Chain—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off engine.

Valves:—

	Head Diameter	Stem Diameter	Length
All Valves	1 15/32"	.3405"	4 27/32"

	Seat Angle	Lift	Stem-to-Guide Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—Use special tool to remove and install guides. Intake guides installed with taper end up, exhaust guides with taper end down. Top of guides must be ⅞" below top of block. Finish ream new guides to inside diameter of .342-.343" (Int.), .344-.345" (Exh.) after installing.
Tappet Clearance—.006" Int., .008" Exh. engine hot. Set exhaust clearance at .010" for sustained high speed driving. Adjustment accessible by removing cover plate under right front wheel.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress spring to over-all length of less than 1 7/16".

	Spring Pressures	Length
Valves Closed	34-38 lbs.	1¾"
Valves Open	77-83 lbs.	1 7/16"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Set tappet clearance #6 valves at .011" Int., .012" Exh. Install regular timing gauge in timing plug hole over #6 piston. Intake valve should open with piston .015" past top dead center. Reset tappet clearance at .006" Int., .008" Exh. with engine hot.

Lubrication:—Pressure. Gear type oil pump located on right hand side of crankcase.
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Under plug on left hand side of crankcase. Operates at 40-45 lbs. Adjustable by changing spring. Standard springs unpainted. Heavy springs (to increase pressure) are painted green. Lighter spring (to decrease pressure) painted red.
Capacity & Oil—5 qts.

CLUTCH:—**Borg & Beck Models 10A3 (DR, DS), 10A6 (DU).** Model No. stamped on cover, 854 (10A3), 870 10A6). Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for adjustment and relining procedure.
Clutch Pedal Adjustment—Clutch pedal should just clear under side of toeboard. Adjust by turning stop screw located just above clutch pedal shaft at rear. Free movement of pedal must be 1 1/16". To adjust—(DR, DS)—Turn clamp screw on release fork adjusting collar for clearance. (DU)—Adjust by loosening lock nut and turning release fork rod adjusting nut (at clutch release fork).
Clutch Facings—Moulded asbestos (flywheel side), woven asbestos (pressure plate side), one of each required, 6⅛" I.D., 9⅞" O.D., .133" thick.
NOTE—Mark clutch cover and flywheel before disassembling and reassemble in same position.

STEERING:—**Steering Gear**—Gemmer Model Worm-and-Roller type. See article in Steering Section.
Front Suspension (DU):—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—9½° crosswise.
Caster—2° (1½-2½°). Adjust by inserting wedge plates between springs and axle pads. Wedges furnished in ½, 1, 2° angles.
Camber—½° (¼-¾°). No adjustment provided. Axle may be bent cold not more than ½° to correct camber. Replace axle if out more than ½°.
Toe In—1/16" (0-⅛"). Adjust in usual manner by loosening tie rod end clamps and turning tie rod.
Front Suspension (DR, DS):—Independent, linked, parallelogram type with coil springs. See article in Steering Section. Specifications below apply with car weight on wheels.
Kingpin Inclination—10° plus or minus ½°.
Caster—1½°. **Toe In**—1/16-⅛".
Camber—¼-1° Limits. ½° preferred.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for relining and complete adjustment procedure.
Wheel Cylinders—Diameters (DR, DS—straight bore) Front wheel—1¼". Rear wheel 1⅛". (DU—step cut bore) Front wheel (front shoe 1¼", rear shoe 1⅜"), Rear wheel (front shoe 1⅛", rear shoe 1¼").
NOTE—Wheel cylinders marked 'R' for right brakes, 'L' for left brakes, not interchangeable.
Drum Diameter—10".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel (DR, DS—15 25/32"; DU—19 13/16").
Clearance—.012" toe, .006" heel, for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance is 1/16" between lining and drum, lock anchor screw with wire. Adjusting bolt nut should then be adjusted to give correct clearance (as above) for both ends of brake band. On DU model, loosen locknut and turn guide bolt, if necessary, to secure uniform clearance around drum.
NOTE—On first DR, DS models thru Serial Number 3,816,194 adjustment is provided on hand brake rod at hand brake lever end below ratchet.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".
NOTE—When relining, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides of anchor saddle .005" maximum.

SERIAL NUMBER:—First number 4,015,051 (Detroit), 9,405,681 (Canada). On right front door hinge pillar post.

ENGINE NUMBER:—First Number—D2-1001. Stamped on boss on left side of cylinder block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering data (denoting special bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cubic inches.
Rated Horsepower—25.35 (AMA).
Developed Horsepower—87 HP at 3600 R.P.M.
Compression Ratio—6.5-1 Std. cast-iron head. No optl. ratios.
Compression Pressure—135-145 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 7-8 M.P.H.

PISTONS:—Aluminum alloy, Invar strut, slotted skirt type.
Length—3 11/16".
Weight—Held to two gram max. variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Bottom .0015-.002". See Fitting New Pistons.

Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished: (1) standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be slotted and then finished to correct fit.

Fitting New Pistons:—Micrometer gauge recommended. Using feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler must be 7-10 lbs.

Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two undercut compression rings, two oil control rings per piston, all above pin. Lower ring grooves drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. all	⅛"	.007-.015"	.001-.003"
Oil (both)	5/32"	.007-.015"	.003-.005"

Replacement Rings:—Furnished in standard and .003", .010", .020", .030", .040", .050", .060" oversizes. NOTE—Install compression rings with step down.

PISTON PIN:—Diameter—55/64". **Length**—2¾". Pin floats in piston and rod. Held by retaining rings. Pin hole in rod is bronze bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Tight thumb push fit with piston and rod at 70° F.

Replacement Pins:—Pins furnished in standard and .003", .005", .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING ROD:—Weight All rods held to ¼ oz. maximum variation. **Length** 7 15/16" (center-to-center).
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Steel-backed, copper-lead lined, interchangeable. Furnished standard and .010" undersize.
Clearance—.001-.003". Sideplay .0055-.0115".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small bosses engaging groves in rod and cap.

Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) and toward front (#2, 4, 6). Oil hole in lower bearing upper half must be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¼" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined (#1 and 4), copper-lead or cadmium-nickel (#2 and 3). Furnished standard and .010" undersize.
Clearance—(#1 and 4) .001-.002". (#2 and 3) .0015-.0025".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Shop Notes for Front Main Bearing Cap Removal, and installation & adjustment of Replacement Bearings & Caps.*

End Thrust:—Taken by flange faces on rear (#4) bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 13/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—New bearings require no line-reaming.

End Thrust:—Taken by thrust plate at rear of sprocket hub. Endplay .002-.006".

Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers. Install chain endless.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES:—

	Head diam.	Stem diam.	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.

Tappet Clearance—.006" Int., .008 Exh. (hot). .010" Exh. recommended for sustained high speed.

Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) and down (exhaust). Top of guide must be ⅞" below top of block. Finish ream new guides to inside diameter of .342-.343" (Int.), .344-.345" (Exh.).

Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1⅜".

	Spring Pressure	Spring Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Install regular timing gauge in timing plug hole over #6 piston, set tappet clearance #6 valves at .011" (intake), .012" (exhaust). Intake valve should open with piston .015" past top dead center, and exhaust valve close with piston .027" past top dead center. Reset tappet clearance at .006" Int., .008" Exh., hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Pressure. Gear type oil pump located at right of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left hand side of crankcase. Operates at 40 lbs. Adjustable by changing spring. Stand. spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Crankcase Capacity—5 qts. (refill).

CLUTCH:—Borg & Beck Model 10A6. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven (pressure plate side), molded (flywheel side), Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Clutch pedal should just clear underside of toe board with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1 1/16". To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Removal—Disconnect clutch pedal linkage, remove fork pivot screw, take out clutch fork. Remove transmission (release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension and avoid distortion of clutch cover. Remove clutch from below. Use pilot studs when removing and installing transmission to avoid springing clutch plate.

Automatic Clutch:—See article in Clutch Section.

STEERING:—Steering Gear—Gemmer Worm-and-Roller type. See article in Steering Section for adjustment.

Front Suspension:—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—9½° crosswise. Limits 9-10°.
Caster—2° (1-3°). Adjust by inserting wedge plates between springs and axle pads. Wedges available in ½, 1, 2° angles.
Camber—½° (¼-¾°). No adjustment. Replace tubular axle if camber is out more than ½°.
Toe In—0-⅛". Adjust in usual manner by loosening tie rod end clamps and rotating tie rod.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand lever applies brake at rear of transmission or rear wheel service brakes (on 7 pass. sedan). See article in Brake Section for complete adjustment procedure.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear end 1⅜"). Rear Wheel (Front end 1⅛", Rear end 1¼").
NOTE—Wheel cylinders marked 'R' right side of car, 'L' left side of car. Not interchangeable.
Drum Diameter—10".
Lining—Moulded type. Width 2". Thickness 13/64". Length per wheel 19 13/16".
Clearance—.012" toe, .006" heel, for each shoe.

Hand Brake:—External type on drum at rear of transmission. See Service Brake (above) for cars with Rear wheel hand brake.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Adjust brake band guide bolt nut to give 1/16" clearance (as above) for lower portion of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/16" clearance (as above), making sure that groove in bolt nut is lined up with ridge lockwasher.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".
NOTE—When relining, cut out lining adjacent to anchor and chamfer ends. Clearance between anchor and sides f anchor saddle .005" maximum.

SERIAL NUMBER:—First number 4,530,451 (Detroit), 9,409,056 (Canada). Stamped on right front door hinge pillar post.

ENGINE NUMBER:—First number D-5-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering data (denoting special bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cubic inches.
Rated Horsepower—25.35 (AMA).
Developed Horsepower—87 HP. at 3600 R.P.M.
Compression Ratio—6.5-1 cast-iron head.
Compression Pressure—135-145 lbs. at 1000 R.P.M. or approximately 110 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 7-8 M.P.H.

PISTONS:—Aluminum alloy, Invar strut, slotted skirt type. **Length**—3 11/16".
Weight—17.92 ozs. (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .0005". Limits .0005-.001".
Replacement Pistons:—Finished pistons furnished standard and .003", .005", .010", .015", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished (1) standard to .023" oversize (2) .025-.050" oversize, not interchangeable. Pistons should be slotted, then finished by cam grinding.
Fitting New Pistons:—Micrometer gauge recommended. Using feeler gauge (.002") inserted between piston and cylinder wall on side opposite slot, pull required to withdraw feeler 7-14 lbs.
Installing Pistons:—Slot to left, away from valves.

PISTON RINGS:—Two undercut compression, two oil control rings per piston, all above pin. Oil ring grooves drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversizes.
NOTE—Install compression rings with step down.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit at 160° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished standard and .003", .005", .008" oversizes. Ream bushing and pin hole to size.

CONNECTING ROD:—**Weight**—30.6 ounces.
Length—7 15/16".
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Steel-backed, babbitt-lined, interchangeable. Furnished std. & .0015", .010" undersize.
Clearance—.0005-.0025". **Sideplay**—.005-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Lower bearings offset. Install wide portion to rear on #1, 3, 5, to front on #2, 4, 6. Oil hole in lower bearing upper half toward valves.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2½" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined. Furnished std. and .0015", .010" undersize.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Front Main Bearing Cap removal, adjustment directions, and Replacement Bearing Cap data.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in block).
Clearance—.0015-.0035".
End Thrust:—Taken by thrust plate at rear of camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES—

	Head Diameter	Stem Diameter	Length
All Valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh. (hot). Remove front wheel and wheel housing to adjust.
Valve Guides:—Guides must be ⅞" below top of block. Ream guides after installing (.342-343" Int., .344-345" Exh.).
Valve Springs:—1⅜" limit of compression.

	Spring Pressure	Spring Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing:—Install timing gauge in hole over #6 piston, set intake valve at .011" (cold). Valve should open with piston .015" past top dead center. Reset tappet clearance .006" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on right of engine.
NOTE—Check ignition timing whenever oil pump installed on engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of crankcase. Operates at 40-50 lbs. Adjustable. Heavy (green) spring to increase pressure, lighter (red) spring to decrease pressure.
Crankcase Capacity:—5 quarts (refill).

CLUTCH:—**Borg &Beck Mod. 10A7.** Model #899 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven (press. plate side), moulded (flywheel side). 1 of each required. I.D. 6". O.D. 10". ⅛" thick. *See Chrysler Special Shop Notes.*
Adjustment—Adjust stopscrew (just above clutch pedal shaft) so that pedal just clears floor board. Free movement of pedal should be 1 1/16" (adjust by turning release fork rod adjusting nut).
Removal:—Remove transmission (see Transmission Removal below), remove housing under-pan, mark cover and flywheel, remove cover bolts evenly, remove assembly from below.

TRANSMISSION:—**Own**—All helical gear type with synchronizing shift on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear U-joints, disconnect hand brake, remove nuts from studs at clutch housing, disconnect release fork pull-back spring, pull release fork out of clutch housing, remove transmission cover assembly, remove unit with two pilot studs in upper stud holes.
NOTE—Run-out of clutch housing .003" maximum.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200.** Ball and trunion type with roller bearings. 2 used.
NOTE—Three U-joints used on 7 passenger sedan.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on 7 Pass. models. *See Chrysler Shop Notes for data.*

REAR AXLE:—**Own**—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 (5 pass.), 3.9-1 (coupes), 4.3-1 (7 pass.).
Backlash—.006-.010". Shim adjustment.
Removal:—Remove axle shaft nut, hub and drum assembly (use hub puller, do not hammer out or bearing damage may result), disconnect brake line at wheel cylinder, remove backing plate (with oil seal). Use shaft puller to remove axle shaft and bearing. With axle shafts removed, differential carrier may be removed by disconnecting rear U-joint at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims between brake backing plates and flanged ends of housing. Remove brake backing plates (see above) and add or remove shims to give proper clearance.
Endplay—.003-.008".
NOTE—Shims supplied .010", .0125", .030" thick.

SHOCK ABSORBERS:—**Delco.** Direct acting, hydraulic type (made by Chrysler).
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300). Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional tubular section axle, Reverse-Elliott ends, semi- elliptic springs.
Kingpin Inclination—4½-5½° crosswise.
Caster—2° (1-3°). Adj. by inserting wedge shims between springs & axle pad. ½° & 2° wedges supplied.
Camber—½° (¼-¾°). No adjustment.
Toe In—1/16" (0-⅛"). Adjust by turning tie rod.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°50', 22°20' (7 pass.).

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type: Front Wheel—Front cyl. 1¼", Rear 1⅜".
Rear Wheel—Front cyl. 1⅛", Rear 1¼".
Drum Diameter—10".
Lining—Moulded. Width 2". Thickness .200". Length rear wh.-rear shoe) 7 25/64", (all others) 9 29/32".
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—55% front wheels, 45% rear.
Hand Brake:—On drum at rear of transmission.
Adjustment—Fully release hand brake lever. Remove anchor screw locking wire (left side), adjust anchor screw for .025" clearance between band and drum, set anchor screw with lock wire. Free large adjusting bolt nut (upper end of band), loosen locknut, adjust guide bolt nut to .025" clearance between band and drum, set with locknut. Tighten adjusting bolt nut until tension on either end of guide bolt is just relieved (groove in nut must align with ridge in lockwasher).
Drum Diameter—6".
Lining—Width 2". Thick. 5/32". Length 16 15/16".
NOTE—Clearance at anchor and saddle .005" max.

SERIAL NUMBER:—On right front door hinge pillar post. First number: 30,000,001 (Detroit), 40,000,001 (Evansville), 9,413,746 (Canada).

ENGINE NUMBER:—First number D-8-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cubic inches.
Rated Horsepower—25.35 (A.M.A.)
Developed Horsepower—87 HP. at 3600 R.P.M.
Compression Ratio—6.5-1 cast-iron hd. No optl.
Compression Pressure—135-145 lbs. at 1000 R.P.M. or approximately 110 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

PISTON:—Aluminum alloy, split skirt, steel strut type.
Length—3 11/16". **Weight**—17.45 ozs.
Removal—Pistons and rods removed from above.
Clearance—Top .022". See Fitting New Pistons.
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check piston size with micrometer gauge on skirt across piston pin support ribs. Insert .002" feeler between cylinder wall and piston on side opposite slot. With piston and block at 70°F. pull to withdraw feeler must be 7-14 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 undercut compression, 2 slotted oil rings per piston, all above pin.
NOTE—Install top ring with step on inner edge to top. #2 ring with step on outer edge down.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	⅛"	.007-.015"	.002-.0035"
Comp. (#2)	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished std. and .003", .005", .010", .015",. 020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾".
Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Furnished std. & .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—**Weight** 30.01 oz. **Lgth.**—7 15/16".
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished std. & .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Install rods with wide portion of bearing to rear on #1, 3, 5, to front on #2, 4, 6. Oil spit hole to camshaft (all rods).

CRANKSHAFT:—4 bearing type. Impulse neutralizer mounted on forward end.
Journal Diameters—2½" all bearings.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Front Main Bearing Cap Removal, Replacement Bearings and Bearing Caps, Bearing adjustment data and Crankshaft Oil Seals.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2".; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" ,#1), .0015-.0035" (all others).
NOTE—Replacement bushings finish reamed.
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse #1866 (restricted bend). Width 1". Pitch .500". Length 24" or 48 links.
See Chrysler Special Shop Notes for front end removal for work on timing chain.
Camshaft Setting:—Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge cross the shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust Valve Seat insert removal and installation.
Tappet Clearance—.006" Int., .008" Exh. (hot). .010" Exh. setting recommended for sustained high speed driving. Valves accessible by removing right front wheel and wheel housing panel.
Valve Guides:—Install with round end up to ⅞" below top of block. Finish ream guides after installing to .342-.343" Int., .344-.345" Exh.
Valve Springs:—Free length approx. 2 3/32". Limit of compression 1 9/32".

	Spring Pressure	Spring Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream guides from above for following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Timing—Set tappet clearance #6 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center when 6° ATDC. mark on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on right of engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of engine. Operates at 40 lbs. Adjustable. Change to heavy (green) spring to increase pressure, light (red) spring to decrease.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Water Pump.** Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, remove fan blades and pulley (attached by 4 capscrews), disconnect pump hoses, remove nuts from pump mounting studs and lift out.
Thermostat:—Fulton. In water outlet on head.
NOTE—Install thermostat with bellows down.
Setting—Start to open 150-155°F. Fully open 176°F.
Water Capacity:—15 quarts.
Drain Valves:—At lower left corner of radiator and on left side of block in front of distributor.

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi).** Model 913, 917 (Taxi) stamped on cover. Single plate, dry disc type with new spiral grooved type facings and clutch pressure plate oil baffle.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven (spiral grooved), 2 required. Thickness ⅛". Inside diameter 6", 6½" (Taxi). Outside diameter 10", 11" (Taxi).
Adjustment—Adjust stopscrew (to rear of pedal) so that pedal arm just clears floor board. Pedal free movement must be 1 1/16". Adjusting nut provided on fork rod next to release fork.
Removal:—Remove floor board, release fork pull-back spring, free clevis pin on release fork rod. Remove transmission (see Transmission Removal below), remove housing underpan, mark cover and flywheel, remove cover bolts evenly, take out assembly

TRANSMISSION:—**Own Make.** All helical gear type with synchro-mesh on second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, battery cable, disconnect front and rear universals (see Propeller Shaft Center Bearing below for 7 pass. sedan), free hand brake cable at clevis. Take off nuts on mounting studs, disconnect clutch release fork pull-back spring, free clevis pin on release fork rod, remove cover (gear-shifter assembly), insert 2 pilot studs in top holes and withdraw transmission.

UNIVERSAL JOINTS:—**Detroit-Universal.** Series 4200. Ball and trunnion type with roller bearings. 2 used.
NOTE—Three universals used on 7 pass. sedan.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on 7 passenger models. *See Chrysler Shop Notes.*

REAR AXLE:—**Own make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—Standard 4.1-1 (Sedans), 3.9-1 (Coupes), 4.3-1 (7 pass. sedan & cars with 6.00 X 18 tires).
Backlash—.006-.010". Screw adjustment.
Removal:—Remove wheel, hub, and drum assembly (using screw type hub puller). Place block under brake pedal, disconnect brake line, remove backing plate and oil seal, pull axle shaft and bearing (Tool C-158). With shafts removed, carrier may be removed by disconnecting rear universal at flange, and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims at flanged ends of axle housing. With wheel and hub removed measure endplay with dial indicator. To adjust remove backing plate (see above) and add or remove shims (equally at both sides) to proper clearance. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco**—Model 1183-U (front), 1184-U (rear). Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300). Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional tubular section axle, Reverse-Elliott ends, semi-elliptic springs.
Kingpin Inclination—4½-5½° crosswise.
Caster—2° (1-3°). Adjust by inserting wedge plates between springs and axle center. Thick portion to rear increases caster, to front decreases caster.
Camber—½° (¼-¾°). Not adjustable.
Toe In—1/16" (0-⅛"). Turn tie rod to adjust.
Steering Geometry—Outer wheel 20°. Inner wheel 22°50'.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheel—Front cylinder 1¼", Rear 1⅜".
Rear Wheel—Front cylinder 1⅛", Rear 1¼".
Drum—Cast-iron. Diameter—11".
Lining—Moulded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—External at rear of transmission.
Adjustment—*See Chrysler Special Shop Notes.*
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Canada
Deluxe	30,100,001 & up	9,416,686 & up
Special	4,267,701 & up	

ENGINE NUMBER:—First number D-11-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for Engine Number Lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅜".
Displaccment—217.8 cu. ins. **Rated HP.**—25.35.
Developed Horsepower—87 HP. at 3600 R.P.M.
Compresion Ratio—6.5-1 cast-iron head. No optl.
Compression Pressure—135-145 lbs. at 1000 R.P.M. or approximately 110 lbs. at cranking speed.
Vacuum Reading—Steady 18-21" idling at 6 M.P.H. *See Chrysler Shop Notes for Engine Removal data.*

PISTONS:—Aluminum alloy, cam ground, split skirt, steel strut type. **Length**—3 11/16". **Weight**—17.45 oz.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .0005" desired.
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer gauge on skirt across piston pin support ribs. Insert .002" feeler between cylinder wall and piston on side opposite slot. With piston and block at 70° F. pull to withdraw feeler should be 10-16 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge stepped), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished std. & .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—**Weight** 30.01 oz. **Length** 7 15/16".
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Removable, steel-backed, babbitt-lined. Furnished std. & .002", .010", .012" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.
Installing Rods:—Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT:—4 bearing type with 7 counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Journal Diameters—2½" all bearings.
Bearing Type—Removable, precision type steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustm't:—*See Chrysler Shop Notes for Front Main Bearing Cap removal, and replacement bearings.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1866-N, No. 2661. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Shop Notes for Exh. Valve Seat Insert data.
Tappet Clearance:—.006" Intake, .008" Exh. (Hot). .002" additional exhaust clearance recommended for sustained high speed driving. NOTE—Tappet screws self-locking type (no locknuts). Remove right wheel and housing panel for access to valves.
Valve Guides:—Remove from above. Press new guides in (tapered end up) so top ⅞" below top of block, then finish ream to .342-.343" Int., .344-.345" Exh.
Valve Springs:—Free length approx. 2 3/32". Limit of compression 1 9/32".

	Spring Pressure	Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Stem diam. ⅝". Ream holes from above (pilot in valve stem guide) for lifters furnished .001", .008", .030", .060" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC. Correct with tappet clearance of .011" Int., .012" Exh.
Valve Timing Check—Set tappet clearance #6 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center when 6° ATDC. mark on impulse neutralizer at front of engine lines up with pointer. Reset tappet cl. .006" hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type pump, right of engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Under cap below starter. Opens at 40-45 lbs. To increase pressure use heavy (green) spring, to decrease use light (red) spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—15 quarts.
Radiator Core Removal—*See Chrysler Shop Notes.*
Water Pump:—Packless type, belt-driven. *See article in Mechanical Equipment Section for data.*
Removal—Drain water, remove hood side panels, fan blade assembly, pulley, radiator outlet hose at pump, by-pass (with small hose), pump mounting stud nuts, fan belt adjusting strap at generator.
Thermostat:—Fulton. In water outlet on cyl. head. **Setting**—Start to open 157-162° F. Fully open 183°.
Temperature Gauge:—Motometer (Auto Lite) Vapor Tension type. Part No. H-9022. *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi).** #928 (10A7), #931 (11A6) stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and new Over-center return spring (hooked to pedal). *See article in Mechanical Equipment Section for data.*
Facings—Woven & compressed, 2 required. Inside Diam. 7" (10A7), 6½" (11A6). Outside Diam. 10" (10A7), 11" (11A6). Thickness .125" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove floorboard, unhook clutch fork pull-back spring and take out clevis pin in connector link. Remove transmission (see below) and housing underpan, mark cover and flywheel, remove clutch cover bolts evenly, lower assembly out.

TRANSMISSION:—**Own make (Warner design).** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse). Synchronizers made by Warner.
Transmission Control:—Remote control type. *See articles in Mechanical Equipment Section for data.*
Removal:—Remove floor boards, battery ground cable, disconnect front and rear U-joints (see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.), hand brake cable at clevis, speedometer cable, and gearshifter rod and cable at lever on case. Remove mounting stud nuts, cover assembly, and 2 upper mounting studs (insert pilot studs). Withdraw transmission assembly.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200.** Ball and trunnion type with roller bearings. *See article in Mechanical Equipment Section for data.*
Propeller Shaft Center Bearing:—On 7 pass. sedans. *See Chrysler Shop Notes for Propeller Shaft Center Bearing Removal and Installation instructions.*

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
Ratio—3.9-1 (Coupes), 4.1-1 (5 pass.), 4.3-1 (7 pass. and cars with 6.00x18 & 5.25x20 tires).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Remove wheel, hub and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158).
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims equally (at both sides). **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco.** Direct acting type. Domestic—Front 1110-C. Rear 1111-T, W (20" wh.). Exp.—Front 1114-C. Rear 1115-T, W (20" wh.). Adj. Exp.—Front 1134-E. Rear 1130-W, Y (20" wh.). Adj. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300 standard, 305 'push-pull' adjustment 7 passenger sedan). Worm-and-roller type. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—5¼-6½° (4¾-6°—7 pass.).
Caster—Minus ½° to plus 1½° (minus ¼° to plus ¾° —¼° preferred—7 passenger).
Camber—0° preferred. Limits minus ¼° to plus ½°. Plus ½° to plus 2½° (7 passenger).
Toe In—1/16" (0-⅛"). Set long tie rod to 31 11/16" (between ball centers). Adjust short rod only.
Steering Geometry (Toe-out on Turns)—Outer wheel turned 20°. Inner wheel 22°30'.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Cast-iron. Diameter—11".
Lining—Molded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32"; (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for data.*
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

ENGINE NUMBER:—Stamped on left rear engine support.

ENGINE:—Eight cylinder, In line, Overhead valve type. Two intake and two exhaust valves per cylinder operated by two camshafts on cylinder head (exh. camshaft right, int. camshaft left).
Bore—3¾". **Stroke**—4¾".
Piston Displacement—420 cubic inches.
Rated Horsepower—45.
Developed Horsepower—(J) 265 at 4200 R.P.M.
Compression Ratio—5.2-1 Std. cast-iron head.
Compression Pressure—110 lbs. at 80 R.P.M.

Pistons:—Ray-Day, aluminum alloy, split, full skirt type. Skirt is separated from head by horizontal slot. Piston length 4⅜". **Weight**—20 ounces.
Removal—Pistons and rods removed from below.
Clearance—Top .032". Lands .027". Bottom .0035-.004".

Piston Rings:—Four rings per piston, three compression, one oil control, all above pin. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.014-.016"	.150"
Oil Cont.	3/16"	.014-.016"	.150"

Piston Pin:—Diameter 1 1/16". Length 3 17/64". Pin floats in piston and rod. Held by two locking rings at each end. Pin hole in connecting rod is bushed and diamond-bored to size.
Pin Fit in Piston—Slight driving fit at room temperature (pin holes reamed to 1.06225-1.06175").
Pin Fit in Rod Bushing—Free push fit (bushing diamond bored to inside diameter of 1.0625".

Connecting Rod:—Weight 18 ozs. (without cap bolts or bushing). Length 9 13/16". Rod is a Duralumin forging used with a steel bearing cap.
Lower Bearing—Poured 'Mogul alloy' lined type.
Clearance—.0015-.002".
Adjustment—None (no shims). Bearings should not require adjustment during life of engine. Caps can be reduced with fine emery cloth on a surface plate if necessary.

Crankshaft:—Five bearings. Integral counterweights. Special mercury-cartridge type damper.
Journal Diameters—2¾" all bearings.
Bearing Type—'Mogul alloy' lined type.
Clearance—.0015".
Adjustment—None (no shims). Bearings should not require adjustment during life of engine. Caps can be reduced with fine emery cloth on a surface plate if necessary.
End Thrust—Taken by front main bearing. Thrust washer assembled between bearing and crankshaft sprocket. Endplay .0015-.003".

Camshaft:—Two camshafts on cylinder head. Each camshaft supported by five bearings.
Journal Diameters—1¼" all bearings.
Bearing Type—'Mogul alloy' lined type.
Clearance—.0015".
End Thrust—Taken by front bearing. Endplay, .0015-.003".
Timing Chains—Link Belt. **Upper Chain**—Width 1 11/16", Pitch ⅜", Length 51¾". **Lower Chain**—Width 2", Pitch ⅜", Length 47¼". Both camshafts are driven in tandem by upper chain from transfer sprocket on front of engine. Transfer sprocket driven in tandem with two accessory sprockets by lower chain from crankshaft. Automatic idler take-ups used on both chains.
Camshaft Setting—To change or set valve timing, turn engine over (by prying on flywheel ring gear with pry-bar inserted through inspection plate hole in housing) until #8 piston is slightly before top dead center entering power stroke (distributor rotor will be opposite #8 segment in distributor cap), stop when flywheel mark '/INT. OPENS' lines up with reference line on housing. This mark is exactly ⅝" before top dead center mark '1&8/CL'. Take off upper chain case cover, release idler sprocket by taking off cotter pin and plain washer, pry forward on sprocket bushing and spring until spring is nearly released, use tool #J-7016 to release spring tension, withdraw bushing lift chain off sprocket, remove sprocket, block chain up at lower end to prevent it dropping off transfer sprocket. Then set each camshaft as follows:
Intake Camshaft. Take out 6 capscrews, remove intake camshaft sprocket, set tappet clearance #1 intake valve at .025" (see note on tappet clearance), turn intake camshaft in direction of rotation until intake valve begins to open (use straddle clamp to twist valve tappet, valve opens when clearance is taken up and cam grips valve tappet), mesh sprocket in chain, keep driving side of chain taut, slip chain on sprocket one tooth at a time until sprocket can be mounted on camshaft without disturbing position of shaft or transfer sprocket, insert capscrews. Check ignition timing.
Exhaust Camshaft. With #8 piston slightly past top dead center entering power stroke and flywheel mark '/EXH.CLOSES', which is 1¼" past top dead center mark '1&8/CL', at reference line on housing, take off 6 cap screws, remove exhaust camshaft sprocket, set tappet clearance #1 exhaust valve at .025", turn exhaust camshaft in direction of rotation (clockwise) until #1 exhaust valve begins to close (use straddle clamp to twist valve tappet, valve closes when tappet is just released by cam so that tappet can be turned easily), mesh sprocket in chain, keep driving side of chain taut, slip chain on sprocket one tooth at a time until sprocket can be mounted on camshaft without disturbing position of camshaft or transfer sprocket, insert cap screws.
Idler Sprocket Assembly:—Mesh idler sprocket in chain, insert bushing and spring, use special tool to wind up spring 12 notches or two complete turns, assemble washer and cotter pin. Turn engine over with starter to allow chain to assume normal running position, then release spring tension, change setting to 9 notches or 1½ turns. See Equipment Section for complete data on Link Belt automatic idler sprockets.

Valves:—	Head Diam.	Stem Diam.	Stem Lgth
Intake	1½"	11/32"	5.002"
Exhaust	1 7/16"	11/32"	4.992"

Seat Angle—30° (all valves). **Lift** .350".
Stem-to-Guide Clearance—.002".
Valve Springs—Double springs used on all valves.

Inner Springs—	Pressure	Length
Valve Closed	26 lbs.	1 15/16"
Valve Open	36-40 lbs.	1 19/32"
Outer Springs—	**Pressure**	**Length**
Valve Closed	35-40 lbs.	2¼"
Valve Open	65-70 lbs.	1 29/32"

Tappet Clearance—.025" (cold) all valves.
NOTE:—To change or set tappet clearance, use feeler gauge and check actual tappet clearance of each valve (clearance between heel of cam and tappet). Remove camshafts, tappets, tappet adjusting nuts. Use shims of various thickness to change length of adjusting nut so that clearance when assembled will be .025" (measure length of adjusting nut with 1" micrometer, add or remove shims as necessary, recheck adjusting nut with micrometer).

Valve Timing

Intake Valves open 6° BTDC. Close 40° ALDC.
Exhaust Valves open 40° BLDC. Close 14° ATDC.
To Check Valve Timing:—Check tappet clearance #1 intake and exhaust valves (set at .025" cold). #1 intake valve should open with #8 piston slightly before top dead center entering power Stroke when flywheel mark '/INT.OPENS' lines up with reference line on housing. This mark is exactly ⅝" before top dead center mark '1&8/CL'. #1 exhaust valve should close with #8 piston slightly past top dead center when flywheel mark '/EXH.CLOSES' lines up with reference line. This mark is 1¼" past top dead center mark '1&8/CL'.

Lubrication:—Pressure type. Gear type oil pump located in oil pan.
Oil Pressure—2-10 lbs. (low idling speeds) increasing approximately 1 lb. per M.P.H. Maximum pressure, 80-100 lbs (high speed operation).
Oil Pressure Relief Valve—Built into oil pump. Controlled by adjustment nut located on lower left hand side of crankcase directly in front of oil float gauge indicator. Turn adjustment nut clockwise to increase, or counter-clockwise to decrease pressure. **Capacity**—12 qts.

CLUTCH:—Long Model 31-A. Double plate, dry disc type. No adjustment required for wear. See article in Clutch Section for complete data.
Clutch Pedal Adjustment—Free movement of clutch pedal must be 1-1½".
Clutch Facings—Special moulded composition, 4 required, 6½" I.D., 11" O.D., .137" thick.
NOTE:—Manufacturer recommends that cover plate assembly and driven member assembly be returned to factory for reconditioning.
Clutch Assembly—The three center driving plate adjusting screws (round-headed screws) must be backed off until the ends are flush with the pressure plate before the cover plate is bolted on the flywheel. Adjust these screws by turning in until they bottom and then backing each screw off exactly 4 notches.

STEERING:—Front Suspension—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Caster—1°. Shim adjustment. **Camber**—1°.
Toe In—⅛-¼". Adjust in usual manner by loosening tie rod end clamps and rotating tie rod.
KingPin Bearing Adjustment—Kingpins are carried on a double-row ball bearing at the top and a ball thrust bearing at the bottom. Adjustment for end-thrust (up-and-down movement) is provided at lower bearing. To adjust, remove locking bar in adjusting nut below kingpin, back off adjusting nut, remove shims until there is no perceptible up- and-down movement of steering knuckle with adjusting nut tightened, or there is is a slight drag on steering knuckle when revolved around kingpin. Replace locking bar.

Steering Gear:—Ross Cam-and-Lever type. See article in Steering Section for complete data.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section.
Drum Diameter—15".
Lining—Moulded. Width 2¼". Thickness ¼". Length per wheel 28¾".
Clearance—.010" between lining and drum.

MERCURY NOTE:—All '95' Engine data below applies to Mercury as well as Ford models with '95' Engine.

1938 (ALL), 1939 (STD. MODELS)

HOOD, SIDE PANEL & GRILLE REMOVAL:—Turn radiator ornament counter-clockwise to free latch, lift hood up at forward end.

Side Panels:—To remove, take out three screws along top edge as follows: (1) extreme front corner at top of grille emblem, (2) at radiator shell, (3) extreme rear corner at cowl. Remove two thumbnuts on lower edge (inside), lift panel out.

Front Grille:—Made up of right and left sections but can be removed as an assembly. To remove, take out four bolts on fender edge on each side, one bolt on each side at splash shield edge on bottom,

1939 MODELS

HOOD (DELUXE FORD & MERCURY):—To raise hood, release latch by pulling up on latch handle on front of hood at upper edge of grille, raise hood slightly, press down on safety latch handle (to right of latch handle under hood). Separate side panels not used.

1936-39 MODELS

OIL PAN REMOVAL:—To remove oil pan, disconnect radius rods at rear end, remove oil level indicator and tube, attach hoist to front bumper bars and raise front end of car, push radius rods down and install block between bolt and cross-member. Remove oil pan screws, maneuver pan off.

1938 MODELS

STARTER SUPPORT BRACE:—To correct thump or pound in engine when accelerated between 18 and 28 M.P.H., special starter motor to oil pan brace 82-A-11140-A1 (60 Engine), 81-A-11140 (85 Engine) should be installed. Fasten this brace or bracket to starter through-bolt at starter end, remove one oil pan to cylinder block bolt and replace with special bolt 20426-S (60 Engine), 20426-S2 (85 Engine) to hold opposite end.

1937-38-39 MODELS

REPLACEMENT PISTONS ('60' ENGINES):—Steel-alloy pistons only used on these models. Finished pistons furnished in following sizes:

Part No.	Piston Sizes
52-6110-A	Standard
52-6110-B	.0025" Oversize
52-6110-C	.005" Oversize
52-6110-D	.015" Oversize
52-6110-E	.030" Oversize
52-6110-F	.045" Oversize

1932-39 MODELS

REPLACEMENT PISTONS ('85' ENGINES):—Flat head (aluminum) pistons used on all 1932-35 engines and part production 1936. Dome head pistons (aluminum or steel-alloy) used on part production 1936 and all 1937-38-39 engines.

IMPORTANT—Flat head type pistons and Dome head pistons are not interchangeable. Dome head pistons used only with special cylinder heads.

Aluminum (flat head)—Finished pistons furnished for 1932-36 engines in following sizes: Part No. 40-6110-A2 (Std.), B2 (.0025" O.S.), C2 (.005" O.S.), D2 (.015" O.S.), E2 (.030" O.S.), F2 (.045" O.S.), G2 (.060" O.S.).

Steel-alloy (dome head)—Finished pistons available for 1936 to 1939 engines as follows:

1936-37-38 — Part No.	— 1939	Piston Sizes
68-6110-A1	91-A-6110-A	Standard
68-6110-B1	91-A-6110-B	.0025" Oversize

NOTE—For .005" to .060" oversize pistons on these engines use aluminum (dome head) listed below.

Aluminum (dome head)—Finished pistons furnished for part production 1936 and all 1937-38-39 engines as follows:

Part No.	Piston Sizes
81-A-6110-C	.005" Oversize
81-A-6110-D	.015" Oversize
81-A-6110-E	.030" Oversize
81-A-6110-F	.045" Oversize
81-A-6110-G	.060" Oversize

1939 MODELS

REPLACEMENT PISTONS ('95' ENGINES):—Steel-alloy (dome head) pistons only used as follows:

Part No.	Piston Sizes
99-A-6110-A	Standard
99-A-6110-B	.0025" Oversize

1932-39 MODELS

CONNECTING ROD BEARING SERVICING:—Bearings float between connecting rods and crankpin. Special Replacement bearings furnished oversize on outer diameter (for oversize rods) and undersize on inner diameter (undersize crankpins) as follows:

'60' Engine (1937-38-39)

Part No.	Connecting Rod Oversize	Crankpin Undersize
52-6211-A	Std.	Std.
52-6211-B	Std.	.003"
52-6211-C	Std.	.010"
52-6211-D	.004"	.003"
52-6211-E	.008"	.010"
52-6211-F	.008"	.003"
52-6211-G	.004"	.010"
52-6211-H	.004"	Std.
52-6211-J	.008"	Std.

'85' Engine (1932 to 38)

48-6211-A	Std.	Std.
48-6211-BRP	Std.	.003"
48-6211-CRP	Std.	.010"
48-6211-D	.004"	.003"
48-6211-E	.008"	.010"
48-6211-FRP	.004"	.003"
48-6211-GRP	.004"	.010"

'85' & '95' Engines (1939)

Part Numbers 85	95	Con. Rod Oversize	Crankpin Undersize
81-A-6211-A	99-A-6211-A	Std.	Std.
81-A-6211-D	99-A-6211-B	.004"	.003"
81-A-6211-E	99-A-6211-C	.008"	.010"
81-A-6211-F	99-A-6211-D	.008"	.003"
81-A-6211-G	99-A-6211-E	.004"	.010"
81-A-6211-J	99-A-6211-G	.004"	Std.
81-A-6211-K	99-A-6211-H	.008"	Std.

1936-39 MODELS

CRANKSHAFT BEARINGS:—Replacement bearings furnished in Standard Size and Undersizes as shown below. In addition, Rear Main Bearings (flanged on both ends—take crankshaft end thrust) furnished in special lengths as follows:

'60' Engine (1937-38-39)

Part Number Frt. & Center	Rear	Size
52-6333-A	52-6331-A	Standard
52-6333-B	52-6331-B	.005" Undersize
52-6333-C	52-6331-C	.010" Undersize
52-6333-E*	52-6331-D**	Standard
	52-6331-E*	Standard
	52-6331-F**	.005" Undersize
	52-6331-G**	.010" Undersize

'85' Engine (1936-37-38)

68-6333-A	68-6331-A	Standard
68-6333-B	68-6331-B	.005" Undersize
68-6333-C	68-6331-C	.010" Undersize
68-6333-E*	68-6331-D**	Standard
	68-6331-E*	Standard
	68-6331-F**	.005" Undersize
	68-6331-G**	.010" Undersize
68-6333-F	68-6331-H	.015" Undersize

'85' & '95' Engines (1939)

Part Number Frt. & Center	Rear	Size
81-A-6333-A	81-A-6331-A	Standard
81-A-6333-B	81-A-6331-B	.005" Undersize
81-A-6333-C	81-A-6331-C	.010" Undersize
81-A-6333-D	81-A-6331-H	.015" Undersize
81-A-6333-E*	81-A-6331-D**	Standard
	81-A-6331-E*	Standard
	81-A-6331-F**	.005" Undersize
	81-A-6331-G**	.010" Undersize

**—These bearings .015" oversize in length.

*—O.D. .015" oversize, .015" undersize within flanges.

1932-39 MODELS

PISTON PIN FITTING:—Steel Pistons. Pins can be removed and installed without heating pistons. Pins, pistons, and rod bushings held to close limits so no fitting required. Check clearance as follows:

Pin Fit in Piston—With piston and pin at same temperature and clean, pin should drop through pin hole in piston (clearance .0007" maximum).

Pin Fit in Rod Bushing—With pin installed, hold pin so that rod hangs vertically, then rotate pin. Lower end of rod should move upward through arc of ½" max. before dropping back to vertical.

Aluminum Pistons:—Pistons must be heated by immersion in boiling water for one minute, or on special piston heater to a temperature not to exceed 200°F. for pin removal and installation. Pins, pistons, and rod bushings held to close limits so that no fitting required. Check clearances as follows:

Pin Fit in Piston—Pin should be hard hand push fit in piston with piston at room temperature.

Pin Fit in Rod Bushing—Same as for steel pistons

1933-39 MODELS

VALVE SERVICING (ALL FORD AND MERCURY ENGINES):—Complete valve assembly (valve, spring, guide) should be removed as follows:

Valve Assembly Removal:—Use special bar type lifter V-78 (All Fords and Mercury) inserting the end of lifter through valve spring coils to engage flanged lower end of guides, pull guide down slightly, withdraw 'C' type guide retainer, lift valve assembly out through top of block.

Valve Assembly Dismantling:—Use special bench fixture V-130 (85 Valves), S-214 (60 Valves). Consists of special press by which valve spring can be compressed to free spring retainer (fixture has stop which prevents excessive valve spring compression).

Valve Grinding and Tappet Clearance Note for all V8 Models):—To perform these operations with minimum amount of hand cranking, note which valves are fully open (first column in table below), grind or check valves listed on same line of table—then turn shaft 'til next 'valve open' point reached.

Valves Open	Valves to Grind
1. 4X & 1N	3X, 8N, 6N, 7X, 3N, 2X
2. 3X & 8N	1X, 7N, 5X, 2N, 4X, 1N
3. 1X & 7N	8X, 5N, 6X, 4N
OR	
1. 8X & 5N	1X, 7N, 6N, 7X, 3N, 2X
2. 6N & 7X	5X, 2N, 4X, 1N, 8X, 5N
3. 5X & 2N	6X, 4N, 3X, 8N

NOTE—'X' Exhaust Valve. 'N' Intake Valve.

Tappet Clearance Checking (All Models):—Use special two-step feeler to check clearance with valve lifter on heel of cam (see above). First .0125" step should be 'go', second .0135" 'no go'.

Exhaust Valve Seat Insert Grinding Note:—Seat inserts are exceedingly hard (high-tungsten, chrome-alloy steel). Manufacturer recommends eccentric-grinding equipment be used to reface these inserts.

OIL PAN REMOVAL:—To remove oil pan for work on engine, drain radiator, disconnect radiator hose connections, loosen front motor support, hoist motor, take out pan screws and maneuver pan off.

SERIAL NUMBER:—Same as Engine Number. Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE NUMBER:—See Serial Number.

ENGINE:—Eight cylinder, 90 degree V, 'L' head type.

Dimensions—Bore, 3 1/16". Stroke, 3¾". Displacement, 221 cu. ins.

Horsepower—Rated 30.0. Developed—65 at 3400 R.P.M.

Compression—Ratio 5.5-1 cast-iron ('32), 6.3-1 aluminum (Std. '33, Optl. '32). Pressure 115 lbs. at 1800 R.P.M. or approximately 100 lbs. at cranking speed (5.5-1). 138 lbs. at 1600 R.P.M. or approximately 105 lbs. at cranking speed (6.3-1).

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

NOTE—Same cylinder head gasket used for both banks. Install gasket so that word 'Front' is toward front of engine on both banks.

Pistons:—Aluminum, split skirt, cam ground type. Piston diameter is slightly less across piston pin bosses. Skirt also tapered from top to bottom (approximately .001" greater diameter at bottom of skirt). Recondition cylinders to standard oversize. Pistons furnished in standard oversizes of .0025", .005", .015", .030", .045".

Weight—287-291 grams (stripped), 389.5-396.9 grams (with rings and pin).

Removal—Piston and rod assembly removed from top of engine.

Clearance—Skirt, 002" minimum, .003" maximum (see Fitting New Pistons).

Fitting New Pistons—Use micrometer gauge to check pistons size and cylinder bore. Measurement on piston should be be made at top of skirt (directly below slot and to left of piston skirt split). Measurement of cylinder bore should be made at right angles to crankshaft at point 2" above bottom of cylinder bore. Piston selected for cylinder should show correct clearance (difference between two measurements). Pistons cannot be ground and cylinders should be reconditioned to take standard replacement piston. New pistons should be measured before installing pin. Do not use feeler gauges.

NOTE:—Install pistons with slot to left (viewed from driver's seat).

Piston Rings:—Three rings per piston, #1 and 2—compression rings, #3—oil control ring. All rings above piston pin. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness	Groove Depth in Piston
Comp. (all)	.0915-.092"	.009-.015"	.140"	.154-.159"
Oil Cont.	.1545-.155"	.005-.009"	.140"	.154-.159"

Piston Pin:—Diameter, .7501-.7504". Length, 2.77". Pin floats in piston and rod and is held by retainer ring in rod (engages slot in center of pin). Piston should be heated to 200°F. (dip in boiling water for one minute) to remove or install pins.

Pin Fit in Piston—Slight drag with piston heated to 200°F.

Pin Fit in Rod—.0002". Pin hole in rod is diamond-bored to provide this clearance. With correct clearance, rod should rock on pin of its own weight but piston should not rock (make test before retainer is installed).

NOTE:—Use a taper pilot inserted ahead of piston pin to expand retainer ring when pins are installed.

Connecting Rod:—Weight, 469-473 grams. Length, 7" (center-to-center).

Big End Bearing—Separate babbitted bearing sleeves assembled on crankpin. Bearing diameter, 2" (inside), 2.218" (outside). Length, 1.937" (on crankpin).

Clearance—.003". Sideplay .010-.022". No shims used.

Adjustment—None (no shims used). Replace bearings.

NOTE:—A new tool, Part #V-131, has been developed to test bearings with connecting rod caps tightened. Tool is used to grasp bearing flanges and test fit by rotating bearings. Bearings should rotate freely. If bearings cannot be turned, or turns hard, check for bent connecting rods, distorted or burred bearings.

Crankshaft:—Three bearing, 90° type with integral counterweights.

Journal Sizes—2" diameter (all bearings).

Bearing Type—Babbitt bearing surface integral with cap and case.
Clearance—.001-.003".
Adjustment—None (no shims used).
End Thrust—Taken by #3 (rear) main bearing. Endplay, .002-.006".

Camshaft:—Three bearing type. Camshaft drive—Gears.
Camshaft Bearings—1.812" diameter (all bearings).
Gears—Crankshaft gear, steel. Camshaft gear, Bakelized Fabric.
Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear opposite space between gears marked by straight line on camshaft gear.
NOTE:—Backlash between gears should not exceed .004".

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
All valves	1.537"	.3105"-.3115"	4.750-.4.751"	45°	.295"

See Ford Special Shop Note for complete Valve Servicing data.

Stem-to-Guide Clearance—.0015-.0035" (all valves).
Tappet Clearance—.0125-.0135" all valves. Not adjustable. Use special two step feeler gauge to check clearance (.0125" step 'go,' .0135" step 'no-go.' Replace valves if clearance is excessive, or grind off end of stem slightly if insufficient.

NOTE—Valve guides are split type and must be removed before valves can be taken out (valve stem has large end which will not clear). To remove valves, remove valve spring lock, remove valve spring, pull valve up slightly, insert special offset guide remover through valve port, press guides out and remove from below. Valves can then be lifted out.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9°30' Before TDC. Close 54°30' After LDC.
Exhaust Valves—Open 57°30' Before LDC. Close 6°30' After TDC.
To Check Valve Timing—No flywheel marks or other means provided to check valve timing. If dead center point for piston #1 established on flywheel, #1 intake valve opening will be approximately 2.96 teeth before this point with piston .0327" before top dead center.

LUBRICATION:—Pressure type. Gear type oil pump located in crankcase and driven by gears at rear of camshaft (under cover in back of rear bearing).
Normal Oil Pressure—30 lbs. at 55 M.P.H.
Oil Pressure Relief Valve—Operates at 30 lbs. Not adjustable. Located under plug directly above camshaft front bearing.
NOTE—First type relief valve fitted with adjusting setscrew and locknut should be replaced with later non-adjustable type whenever found.
Crankcase Capacity—5 qts. Use SAE. #40 (summer), #20 or #10 (winter).

CLUTCH:—Long Model 9AB. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Moulded type, 2 required. Thickness .137". Inside diameter 5¾". Outside Diameter 9".
Adjustment—Free movement of clutch pedal must be 1-1¼". To adjust, take out clevis pin on clutch release lever at forward end of clutch pedal rod, turn clevis on rod.

STEERING:—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Ford type. 'I' beam section front axle with Reverse Elliott ends and transverse cantilever spring. Axle positioned by forked radius rod anchored at rear end at frame 'X' member cross member.
Kingpin Inclination—7° crosswise.
Caster—4½-9°. Must be equal within ½° for both wheels. No adjustment.
NOTE—Caster should be 3-5° and equal within ½° for 131½ and 157" WB. trucks.
Camber—1¼-2° (8¼-9° with kingpin inclination). No adjustment.
Toe In—3/32". Must be proportional to camber in ratio of 10-1. Adjusted in usual manner by changing length of tie rod.

BRAKES:—Service—Own design. Two shoe, internal expanding, mechanically operated type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diameter—12".
Lining—Semi-moulded type. Thickness 3/16". Width 1½" Length 31" per wheel.
NOTE—Lining should be ground concentrically when installed on shoes.

Hand Brake:—See Service Brake above and adjustment instructions.

OIL PAN REMOVAL:—To remove pan for work on engine, it is necessary to drain radiator, disconnect water pump hose connections, loosen front motor support, hoist motor, maneuver oil pan off.

ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE:—Own Model 48. Eight cylinder, 90 degree 'Vee', 'L' head type. Both cylinder banks and crankcase cast integrally.
Bore—3.062". Stroke—3.75".
Piston Displacement—221 cubic inches.
Rated Horsepower—30.
Developed Horsepower—90 at 3800 R.P.M.
Compression Ratio—6.3-1 (Std. aluminum head). 5.32-1 (cast-iron head) 131" & 157" WB. trucks.
Compression Pressure—105 lbs. at cranking speed or 138 lbs. at 1600 R.P.M. (passenger cars), 109 lbs. at 2500 R.P.M. (131" and 157" WB. trucks with 5.32-1 cast-iron head).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Aluminum alloy, open split skirt, cam ground type. Skirt is tapered from top to bottom (.001-.002" greater diameter at bottom of skirt measured at right angles to bosses). Recondition cylinders to take replacement pistons furnished .0025", .005", .015", .030", .045", .060" oversize. Piston length 2.97".
Weight—287-291 grams (stripped), 389.5-396 grams (with rings and pin).
Removal—Pistons and rods removed from above.
Clearance—Skirt .002" min., .003" max.

Replacement Pistons:—*See Ford Special Shop Notes.*
Fitting New Pistons—Use .002" feeler ½" wide inserted between piston and cylinder wall at right angles to pin on side opposite slot, Pull to withdraw feeler must be within 5-10 lbs.
Installing Pistons—Slot should be toward left viewed from driver's seat.

Piston Rings:—Two compression rings, one oil control ring per piston, all above pin. Oil ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. All	.0915-.092"	.009-.015"	.140"
Oil Cont.	.1545-.155"	.005-.009"	.140"

Piston Pin:—Diameter .7501-.7504". Length 2.77". Pin floats in piston and rod and is held by retainer ring in rod which engages groove in pin. Heat piston to 200°F. (dip in boiling water for one minute) to remove or install pins.
Pin Fit in Piston—Slight drag with piston at 200°F.
Clearance in Rod—.0002". With this clearance rod should rock on piston of its own weight, but piston should not rock on rod. This test should be made before retainer ring is installed.
Installing Pins—Use a taper pilot inserted ahead of pin to expand retainer ring.

Connecting Rod:—Weight 469-473 grams. Length 7".
Lower Bearing Type—Separate copper-lead type bearing sleeves assembled on crankpin.
Crankpin Journal Diameter—1.999".
Bearing Size—2" I.D., 2.218" O.DD., 1.937" long on crankpin.
Clearance—.003". Sideplay .010-.022".
Adjustment—None. Replace bearings.
NOTE—Use tool, #V-131, to check bearing fit with rod caps tightened. Tool grasps bearing flanges and allows bearings to be rotated to test fit. Bearings should rotate freely. If bearings cannot be turned or turn hard, check for bent rods, distorted bearings, or burrs. This tool now has serrations on the jaws to engage the smaller diameter flanges of the copper-lead type bearings. First type tool without serrations can be adapted by filing notches 1/16" wide on face of jaws.

Crankshaft:—3 bearing. Integral counterweights.
Journal Diameters—1.999" (all bearings).
Bearing Type—Babbitt bearing surface integral with crankcase and bearing cap.
Clearance—.001-.003". Endplay .002-.006".
Adjustment—None (no shims). Do not file caps.
End Thrust—Taken by rear bearing.

Camshaft:—Three bearings. Gear driven.
Bearing Diameters—1.812" all bearings.
Timing Gears—Crankshaft gear steel. Camshaft gear Bakelized fabric. Gears have been changed from 10 pitch to 8 pitch. Camshaft gear 44 teeth (new), 56 teeth (old). Crankshaft gear 22 teeth (new), 28 teeth (old).
Gear Backlash—.004" maximum.
Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear with space on camshaft gear marked by straight line.

Valves:—

	Head Diameter	Stem Diameter	Length
All valves	1.537"	.3105-.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Special Shop Notes for Valve Servicing data.
Tappet Clearance—.0125-.0135" all valves. No adjustment. Use special two-step feeler as Go-No Go gauge. First step (.0125") should pass between valve stem and lifter with lifter on heel of cam. Second step (.0135") should be 'no go'. Replace valves if clearance is excessive or grind off end of valve stem if clearance is insufficient.
Valve Springs—See note on Valve Assembly below. Spring free length 2.38".

	Spring Pressure	Length
Valve Closed	39-44 lbs.	2.13"
Valve Open	62-65 lbs.	1.84"

NOTE—Split type valve guide bushings retained by a 'C' washer type retainer on lower end are used. To remove valves, use V-78 bar type valve lifter, insert tongue of lifter between valve spring coils and engage flanged lower end of valve guide bushing, pull bushing down and remove valve guide bushing retainer, then pull valve assembly out from above. Use special fixture #V-130 to disassemble valve units. Insert valve assembly in fixture, compress spring with lever engaging valve head, remove valve spring retainers. With this fixture the valve head acts as a stop to prevent excessive compression of the valve spring.
Valve Timing—See Camshaft Setting above.
Intake Valves—Open 9½° BTDC. Close 54½° ALDC.
Exh. Valves—Open 57½° BLDC. Close 6½° ATDC.
Valve Timing Check—No flywheel marks or other means of checking timing provided. If dead center point for piston #1 is established on flywheel. #1 intake opening will be approximately 2.96 teeth before this point.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Lubrication:—Pressure. Gear type oil pump located in crankcase. Driven by gears from camshaft.
Normal Oil Pressure—30 lbs. at 55 M.P.H.
Oil Pressure Relief Valve—Operates at 30 lbs. Located under plug directly above camshaft front bearing. Not adjustable.
Oil Pressure Gauge—Electrical type. See complete article in Mechanical Equipment Section on King-Seeley Gauges (used on 1935 model only).
Capacity and Oil—5 qts. Use SAE. #40 (summer 32° to 100°F), #50 (summer above 90°F), #30 (20° to 65°F), #20 or 20-W (winter 50° to 30°F), #10-W (30° to —15°F).

CLUTCH:—Long Models 9AB (1934 all), 9CF (1935), 11CF ('35 Trucks).
See article in Mechanical Equipment Section for data.
1934—Single plate, dry disc type. **1935**—Semi-centrifugal single plate, dry disc type. Release levers have weights at outer ends which increase clutch pressure from 810 lbs (engine stopped) to 1980 lbs. (at 4000 R.P.M.) by centrifugal force. Pedal pressure has been reduced to 25 lbs. at idling speed. No adjustment required for wear. See article on each type in Clutch Section for complete data.
Facings—Molded asbestos, 2 required.

	Inside Diam.	Outside Diam.	Thick.
Pass. Cars	5.76"	9.0"	.140"
Trucks '34	5.5"	9.75"	.138"
Trucks '35	6.5"	11.0"	.140"

Clutch Pedal Adjustment—Free movement of clutch pedal must be 1-1½" (1934), 1½-2" (1935). The greater clearance on 9CF and 11CF models must be maintained to provide clearance for release bearing when release levers move back under centrifugal action. To adjust, remove clevis pin on clutch lever adjusting rod (at upper end of clutch release lever), turn clevis on forward end of adjusting rod.
NOTE—1935 clutch cover plate bolted directly to flat surface of flywheel by six special pilot cap screws. Driven plate has six springs in vibration damper instead of 12 springs on old design.

STEERING:—Front Suspension—Front axle 'I' beam section with Reverse-Elliott ends and transverse-cantilever spring.
Kingpin Inclination—7° crosswise.
Caster—9° Max., 4½° Min. (Pass. Cars), 5° Max., 3° Min. (Trucks). Must be alike within ½°. No adjustment provided.
Camber—1° Max., ¼° Min. No adjustment.
Toe In—3/32" (Pass. Cars), 0" (Trucks). On trucks, toe in increases with load and should be set with truck empty. Adjust all models by loosening tie rod clamp bolts and turning rod.
Steering Geometry (Toe out on turns)—Inner wheel turned 23 1/3° (Pass. Cars), 22 2/3° (131½" W.B. Trucks), 22¼° (157" W.B. Trucks), outer wheel turned 20° (all models). Allowable variation ½°.
Steering Gear:—Gemmer model, Worm-and-Sector. ***See article in Mechanical Equipment Section for data.***

BRAKES:—Service—Own make. Mechanical type. Hand lever applies all four service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—12".
Lining—Semi-moulded type. Width 1.5" ('34), 1.75" ('35). Thickness .172" ('34), .185" ('35). Length per wheel 31" ('34), 26.5" ('35).
Hand Brake Adjustment:—See Service Brakes.

OIL PAN REMOVAL:—*See Ford Shop Notes.*

NOTE:—Engine changes made during year as follows: New type steel-alloy piston (requiring special cylinder head) superseding aluminum alloy pistons. Heavier crankshaft with removable main bearings, new oil pump, new oil pan. Data on all types given below. Engines with each type equipment identified as follows:
Aluminum Alloy Pistons—Block not marked. Head marked '40'.
Steel-alloy Pistons—Black marked 'SP' or 'SPG' on upper front end of left cylinder block near water coupling. Head marked '46' on top.
Heavier Crankshaft—Engine not marked but new pan with greater bearing clearance used.

ENGINE NUMBER:—First number—68-2,207,111 (Sept. 4, 1935). Stamped on top of clutch housing, and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS MODEL 68 and 67:—Own Model 68. Eight cylinder, 90° Vee, 'L' head type with both cylinder blocks and crankcase cast enbloc.
Bore—3.062". **Stroke**—3.75".
Piston Displacement—221 cubic inches.
Rated Horsepower—30.
Developed Horsepower—90 at 3800 R.P.M.
Compression Ratio—6.3-1 Std. aluminum head.
Compression Pressure—140 lbs. at 2500 R.P.M. or 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

ENGINE SPECIFICATIONS MODEL 51 (TRUCK):— Same as above model except as follows:
Developed Horsepower—80 at 3800 R.P.M.
Compression Ratio—5.32-1 Std. cast-iron head.
Compression Pressure—110 lbs. at 2500 R.P.M. or 90 lbs. at cranking speed of 100 R.P.M.

PISTONS—ALUMINUM ALLOY TYPE:—Split skirt, Cam ground type. Length 2.97". Recondition engines to take finished replacement pistons.
Weight—287-291 grams (stripped), 389.5-396.5 grams with rings and pin.
Removal—Pistons and rods removed from above.
Clearance—.002" Min., .003" Max. See Fitting New Pistons.
Replacement Pistons:—*See Ford Special Shop Notes.*
Fitting New Pistons:—Use .002" feeler ½" wide inserted between piston and cylinder wall at right angles to pin on side opposite slot. Pull to withdraw feeler must be within 5-10 lbs.
Installing Pistons:—Slot to left (viewed from driver's seat) for all pistons.

PISTONS—STEEL ALLOY TYPE:—Heat treated, steel-alloy, Cam ground type with domed head and cut-away skirt. Recondition cylinders to take finished replacement pistons.
NOTE—Original equipment steel-alloy pistons furnished as an assembly with fitted pins and connecting rods. For replacement, separate pistons, pins, and connecting rods must be used. Piston assembly with fitted pins and rods discontinued.
Replacement Pistons:—*See Ford Special Shop Notes.*
Fitting New Pistons:—Use .0025" feeler ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be within 7-12 lbs.
Installing Pistons: See rod data.

PISTON RINGS—ALL PISTONS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled with eight ⅛" oil drain holes (slot on each side also used on aluminum pistons).

Ring	Width	End Gap	Wall Thick.
Comp.	.0915-.092"	.009-.015"	.140"
Oil Cont.	.1545-.155"	.005-.009"	.140"

PISTON PIN—ALUMINUM PISTONS:—Diam.—.7501-.7504". **Length**—2.77". Pin floats in piston and rod and is held by retaining ring in connecting rod. Heat piston to 200° F. (dip in boiling water for one minute) to remove or install pins.
Pin Fit in Piston—.0001" clearance.
Pin Fit in Rod—.0002" clearance. Rod should just rock on piston of own weight but piston should not rock on rod (retainer not installed).
Installing Pins:—Use tapered pilot inserted ahead of pin to expand retainer in rod.

PISTON PIN—STEEL PISTONS:—Original equipment pins retained by plugs expanded in groove in piston bosses. These pins cannot be removed in the field. See NOTE under Steel-alloy pistons above.
See Ford Shop Notes for Pin Servicing Directions.

CONNECTING ROD—ALL PISTONS:—Length 7".
Weight—469-473 grams.
Crankpin Journal Diameter—1.999".
Lower Bearing—Copper-lead, Cadmium-nickel, or Cadmium-silver type. Bearing surface on outer face (in rod), and inner face (on crankpin). Bearing halves float in rods (side-by-side rod mounting).
Bearing Dimensions—2" inside diameter, 2.218" outside diameter, 1.937" length on crankpin.
Clearance—.0015-.0035" (total diametrical), .010-.022" (total endplay).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Use tool, Part No. V-131, to check bearing fit. Bearings should rotate freely with bearing caps tight.
Replacement Bearings:—*See Ford Shop Notes for Bearings for Oversize Rods and undersize crankpins.*
Installing Rods:—Rods and caps marked 'R1', 'L1' etc. Install rods in same numbered cylinder with mark on rod and cap together and pointing down.

CRANKSHAFT—FIRST TYPE:—Three bearing, integral counterweights. Weight 56.5 lbs.
Journal Diameters—1.999" (all bearings).
Bearing Type—Babbitt bearing surface integral with crankcase and bearing caps.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Do not file bearing caps. Engine must be taken down and new bearings poured in crankcase and caps.
End Thrust:—Taken by #3 (rear) main bearing. Endplay .002-.006". Adjusted by replacing bearing.

CRANKSHAFT—SECOND TYPE:—Larger journal diameters and heavier than first type.
Journal Diameters—2.399" (all bearings).
Bearing Type—Removable steel-backed, copper-lead lined. Bearings furnished for service std., .003", .010" undersize.
NOTE—Install bearings with tongue or lug in groove and assemble caps so that groove in block and cap are on same side.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long rear bearings.*
End Thrust:—Same as for first type above.
NOTE—New design oil pan with greater clearance for main bearing studs used with this crankshaft. Interchangeable with old pan. Old pan can be used with new crankshaft by denting pan with ball-pein hammer to increase clearance.

CAMSHAFT:—Three bearing. Hellical gear drive.
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitt-lined.
Bearing Clearance—.001-.002".
End Thrust:—Taken by gear hub and front bearing and by hub and cover plate. Endplay .005". Adjusted by replacing bearing or cover plate.
Timing Gears:—Crankshaft gear alloy steel. Camshaft gear Bakelized Fabric. Backlash between gears .004" maximum.
Camshaft Setting:—Mesh crankshaft gear tooth marked 'O' with camshaft gear space marked '/'.

VALVES:—	Head. Diam.	Stem.Diam.	Length
All Valves	1.537"	.3105-.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Special Shop Notes for Valve Servicing data.
NOTE—High tungsten chrome alloy steel exhaust valve seat inserts are used.
Tappet Clearance—.0125-.0135" all valves. No adjustment. Grind off valve stem end if clearance insufficient or replace valves if excessive.
Valve Guides:—Split type. See Valve Assembly Removal.
Valve Lifters:—Alloy-iron type operating in reamed holes in block. Serviced by installing oversize lifters.
Diameter—.999-.9995". **Clearance**—.0005-.001".
Valve Springs:—Free length 2.42". See Valve Assembly removal below.

	Spring Pressure	Spring Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Assembly Removal:—Insert end of V-78 bar type valve lifter between spring coils to engage flanged lower end of guide, pry down on guide until 'C' washer at upper end can be removed, remove assembly from above. Use special fixture V-130 to compress spring and remove spring retainer. Install valves in same manner.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 9°30' BTDC. Close 54°30' ALDC.
Exh. Valves—Open 57°30' BLDC. Close 6°30' ATDC.
To Check Valve Timing—No flywheel marks or other means provided to check valve timing. If dead center point for any piston is established on flywheel, intake opening for valve in this cylinder will be approximately 2.96 teeth before this point with piston .0327" before top dead center.
Motor Gauge—Weidenhoff #104 Adapter, #40 Rod.

LUBRICATION:—Pressure System. Gear type oil pump located in oil pan at rear of engine.
NOTE—Two types of oil pump have been used. Interchangeable except that oil return pipe from rear main bearing must be removed when new type oil pump installed.
Normal Oil Pressure—30 lbs. at 55 M.P.H.
Oil Pressure Regulator—Located under plug directly above front camshaft bearing. Operates at 30 lbs. Not adjustable.
Oil Pressure Gauge—King-Seeley Electric type. Ford Part No. 48-9273 (dash unit—68 Deluxe and 51 Truck), 48-9278 (engine unit for above).
See article in Mechanical Equipment Section for data.
NOTE—Model 68 Std. and 67 Comm. not regularly equipped. Part No. 68-18426 gasoline gauge and oil pressure gauge assembly may be installed replacing regular gasoline gauge. Same engine unit as above.
Crankcase Capacity—5 qts.

CONTINUED ON PAGE M-126

NOTE:—Engine hood hinged at cowl and lifts from forward end. Free latch by turning radiator ornament counter-clockwise. Side panels can be removed for work on engine by taking out screw in top flange at rear and bolt at front. Washers installed under flange on rear screw to adjust panel height.

OIL PAN REMOVAL:—*See Ford Special Shop Notes.*

ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS:—Own Model 60. Eight cylinder, 90° Vee, 'L' head type.
Bore—2.6". **Stroke**—3.2".
Piston Displacement—136 cubic inches.
Rated Horsepower—21.6.
Developed Horsepower—60 at 4200 R.P.M.
Compression Ratio—6.6-1 Std. aluminum head.
NOTE—Aluminum head superseded by cast-iron head with 6.75-1 compression ratio.
Compression Pressure—150 lbs. at 2800 R.P.M. (aluminum head), 158 lbs. at 3200 R.P.M. (cast-iron head) or approximately 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady reading with engine idling at 5-7 M.P.H.

PISTONS:—Cast alloy steel, Cam ground type. Recondition cylinders to take finished replacement pistons.
Weight—228-232 grams (stripped), 302.65 grams (with rings and pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.

Replacement Pistons:—*See Ford Special Shop Notes.*

Fitting New Pistons:—Use .0015" feeler inserted between piston and wall at right angles to pin bosses. Pull required to withdraw feeler must be within 7-12 lbs.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled with oil drain holes. Replacement rings furnished standard and .005", .010", .020", .025" oversize.

Ring	Width	End Gap	Side Clear.
Comp. (top)	.092-.0925"	.005-.012"	.003"
Comp. (#2)	.092-.0925"	.005-.012"	.0015"
Oil Cont.	.1545-.155"	.005-.012"	.0015"

PISTON PIN:—Diameter—.6876-.6879". **Length**—2.365-2.368". Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod bronze-bushed.
Pin Fit in Piston—.0004" clearance.
Pin Fit in Rod Bushing—.0001" clearance. Bushing diamond-bored to diameter of .6878-.6881".
See Ford Shop Notes for Pin Fitting directions.

CONNECTING ROD:—Length 6.125". **Weight** 268-272 grams. **Lower Bearing Diameter**—1.800".
Crankpin Journal Diameter—1.600".
Lower Bearing Type—Steel-backed, special alloy lined. Bearing surface on outer face (in rod) and inner face (on crankpin). Bearings extend through both rods (rods mounted side-by-side) and are free to rotate. Bearings furnished standard and .003", .010" undersize.
Bearing Dimensions—Thickness .09995". Length 1.535".
Clearance—.0005-.0025" (total diametrical), .010-.022" (total sideplay).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Bearings must turn freely with caps tight. Use special tool to check bearings.

Replacement Bearings:—*See Ford Shop Notes for Bearings for Oversize Rods and undersize crankpins.*

Installing Rods:—Rods and caps marked 'R1', 'L1' etc. Install rods in same numbered cylinders with marks on rods and caps together and pointing down.

CRANKSHAFT:—Cast-steel. Three bearing type with integral counterweights. Weight 45 lbs. 6 ozs.
Journal Diameters—1.999" (all bearings).
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0005-.0025".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearings furnished standard and .005", .010", .015" undersize.

End Thrust:—Taken by #3 (rear) main bearing. Endplay .002-.006". Adjusted by replacing bearing (special .015" undersize bearing which is .015" longer furnished for this purpose).

Replacement Bearings:—*See Ford Shop Notes for Undersize and special long rear bearings.*

CAMSHAFT:—Three bearing. Helical gear driven.
Journal Diameters—1.498" (all bearings).
Bearing Type—Steel-backed, babbitt-lined bushings.
Clearance—.002".

End Thrust:—Taken by gear hub and front bearing and by gear hub and cover plate. Endplay .004-.008". Adjusted by replacing bearing or cover plate.

Timing Gears:—Crankshaft gear cast alloy-steel. Camshaft gear Bakelized fabric.

Camshaft Setting:—Mesh crankshaft gear tooth marked '0' with camshaft gear space marked '/'. Camshaft gear hub similarly marked and both marks must be in line.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1.281"	2785-.2795"	4.375"

	Seat Angle	Lift	Stem Clearance
All valves	45°	.251"	.0015-.0035"

See Ford Special Shop Notes for Valve Servicing data.

Tappet Clearance:—.0125-.0135" all valves. No adjustment. Use special two-step feeler to check clearance. First step (.0125") should be 'Go', second step (.0135") should be 'No Go'. Replace valves if clearance excessive, grind off end of valve stem if clearance insufficient.

Valve Guides:—Split type. See Valve Assembly Removal.

Valve Lifters:—Alloy iron type operating in reamed holes in block.
Diameter—.8290-.8295". **Clearance**—.0005-.001".

Valve Springs:—See Valve Assembly Removal.

	Spring Pressure	Spring Length
Valve Closed	26-30 lbs.	2.05"
Valve Open	48-52 lbs.	1.80"

Valve Assembly Removal:—Insert end of V-78 bar type valve lifter between spring coils and engage flanged lower end of guide, pry down on guide until 'C' washer at upper end can be removed, remove valve assembly from above. Use special fixture to compress spring and remove spring retainer. Install valves in same manner.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9°30' BTDC. Close 54°30' ALDC.
Exh. Valves—Open 57°30' BLDC. Close 6°30' ATDC.
To Check Valve Timing—No flywheel marks provided. If dead center point for any cylinder established on flywheel, intake valve for this cylinder should open approximately 3.22 flywheel teeth befor this point with piston .0270" BTDC.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

LUBRICATION:—Pressure system. Gear type oil pump mounted on front main bearing cap in crankcase and driven by bakelite gear meshed with crankshaft gear. Oil delivered by pump flows through channel in pump bracket and crankcase web to front crankshaft bearing and front camshaft bearing to oil tube above camshaft for distribution to other bearings.
Normal Oil Pressure—30 lbs. at 3200 R.P.M.
Oil Pressure Regulator—Opens at 30 lbs. Located above front camshaft bearing between cylinder banks. Overflow from valve oils timing gears. Not adjustable.
Crankcase Capacity—4 qts.

CLUTCH (74):—Long Model 8½CB-CS6. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. Inside diameter 6". Outside diameter 8½". Thickness .125".

Adjustment:—Clutch pedal free travel should be ¾-1". To adjust, remove clevis pin at end of clutch pedal adjusting rod, turn clevis on rod.

Removal:—Disconnect rear spring at frame connection in center, rear shock absorber links, rear brake cables, speedometer cable. Support engine, take out rear engine mounting bolts, take out clutch housing mounting screws, slide drive unit (transmission and rear end) to rear to expose clutch. Take out clutch mounting screws in cover flange on flywheel.

CLUTCH (73, 75):—Long Model 9CF-CS. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded (asbestos composition) type, 2 required. Inside Diam. 5¾". Outside Diam. 9". Thickness .140".

Adjustment & Removal:—Same as for Model 74 (above) except that pedal travel should be 1.5-1.75".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

TRANSMISSION (MODELS 73, 74):—Own make. 3 speed, Helical constant-mesh, synchro-mesh gears (second and high), sliding spur gear (low and reverse).
See article in Mechanical Equipment Section for data.

NOTE—This transmission optional equipment on Model 77.

Removal:—Disconnect rear shock absorbers and brake cables, disconnect rear spring at frame connection in center, disconnect speedometer drive cable. Take out universal joint ball housing screws, slide rear end back to disengage drive shaft at splined joint of universal yoke. Support engine, take out rear engine mounting bolts, take out clutch housing screws, pull transmission straight back.

TRANSMISSION (MODEL 75):—Own make. 4 speed, sliding spur gears (all speeds).
See article in Mechanical Equipment Section for data.

Removal:—Take out all except top bolt in intermediate universal joint ball housing (frame bolts), remove all screws in front universal joint cover, slide cover back 6" on housing, take out screws in universal joint flange directly back of universal, disengage by pushing flange back on shaft against spring, take out remaining bolt at intermediate universal, pull shaft down at front to clear frame cross-member, pull forward until intermediate universal is free of shaft at spline joint, remove shaft assembly. Support engine, remove rear engine mounting bolts ,take out clutch housing mounting screws, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. Steel bushing type (73, 74), needle bearing type (75). Single universal joint mounted in housing at rear of transmission case (all models), intermediate universal mounted on frame cross-member between front and rear propeller shafts (trucks only).
See article in Mechanical Equipment Section.

REAR AXLE (MODELS 73, 74):—Own make. 3/4 floating, spiral-bevel gear type with straddle mounted pinion and torque tube drive.
See article in Mechanical Equipment Section for data.

Ratio—4.44-1 Std., 4.55-1 Optl.

Backlash—.010" maximum. Adjusted by changing gasket thickness between axle housing and differential housing.

Removal:—Disconnect rear shock absorber links, rear brake cables, speedometer cable, and rear spring center connection on frame. Take out universal joint ball housing screws, pull axle assembly to rear to disengage drive shaft at splined joint in universal joint rear yoke.

Axle Shaft Removal—Remove wheels and wheel hubs, take out axle housing flange screws in differential housing, remove housing, dismantle differential, pull axle shafts out at inner end (shaft and differential side gear integral).

Wheel Bearing Adjustment:—None. Wheel bearings retained in hub by grease retainer and lock ring.

REAR AXLE (MODEL 75):—Own Make. Full floating, spiral bevel gear type with straddle-mounted pinion and torque tube drive.
See article in Mechanical Equipment Section for data.

Ratio—6.67-1 Std., 5.14-1, 5.83-1 Optl.

Backlash—.004-.016".

Removal:—Same as for passenger car models (above) except that rear springs are semi-elliptic and drive shaft is disconnected at intermediate universal joint.

Axle Shaft Removal—Remove rear wheel hub cap, take off nuts on eight hub studs which hold axle flange in place, install two special screws in tapped holes in flange, turn screws up evenly to break flange away from hub, back screws off, strike axle shaft flange at center to loosen cones on studs, remove cones, pull axle shaft out (does not disturb wheel bearing adjustment).

Wheel Bearing Adjustment:—Remove axle shaft (see above), unscrew outer bearing nut, remove adjusting nut retainer and grease retainer. Use special bearing adjusting wrench, turn inner adjusting nut up tight and then back off ⅛ turn, install retainer, grease retainer, outer bearing nut, turn outer nut up tight.

SHOCK ABSORBERS:—Ford (Houde). Hydraulic type.
See article in Mechanical Equipment Section.

STEERING (ALL MODELS):—Steering Gear—Gemmer Model 305 Worm-and-Roller type with push-pull adjustment.
See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and transverse cantilever spring. Axle positioned by radius rods at spring ends.

Kingpin Inclination—8° crosswise (all models).

Caster—4½-9° (73, 74), 3-5° (75). Must be equal for both wheels within ½°. Axle may be bent cold to correct caster provided that proper equipment (including wedges and blocks to prevent crushing axle flange) used.

Camber—¼-1° (all models). Camber must be equal for both wheels within ¼° (camber for right wheel must never be greater than left wheel). Axle may be bent cold providing proper equipment used (see Caster adjustment).

Toe In—1/16" (73, 74), 0" (75). Toe-in should be set at 10-1 ratio to camber. Toe in on trucks increases with load and should be set at 0" with truck empty. Adjusted in usual manner by loosening clamp bolts and turning tie rod on all models.

Steering Geometry (Toe out on turns)—Outer wheel turned 20°, Inner wheel turned 23 1/3° (73, 74), 22 2/3° (75-134" W.B.). Allowable variation ½°. No adjustment.

BRAKES (MODELS 73, 74):—Service—Own make, Mechanical, two shoe, self-energizing type. New design with cable actuation for all wheels. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.

Drum Diameter—12". Cast iron alloy type.

Lining—Two types used. May be identified by brass wire (primary shoe), zinc wire (secondary shoe). Width 1.75". Thickness .185". Length 13.25" per shoe.

Hand Brake:—See Service Brakes above.

BRAKES (MODEL 75):—Service—Own make, Mechanical, two shoe, four wheel type.
See article in Mechanical Equipment Section for data.

Drum Diameter—14". Cast iron type.

Lining—Brass wire type (all shoes). Width 2.5". Thickness .25". Length 17.5" per shoe.

Hand Brake:—Applies independent self-energizing band in each rear wheel.

Lining—Brass wire type. Width 1.5". Thickness .187". Length 41.12" per wheel.

FORD V8 MODELS (1936).

CONTINUED FROM PAGE M-124

CLUTCH:—Long Model 9CF-CI (68, 67), 11CF-CI (51). Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.

Facings—Moulded type, 2 required. Inside Diam. 5.76". Outside Diam. 9" (68, 67), 11" (51), Thickness .140".

Clutch Pedal Adjustment—Free movement of pedal must be 1½-2". To adjust, remove clevis pin in end of clutch lever adjusting rod, turn clevis.

Removal:—Disconnect rear spring at frame connection in center, take out clutch housing screws, slide rear end and transmission to rear as a unit exposing clutch, take out capscrews mounting clutch on flywheel.

STEERING:—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and transverse cantilever spring.

Kingpin Inclination—8° crosswise.

Caster (68 and 67)—7° loaded (9° max., 4½° min.). Must be alike within ½° for both wheels. No adjustment. **(51 Truck)**—3-3½° empty (5° max., 3° min.). Increase ¾° for each ton of load.

Camber—¾° (1° Max., ¼° Min.) all models. Must be alike within ¼° for both wheels and camber of right wheel must not exceed left wheel. No adjustment.

Toe In (68, 67 Comm.)—1/16" (1/16" min., ⅛" max.). **(51 Truck)**—0° empty. Increases with load and must be set with truck empty. All models adjusted by loosening tie rod end clamp bolts and turning tie rod.

Steering Geometry—Inner wheel turned 23 1/3° (68, 67), 22 2/3° (51—131½" W.B.), 22¼° (51—157" W.B.), outer wheel turned 20° (all models).

BRAKES:—Service—Own make. Mechanical type. Hand lever applies all four service brakes (68, 67), or operates independent rear wheel brake (51).
See article in Mechanical Equipment Section for data.

Drum Diameter—12" (68, 67), 14" (51).

Lining (68, 67)—Semi-moulded type. Width 1.75", Thickness .185", Length 26.5" per wheel.

Lining (51)—Width 2.5". Thickness .25", Length 17.5" per shoe (all shoes interchangeable).

Hand Brake:—See Service Brake adjustment.

Lining (51)—Width 1.5", Thickness .187", Length 41.1" per band.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Free latch by turning radiator ornament counter-clockwise. Side panels can be removed for work on engine by taking out screw in top flange at rear and bolt at front. Washers installed under flange on rear screw to adjust panel height.

Oil Pan Removal—To remove oil pan, remove oil level indicator and tube, remove right front engine splash shield, attach hoist to front bumper bars and raise front of car, push radius rods down and insert 12" block between bolt and cross member. Take out screws and maneuver pan off.

ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS:—Own Model 85. Eight cylinder, 90° Vee, 'L' head type.
Bore—3.062". **Stroke**—3.75".
Piston Displacement—221 cubic inches.
Rated Horsepower—30.
Developed Horsepower—85 at 3800 R.P.M.
Compression Ratio—6.12-1.
NOTE—Aluminum head superseded by cast-iron head with same compression ratio.
Compression Pressure—135 lbs. at 2500 R.P.M. (Aluminum head), 147 lbs. at 2200 R.P.M. (cast-iron head) or approximately 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady reading with engine idling at 5-7 M.P.H.

PISTONS:—Cast alloy steel, Cam ground type. Recondition cylinders to take finished replacement pistons.
Weight—301-305 grams (stripped), 408-416.8 grams with rings and pin.
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Special Shop Notes.*
Fitting New Pistons:—Use .0025" feeler inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be 7-12 lbs. NOTE—If aluminum pistons (split skirt type) used, fit pistons with .002" feeler to 6-10 lbs. pull.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled with oil drain holes. Rings furnished standard and .005", .015", .030", .045", .060" oversize.

Ring	Width	End Gap	Side Clear.
Comp. (Top)	.0915-.092"	.012-.017"	.003"
Comp. (#2)	.0915-.092"	.012-.017"	.0015"
Oil Cont.	.1545-.155"	.012-.017"	.0015"

PISTON PIN:—Diameter—.7501-.7504". **Length**—2.847-2.850". Pin floats in rod and piston. Held by locking ring at each end. Pin hole in rod is bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance. Bushing diamond-bored to diameter of .7503-.7506".
See Ford Shop Notes for Pin Fitting directions.

CONNECTING ROD:—Length 7". **Weight** 451-455 grams.
Rod Lower Bearing Diameter—2.2195-2.220".
Crankpin Journal Diameters—1.999".
Bearing Type—Steel-backed, special alloy type. Bearing surface on outer face (in rod) and inner face (on crankpin). Bearings extend through both rods (rods mounted side-by-side) and are free to rotate. Bearings furnished standard and .003", .010" undersize.
Bearing Dimensions—Thickness .1095". Length 1.933".
Clearance—.0005-.0025" (total diametrical), .010-.022" (total sideplay).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Bearings must turn freely with caps tight. Use V-131 tool to check bearings.

Replacement Bearings:—*See Ford Shop Notes for Bearings for Oversize Rods and undersize crankpins.*

Installing Rods:—Rods and caps marked 'R1', 'L1' etc. Install rods in same numbered cylinders with marks on rods and caps together and pointing down.

CRANKSHAFT:—Cast-steel, three bearing type with integral counterweights. Weight 63.5 lbs.
Journal Diameters—2.399" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined. Furnished standard and .005", .010", .015" undersize.
Clearance—.0005-.0025".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by #3 (rear) main bearing. Endplay .002-.006". Adjusted by replacing bearing (special .015" undersize bearing furnished .015" longer for this purpose).

Replacement Bearings:—*See Ford Shop Notes for Undersize and special long rear bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitt-lined bushings.
Clearance—.002".

End Thrust:—Taken by gear hub and front bearing and by hub and cover plate. Endplay .005". Adjusted by replacing bearing or cover plate.

Timing Gears:—Crankshaft gear cast alloy-steel. Camshaft gear Bakelized fabric.
Backlash—.004" maximum.

Camshaft Setting:—Mesh crankshaft gear tooth marked '0' with camshaft gear space marked '/'. Camshaft gear hub similarly marked and both marks should be in line.

VALVES:—

	Head Diam.	Stem Diam.	Length
All valves	1.537"	.3105-.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All valves	45°	.292"	.0015-.0035"

See Ford Special Shop Notes for Valve Servicing data.

Tappet Clearance:—.0125-.0135" all valves. No adjustment. Use special two-step feeler to check clearance. First step (.0125") should be 'Go', second step (.0135") should be 'No Go'. Replace valves if clearance excessive, grind off end of valve stem if clearance insufficient.

Valve Guides:—Split type. See Valve Assembly Removal.

Valve Lifters:—Alloy iron type operating in reamed holes in block.
Diameter—.999-.9995". **Clearance**—.0005-.001".

Valve Springs:—See Valve Assembly Removal.

	Spring Pressure	Spring Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Assembly Removal:—Insert end of V-78 bar type valve lifter between spring coils and engage flanged lower end of guide, pry down on guide until 'C' washer at upper end can be removed, remove valve assembly from above. Use special fixture V-130 to compress spring and remove spring retainer. Install valves in same manner.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 9°30' BTDC. Close 54°30' ALDC
Exh. Valves—Open 57°30' BLDC. Close 6°30' ATDC.
To Check Valve Timing—No flywheel marks or other means provided to check timing. If dead center for any piston is established on flywheel, intake valve opening for this cylinder will be approximately 2.96 teeth before this point with piston .0327" before top dead center.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase at rear of engine.
Normal Oil Pressure—30 lbs. at 2600 R.P.M.
Oil Pressure Regulator—Located under plug directly above front camshaft bearing. Operates at 30 lbs. Not adjustable.
Oil Pressure Gauge—King-Seeley Electric type. Ford Part No. 78-9273 (dash unit), 48-9278 (engine unit).
NOTE—Use dash unit Ford Part No. 81A-9273A for replacement.
See article in Mechanical Equipment Section for data.
Crankcase Capacity—5 quarts.

CLUTCH:—Long Model 9CF-CS (77, 78). 11CF-CS (79). Semi-centrifugal, single plate ,dry disc type.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement of pedal must be 1½-1¾". To adjust, remove clevis pin in end of clutch pedal adjusting rod, turn clevis.
Clutch Facings—Molded asbestos composition, 2 required.

	Inside Diam.	Outside Diam.	Thickness
9CF-CS	5¾"	9"	.140"
11CF-CS	6½"	11"	.140"

Removal:—Disconnect rear spring at frame connection in center, rear shock absorber links, rear brake cables, speedometer cable. Support engine, take out rear engine mounting bolts, take out clutch housing mounting screws, slide drive unit (transmission and rear end) to rear to expose clutch. Take out mounting screws in clutch cover flange on flywheel, remove clutch.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

TRANSMISSION (MODELS 77,78):—Own make. 3 speed, Helical gears (all speeds). Constant-mesh, synchromesh (second and high), sliding gear (low and reverse).

See article in Mechanical Equipment Section for data.

NOTE—Model 51 4-Speed Transmission Optional on Model 77 Commercial cars.

Removal:—Disconnect rear shock absorbers and brake cables, disconnect rear spring at frame connection in center, disconnect speedometer drive cables. Take out universal joint ball housing screws, slide rear end back to disengage drive shaft at splined joint of universal yoke. Support engine, take out rear engine mounting bolts, take out clutch housing screws, pull transmission straight back.

TRANSMISSION (MODEL 79):—Own Make. 4 speed, sliding spur gears (all speeds).
NOTE—Three speed transmission (Helical gears with Spur type low-speed gear) Optl.

See article in Mechanical Equipment Section for data.

Removal:—Take out all except top bolt in intermediate universal joint ball housing (frame bolts), remove all screws in front universal joint cover, slide cover back 6" on housing, take out screws in universal joint flange directly back of universal, disengage by pushing flange back on shaft against spring, take out remaining bolt at intermediate universal, pull shaft down at front to clear frame cross-member, pull forward until intermediate universal is free of shaft at spline joint, remove shaft assembly. Support engine, remove rear engine mounting bolts, take out clutch housing mounting screws, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. Steel bushing type, (77, 78), needle bearing type (79). Single universal joint mounted in housing at rear of transmission case (all models), intermediate universal mounted on frame cross-member between front and rear propeller shafts (79 trucks only).

See article in Mechanical Equipment Section for data.

REAR AXLE (MODELS 77, 78):—Own Make. 3/4 floating, spiral-bevel gear type with straddle-mounted pinion and torque tube drive.

See article in Mechanical Equipment Section for data.

Ratio	Standard	Optional
Models 77, 78	3.78-1	4.11-1, 3.54-1

Backlash—.010" maximum. Adjusted by changing gasket thickness between axle housing and differential housing.

Removal:—Disconnect rear shock absorber links, rear brake cables, speedometer cable, and rear spring center connection on frame. Take out universal joint ball housing screws, pull axle assembly to rear to disengage drive shaft at splined joint in universal joint rear yoke.

Axle Shaft Removal—Remove wheels and wheel hubs, take out axle housing flange screws in differential housing, remove housing, dismantle differential, pull axle shafts out at inner end (shaft and differential side gear integral).

Wheel Bearing Adjustment:—None. Wheel bearings retained in hub by grease retainer and lock ring.

REAR AXLE (MODEL 79):—Own Make. Full floating, spiral bevel gear type with straddle-mounted pinion and torque tube drive.

See article in Mechanical Equipment Section for data.

Ratio—6.67-1 Std., 5.14-1, 5.83-1 Optl.

Backlash—.010".

Removal:—Same as for passenger car models (above) except that rear springs are semi-elliptic and drive shaft is disconnected at intermediate universal joint.

Axle Shaft Removal—Remove rear wheel hub cap, take off nuts on eight hub studs which hold axle flange in place, install two special screws in tapped holes in flange, turn screws up evenly to break flange away from hub, back screws off, strike axle shaft flange at center to loosen cones on studs, remove cones, pull axle shaft out (does not disturb wheel bearing adjustment).

Wheel Bearing Adjustment:—Remove axle shaft (see above), unscrew outer bearing nut, remove adjusting nut retainer and grease retainer. Use special bearing adjusting wrench, turn inner adjusting nut up tight and then back off ⅛ turn, install retainer, grease retainer, outer bearing nut, turn outer nut up tight.

SHOCK ABSORBERS:—Ford (Houde). Hydraulic type.

See article in Mechanical Equipment Section for data.

STEERING (ALL MODELS):—Steering Gear—Gemmer Model 305 Worm-and-Roller type with push-pull type adjustment.

See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and transverse cantilever spring. Axle positioned by radius rods at spring ends.

Kingpin Inclination—8° crosswise (all models).

Caster—4½-9° (77, 78), 3-5° (79). Must be equal for both wheels within ½ degree. Axle may be bent cold to correct caster provided that proper equipment (including wedges and blocks to prevent crushing axle flange) used.

Camber—¼-1° (All Models). Camber should be equal for both front wheels within ¼° (camber for right wheel must never be greater than left wheel). Axle may be bent cold providing proper equipment used (see Caster adjustment).

Toe In—1/16" (77, 78), 0" (79). Toe-in should be set at 10-1 ratio to camber. Toe-in on trucks increases with load and should be set at 0" with truck empty. Adjusted in usual manner by loosening clamp bolts and turning tie rod on all models.

Steering Geometry (toe out on turns)—Outer wheel turned 20°, Inner wheel turned 23 1/3° (77, 78), 22 2/3° (79—131½" W. B.), 22¼° (79—157" W.B.). Allowable variation ½°. No adjustment.

BRAKES (MODELS 77, 78):—Service—Own make Mechanical, two shoe, self-energizing type. New design with cable actuation for all wheels. Hand lever applies all four service brakes.

See article in Mechanical Equipment Section for data.

Drum Diameter—12". Cast iron alloy type.
Lining—Two types used. May be identified by brass wire (primary shoe), zinc wire (secondary shoe). Width 1.75". Thickness .185". Length 13.25" per shoe.

Hand Brake:—See Service Brakes above.

BRAKES (MODEL 79):—Service—Own make, Mechanical, two shoe, four wheel type.

See article in Mechanical Equipment Section for data.

Drum Diameter—14". Cast iron type.
Lining—Brass wire type (all shoes). Width 2.5". Thickness .25". Length 17.5" per shoe.

Hand Brake:—Applies independent self-energizing band in each rear wheel.
Lining—Brass wire type. Width 1.5". Thickness .187". Length 41.12" per wheel.

NOTE:—All engine data given below applies also to the 1938 truck, Model 82Y, with '60' Engine.

HOOD & SIDE PANEL REMOVAL:—*See Ford Shop Notes.*
OIL PAN REMOVAL:—*See Ford Shop Notes.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS:—Own Model. 8 Cylinder 90° V, L head. Both banks & crankcase cast enbloc.
Bore—2.6". **Stroke**—3.2". **Displm't**—136 cu. ins.
Rated Horsepower—21.6.
Developed Horsepower—60 at 3500 R.P.M.
Compression Ratio—6.6-1 Std. No Optl. ratios.
Compression Pressure—158 lbs. at 2800 R.P.M. or 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady at 5-7 M.P.H.

PISTONS:—Light weight steel alloy, Cam ground type. Recondition cylinders to take finished replacement pistons.
Weight—228-232 grams stripped, 302.65 grams with rings and pin.
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes.*
Fitting Pistons:—Use .0015" feeler ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler should be 7-12 lbs.

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes.

Ring	Width	End Gap	Side Clearance
Compr. #1	.092-.0925"	.009-.012"	.003"
Compr. #2	.092-.0925"	.009-.012"	.0015"
Oil Contr.	1545-155"	.005-.012"	.0015"

Replacement Rings:—Furnished Std. and .005", .015", .030", .045", .060" oversize (sets in cartons only).

PISTON PIN:—Diam. .6876-6879". Length 2.365-2.368". Pin floats in piston and rod (held by locking ring at each end). Pin hole in rod bronze-bushed.
Pin Fit in Piston—.0004" clearance.
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting Directions.*

CONNECTING ROD:—Length 6.125". Weight 268-272 grams.
Rod Lower Bearing Diameter—1.800".
Crankpin Journal Diameter—1.600".
Bearing Type—Steel-backed, special alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on inner face (on crankpin), outer face (in rod).
Bearing Dimensions—Thickness .09995". Length 1.535".
Clearance—.0005-.0025" (total diametrical).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for Bearings for Oversize Rods and undersize crankpins.*
Installing Rods:—Rods and caps marked. Marks must be together and rods installed in same numbered cylinders with marks pointing down toward pan.

CRANKSHAFT:—3 Bearing. Integral counterweights.
Journal Diameters—1.999" (all bearings).
Bearing Type—Steel-backed, Special-alloy lined.
Clearance—.0005-.0025".
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear bearing. Adjusted by replacing bearing. **Endplay**—.002-.005".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long rear bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.
Journal Diameters—1.498" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjusted by replacing coverplate. Endplay .004-.008".
Timing Gears:—Crankshaft—cast alloy-steel, camshaft—bakelized fabric. Backlash .004" Max.
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must line up with mark on gear hub).

VALVES:—	Head Diameter	Stem Diameter	Length
All Valves	1.281"	.2785-.2795"	4.375"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.251"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Tungsten, chrome alloy seat inserts used for exhaust valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for Removal.*
Valve Lifters:—Alloy iron barrel type in reamed holes. **Diameter**—.8290-.8295". **Clearance**—.0005-.001".

Valve Springs:—	Pressure	Length
Valve Closed	26-30 lbs.	2.05"
Valve Open	48-52 lbs.	1.80"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9°30' BTDC. Close 54°30' ALDC.
Exh. Valves—Open 57°30' BLDC. Close 6°30' ATDC.
To Check Valve Timing—No flywheel marks provided. If dead center point for any cylinder established on flywheel, intake valve for this cylinder should open approximately 3.22 flywheel teeth before this point with piston .027" BTDC.
Motor Gauge—Weidenhoff Adapter #114. Rod #40.

LUBRICATION:—Pressure. Gear type oil pump mounted on front main bearing cap in crankcase.
Normal Oil Pressure—30 lbs. at 3200 R.P.M.
Oil Pressure Regulator—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge—King-Seeley Electric. Ford No. 81-A-9273-A (dash unit—Std.), 81-A-9273-B (dash unit—Deluxe), 48-9278 (motor unit—all).
See article in Mechanical Equipment Section.
Crankcase Capacity—4 quarts.

COOLING SYSTEM:—Water Pump—Centrifugal, packless type, 2 used (1 pump for each cyinder bank).
See article in Mechanical Equipment Section.
Removal—Slack off belt adjustment, unscrew large mounting nut behind pulley, pull pump out.
Thermostat:—In outlet hose for each bank (2 used).
Water Capacity—15 qts. (82A), 16 qts. (82C, 82Y).
Drain Valves:—On each side at bottom of radiator.

CLUTCH:—Long Model 8½CB-CS6 (Std. 82A), 9CF-CS (Std. 82C, Optl. on 82A Sedan Delivery). Single plate, dry disc type. Mod. 9CF-CS semi-centrif. type.
See article in Mechanical Equipment Section for data.
Facings—Molded Asbestos Composition, 2 required. Inside Diameter 6" (8½CB), 5¾" (9CF), Outside Diameter 8.5" (8½CB), 9" (9CF), Thickness .125" (8½CB), .137" (9CF).
Adjustment—Pedal free movement should be .75-1" (8½CB), 1.5-1.75" (9CF). To adjust, remove clevis pin at end of connecting rod, turn clevis on rod.
Removal:—Slide transmission and rear axle to rear as a unit to expose clutch (see Transmission removal), take out mounting screws in clutch cover flange on flywheel.

TRANSMISSION (STD.):—Own Make. Constant-mesh, Synchro-mesh (second and high), sliding gear (low and reverse), all helical gears (82A), second and high only (82C). NOTE—4-speed transmission with all spur gears Optl. on Model 82-C.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear shock absorbers, brake cables, speedometer drive cable. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, remove clutch housing screws, pull transmission straight back.

UNIVERSAL JOINT:—Spicer. Steel bushing type. Single universal at rear of transmission.
See article in Mechanical Equipment Section.

REAR AXLE (82A, 82C):—Own Make. ¾ floating, Spiral Bevel Gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.44-1 Std., 4.11-1, 4.55-1 Optl.
Backlash—.010" Maximum.
Removal:—Disconnect rear shock absorber links, brake cables, speedometer cable, rear spring at center frame connection. Take out universal joint ball housing mounting screws, pull axle assembly to rear to disengage driveshaft at splined joint.
Axle Shaft Removal—Axle must be dismantled and shafts removed from inner end (see Disassembly directions in Rear Axle Section).

SHOCK ABSORBERS:—Houde (Houdaille) Type BBDE (Front), BBDU (Rear). Double acting, hydraulic, adjustable. *See data in Mechanical Equipment Section.*

STEERING:—Steering Gear. Gemmer Model 305 Worm-and-Roller type with 'Push-Pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise (all models).
Caster—9° Max., 4½° Min. (all). Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing of axle flange) used.
Camber—1° Max., ¼° Min. (all). Must be equal within ¼°, right wheel must not exceed left. Axle may be bent cold to correct camber.
Toe In—1/16". Adjust in usual manner by loosening tie rod clamp bolts and turning tie rod.
Steering Geometry (Toe out on turns)—Outer wheel turned 20°, Inner wheel turned 23 1/3°. Allowable variation ½°. No adjustment.

BRAKES:—**Service.** Own Make. Mechanical, two shoe, self-energizing type with cable actuation. Hand lever applies all service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast iron. Diameter 12".
Lining—Molded (primary), Woven (secondary). Width 1.75", Thickness .185", Length per shoe 13.25".
Hand Brake:—See Service Brakes above.

NOTE:—All engine data given below applies also to 1938 truck models with '85' engines.

HOOD & SIDE PANEL REMOVAL:—*See Ford Shop Notes.*

OIL PAN REMOVAL:—*See Ford Shop Notes.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS:—Own Model. 8 Cylinder, 90° V, L head. Both banks & crankcase cast enbloc.

Bore 3.062". Stroke 3.75". **Displm't.** 221 cu. ins.

Rated Horsepower—30.

Developed Horsepower—85 at 3800 R.P.M.

Compression Ratio—6.12-1 Std. Optl. H.C. head 81-A-6050-B available for Alt. or special fuel.

Compression Pressure—141 lbs. at 2400 R.P.M., 100 lbs. at cranking speed of 100 R.P.M.

Vacuum Reading—18-20" steady at 5-7 M.P.H.

PISTONS:—Steel alloy (Pass. Cars), Aluminum alloy (Trucks), Domed, cam ground type. Recondition cylinders for finished replacement pistons.

Weight—301-305 grams (stripped), 408.8-416.8 grams (with rings and pin).

Removal—Pistons and rods removed from above.

Clearance—See Fitting New Pistons.

Replacement Pistons:—*See Ford Shop Notes.*

Fitting New Pistons:—Use .0025" feeler (Steel Pistons), .002" feeler (Al. Pistons) ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler should be 7-12 lbs. (steel pistons), 6-10 lbs. (Al. pistons).

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.092"	.012-.017"	.003"
Compr. #2	.0915-.092"	.012-.017"	.0015"
Oil Contr.	.1545-.155"	.012-.017"	.0015"

Replacement Rings:—Furnished Std. and .005", .015", .030", .045", .060" oversize (sets in cartons only).

PISTON PIN:—Diam. .7501-.7504". **Length** 2.847-2.850". Pin floats in piston and rod (held by locking ring at each end). Pin hole in rod bronze-bushed.

Pin Fit in Piston—.0005" clearance.

Pin Fit in Rod Bushing—.0001" clearance.

See Ford Shop Notes for Pin fitting directions.

CONNECTING ROD:—Length 7". **Weight** 451-455 grams.

Rod Lower Bearing Diameter—2.220".

Crankpin Journal Diameter—1.999".

Bearing Type—Steel-backed, special alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on inner face (on crankpin), outer face (in rod).

Bearing Dimensions—Thickness .1095". Length 1.933".

Clearance—.0005-.0025" (total diametrical).

Bearing Adjustment:—None (no shims). Do not file.

Replacement Bearings:—*See Ford Shop Notes for Bearings for Oversize Rods and undersize crankpins.*

Installing Rods:—Rods and caps marked. Marks must be together and rods installed in same numbered cylinders with marks pointing down toward pan.

CRANKSHAFT:—3 Bearing. Integral counterweights.

Journal Diameters—2.399" (all bearings).

Bearing Type—Steel-backed, Special-alloy lined.

Clearance—.0005-.0025".

Bearing Adjustment:—None (no shims). Do not file.

End Thrust:—Taken by rear bearing. Adjusted by replacing bearing. **Endplay** .002-.006".

Replacement Bearings—*See Ford Shop Notes for Undersizes and special long rear bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.

Journal Diameters—1.797" (all bearings).

Bearings—Steel-backed, babbitt-lined bushings.

Clearance—.002".

End Thrust:—Taken by gear hub and cover plate. Adjust by replacing coverplate. Endplay .005".

Timing Gears:—Crankshaft—cast alloy-steel, camshaft—bakelized fabric. Backlash .004" Max.

Camshaft Setting:—Mesh 'O' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must line up with mark on gear hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3105-.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.

Tappet Clearance:—.0125-.0135". No adjustment.

Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for Removal.*

Valve Lifters:—Alloy-iron barrel type in reamed holes. **Diameter** .999-.9995". **Clearance** .0005-.001"

Valve Springs:—	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open at TDC. Close 44° ALDC.

Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

To Check Timing—No flywheel marks provided. Intake valve opens with piston on top dead center.

LUBRICATION:—Pressure. Gear type oil pump in crankcase at rear of engine.

Normal Oil Pressure—30 lbs. at 2000 R.P.M.

Oil Pressure Regulator—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.

Oil Pressure Gauge—King-Seeley Electric. Ford No. 81-A-9273-A (dash unit—Std), 81-A-9273-B (dash unit—deluxe), 48-9278 (motor unit—all).

See article in Mechanical Equipment Section.

Crankcase Capacity—5 quarts.

COOLING SYSTEM:—Water Pump—Centrifugal, packless type, 2 used (1 pump for each cylinder bank).

See article in Mechanical Equipment Section.

Removal—Slack off belt adjustment, support engine at forward end, remove front engine mounting bolts, take out mounting screws in pump body.

Thermostat:—In outlet hose for each bank (2 used).

Water Capacity:—22 qt.(81A,C,Y), 24 qt.(81T,U,817T).

Drain Valves:—One each side at bottom of radiator.

CLUTCH:—Long Model 9CF-CS. Semi-centrifugal, single plate, dry disc type.

See article in Mechanical Equipment Section for data.

Facings—Molded Asbestos Comp., 2 required. Inside Diam. 5.76". Outside Diam. 9". Thickness .137".

Adjustment—Pedal free movement should be 1.5-1.75". To adjust, remove clevis pin, turn release rod.

Removal:—Slide transmission and rear axle to rear as a unit to expose clutch (see Transmission removal below), take out mounting screws in clutch cover flange on flywheel.

TRANSMISSION:—Own Model 68. Three speed, constant-mesh, synchro-mesh (second & high), sliding gear (low and reverse), all helical gear type Std. NOTE—Model 67 3-speed, spur gear type Optl. on 81A, 81C. Model 51 4-speed, all spur gear type Optl. on Model 81C.

See article in Mechanical Equipment Section for data.

Removal:—Disconnect rear shocks, brake cables speedometer drive cable. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, remove clutch housing screws, pull unit back.

UNIVERSAL JOINTS:—**Spicer.** Steel bushing type. Single universal at rear of transmission.

See article in Mechanical Equipment Section.

REAR AXLE (81A, 81C):—Own Make. 3/4 floating, Spiral bevel gear type with straddle mounted pinion and Torque Tube drive. **Backlash**—.010" Max.

See article in Mechanical Equipment Section for data.

Ratio—3.78-1 Std., 3.54-1, 4.11-1 Optl.

Removal:—Disconnect rear shock absorber links, brake cables, speedometer cable, rear spring at center frame connection. Take out universal joint ball housing mounting screws, pull axle assembly to rear to disengage driveshaft at splined joint.

Axle Shaft Removal—Must be dismantled to remove shafts. *See article in Mechanical Equipment Section for directions.*

SHOCK ABSORBERS:—Houde (Houdaille) Type BBDE (Front), BBDU (Rear). Double acting, hydraulic, adjustable. *See data in Mechanical Equipment Section.*

STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with 'Push-Pull' adjustment.

See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.

Kingpin Inclination—8° crosswise (all models).

Caster—9° Max., 4½° Min. Must be equal for both wheels within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.

Camber—1° Max., ¼° Min. (all). Must be equal within ¼°, right wheel must not exceed left.

Toe In—1/16". Adjust in usual manner by loosening tie rod clamp bolts and turning tie rod.

Steering Geometry (toe out on turns)—Outer wheel turned 20°, Inner wheel 23 1/3°. Allowable variation ½°. No adjustment.

BRAKES:—Service. Own Make, Mechanical, two shoe, self-energizing type with cable actuation. Hand lever applies all service brakes.

See article in Mechanical Equipment Section for data.

Drum—Cast iron. Diameter 12".

Lining—Molded (primary), Woven (secondary). Width 1.75". Thickness .185". Length per shoe 13.25".

Hand Brake:—See Service Brakes above.

MODEL DESIGNATION:—Models, Engine type, and wheel-bases for all 1938 Trucks are as follows:

One Tonner

Model	Engine	Wheelbase
81Y	85	122"
82Y	60	122"

Cab-Over-Engine Models

811W, Z	85	101"
81W	85	134"
817W	85	157"

Other Truck Models

81T, U	85	134"
811T School Bus	85	191"
817T	85	157"

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing.

ENGINE SPECIFICATIONS & SERVICE DATA:—*See Ford '60' and '85' 1938 M pages for complete data.* All data on Pistons, Pins, Rings, Connecting Rods, Main Bearings, Camshaft, Valves and Valve Timing, Lubrication and Cooling System same as for passenger car models except as noted.

CLUTCH:—Long Model 9CF-CS (82Y), 11CF-CS (all others). Semi-centrifugal, single plate, dry disc type. *See article in Mechanical Equipment Section for data.*

Facings—Molded type. 2 required. Inside Diam. 5.76" (9CF), 6.5" (11CF), Outside Diam. 9" (9CF), 11" (11CF). Thickness .137" (all).

Adjustment:—Pedal free movement should be 1.5-1.75". To adjust, remove clevis pin at end of pedal connector rod, turn clevis on rod.

Removal:—Disconnect front propeller shaft (coupling shaft) and remove transmission (see Transmission Removal below), take out mounting screws in clutch cover flange, remove clutch assembly.

TRANSMISSION (3 SPD.):—Own Model 73A (Std. 82Y), 67 (Std. 81Y), 70B, 70C (Optl. on other Trucks). Constant mesh, helical gears (Second and High), sliding spur gears (Low and Reverse). Synchro-mesh for second and high on Models 73A, 67 only.

NOTE—Model 75 4-spd. transmission optional on Model 82Y.

See article in Mechanical Equipment Section for data.

Removal:—Disconnect and remove front propeller shaft (coupling shaft) as directed below. Support engine at rear end, take out rear engine mounting bolts, take out clutch housing mounting screws, pull transmission straight back and remove.

NOTE—Models 811-W, Z have one universal joint only (no coupling shaft used).

Front Propeller Shaft (Coupling Shaft) Removal:—Remove as follows: Take out all except top bolt in intermediate universal joint ball housing (at frame) remove all screws in front universal joint cover, slide cover back 6" on housing, take out screws in universal joint flange directly in back of universal, disengage by pushing flange back on shaft against spring tension, take out remaining bolt at intermediate universal, pull shaft down at front to clear cross-member, pull shaft forward until free at rear splined joint, remove shaft assembly.

TRANSMISSION (4 SPD.):—Model 51 (Std. except 81Y, 82Y; Optl. on 82Y). Sliding spur gear type. *See article in Mechanical Equipment Section for data.*

Removal:—Same as for 3-speed type (above).

UNIVERSAL JOINT:—Spicer. Two used (one at rear of transmission case, additional joint at frame cross-member between front and rear driveshafts. Steel bushing type (1 Ton), Needle bearing (others). NOTE—One joint only used on Models 811-W, Z. *See article in Mechanical Equipment Section for data.*

REAR AXLE (STD.):—Own Make. Full floating, spiral gear type with straddle mounted pinion and torque tube drive. *See article in Mechanical Equipment Section for data.*

Ratio—Std. 6.67-1 (except 81Y), 4.857-1 (81Y). Optl. 5.14-1, 5.83-1 (except 81Y), 4.11-1 (81Y).
NOTE—No Optl. ratios offered for Model 82Y.

Backlash—.004-.016".

Removal:—Disconnect brake cables, speedometer cable, rear springs (semi-elliptic type). Take out universal joint ball housing bolts (rear joint), pull axle assembly to rear to free splined joint, remove assembly from under truck.

Axle Shaft Removal. Remove wheel hub cap by taking out two screws, take off nuts on 8 hub studs which hold axle flange in place, install two special screws in tapped holes in flange, turn screws up evenly to break flange loose from hub, **back these screws out** and strike axle shaft flange at center to loosen centering cones on studs, remove cones, pull axle shaft out (wheel bearings not disturbed).

NOTE—When installing axle shaft, make certain that gasket in place under shaft flange, cones in place on studs, and that the two loosening screws backed off sufficientily so that stud nuts can be securely tightened. Then turn the two loosening screw in just enough to prevent loosening in service.

Wheel Bearing Adjustment. Remove axle shaft (above), use special bearing adjusting wrench BB-17033-B and remove outer or bearing locknut, pull out nut retainer and grease retainer. Inner bearing adjusting nut can then be adjusted or removed. To adjust, turn nut up tight, back off ⅛ turn, install nut retainer, grease retainer and outer bearing nut, turning outer nut up tight.

REAR AXLE GEAR CHANGE (TRUCKS):—Ring and pinion gears have been changed from 'Generated' type to 'Formate' type. These gears not interchangeable singly (use both ring and pinion gear of same type). Formate gears stamped 'SS'.

REAR AXLE (OPTL.):—Two speed type with planetary reduction gear set built in differential case. *See article in Mechanical Equipment Section for data.*

Ratio—5.83-1 (Direct), 8.11-1 (Second speed).

Backlash—.006-.020".

Removal:—Same as for standard axle (above) except that control linkage must also be disconnected.

SHOCK ABSORBERS:—Houde (Houdaille). Double acting, hydraulic, adjustable type. Used on front end only. *See article in Mechanical Equipment Section for data.*

STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with push-pull adjustments. *See article in Mechanical Equipment Section for data.*

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs (Cab over engine trucks), transverse spring (others). Axle positioned by radius rods.

Kingpin Inclination—8° crosswise (except Cab over Engine Trucks—7°).

Caster—9° Max., 4½° Min. (81Y, 82Y), 3½° Max., 1° Min. (Cab over engine trucks), 50 Max., 3° Min. (others). Must be equal within ½°. Axle may be bent cold to correct caster providing that proper tools used (wedges and blocks to prevent crushing axle flange).

Camber—1° Max., ¼° Min. (all models). Must be equal within ¼° and right wheel must not exceed left. Correct in same manner as caster (above).

Toe In—1/16" (Cab over engine trucks), 0" (others). Set at 10-1 ratio with camber. Toe in increases with load on trucks and should be set with truck empty. Adjust by loosening clamp bolts and turning tie rod.

Steering Geometry (toe out on turns)—Outer wheel turned 20°, Inner wheel turned 23° (81Y, 82Y), 23¾° (101" WB. models), 22 2/3° (134" WB. models), 22¼° (157" WB. models). Allowable variation ½°. No adjustment.

BRAKES:—Service—Own make, mechanical, two-shoe, self-energizing type with cable actuation. Hand lever applies all service brakes (81Y, 82Y), separate brake band in rear wheels (others). *See article in Mechanical Equipment Section for data.*

Drum—Cast iron. Diameter 12" (81Y, 82Y front wheels), 15.12" (all others—including 81Y, 82Y rear wheels).

	Width	Thickness	Length per shoe
81Y, 82Y Front	1.75"	.185"	13.25"
All Others	2.5"	.25"	18.41"

Hand Brake (except 81Y, 82Y):—Independent internal expanding brake band in each rear wheel.

Drum—Diameter 14".

Lining—Woven type. Width 1.5". Thickness .185". Length 41.12" per band.

HOOD & SIDE PANEL REMOVAL:—*See Ford Shop Notes.*

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS:—**Own '60'.** 8 Cylinder, 90° Vee, L head. Both banks & crankcase cast enbloc. **Bore**—2.6". **Stroke**—3.2". **Displacement**—136 cu. ins. **Rated Horsepower**—21.6. **Developed Horsepower**—60 at 3500 R.P.M. **Compression Ratio**—6.6-1 Std. No Optl. ratios. **Compression Pressure**—158 lbs. at 2800 R.P.M. max., or 105 lbs. at cranking speed of 100 R.P.M. **Vacuum Reading**—18-20" steady at 5-7 M.P.H.

PISTONS:—Steel alloy, light wgt., cam-ground. Recondition cylinders for finished replacement pistons. **Weight**—230 grams (without rings or pin). **Removal**—Pistons and rods removed from above. **Clearance**—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .0015" feeler, .50" wide, inserted between piston and cylinder wall at right angles to pin. Feeler should withdraw with 7-12 lbs. pull.

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes. NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.092-.0925"	.009-.012"	.003"
Compr. #2	.092-.0925"	.009-.012"	.0015"
Oil Cont.	.1535-.154"	.005-.012"	.0015"

Replacement Rings:—Furnished (sets in cartons only) Std. and .005", .015", .030", .045" oversize.

PISTON PIN:—**Diameter** .6876-.6879". **Length** 2.368". Floating type (locking rings in piston at each end). Pin hole in connecting rod bronze-bushed. **Pin Fit in Piston**—.0004" clearance. **Pin Fit in Rod Bushing**—.0001" clearance. *See Ford Shop Notes for Pin Fitting Directions.*
Replacement Pins:—Furnished Std. and .002" under- and over-size.

CONNECTING ROD:—**Length** 6.125". **Weight** 270 grams. **Crankpin Journal Diameter**—1.600" (connecting rod diameter on crankpin 1.800"). **Bearing Type**—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on both inner and outer face. **Bearing Dimensions**—Length 1.535". Thickness .09995". **Clearance**—.0005-.0025" (total diametrical).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for Oversize Rods & Undersize Crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights. **Journal Diameters**—1.999" (all bearings). **Bearing Type**—Steel-backed, special-alloy lined. **Clearance**—.0005-.0025".
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear bearing. Adjust by replacing bearing. **Endplay**—.002-.005".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long bearings.*

CAMSHAFT:—Three bearings. Helical gear drive. **Bearing Diameters**—1.498" (all bearings). **Bearings**—Steel-backed, babbitt-lined bushings. **Clearance**—.002".
End Thrust:—Taken by gear hub and cover plate. Adjust by replacing coverplate. **Endplay**—.004-.008".
Timing Gears:—Cast alloy steel (crankshaft), Bakelized Fabric (Camshaft). **Backlash**—.004" max.
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must line up with mark on gear hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.281"	.2795"	4.375"
	Seat Angle	**Lift**	**Stem Clearance**
All Valves	45°	.251"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Inserts used for exhaust valves only.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.8295". **Clearance**—.0005-.001".

Valve Springs:—	Pressure	Length
Valve Closed	26-30 lbs.	2.05"
Valve Open	48-52 lbs.	1.80"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9½° BTDC. Close 54½° ALDC.
Exhaust Valves—Open 57½° BLDC. Close 6½° ATDC
To Check Valve Timing—No flywheel marks provided. If dead center point established for any cylinder on flywheel, intake valve for this cylinder should open approximately 3.22 flywheel teeth before this point with the piston .027" BTDC.
Motor Gauge—Weidenhoff Adapter #114. Rod #40.

LUBRICATION:—Pressure. Gear type oil pump mounted on front main bearing cap in crankcase.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. 91-A-9273-A (dash unit), No. 48-9278 (Engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—4 qts.

COOLING SYSTEM:—**Capacity** 15 qt. (922A), 16 (922C).
Water Pump:—Packless 2 used (1 for each bank).
See article in Mechanical Equipment Section for data.
Removal—Slack off belt adjustment, unscrew large mounting nut behind pulley, pull pump out.
Thermostat:—In each cylinder head outlet (2 used). **Setting**—Starts to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley (Not Electric). Ford No. 91-A-10883-A.
See article in Mechanical Equipment Section for data.
Drain Valves:—At lower right front corner of radiator.

CLUTCH:—**Long Model 8½CB-CS (922A), 9CF-CS** (922C). Single plate, dry disc type. Semi-centrifugal (9CF-CS only).
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 6" (8½CB), 5.76" (9CF). Outside Diam. 8.5" (8½CB), 9" (9CF). Thickness .125" (8½CB), .137" (9CF).
Adjustment:—Pedal free movement should be .75-1" (8½CB), 1.5-1.75" (9CF). To adjust, remove clevis pin at end of connector rod, turn clevis on rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in clutch cover.

TRANSMISSION:—**Own Model 74-B (922A), 73-B (Std.** (922C), **73-A (Optional** 922C). Constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gears (74-B, 73-B), second & high only (73-A).
Optional Transmission (922C)—**Model 75:**—Four speed, sliding spur gear type.
See articles in Mechanical Equipment Section for data.
Removal (922A, 922C):—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, remove clutch housing screws, pull transmission straight back.

UNIVERSAL JOINT:—**Spicer Model 7990-SF.** Steel-bushing type. Single joint at rear of transmission (all models), additional joint at frame cross-member between front and rear drive shafts (92Y only).
See article in Mechanical Equipment Section for data.

REAR AXLE (922A, 922C):—**Own Make.** ¾ floating, Spiral Bevel gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.44-1 Std. **Backlash**—.010" maximum.
Removal:—Disconnect hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing mounting screws, pull axle assembly to rear to disengage drive shaft at splined joint.
Axle Shaft Removal—Axle must be dismantled and shaft removed through differential housing at inner end. *See Ford Axle article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—**Houde (Houdaille) Type BBDK (Frt.), BBDW (Rear).** Double acting, hydraulic, adjustable. *See data in Mechanical Equipment Section.*

STEERING:—**Steering Gear**—Gemmer Model 305 Worm -and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise (all models).
Caster—9° Max., 4½° Min. (all models). Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.
Camber—1° Max., ¼° Min. (all models). Must be equal within ¼°, right wheel must not exceed left. Adjust as for caster (see caster data above).
Toe In—1/16". Set at 10-1 ratio to Camber. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry (Toe out on turns)—Outer wheel turned 20°. Inner wheel 23⅓°. Allowable variation ½°. No adjustment.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor, non-energizing type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped type as follows:

	Front Wheel		Rear Wheel	
	Front End	**Rear End**	**Front End**	**Rear End**
922A, C	1.25"	1.00"	1.125"	1.00"

Drums—Cast iron. Diameter 12".
Lining—Woven type (forward shoe—all wheels), Moulded type (rear shoe—all wheels). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoe —all wheels), 10.1" (rear shoe—all wheels).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

ENGINE HOOD NOTE:—To raise hood, release lock by pulling up on latch handle at front of hood above grille, raise hood slightly, press down on safety latch handle (to right of latch under hood).

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame member in front of dash bracket.

ENGINE SPECIFICATIONS (91A,C):—Own 85, 8 cyl., 90° Vee, L head. Both banks & crankcase cast Enbloc. **Bore**—3.062". **Stroke**—3.75".
Rated Horsepower—30. **Displacement** 221 cu. ins.
Developed Horsepower—85 at 3800 R.P.M.
Compression Ratio—6.15-1 (Pass. Cars, Comm'l., 1 Ton), 5.87-1 (Other Trucks). Cast iron head.
Compression Pressure—145 lbs. (6.15-1 hd.), 130 lbs. (5.87-1 hd). at 2200 R.P.M. Max., 100 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—Steady 18-20" at 5 M.P.H.

ENGINE SPECIFICATIONS (99C):—Own 95. See Mercury 'M' Page for complete 95 Engine data.

PISTONS:—Steel alloy, light wgt., cam ground type. Recondition for finished replacement pistons.
Weight—335 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .0025" feeler, .50" wide, inserted between piston and cylinder wall at right angles to pin. Pull to withdraw feeler—7-12 lbs.
NOTE—If aluminum pistons fitted, use .002" feeler with 6-10 lbs. pull.

PISTON RINGS:—Two compression, one slotted oil ring, all above pin (drain holes in oil ring groove).
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.003"
Compr. #2	.0915-.0920"	.012-.017"	.0015"
Oil Cont.	.1535-.1540"	.012-.017"	.0015"

Replacement Rings:—Furnished (sets in cartons only) Std. and .005", .015", .030", .045", .060" oversize.

PISTON PIN:—**Diameter** .7501-.7504". **Length** 2.850". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting directions.*
Replacement Pins:—Std. & .002" over- & under-size.

CONNECTING ROD:—Length 7.00". **Weight** 476 grams.
Crankpin Journal Diameter—1.999" (connecting rod diameter on crankpin—2.220").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on inner and outer faces.
Bearing Dimensions—Length 1.747". Thickness .1095". These bearings do not have end flanges.
Clearance—.0005-.0025". (total diametrical).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for oversize rods and undersize crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2.499" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.0005-.0025".
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".
Replacement Bearings:—*See Ford Shop Notes for Unundersizes and special long main bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.
Bearing Diameters—1.797" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjust by replacing coverplate. **Endplay**—.004-.008".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric (camshaft). **Backlash**—.004" max.
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Seat inserts used for all valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
To Check Valve Timing—No flywheel marks provided. Intake valve opens with piston at TDC.

LUBRICATION:—Pressure. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford Nos: Dash Unit—91-A-9273-B (Deluxe Pass. Cars), 91-A-9273-A (all others). Engine Unit—48-9273 (all).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 qts.

COOLING SYSTEM:—**Capacity**—22 qts. (Std. Pass. Cars, Comm'l., 1 Ton), 21 qts. (Deluxe Pass. Cars), 24 qts. (Trucks).
Water Pump:—Packless type, 2 used (1 for each bank). *See Mechanical Equipment Section for data.*
Removal—Slack off drive belt, support engine at forward end, remove front engine mounting bolts, take out mounting screws in pump body.
Thermostat:—In each cylinder head outlet (2 used).
Setting—Start to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley (not electric). Ford No. 91-A-10883-B (Deluxe Pass Cars), 91-A-10883-A (all others).
See article in Mechanical Equipment Section for data.
Drain Valves:—One at lower right front corner of radiator.

CLUTCH:—**Long Model 9CF-CS.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. Inside Diam. 5.76". Outside Diam. 9". Thickness .137".
Adjustment:—Pedal free movement should be 1.5-1.75". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in cover.

TRANSMISSION:—**Own Model 68 (Std.), 67 (Optl.).** Constant-mesh, synchro-mesh, helical gears (Second & High), sliding helical gear (Low & Reverse—68), spur gear (Low & Reverse—67).
NOTE—Model 51 4 spd. type optl. on Comm'l.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable. Disconnect rear spring at center frame connection, take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, remove clutch housing screws, pull transmission straight back.

UNIVERSAL JOINT:—**Spicer Model 6454-FS.** Steel bushing type. Single joint at rear of transmission case.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** ¾ Floating, Spiral Bevel gear type with straddle-mounted pinion and Torque tube drive.
Optional Axle:—Columbia Two-speed type.
See article in Mechanical Equipment Section for data.
Ratio—3.78-1 Std.; 3.54-1, 4.11-1 Optl.
Backlash—.010" Max.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable. Disconnect rear spring at center frame connection, take out universal joint ball housing screws, pull axle assembly to rear to disengage splined joint, remove axle assembly.
Axle Shaft Removal—Axle assembly must be dismantled as follows: Remove wheels and hubs, disconnect spring, remove axle housing mounting screws in differential housing, remove housing. Dismantle differential assembly, pull axle shafts out at inner end (integral with differential side gear).

SHOCK ABSORBERS:—**Houde (Houdaille) BBDK (frt.), BBDW (rear).** Double acting, hydraulic, adjustable.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse front spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise.
Caster—9° Max., 4½° Min. Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.
Camber—1° Max., ¼° Min. Must be equal within ¼° and right wheel must not exceed left. Adjust as for Caster (see Caster adjustment above).
Toe In—1/16". Set at 10-1 ratio to Camber. Adjust by loosening tie rod clamp bolts and turning tie rod.
Steering Geometry (Toe out on Turns)—Outer wheel turned 20°, Inner wheel 23⅓°. Allowable variation ½°. No adjustment.

BRAKES:—**Service**—Lockheed hydraulic, double anchor, non-energizing type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast iron. Diameter 12".
Wheel Cylinders—Stepped type with larger end of cylinder actuating forward shoe. Not interchangeable (front wheel cylinders larger) as follows:

	Front Wheel		Rear Wheel	
	Front	Rear	Front	Rear
All Models	1.25"	1.00"	1.125"	1.00"

Lining—Woven type (forward shoe, all wheels), Molded type (rear shoe, all wheels) as follows: Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoe, all wheels), 10.1" (rear shoe, all wheels).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

MODEL DESIGNATION:—Models, Engine type, and Wheelbases for all trucks are as follows:

1 Tonner

Model	Engine	Wheelbase
91Y	85	122"
92Y	60	122"

Cab-Over-Engine Models

911W, Z	85	101"
91W	85	134"
917W	85	157"
991W, Z	95	101"
99W	95	134"
997W	95	157"

Other Trucks

91T, U	85	134"
917T	85	157"
911T (School Bus)	85	191"
99T, U	95	134"
997T	95	157"
991T (School Bus)	95	191"

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing.

ENGINE SPECIFICATIONS & SERVICE DATA:—*See Ford '60', Ford '85', and Mercury (for '95' Engine) 'M' pages for complete data.* All data (Pistons, Pins, Rings, Connecting Rods, Main bearings, Camshaft, Valves, Lubrication and Cooling System) same as for passenger car models except as noted.

CLUTCH:—Long Model 9CF-CS (92Y), 11CF-CI (all others). Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. Inside Diam. 5.76" (9CF), 6.5" (11CF). Outside Diam. 9" (9CF), 11" (11CF). Thickness .137" (all).

Adjustment:—Pedal free movement should be 1.5-1.75". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.

Removal:—Disconnect front propeller shaft (coupling shaft) and remove transmission (see Transmission Removal below). Take out mounting screws in clutch cover flange.

TRANSMISSION (3 SPD.):—Own Model 67 (Std. 1 Ton), Models 70-B, 70-C (Optl. Others). Constant-mesh, synchro-mesh, helical gears (Second & High), sliding spur gear (Low & Reverse).
NOTE—4 Spd. Trans. Optl. on 1 Ton models.
See article in Mechanical Equipment Section for data.

Removal:—Remove front propeller shaft (coupling shaft) as follows: Take out all except top bolt in intermediate universal joint ball housing (frame bolts), remove all screws in front universal joint cover, slide cover back 6" on housing, take out screws in universal joint flange directly in back of universal, disengage coupling by pushing it back on shaft against spring tension, take out remaining bolt at intermediate universal joint, pull shaft down at front end to clear cross-member, pull forward until free at splined joint at rear end, remove shaft assembly. Support engine at rear end, take out rear engine mounting bolts, take out clutch housing mounting screws, pull transmission straight back and remove.
NOTE—Models 911-W, Z have one universal joint only (no coupling shaft used).

TRANSMISSION (4 SPD.):—Own Model 51. Std. on all models except 1 Ton. Sliding spur gear type.
See article in Mechanical Equipment Section for data.
Removal:—Same as for 3 Spd. transmission above.

UNIVERSAL JOINT:—Spicer. Two used (one at rear of transmission case, additional joint at frame cross-member between front and rear driveshafts. Steel bushing type (1 Ton), Needle bearing (others).
NOTE—One joint only used on Models 911-W, Z.
See article in Mechanical Equipment Section for data.

REAR AXLE (STD.):—Own Make. Full floating, Spiral bevel gear type with straddle-mounted pinion and Torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.857-1 Std., 4.11 Optl. (1 Ton), 6.67-1 Std., 5.14-1, 5.83-1 Optl. (others).
Backlash—.004-.016".

Removal:—Disconnect hand brake cables, hydraulic brake line (at torque tube connection—bleed lines when re-connected), speedometer cable. Disconnect rear springs (semi-elliptic type), take out universal joint ball housing bolts (rear joint), pull axle assembly to rear to disconnect splined joint, remove assembly.
Axle Shaft Removal—Take out two screws and remove hub cap, remove nuts on 8 hub studs which hold axle shaft flange in place, turn the two special screws (in tapped holes in flange) up evenly to break flange loose from wheel hub, **back these screws out,** strike axle shaft flange at center to loosen centering cones on studs, remove cones, pull axle shaft out (wheel not disturbed).
Wheel Bearing Adjustment—Remove axle shaft (above), use special bearing adjusting wrench and remove bearing locknut (outer nut), nut retainer, and grease retainer. Adjust inner bearing adjusting nut by turning up until tight and then backing off ⅛ turn, install grease retainer, bearing nut retainer, outer bearing locknut, turn locknut up tight.
NOTE—When installing axle shaft, make certain that gasket in place under shaft flange, cones in place on studs and that two loosening screws backed off sufficiently so that stud nuts can be tightened securely. Turn the two loosening screws in just enough to prevent loosening in service.

REAR AXLE (OPTL.):—Two-speed type.
See article in Mechanical Equipment Section for data.
Ratio—5.83-1 (Direct), 8.11-1 (2nd speed).
Backlash—.006-.020".

Removal:—Same as for standard axle (above) except that control linkage must also be disconnected.

SHOCK ABSORBERS:—Houde (Houdaille). Double acting, hydraulic, adjustable type. Used on front end only.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with 'Push-pull' adjustment.
See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring positioned by radius rods (except Cab over Engine models), semi-elliptic springs (Cab over Engine models).

Kingpin Inclination—8° crosswise (except Cab-Over-Engine Trucks—7°).

Caster—9° Max., 4½° Min. (1 Ton); 3½° Max., 1° Min. (Cab-Over-Engine), 5° Max., 3° Min. (others). Must be equal within ½°. NOTE—Axle may be bent cold to correct caster provided that proper tools (wedges and blocks to prevent crushing axle flange) used.

Camber—1° Max., ¼° Min. (all models). Must be equal within ¼° and right wheel must not exceed left wheel. Adjust as for Caster (see Caster Note).

Toe In—1/16" (Cab-Over-Engine), 0" (other trucks—empty). Set at 10-1 ratio to camber. Toe in increases with load on trucks and should be set with truck empty. Adjust by loosening clamp bolts and turning tie rod.

Steering Geometry (Toe out on turns)—Outer wheel turned 20°, Inner wheel turned 23° (1 Ton), 23¾° (101" WB. models), 22⅔° (134" WB. models), 22¼° (157" WB. models). Allowable variation ½°.

BRAKES:—Service—Lockheed hydraulic, double anchor, non-energizing type. Hand lever applies rear wheel service brakes (1 Ton), separate brake band in rear wheels (others).
See article in Mechanical Equipment Section for data.
Drums—Cast iron. Diameter 12" (1 Ton—front wheel), 14" (1 Ton—rear wheel, Other trucks—front wheel), 15" (all models except 1 Ton—rear wheel).
Wheel Cylinders—Not interchangeable (larger cylinders used for rear wheels, stepped type cylinders used for 1 Ton front wheels only). Cylinder sizes (front & rear end given for 1 Ton front cylinder only) as follows:

	Front Wheel	Rear Wheel
1 Ton	1.25"-1.00"	1.375"
All Others	1.375"	1.50"

Lining—Molded type (all shoes except 1 Ton forward shoes, front wheel which are Woven type).

	Width	Thickness	Length per Shoe Forward	Rear
1 Ton (front)	1.75"	.20"	13.18"	10.1"
1 Ton (rear)	2.00"	.268"	15.53"	10.75"
Others (front)	2.00"	.268"	15.53"	10.75"
Others (rear)	3.50"	.33"	16.64"	11.52"

Clearance—Least possible amount without drag.

Hand Brake (1 Ton):—See Service Brakes above.

Hand Brake (Others):—Independent internal expanding band in each rear wheel.
Lining—Width 1.50". Thickness .185". Length per wheel 41.12".

1936-1939 MODELS

CYLINDER HEAD REMOVAL ON SUPERCHARGER MODELS:—Not necessary to remove Supercharger. Remove nuts holding supercharger bracket to cylinder block and at cylinder head, remove screws and nuts holding intake cross-tube to manifold and supercharger, disconnect gasoline line to carburetor, water pipes to supercharger, vacuum line to distributor. Tip supercharger away from engine block and proceed with cylinder head removal (do not disconnect carburetor throttle and choke connections).

1937-1939 MODELS

PISTONS:—Pistons are full skirt type (no slot) with special oil groove extending entirely around piston at lower end of skirt and four vertical grooves on one side (pistons must be installed with these grooves toward camshaft). These grooves are part of the piston and cylinder wall metered-lubrication system.

1937-1939 MODELS

PISTON & CYLINDER WALL LUBRICATION SYSTEM:—Oil channel in block at side of lifter guide holes feeds oil from engine pressure system to oil groove on side of valve lifters (barrel type). When lifter raised by cam, this groove registers with drilled hole through cylinder wall and oil is fed to piston oil groove (see above) for piston and cylinder wall lubrication. This action occurs twice for each stroke of the piston.

Servicing—Clean out oil channels and drilled holes when pistons and lifters removed.

1937-1939 MODELS

PISTON RINGS:—Compression and top oil ring are special types and must be installed as follows:

Installing Rings:—Compression rings are taper-faced and must be installed with marks on edge of ring up. Top oil ring (wiper ring) is X-90 type. Install this ring with expander joint at back of ring, springs seated in notches at ring ends, word 'NO.' on expander right side up and visible in ring joint, and oil groove on ring face down.

Replacement Rings:—Compression and oil rings (except X-90) furnished standard and .010", .020", .030" oversize. X-90 ring furnished standard and .020" oversize.

1936-1939 MODELS

MAIN BEARING SERVICING:—Front Bearing 1938-39. Consists of a special bushing (not split) inserted in hole in front face of crankcase. This bearing cannot be adjusted and must be replaced if clearance excessive.

Front Bearing Replacement—Remove radiator, vibration dampener, chain case cover. Remove nut holding camshaft sprocket, pull camshaft and crankshaft sprockets together (to avoid damage to chain), remove front bearing bushing.

Bearing Replacement (All except #1 1938-39):—To determine correct size for replacement bearing, install .003" feeler 1" long in bearing cap between bearing and crankshaft, tighten cap securely. If bearing is tight on this feeler, install standard replacement bearing. If crankshaft turns freely with this feeler in place, install .001" undersize bearing.

NOTE—No undersize bearings furnished on following models: 80, 80A, 85, 90, 90A, 110.

Bearing Installation—Not necessary to remove crankshaft. New upper bearing halves can be 'rotated' in place. Bearing caps are doweled to crankcase to insure alignment.

Bearing Clearance—Check clearance of new bearings by installing .002" feeler 1" long under bearing cap. With bearing cap tight, shaft should bind with feeler in place but should be free with feeler removed. Face bearing cap with emery cloth on surface plate to secure this fit.

Endplay Adjustment:—Remove radiator, vibration dampener, chain case cover. Check endplay with feeler gauge. To adjust, pull camshaft and crankshaft sprockets together, add or remove shims between crankshaft shoulder and steel thrust washer (furnished .002" & .008" thick). See that floating bronze thrust washer is in place between steel washer and main bearing.

1936-1939 MODELS

VALVE GUIDE REMOVAL & INSTALLATION:—Use special puller mounted on top of block (install steel plate under puller legs to distribute strain on block) and pull old guides up through top of block (if guides stick, use knock-out bar to loosen guide and avoid strain on puller draw-bar). Install new guides in same manner pulling guides up into holes in block from below.

1937-1939 MODELS

SUPERCHARGER:—Supercharger is entirely separate unit mounted on left hand side of engine block and belt driven from the crankshaft.

Supercharger Drive:—Two exposed Vee belt drive taken from crankshaft pulley at front of engine.

Belt Adjustment—None (automatic). Belt tension maintained by automatic take-up consisting of driven pulley mounted on pivoted arm with light coil spring pressing outward on arm and held by ratchet (allows outward movement to take up slack only).

1936-1939 MODELS

Supercharger Removal:—Disconnect throttle and choke linkage, fuel line from pump, vacuum line to carburetor. Remove nuts holding supercharger bracket to cylinder block and at cylinder head, take out screws and nuts connecting cross-tube to supercharger cover at top and oil line to supercharger case at bottom, remove bolts in lower mounting bracket, lift supercharger and carburetor assembly out.

1938-1939 MODELS

HAND BRAKE:—Consists of an external-contracting band on a drum at rear of the transmission. Hand lever is linked directly to operating lever on band.

Adjustment—With hand lever in released position, remove anchor screw locking wire, turn anchor screw to give .025" clearance between lining and drum, lock anchor screw with wire. Back off brake adjusting bolt nut (at top), loosen locknut on guide bolt and adjust to give .025" clearance for lower portion of band, tighten locknut, finally turn adjusting bolt nut to .025" clearance for upper portion of band (tension on guide bolt should just be relieved).

SERIAL NUMBER:—First number 1,605,001 (65), 1,615,001 (68). On plate under floor mat near right rear door or under front seat.

ENGINE NUMBER:—First number 1,620,001 (68). On plate on side of engine block.

ENGINE:—Six cylinder, 'L' head type. Cylinders cast enbloc.

Dimensions—Bore, 3¼". Stroke, 4½". Displacement, 224 cu. ins.

Horsepower—Rated, 25.35. Developed, 85 H.P. at 3400 R.P.M.

Compression—6.5-1. Compression pressure, 110 lbs. at cranking speed.

NOTE:—Cylinder head is aluminum.

Pistons:—Nelson Bohnalite, Invar strut, split skirt type.
Weight—17 ozs. (stripped). Length, 3 23/32".
Removal—Piston and rod assembly removed through bottom of engine.
Clearance—.0015" (skirt).

Piston Rings:—Three rings per piston, #1 and 2—compression rings, #3—oil control ring.

Ring	Width	End Gap	Wall Thickness
Comp. (#1, 2)	⅛"	.008-.012"	.145"
Oil Cont. (#3)	3/16"	.008-.012"	.145"

Piston Pin:—Diameter, 13/16". Length, 2 13/16". Pins are clamped in rod.
Pin Fit in Piston—Push fit.

Connecting Rod:—Length, 9¼".
Crankpin Journal Diameter—2¼".
Big End Bearing—Babbitt-lined type. Shims used.
Clearance—.002". Sideplay .005".
Adjustment—Shims provided for adjustment.

Crankshaft:—Seven main bearing type.
Journal Sizes—2½" diameter (all bearings).
Bearing Type—Removable bronze-backed (65), steel-backed (68), babbitt-lined.
Clearance—.002".
Adjustment—None (no shims).
End Thrust—Taken by #1 (front) main bearing. Endplay, .006".

Camshaft:—Four bearing type. Three-sprocket adjustable chain drive (65), two-sprocket non-adjustable chain drive (68).
Timing Chain (65 '33):—Link Belt. Width 1¼". Pitch ½". Length 34" or 68 links. See Chain adjustment below.
Timing Chain (68 '34):—Link Belt. Width 1¼". Pitch ½". Length 26" or 52 links.
Camshaft Setting—Sprockets are marked. Mesh chain so there are exactly ten links or eleven teeth (inclusive) between marks on sprockets.
Timing Chain Adjustment (Model 65 only):—Adjust chain at 6000 mile intervals. To take up chain, losen two flange mounting screws on accessory sprocket mounting (water pump bracket), back off adjustment screw locknut, turn up adjusting screw until chain hums with engine running, back off adjusting screw until chain runs noiselessly, tighten locknut and mounting screws.

Model 65 (1933) Specifications

VALVES:—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.562"	.34075"	5.5"	30°	.318"
Exhaust	1.467"	.34075"	5.5"	45°	.327"

Model 68 (1934) Specifications

Intake	1.567-1.557"	.341-.3405"	5.515-5.485"	30°	.318"
Exhaust	1.255-1.245"	.341-.3405"	4.906-4.876"	45°	.327"

Tappet Clearance—.010" (all valves—engine hot).
Valve Springs—1⅞" with load of 94-96 pounds.

Valve Timing

Intake Valves Open—At TDC.	Close—40° ALDC.
Exhaust Valves Open—40° BLDC.	Close—10° ATDC.

To Check Valve Timing—Set tappet clearance #6 exhaust valve at .012". This valve should close with piston 10° after top dead center when flywheel mark 'EC-1' lines up with pointer on housing in inspection hole right front face of flywheel housing. Reset tappet clearance at .010".

Motor Gauge—Weidenhoff Adapter #102. Rod #2.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—50 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Operates at 50 lbs. Located under plug on side of crankcase (oil pressure signal switch built in regulator case). Adjustable by adding or removing shims or washers above relief valve spring in plug.
Capacity and Oil—6 qts. Use SAE #50 (summer above 70°F.), #40 (40° to 70°F.), #30 (winter 20° to 40°F.), #20-W (winter 0° to 20°F.).

CLUTCH:—**Long Model 9AB.** Single plate, dry disc type. See article in Clutch Section for complete relining and assembling instructions.
Facings—Moulded type, 2 required. Thickness .137". Inside Diameter 5¾". Outside Diameter 9¼".
Adjustment—Free movement of clutch pedal should be 1¼" Adjust when this has decreased to ½". To adjust, loosen locknut and back off adjusting setscrew at lower end of clutch pedal.

STEERING:—**Steering Gear**—Ross Cam-and-Lever type (65), Cam-and-Roller type (68). See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and outboard mounted semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—1½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1½°. No adjustment provided.
Toe In—⅛-3/16". Adjusted in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. See article in Brake Section for complete adjustment instructions.
Drum Diameter—13".
Lining—Woven type. Width 1¾". Thickness 3/16". Length 27¾" per wheel.
Clearance—.012" toe, .006" heel for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—Place hand lever in released position, turn anchor adjusting screw until clearance is 1/32" at this point. Then loosen locknut and turn guide bolt nut until clearance at lower end of band is 1/32". Finally turn adjusting nut at top of adjusting bolt until clearance is 1/32". Clearance should be 1/32" and uniform around brake band.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 9/16"

NOTE:—Supercharged Special Eights use the Custom Eight Model 69 engine. See data on Custom Eight Model 69 (following) for Engine Specifications.

SERIAL NUMBER:—First number (57) 1,015,001, (57A) 1,020,001, (64) 1,800,001, (67) 1,805,001. On plate under floor mat near right rear door or under front seat cushion.

ENGINE NUMBER:—On plate on side of crankcase.

ENGINE:—Eight cylinder, In Line, 'L' head type. Cylinders cast enbloc.

Dimensions—Bore, 3⅛". Stroke, 4". Displacement, 245.5 cu. ins.

Horsepower—Rated 31.25. Developed 90 HP. (57), 95 HP. (57A, 64, 67) at 3400 R.P.M.

Compression—Ratio 6.5-1 (57), 6.7-1 (57A, 64, 67). Pressure 110 lbs. at cranking speed.

Pistons:—Nelson Bohnalite, Invar strut, split skirt type.

Weight—16 ozs. (stripped). Piston length, 3 19/32".

Removal—Piston and rod assembly removed through bottom of engine.

Clearance—.0015" (skirt).

Piston Rings:—Three rings per piston, #1 and 2—compression rings, #3—oil control ring.

Ring	Width	End Gap	Wall Thickness
Comp. (#1, 2)	⅛"	.008-.012"	.140"
Oil Cont. (#3)	3/16"	.008-.012"	.140"

Piston Pin:—Diameter, 13/16". Length, 2⅝". Pin is clamped in rod.

Pin Fit in Piston—Push fit.

Connecting Rod:—Length, 8⅝".

Crankpin Journal Diameter—2⅛".

Big End Bearing—Spun babbitt-lined type. Shims used.

Clearance—.002". Sideplay .005".

Adjustment—Shims provided for adjustment.

Crankshaft:—Five bearing type.

Journal Sizes—2½" diameter—all bearings.

Bearing Type—Removable bronze-backed, babbitt-lined type.

Clearance—.002".

Adjustment—None (no shims).

End Thrust—Taken by #1 (front) main bearing. Endplay, .006".

Camshaft:—Six bearing type. Camshaft drive—Adjustable chain.

Chain—Link belt. Width, 1¼". Length, 67 links. Pitch, ½".

Camshaft Setting—Sprockets are marked. Mesh chain so there are exactly ten links or eleven teeth (inclusive) between marks on sprockets.

Chain Adjustment—Chain adjusted by shifting accessory sprocket (water pump bracket). To adjust, loosen two flange mounting screws, back off adjustment set screw lock nut, turn up adjustment set screw until chain hums with engine running, back off set screw until chain runs noiselessly, tighten lock nut and mounting screws.

Valves:—

Model 57 (1932) Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.4375"	.341-.3405"	4.9375"	45°	.3145"
Exhaust	1.3125"	.341-.3405"	4.9375"	45°	.3195"

Model 57A, 64, 67 (1933-34) Specifications

Intake	1.375"	.341-.3405"	4.894"	45°	.3145"
Exhaust	1.350"	.341-.3405"	4.894"	45°	.3195"

Tappet Clearance—.010" (all valves—engine hot).

Valve Springs:—Double springs used on first Model 57 cars. Can be replaced by new type single spring used on later models.

	Spring Pressure	Spring Length
Valve Closed	47½-52½ lbs.	2 3/16"
Valve Open	103-109 lbs.	1⅞"

Valve Timing

Intake Valves Open—AT TDC. Close—40° ALDC.
Exhaust Valves Open—40° BLDC. Close—10° ATDC.

To Check Valve Timing—Set tappet clearance #8 exhaust valve at .012". This valve should close with piston 10° past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right hand front face of flywheel housing. Reset tappet clearance at .010".

Motor Gauge—Weidenhoff Adapter #102. Rod #40 (67), #2 (all others).

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—50 lbs. at 30 M.P.H.

Oil Pressure Relief Valve—Operates at 50 lbs. Located under plug on side of crankcase (oil pressure signal switch built in regulator case). Adjustable by adding or removing shims or washers above relief valve spring under plug.

Capacity and Oil—6 qts. Use SAE. #50 (summer above 70°F.), #40 (summer 40° to 70°F.), #30 (winter 20° to 40° F.), #20-W (winter 0° to 20°F.).

CLUTCH:—**Long Model 9-AB.** Single plate, dry disc type. See article in Clutch Section for complete relining and assembling instructions.

Facings—Moulded type, 2 required. Thickness 9/64". (.137"). Inside Diameter 5½". Outside Diameter 9¾".

Adjustment—Free movement of clutch pedal should be 1". Adjust when this decreases to ½". To adjust, loosen locknut and back off adjusting setscrew at lower end of pedal.

STEERING:—**Steering Gear**—Ross Cam-and-Roller type. See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and outboard mounted semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Caster—1½°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1½°. No adjustment provided.

Toe In—⅛-3/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. See article in Brake Section for complete adjustment instructions.

Drum Diameter—13".

Lining—Moulded type (1932), Woven type (1933-34). Width 2". Thickness 3/16". Length 27¾" per wheel.

Clearance—.012" toe, .006" heel for each shoe.

Hand Brake:—External type on drum at rear of transmission.

Adjustment—Place lever in released position, turn up anchor adjusting screw until clearance at this point 1/32". Loosen locknut and turn nut on guide bolt until clearance at lower end of band is 1/32". Turn adjusting nut at top of adjusting bolt until clearance is 1/32". Clearance must be uniform around band.

Drum Diameter—6".

Lining—Width 2". Thickness 5/32". Length 18 9/16".

ENGINE NUMBER: — First number, 1,705,001. On plate on left hand side of crankcase and on chassis serial number plate.

ENGINE:—Own. Model 74. Six cylinder, 'L' head type.

Bore—3". Stroke—4".

Piston Displacement—169.6 cubic inches.

Rated Horsepower—21.6 A.M.A.

Developed Horsepower—60 at 3500 R.P.M.

Compression Ratio—5.8-1 Std. cast-iron head, 6.87-1 optl. aluminum head.

Compression Pressure—95-100 lbs. (5.8-1 head), 115 lbs. (6.87-1 head) at 50 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn Bohnalite, aluminum alloy, Invar strut, split skirt type. Length—3 41/64".

Weight—14 ounces. Held to 2 gram variation.

Removal—Pistons and rods removed from below.

Clearance—Skirt .002" see Fitting Pistons.

Fitting New Pistons—Use .002" feeler stock ½" wide inserted between piston and cylinder wall on side opposite slot. Pull required to withdraw feeler should be within 10-17 lbs.

Installing Pistons—Slot should be toward left or away from valves.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with eight 9/64" oil drain holes.

Ring	Width	End Gap
Comp. all	⅛"	.005-.010"
Oil Cont.	3/16"	.005-.010"

Piston Pin:—Diameter 13/16". Length 2 9/16". Pin is locked in the connecting rod.

Pin Clearance in Piston—.0001" or push fit.

Connecting Rod:—Length 7" (center-to-center).

Crankpin Journal Diameter—1 15/16".

Lower Bearing Type—Interchangeable, steel-backed, cadmium-nickel lined type, no shims.

Clearance—.001-.0025". Sideplay .005-.008".

Adjustment—None (no shims). Replace bearings.

Installing Rods—Oil hole in upper side of rod lower bearing must be toward right or camshaft side of engine on all rods.

Crankshaft:—Four bearings. Integral counterweights.

Journal Diameters—2¼" all bearings.

Bearing Type — Interchangeable, steel-backed, cadmium nickel-lined type.

Clearance—.001-.0027".

Adjustment—None (no shims). Replace bearings.

End Thrust—Taken by front bearing. Endplay .004-.006".

Camshaft:—Four bearing. Non-adjustable chain drive.

Bearing Type—#1 and 4 steel-backed, babbitt-lined type. #2 and 3 are cast-iron.

Clearance—#1 and 4—.0015-.002". #2 and 3—.002-.003".

End Thrust—Taken by spring-loaded plunger in camshaft sprocket and thrust plate on chain case cover.

Timing Chain—Link Belt. Width 1". Pitch ½". Length 23" or 46 links.

Camshaft Setting—Sprockets are marked. Mesh chain so that there are nine links or ten teeth (inclusive) between marks on sprockets.

Valves:—

	Head Diameter.	Stem Diameter.	Length.
Intake	1 33/64"	3125"	5 3/16"
Exhaust	1 13/64"	3125"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	9/32"	.001-.0026"
Exhaust	30°	9/32"	.002-.0036"

Tappet Clearance—.010" all valves — engine hot.

Valve Springs	Spring Pressure	Length
Valve Closed	32.2-34.2 lbs.	1 21/32".
Valve Open	71-75 lbs.	1 3/8".

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 42° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.

To Check Valve Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .025" past top dead center when flywheel mark 'EC-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #102, Rod #2.

Lubrication:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure—50 lbs. at 30 M.P.H.

Oil Pressure Relief Valve—Operates at 40-45 lbs. Located within crankcase. Adjustable by adding or removing shims or washers in plug above spring.

Capacity & Oil—5 qts. Use SAE. #50 (summer above 70°F), #40 (summer 40° to 70°F), #30 (winter 20° to 40°F), #20-W (winter 0° to 20°F).

CLUTCH:—Illinois. Single plate, dry disc type. Clutch consists of pressure plate assembly bolted directly to flywheel by six capscrews in release lever mounting brackets. Adjusting shims located between bracket and face of flywheel (see clutch pedal adjustment for details of shims).
See article in Mechanical Equipment Section for data.

Clutch Pedal Adjustment—Free movement of clutch pedal must be 1-1¼". To adjust, take out cotter pin at either end of clutch pedal connecting link, turn turnbuckle to secure correct lash, replace cotter pin, tighten turnbuckle locknut. When limit of adjustment is reached, loosen two capscrews in each clutch mounting bracket slightly, pull out shim under bracket (shim holes are slotted — not necessary to take out capscrews completely), tighten bracket screws. This will provide new range of adjustment on connecting link. Shims can be discarded. New shims of correct thickness are supplied with new driven plate.

Clutch Facings—Manufacturer recommends that no attempt be made to reline driven plate in the field as it is important that driven plate thickness under pressure be maintained accurately. Driven plate with new facings are furnished with new shims of correct thickness. These shims should be installed under bracket mounting screws.

Clutch Facings—Moulded type, 2 required, 5⅛" I.D., 7⅞" O.D., ⅛" thick.
NOTE:—Release levers are pivoted on eccentric pins which are correctly positioned and peened in place when clutch is assembled. Levers and pins should not be disturbed.

STEERING:—Front Suspension — Conventional 'I' beam section front axle with Reverse-Elliott ends and outboard-mounted semi-elliptic springs.

Kingpin Inclination—7½° crosswise.

Caster—2½°. Use wedge shims inserted between spring and spring pad on axle to correct caster.

Camber—1°.

Toe In—⅛". Adjust in usual manner by changing length of tie rod.

Steering Gear:—Cam-and-Lever type. See article in Steering Section for adjustments.

BRAKES:—Service—'Graham' Hydraulic, double anchor type. Hand lever applies rear wheel service brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—9".

Lining—Moulded type. Width 1¾". Thickness .200". Length per wheel 18".

Clearance—.008" between lining and drum.

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number, 1,640,001. On plate on right hand side of crankcase and on chassis serial number plate.

ENGINE:—**Own, Model 73.** Six cylinder, 'L' head type.
Bore—3¼". **Stroke**—4½".
Piston Displacement—224 cubic inches.
Rated Horsepower—25.35 A.M.A.
Developed Horsepower—85 at 3400 R.P.M.
Compression Ratio—6.5-1. Std. aluminum head.
Compression Pressure—105 lbs. at cranking speed (60 R.P.M.).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn Bohnalite, aluminum alloy, Invar strut, split skirt type. Length, 3 23/32".
Weight—17 ozs. Held to 2 gram variation.
Removal—Pistons and rods removed from below.
Clearance—Top .020". Skirt .002". See Fitting Pistons.
Fitting New Pistons—Use .002" feeler stock ½" wide inserted between piston and cylinder wall on side opposite slot. Pull required to withdraw feeler should be between 10-16 lbs.
Installing Pistons—Slot should be toward left or camshaft side of engine.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with eight 9/64" oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.007-.015"	.145"
Oil Cont.	3/16"	.010-.015"	.145"

Piston Pin:—Diameter 13/16". Length 2 13/16". Pin is locked in the connecting rod.
Pin Clearance in Piston—.0001" or push fit.

Connecting Rod:—Weight 34¼ ozs. Length 9¼".
Crankpin Journal Diameter—2¼".
Lower Bearing Type—Spun babbitt-lined type.
Clearance—.002". Sideplay .005".
Adjustment—Laminated shims provided. Do not file rods or bearing caps.
Installing Rods—Oil hole in upper side of rod lower bearing must be toward right or away from camshaft on all rods.

Crankshaft:—Seven bearing. Crankshaft is machined and crank throws bored out to reduce rotating weight (no counterweights).
Journal Diameters—2 47/64" all bearings.
Bearing Type—Interchangeable, steel-backed, babbitt-lined, except #1—bronze-backed, babbitt-lined type.
Clearance—.002".
Adjustment—None (no shims). Replace bearings.
End Thrust—Taken by front bearing. Endplay .004-.006".

Camshaft:—Four bearing. Non-adjustable chain drive.
Bearing Type—Babbitt-lined.
Clearance—.001-.0025" on diameters.
End Thrust—Taken by spring-loaded plunger in camshaft sprocket and thrust plate on chain case cover.
Timing Chain—Link Belt. Width 1". Pitch .500". Length 26" or 52 links.
Camshaft Setting—Sprockets are marked. Mesh chain so that there are exactly 10 links or 11 teeth (inclusive) between marks on sprockets.

Valves:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.341"	5½"
Exhaust	1 15/32"	.341"	5½"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3125"	.001"
Exhaust	45°	.3175"	.001"

Tappet Clearance—.010" all valves, engine hot.

Valve Springs	Spring Pressure	Length
Valve Closed	50-55 lbs.	2 3/16"
Valve Open	94-99 lbs.	1⅞"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 40° ALDC.
Exhaust Valves—Open 40° BLDC. Close 10° ATDC.

To Check Valve Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .0422" past top dead center when flywheel mark 'EC-1' lines up with indicator in inspection hole in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #102, Rod #2.

Lubrication:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—50 lbs. at 30 M.P.H.
Oil Presure Relief Valve—Operates at 40-45 lbs. Located under plug on right side of crankcase. Adjustable by adding or removing shims or washers in plug above spring.
Capacity and Oil—6 qts. Use SAE. #50 (summer above 70°F.), #40 (40° to 70°F.), #30 (winter 20° to 40°F.), #20-W (winter 0° to 20°F.).

CLUTCH:—**Long Model 9AB-M.** Single plate, dry disc type. No adjustment for wear required.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement of clutch pedal should be 1¼". Adjust whenever free movement has decreased to ½". To adjust, turn set screw at lower end of clutch pedal (unscrew to increase free movement).
Clutch Facings—Moulded type, 2 required, 5¾" I.D., 9" O.D., 9/64" thick.

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Reverse-Elliott ends and outboard-mounted semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—2°. Use wedge shims inserted between spring and spring pad on axle to correct caster.
Camber—1°.
Toe In—⅛". Adjust in usual manner by changing length of tie rod.

Steering Gear:—Ross Cam-and-Lever type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for complete adjustment procedure.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 24".
Clearance—.006" heel, .012" toe, between lining and drum for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw to give 1/32" clearance betwen lining and drum, lock anchor screw with wire. Adjust brake band bolt nut to give 1/32" clearance for lower half of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/32" clearance (as above) for upper portion of band.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 9/16".

ENGINE NUMBER:—First number, 1,815,001. On plate on right side of crankcase and on chassis serial number plate.

ENGINE:—**Own Model 72.** Eight cylinder, In Line, 'L' head type.
Bore—3⅛". Stroke—4".
Piston Displacement—245.4 cubic inches.
Rated Horsepower——31.25 A.M.A.
Developed Horsepower—95 at 3400 R.P.M.
Compression Ratio—6.7-1. Std. aluminum head.
Compression Pressure—115 lbs. at cranking speed (60 R.P.M.).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn, Bohnalite, aluminum alloy, Invar strut, split skirt type. Length 3 19/32".
Weight—16 ounces. Held to 2 gram variation.
Removal—Pistons and rods removed from below.
Clearance—Top .025". Skirt .002" (see Fitting Pistons).
Fitting New Pistons—Use .002" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 10-16 lbs.
Installing Pistons—Slot should be toward left or on camshaft side of engine.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with eight 9/64" oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.010-.015"	.140"
Oil Cont.	3/16"	.007-.015"	.140"

Piston Pin:—Diameter 13/16". Length 2⅝". Pin is locked in the connecting rod.
Pin Clearance in Piston—.0001" or push fit.

Connecting Rod:—Weight 30¾ ozs. Length 8⅝".
Crankpin Journal Diameter—2⅛".
Lower Bearing Type—Spun babbitt-lined type.
Clearance—.002". Sideplay .005".
Adjustment—Laminated shims provided. Do not file rods or caps.
Installing Rods—Oil hole in upper side of rod lower bearing must be toward right or away from camshaft on all rods.

Crankshaft:—Five bearing. Lanchester vibration dampener.
Journal Diameter—2⅜" all bearings.
Bearing Type—Interchangeable bronze-backed, babbitt-lined type. No shims.
Clearance—.002".
Adjustment—None (no shims). Replace bearings.
End Thrust—Taken by front bearing. Endplay .006".

Camshaft:—Six bearing. Adjustable chain drive.
Bearing Type—Babbitt-lined type.
Clearance—.0015-.002".
End Thrust—Taken by spring-loaded plunger in camshaft gear and thrust plate on chain case cover.
Timing Chain—Link Belt. Width 1¼". Pitch ½". Length 33⅛" or 67 links.
Chain Adjustment—Chain adjusted by shifting accessory sprocket (water pump bracket). To adjust, loosen two flange mouting screws, back off adjustment set screw lock nut, turn up adjustment set screw until chain hums with engine running, back off screw until chain runs noiselessly, tighten lock nut and mounting screws.
Camshaft Setting—Sprockets are marked. Mesh chain so there are exactly ten links between marks on sprockets or eleven teeth inclusive of teeth meshed opposite marks.

Valves:—	Head Diameter	Stem Diameter	Length
Intake	1⅜"	.341"	4⅞"
Exhaust	1¼"	.341"	4⅞"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.3145"	.001"
Exhaust	45°	.3195"	.001"

Tappet Clearance—.010" all valves—engine hot.

Valve Springs—	Spring Pressure	Length
Valve Closed	50 lbs.	2 3/16"
Valve Open	106 lbs.	1⅞"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 40° ALDC.
Exhaust Valves—Open 40° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .037" past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right hand front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #102, Rod #40.

Lubrication:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—50 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Operates at 40-50 lbs. Located under plug on side of crankcase. Adjustable by adding or removing shims or washers in plug above spring.
Capacity and Oil—7 qts. Use SAE. #50 (summer above 70°F.), #40 (summer 40° to 70°F.), #30 (winter 20° to 40°F.), #20-W (winter 0° to 20°F.).

CLUTCH:—**Long Model 9AB-M.** Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement of clutch pedal should be 1¼". Adjust whenever free movement has decreased to ½". To adjust, turn set screw at lower end of clutch pedal (unscrew to increase free movement).
Clutch Facings—Moulded type, 2 required, 5½" I.D., 9¾" O.D., 9/64" thick.

STEERING:—Front suspension—Conventional 'I' beam section front axle with Reverse-Elliott ends and outboard-mounted semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—2°. Use wedge shims inserted between spring and spring pad on axle to correct caster.
Camber—1°.
Toe In—⅛". Adjust in usual manner by changing length of tie rod.
Steering Gear:—Ross Cam-and-Lever type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for complete adjustment procedure.
Drum Diameter—13".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 26".
Clearance—.006" heel, .012" toe, between lining and drum for each shoe.
Hand Brake:—External type on drum at rear of transmission.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw to give 1/32" clearance betwen lining and drum, lock anchor screw with wire. Adjust brake band bolt nut to give 1/32" clearance for lower half of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/32" clearance (as above) for upper portion of band.
Drum Diameter—6".
Lining—Woven type. Width 2". Thickness 5/32". Length 18 9/16".
Clearance—1/32". See Hand Brake Adjustment (above).

ENGINE NUMBER:—First number—1,030,001 (67, 69), 1,040,001 (75). On plate on right hand side of crankcase.

ENGINE:—Own Make. Eight cylinder, In Line, 'L' head type. Engine is supercharged. Centrifugal type supercharger located between carburetor and manifold (downdraft carburetor is mounted on top of supercharger housing). No special directions required for servicing this engine.
Bore—3¼". **Stroke—4".**
Piston Displacement—265.4 cubic inches.
Rated Horsepower—33.8 A.M.A.
Developed Horsepower—135 (67, 69), 140 (75) at 4000 R.P.M.
Compression Ratio—6.7-1 Std. aluminum head.
Compression Pressure—120 lbs. at cranking speed (60 R.P.M.).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn Bohnalite, aluminum alloy, Invar strut, split skirt type. Length 3 23/32".
Weight—17 ounces. Held to 2 gram variation.
Removal—Pistons and rods removed from below.
Clearance—Skirt .002". See Fitting Pistons.
Fitting New Pistons—Use .002" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 10-16 lbs.
Installing Pistons—Slot should be toward left or camshaft side of engine.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with eight 9/64" oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.010-.015"	.145"
Oil Cont.	3/16"	.007-.015"	.145"

Piston Pin:—Diameter 13/16". Length 2 13/16". Pin is locked in the connecting rod.
Pin Clearance in Piston—.0001" or push fit.

Connecting Rod:—Weight 30¾ ozs. Length 8⅝".
Crankpin Journal Diameter—2⅛".
Lower Bearing Type—Spun-babbitt lined type.
Clearance—.002". Sideplay .005".
Adjustment—Laminated shims provided. Do not file rods or caps.
Installing Rods—Oil hole in upper side of rod lower bearing must be toward right or away from camshaft on all rods.

Crankshaft:—Five bearing. Lanchester vibration dampener.
Journal Diameter—2½" (67, 69), 2⅜" (75) all bearings.
Bearing Type—Interchangeable bronze-backed, babbitt-lined type. No shims.
Clearance—.002".
Adjustment—None (no shims). Replace bearings.
End Thrust—Taken by front bearing. Endplay .006".

Camshaft:—Six bearing. Adjustable chain drive.
Bearing Type—Babbitt-lined type.
Clearance—.0015-.002".
End Thrust—Taken by spring-loaded plunger in camshaft gear and thrust plate on chain case cover.
Timing Chain—Link belt. Width 1½". Pitch ½". Length 34" or 68 links.
NOTE—On first 100 engines, chain length 67 links.
Chain Adjustment—Chain adjusted by shifting accessory sprocket (water pump bracket). To adjust, loosen two flange mounting screws, back off adjutsment setscrew locknut, turn up adjustment setscrew until chain hums with engine running, back off screw until chain runs noiselessly, tighten locknut and mounting screws.
Camshaft Setting—Sprockets are marked. Mesh chain so there are exactly ten links between marks on sprockets ar eleven teeth inclusive of teeth meshed opposite marks.

Valves:—	Head Diam.	Stem Diam.	Length
Intake	1½"	.341"	4⅞"
Exhaust	1⅜"	.341"	4⅞"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.3145"	.001"
Exhaust	45°	.3195"	.001"

Tappet Clearance—.010" all valves—engine hot.

Valve Springs—	Spring Pressure	Length
Valve Closed	50 lbs.	2 3/16"
Valve Open	106 lbs.	1⅞"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 40° ALDC.
Exhaust Valves—Open 40° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston #1 .037" past top dead center when flywheel mark 'EC-1' lines up with pointer in inspection hole in right hand front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

SUPERCHARGER:—Centrifugal type. Carburetor mounted directly on top of case (Supercharger blower between carburetor and engine).
See article in Mechanical Equipment Section for data.

Supercharger Drive:—Through a flexible coupling by an extension of the water pump shaft.
Chain Adjustment—Chain adjusted by shifting accessory sprocket (water pump bracket). To adjust, loosen flange mounting screws, back off adjustment setscrew locknut, turn up adjustment setscrew until chain hums with engine running, back off screw until chain runs noiselessly, tighten locknut and mounting screws. This is the only adjustment necessary for supercharger operation.

Lubrication:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—50 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Operates at 40-45 lbs. Located under plug on side of crankcase. Adjustable by adding or removing shims or washers in plug above spring.
Crankcase Capacity—6 quarts (67, 69), 7 qts. (75).

CLUTCH:—Long Model 9AB-M. Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement of clutch pedal should be 1¼". Adjust whenever free movement has decreased to ½". To adjust, turn setscrew at lower end of clutch pedal (unscrew to increase free movement).
Clutch Facings—Moulded type, 2 required, 5½" I.D., 9¾" O.D., 9/64" thick.

STEERING:—Front Suspension—Conventional 'I' beam section front axle with Reverse-Elliott ends and outboard-mounted semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—1½° (67, 69), 2° (75). Use wedge shims inserted between spring and spring pad on axle to correct caster.
Camber—1½° (67, 69), 1° (75).
Toe In—⅛-3/16". Adjust by loosening clamp bolts at either end of tie rod and turning rod.

Steering Gear:—Ross Model, Cam-and-Lever type.
See article in Mechanical Equipment Section for data.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission. See article in Brake Section for complete adjustment procedure.
Drum Diameter—13".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 27¾" (67, 69), 26" (75).
Clearance—.006" heel, .012" toe, between lining and drum for each shoe.

Hand Brake:—External type on drum at rear of transmission
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw to give 1/32" clearance betwen lining and drum, lock anchor screw with wire. Adjust brake band bolt nut to give 1/32" clearance for lower half of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/32" clearance (as above) for upper portion of band.
Drum Diameter—6".
Lining—Woven type. Width 2". Thickness 5/32". Length 18 9/16".
Clearance—1/32". See Hand Brake Adjustment (above).

ENGINE NUMBER:—First number 305,001 (80, 80A), 320,001 (85). Stamped on plate on right side of engine and on serial number plate.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3". **Stroke**—4".
Displacement—169.6 cubic inches.
Rated Horsepower—21.6 (AMA).
Developed Horsepower—70 at 3500 R.P.M.
Compression Ratio—6.7-1 Std. 7.0-1 Optl.
Compression Pressure—130 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 15-17" with engine idling at 5-7 M.P.H.

PISTONS:—Bohn Bohnalite, aluminum alloy, Invar strut, split skirt type.
NOTE—1937 pistons are plated (bearing metal bearing surface).
Length—3 11/16".
Weight—14 ozs. Held to two gram variation.
Removal—Pistons and rods removed from above.
Clearance—Skirt .002". See Fitting New Pistons.
Replacement Pistons:—Finished replacement pistons furnished 2.997" to 3.006" (in .001" steps), 3.006" to 3.022" (in .002" steps) and 3.030" oversizes.
NOTE—Piston size stamped on head of piston.
Fitting New Pistons:—Use .002" feeler ½" wide inserted between piston and cylinder wall on side opposite slot. Pull required to withdraw feeler should be 10-15 lbs.
Installing New Pistons:—Slot should be toward left or away from valves (on opposite side from head of piston pin clamp screw and oil hole in lower end of rod).

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with eight 9/64" oil drain holes.
NOTE—Oil ring groove depth increased from .161" to .175" on 85, after engine number 320586.

Ring	Width	End Gap
Comp. all	⅛"	.008-.012"
Oil Cont.	3/16"	.008-.012"

NOTE—Side clearance for all rings .0015" min.
NOTE—Oil ring is #X-90 (with inner ring).
Replacement Rings:—Rings furnished standard and .010", .020", .030" oversize (Compression), standard and .020" oversize only (X-90 oil ring).

PISTON PIN:—Diameter 13/16". Length 2⅜".
Pin is locked in connecting rod with clamp screw.
Pin Fit in Piston—.0005" clearance (hand push fit).
Replacement Pins:—Pins furnished standard and .002", .005", .010" oversizes.
NOTE—Pin oiled by four 5/32" oil holes in upper part of piston bosses.

CONNECTING ROD:—Length 7". Bearing caps dowelled on rods and held by capscrews in blind tapped holes.
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Removable steel-backed, cadmium-silver lined type.
Clearance—.002". **Sideplay**—.004-.006".
Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) and toward front (#2, 4, 6). Oil hole in lower bearing upper half must be toward camshaft on all rods.
NOTE—Head of piston pin clamp screw should be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¼" (all bearings).
Bearing Type—Removable steel-backed, cadmium-silver lined.
Clearance—.002".
Bearing Adjustment & Replacement:—*See Graham Special Shop Notes for Main Bearing Servicing.*
End Thrust:—Taken by thrust plate at front (#1) bearing. Adjusted by adding or removing shims. Endplay .004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1⅞"; #2, 1 13/16"; #3, 1¾"; #4, 1¼".
Bearing Type—Bronze.
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
NOTE—Make certain that plunger and spring are in place when installing chain case cover.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 23" or 46 links.
Camshaft Setting:—Sprockets are marked. Mesh chain so there are exactly 9 links between marks on sprockets or 10 pins inclusive of pins meshed opposite marks.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3145"	4 61/64"
Exhaust	1 13/64"	.3135"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.001-.0026"
Exhaust	45°	5/16"	.002-.0036"

Tappet Clearance—.010" all valves. Engine hot.
Valve Guides:—Length 2¾". Finished inside diameter .3164" for all guides. Guides counterbored to .329" for 11/32" at upper end.
Valve Springs:—Free length 1 15/16".

	Spring Pressure	Spring Length
Valve Closed	36 lbs.	1 21/32"
Valve Open	87 lbs.	1 3/8"

Valve Lifters:—Single piece cast-iron, cylindrical type 1" diameter. Lifter guides 1 21/32" long, integral with block. Finished to give .0005-.0015" clearance for lifters.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 4½° BTDC. Close 47½° ALDC.
Exh. Valves—Open 47½° BLDC. Close 4½° ATDC.
To Check Valve Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston .0079" past top dead center when flywheel mark 'EC-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #2.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—40 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Mounted on right hand side of crankcase. Opens at 50 lbs. Adjusted by adding or removing shims or washers above spring within cover plug.
Crankcase Capacity:—5 quarts (refill).

CLUTCH:—Illinois (All '36 and first '37 models). Long Model 9CF-CS (Later '37 models). Single plate, dry disc type. Long clutch is semi-centrifugal type.
See article in Mechanical Equipment Section for data.
Facings (Illinois)—Moulded type, 2 required. Inside Diameter 5⅛". Outside Diameter 7⅞". Thickness ⅛".
Facings (Long)—Woven type, 2 required. Inside Diameter 5¾". Outside Diameter 9". Thickness .125".
Adjustment—Free movement of clutch pedal must be 1¼". To adjust, take out cotter pin at each end of clutch pedal connecting link, turn turnbuckle to secure correct lash, replace cotter pin, tighten turnbuckle locknut.
NOTE—On Illinois clutch when adjustment limit reached, loosen two capscrews in clutch mounting bracket slightly (reached through hand opening in bottom of clutch bell housing), pull out shim under bracket (shim holes are slotted—not necessary to take out capscrews completely), tighten bracket screws. This will provide new range of adjustment on connecting link. Shims can be discarded. New shims of correct thickness are supplied with new driven plate.
Removal:—Remove transmission (see Transmission Section below), remove clutch bell housing, take out clutch bracket mounting bolts (Illinois) or clutch housing mounting screws, turning all screws out evenly to avoid distorting cover (Long).

TRANSMISSION:—Warner Model AS4-TC84C (1937). Helical gear, constant mesh, synchro-mesh (second and high), sliding spur gear (low and reverse).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect drive shaft front and rear universals, hand brake linkage and clutch linkage. Support engine at rear, remove rear engine mounting, take out transmission mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. Needle bearing type, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Spicer. Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.54-1 Std. 4.9-1 Optional.
Backlash—.004-.008". Shim adjustment.
Removal:—Jack up rear of car, remove wheels, disconnect brake line and brake cables, disconnect rear shock absorbers, disconnect drive shaft at rear universal, take off spring bolts at axle housing, disconnect rear spring rear shackles, remove axle assembly.
Wheel Bearing Adjustment—Before No. 315202 (std. ratio), 315529 (optl. ratio)—Jack up car, remove wheel and hub assembly, disconnect brake line, take out bolts and remove oil seal and backing plate. Remove shims between backing plate and axle housing flange until axle shaft clearance at thrust block in differential housing is .002-.007" total.
Adjustment (After No. 315202 or 315529)—No adjustment (New Departure sealed bearings used).

SHOCK ABSORBERS:—Delco. Direct acting, hydraulic type. 1937 (Delco) Model Nos. 1165-L (frt.), 1165-K (rear).
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Ross Model S-14. Cam-and-Lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—4½-5½°. Use wedge shims inserted between spring pad on axle to correct caster.
Camber—1°. Axle can be bent cold for minor corrections.
Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.

BRAKES:—Service—'Graham' Hydraulic, double anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—9".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length 18" per wheel.
Hand Brake:—See Service Brake (above).

ENGINE NUMBER:—First number—205,001 (90), 210,001 (90-A), 105,001 (110). On plate on right side of crankcase and on chassis serial number plate.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3¼". **Stroke**—4" (90-A), 4⅜" (90, 110).
Displacement—199.1 cu. in. (90A), 217.8 cu. in. (90, 110).
Rated Horsepower—25.35 (AMA).
Developed Horsepower—90 (85 @ 3300 R.P.M.), 90-A (80 @ 3300 R.P.M.), 110 (112 @ 4000 R.P.M.).
Compression Ratio—6.7-1 Std. 7.0-1 Optl.
Compression Pressure—130 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 15-17" with engine idling at 5-7 M.P.H.

PISTONS:—Bohn Bohnalite, aluminum alloy, Invar strut, Cam-ground type. Pistons are not slotted.
NOTE—After engine Nos. 207707 (90), 217398 (90A), 110182 (110), silicon alloy pistons used.
Length—3⅝".
Weight—17 ozs. Held to two gram variation.
Removal—Pistons and rods removed from above.
Clearance—Skirt .0025". See Fitting New Pistons.
Replacement Pistons:—Finished replacement pistons furnished in oversizes of 3.247 to 3.252" (in .001" steps), 3.252 to 3.274" (in .002" steps) and 3.277".
NOTE—Piston size stamped on head of piston.
Fitting New Pistons:—Use .0025" feeler ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be 10-15 lbs. at all points in cylinder.

PISTON RINGS:—Two compression (#2 grooved), two oil control rings per piston, all above pin. Lower ring grooves drilled radially with twelve 9/64" oil drain holes.
NOTE—Oil ring groove depth increased from .166" to .171" on aluminum pistons after engine Nos. 207459 (90), 216409 (90A), 109214 (110). Oil ring groove depth .171" for all silicon alloy pistons.

Ring	Width Al. pistons	Width Sil. pistons	End Gap
Comp. (#1)	3/32"	3/32"	.010-.017"
Comp. (#2)	1/8"	3/32"	.010-.017"
Oil (#1)	5/32"	3/16"	.010-.017"
Oil (#2)	5/32"	5/32"	.010-.017"

NOTE—Side clearance for all rings .0015" min.
Replacement Rings:—Furnished in standard and .010", .020", .030" oversizes.
NOTE—Install #2 compression ring with groove down.

PISTON PIN:—Diameter 13/16". Length 2 13/16".
Pin is locked in rod with clamp screw.
Pin Fit in Piston—.0005" clearance (hand push fit).
Replacement Pins:—Pins furnished standard and .002", .005", .010 oversizes.
NOTE—Pin oiled by four 5/32" oil holes in upper part of piston bosses.

CONNECTING ROD:—Length 7". Bearing caps dowelled on rods and held by capscrews in blind tapped holes.
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Removable steel-backed, cadmium-silver-lined type. No shims.
Clearance—.002". Sideplay .004-.006".
Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) and toward front (#2, 4, 6). Oil hole in lower bearing upper half toward camshaft on all rods.
NOTE—Head of piston pin clamp screw should be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¼" (all bearings).
Bearing Type—Removable steel-backed, cadmium-silver-lined type. No shims. **Clearance**—.002".
Bearing Adjustment & Replacement:—*See Graham Special Shop Notes for Main Bearing Servicing.*
End Thrust:—Taken by thrust plate at front (#1) bearing. Adjusted by adding or removing shims. Endplay .004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1⅞"; #2, 1 13/16"; #3, 1¾"; #4, 1¼". **Bearing Type**—Bronze.
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
NOTE—Make certain that plunger and spring are in place when installing chain case cover.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 23" or 46 links.
Camshaft Setting:—Sprockets marked. Mesh chain so that there are nine links between marks on sprockets or ten pins inclusive of pins meshed opposite marks.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3145"	4 61/64"
Exhaust	1 21/64"	.3135"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.001-.0026"
Exhaust	45°	5/16"	.002-.0036"

Tappet Clearance—.010" all valves. Engine hot.
Valve Guides:—Length 2¾". Finished inside diameter .3164" for all guides. Guides counterbored to .329" for 11/32" at upper end.
Valve Springs:—Free length 1 15/16".

	Spring Pressure	Spring Length
Valve Closed	36 lbs.	1 21/32"
Valve Open	87 lbs.	1 3/8"

Valve Lifters:—Single piece cast-iron, cylindrical type 1" diameter. Lifter guides 1 21/32" in length, integral with block. Finished to give .0005-.0015" clearance
Valve Timing:—See Camshaft Setting above.

Models 90 and 110
Intake Valves—Open 4½° BTDC. Close 47½° ALDC.
Exhaust Valves—Open 47½° BLDC. Close 4½° ATDC.

Model 90-A
Intake Valves—Open 2° ATDC. Close 54° ALDC.
Exhaust Valves—Open 41° BLDC. Close 11° ATDC.
To Check Valve Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston .0088" past top dead center (90 & 110) and .0472" past top dead center (90-A) when flywheel mark 'EC-1' lines up with indicator in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #2.

SUPERCHARGER:—Model 110 only. Centrifugal type supercharger located between carburetor and manifold (carburetor mounted on Supercharger).
See article in Mechanical Equipment Section for data.
Supercharger Drive:—Separate chain taken from crankshaft sprocket at front of engine.
Supercharger Drive Chain—Link-Belt. Width 1½". Pitch ⅜". Length 27¾" or 74 links.
Chain Adjustment—Chain adjusted by shifting supercharger drive sprocket. To adjust, loosen flange mounting screws, back off adjustment setscrew locknut, turn up adjustment setscrew until chain hums with engine running, back off screw until chain runs noiselessly, tighten locknut and mounting screws. This is the only adjustment necessary for supercharger operation.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure:—50 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Located on right hand side of crankcase under plug. Maintains pressure in crankcase at 50 lbs. Adjustable by adding or removing shims or washers in plug above spring.
Crankcase Capacity:—5 quarts (refill).

CLUTCH:—Illinois. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 5½". Outside Diam. 8⅞". Thickness ⅛".
NOTE—Long 9CF-CS driven member used on 90, 110 starting with engine number 207437 (90), 109174 (110). Furnished for replacement on 90, 90-A, 110 after May 15, 1936.
Adjustment:—Free movement of clutch pedal must be 1-1¼". To adjust, loosen locknut on left hand end of clutch pedal shaft at pedal, shift pedal on shaft (pedal threaded on shaft), tighten locknut.
NOTE—For all car models equipped with Illinois clutch, when the limit of the Clutch adjustment is reached, loosen two capscrews in clutch mounting bracket slightly (reached through hand opening in bottom of clutch bell housing), pull out shim under bracket (shim holes are slotted—not necessary to take out capscrews completely), tighten bracket screws. This will provide new range of adjustment on connecting link. Shims can be discarded. New shims of correct thickness are supplied with new driven plate.
Removal—Disconnect clutch linkage, drop driveshaft, remove transmission supporting engine at rear of oil pan, remove clutch bell housing, take out two bolts in clutch mounting bracket, remove clutch assembly.

STEERING—Steering Gear. Ross Model 540 (90 & 110) Cam-and-Roller type. Ross Model 140 (90-A) Cam-and-Lever type. See article in Steering Section for adjustments.
Front Suspensions:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—2½°. Use wedge shims inserted between spring and spring pad on axle to correct caster.
Camber—1°. No adjustment.
Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission (90 & 110), rear wheel service brakes (90-A).
See article in Mechanical Equipment Section for data.
Drum Diameter—11" (90 & 110), 9" (90-A).
Lining—Moulded type. Width 1¾". Thickness ¼" (90 & 110), .200" (90-A). Length per wheel 23" (90 & 110), 18" (90-A).
Clearance—.006" heel, .010" toe, for each shoe (90 & 110); .008" between lining and drum (90-A).
Hand Brake:—External type on drums at rear of transmission (90 & 110).
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw to give 1/32" clearance between lining and drum, lock the anchor screw with wire. Adjust guide bolt nut to give 1/32" clearance for lower half of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/32" clearance (as above) for upper portion of band.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 17¾".
NOTE—Hand Brake data above for Models 90 & 110 only. See Service Brake (above) for Model 90-A Hand Brake.

NOTE:—Engines on these models are similar except that Supercharger used on Model 116 with increased power output.

ENGINE NUMBER:—First number 220,000 (95), 135,000 (116). Stamped on plate on right side of crankcase and on chassis serial number plate.

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head
Bore—3¼". **Stroke**—4".
Displacement—199.1 cubic inches.
Rated Horsepower—25.35 (AMA).
Developed Horsepower—(95) 85 at 3300 R.P.M., (116) 106 at 4000 R.P.M.
Compression Ratio—6.7-1 Std. 7.0-1 Optl.
Compression Pressure—130 lbs. at cranking speed.
Vacuum Reading—15-17" steady at 5-7 M.P.H.

PISTONS:—Bohn, Autothermic, Silicon alloy, cam ground, plated type with special cylinder wall lubrication system. *See Graham Special Shop Notes.*
Weight—17 ozs. **Length**—3⅝".
Removal—Pistons and rods removed from above.
Clearance—Top .024-.030". Skirt .0025". See Fitting New Pistons.
Replacement Pistons:—Finished pistons (with pins) furnished in oversizes of 3.247-3.252" (in .001" steps), 3.252-3.274" (in .002" steps), and 3.277".
NOTE—Piston size stamped on head of piston.
Fitting New Pistons:—Pull required to withdraw .0025" feeler ½" wide from between piston and cylinder wall at right angles to pin must be within 10-15 lbs. at all points in cylinder.
Installing Pistons:—Vent hole in oil groove in skirt should be away from camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Compression	3/32"	.007-.017"
Oil (upper)	3/16"	.007-.017"
Oil (lower)	5/32"	.007-.017"

NOTE—Side clearance for all rings .0015" min.
Replacement Rings & Installation Directions:—*See Graham Special Shop Notes for data.*

PISTON PIN:—**Diameter** 13/16". **Length** 2 13/16" Pin locked in rod by clampscrew. Pin holes in piston oiled by four 5/32" oil holes. Pins furnished standard and .002", .005", .010" oversize.
Pin Fit in Piston—.0005" clearance (hand push fit).

CONNECTING ROD:—**Length** 7". Bearing caps dowelled on rods and held by capscrews in blind tapped holes.
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Removable steel-backed, cadmium-silver lined type. Bearings not grooved.
Clearance—.002". **Sideplay**—.004-.006".
Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.
Installing Rods:—Lower bearings offset. Install rod with widest half of bearing toward rear (#1, 3, 5) and toward front (#2, 4, 6). No oil holes used.
NOTE—Head of piston pin clamp screw should be toward camshaft on all rods.

CRANKSHAFT:—Four bearing. Integral counterweights. Lanchester type vibration dampener at front.
Journal Diameters—2¼" all bearings.
Bearing Type—Removable steel-backed, cadmium-silver-lined type. No shims. **Clearance**—.002".
Bearing Adjustment & Replacement:—*See Graham Special Shop Notes for Main Bearing Servicing.*
End Thrust:—Taken by #1 front bearing. Endplay .004-.006". Adjusted by shims furnished .002", .008", .036" thick.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1⅞", #2 1 13/16", #3, 1¾", #4, 1¼". **Bearing Type**—Bronze bushings.
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
NOTE—Make certain that plunger and spring are in place when installing chain case cover.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 23" or 46 links.
Camshaft Setting:—Sprockets are marked. Mesh chain so that there are nine links between marks on sprockets or ten pins inclusive of pins meshed opposite marks.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3145"	4 61/64"
Exhaust	1 21/64"	.3135"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.001-.0026"
Exhaust	45°	5/16"	.002-.0036"

NOTE—Exh. valve stem diameter increased to .3407" after engine nos. 221394 (95), 136292 (116).
Tappet Clearance:—.010" all valves, engine hot.
Valve Guides:—Length 2¾". Finished inside diameter .3164" for all guides. Guides counterbored to .329" for 11/32" at upper end.
NOTE—Counterbore increased to .356" and exhaust guide inside diam. increased to .3435" after engine nos. 221394 (95), 136292 (116).
Valve Springs:—Free length 1 15/16".

	Spring Pressure	Spring Length
Valve Closed	36 lbs.	1 21/32"
Valve Open	87 lbs.	1 3/8"

Valve Lifters:—Cylindrical type. Diameter 1". Operate in guide holes 1 21/32" long finished directly in block. Pressure lubricated. Lifter groove meters oil for piston and cylinder wall lubrication.
Lifter Clearance in Guide—.0005-.0015".
Valve Timing:—See Camshaft Setting above.
Model 95
Intake Valves—Open 2° ATDC. Close 54° ALDC.
Exhaust Valves—Open 41° BLDC. Close 11° ATDC.
Model 116
Intake Valves—Open 4½° BTDC. Close 47½° ALDC.
Exh. Valves—Open 47½° BLDC. Close 4½° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with #1 piston 11° or .0472" (95) and 4½° or .0079" (116) after top dead center when flywheel mark 'EC-1' lines up with indicator under cover in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #2.

SUPERCHARGER:—Model 116 only. All data same as for Model 120 (see next page).
See article in Mechanical Equipment Section for data.

LUBRICATION:—Pressure system. Gear type oil pump located in crankcase.
Normal Oil Pressure—40 lbs. at 30 M.P.H.
Oil Pressure Regulator—Located on right side of crankcase. Opens at 50 lbs. (overflow lubricates timing chain). Adjustable by adding or removing shims above spring within cover plug.
Oil Pressure Gauge—King-Seeley Electric type. K-S No. 6090 (all except Cabriolet), 6610 (Cabriolet) dash unit, No. 6125 (engine unit).
NOTE—Dash unit an assembly with gasoline gauge.
See article in Mechanical Equipment Section for data.
Crankcase Capacity—5 qts.

CLUTCH:—**Long Model 9CF-CS.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 5¾". O.D. 9". Thickness .125".
Adjustment:—Free movement of clutch pedal must be 1¼". To adjust, loosen locknut on left hand end of clutch pedal shaft at pedal, shift clutch pedal on shaft (shaft threaded), tighten locknut.
Removal:—Remove Transmission (see Transmission Section below), remove clutch bell housing, take out clutch housing mounting screws in flywheel, turn screws out evenly to avoid distorting cover.

TRANSMISSION:—**Warner**—Model AS4-T84C (Std. (95). Model AS12-T86 (Std. 116). Overdrive Transmission Model AS30-T86 (Optl. 95, 116). Helical gear, constant mesh, synchro-mesh (second and high), sliding helical gear (low and reverse) except for Std. 95 model which has sliding spur gear (low and reverse).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake and clutch linkage. Drop driveshaft, support engine at rear, remove transmission mounting bolts, remove rear engine mounting, pull unit back and remove.

UNIVERSAL JOINT:—**Detroit-Universal Series 4200.** Ball and trunnion type with roller bearings. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer**—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.45-1 (95), 4.27-1 (116). 4.7-1 (std. with overdrive).
Backlash—.004-.008". Shim adjustment.
Removal:—Hoist rear of car, disconnect rear universal, brake line at housing, shock absorbers, remove spring U-bolts, disconnect rear spring shackles and withdraw assembly. Bleed brake lines when installing assembly.
Wheel Bearing Adjustment—None (sealed bearings).

SHOCK ABSORBERS:—**Delco**—Model 1166-K (front and rear). Two way direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Ross Model S-14 (95) Cam-and-Lever type. Model T-14 (116) Cam-and-Twin Lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Spicer, conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—4-4½° (95). 3-4° (116). Adjusted by inserting wedge shims between spring and pad on axle.
Camber—1°. No adjustment.
Toe In—⅛-3/16". Adjusted in usual manner by changing length of tie rod.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies independent brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Drum Diameter—9" (95), 11" (116).
Lining—Moulded type. Width 1¾". Thickness 3/16" (95), ¼" (116). Length per wheel 18" (95), 23" (116).
Clearance—.006" heel, .010" toe, for each shoe.
Hand Brake:—External type on drum at rear of transmission.
Adjustment—With hand lever in released position, remove anchor screw locking wire, turn anchor screw to give 1/32" clearance between lining and drum, lock anchor screw with wire. Back off brake adjusting bolt nut (at top), loosen locknut on guide bolt and adjust to give 1/32" clearance for lower portion of band, tighten locknut, finally turn adjusting bolt nut to 1/32" clearance for upper portion of band (tension on guide bolt should just be relieved).
Drum Diameter—6" (all models).
Lining—**Width 2". Thickness 5/32". Length 17¾".**

ENGINE NUMBER:—First number 115,000. Stamped on plate on right side of crankcase and on serial number plate on floor inside right hand door.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cubic inches.
Rated Horsepower—25.35 (AMA).
Developed Horsepower—116 at 4000 R.P.M.
Compression Ratio—6.7-1 Std. 7.0-1 Optl.
Compression Pressure—130 lbs. at cranking speed.
Vacuum Reading—15-17" steady reading at 5-7 MPH.

PISTONS:—Bohn, Autothermic, Silicon alloy, cam ground, plated type with special cylinder wall lubrication system. *See Graham Special Shop Notes.*
Weight—17 ozs. **Length**—3⅝".
Removal—Pistons and rods removed from above.
Clearance—Top .024-.030". Skirt .0025". See Fitting New Pistons.

Replacement Pistons:—Finished pistons (with pins) furnished in oversizes of 3.247-3.252" (in .001" steps), 3.252-3.274" (in .002" steps), and 3.277".
NOTE—Piston size stamped on head of piston.

Fitting New Pistons:—Pull required to withdraw .0025" feeler ½" wide from between piston and cylinder wall at right angles to pin must be within 10-15 lbs.

Installing Pistons:—Vent hole in oil groove in skirt should be away from camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Compression	3/32"	.007-.017"
Oil (upper)	3/16"	.007-.017"
Oil (lower)	5/32"	.007-.017"

NOTE—Side clearance for all rings .0015" min.

Replacement Rings & Installation Directions:—*See Graham Special Shop Notes for data.*

PISTON PIN:—**Diameter 13/16". Length 2 13/16".** Pin locked in rod by clampscrew. Pin holes in piston oiled by four 5/32" oil holes. Pins furnished standard and .002", .005", .010" oversize.
Pin Fit in Piston—.0005" clearance (hand push fit).

CONNECTING ROD:—**Length 7".** Bearing caps dowelled on rods and held by capscrews in blind tapped holes.
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Removable steel-backed, cadmium-silver lined type. Bearings not grooved.
Clearance—.002". **Sideplay**—.004-.006".

Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.

Installing Rods:—Lower bearings offset. Install rod with widest half of bearing toward rear (#1, 3, 5) and toward front (#2, 4, 6). No oil holes used.
NOTE—Head of piston pin clamp screw should be toward camshaft on all rods.

CRANKSHAFT:—Four bearing. Integral counterweights. Lanchester type vibration dampener at front.
Journal Diameters—2¼" all bearings.
Bearing Type—Removable steel-backed, cadmium-silver-lined type. No shims.
Clearance—.002".

Bearing Adjustment & Replacement:—*See Graham Special Shop Notes for Main Bearing Servicing.*

End Thrust:—Taken by #1 front bearing. Endplay .004-.006". Adjusted by shims furnished .002", .008", .036" thick.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1⅞", #2, 1 13/16", #3, 1¾", #4, 1¼".
Bearing Type—Bronze bushings.

End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
NOTE—Make certain that plunger and spring are in place when installing chain case cover.

Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 23" or 46 links.

Camshaft setting:—Sprockets are marked. Mesh chain so that there are nine links between marks on sprockets or ten pins inclusive of pins meshed opposite marks.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3145"	4 61/64"
Exhaust	1 21/64"	.3135"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.001-.0026"
Exhaust	45°	5/16"	.002-.0036"

NOTE—Exhaust valve stem diameter increased to .3704" after engine number 115726.

Tappet Clearance:—.010" all valves, engine hot.

Valve Guides:—Length 2¾". Finished inside diameter .3164" for all guides. Guides counterbored to .329" for 11/32" at upper end.
NOTE—Counterbore increased to .356" and exhaust guide inside diam. increased to .3435" after engine number 115726.

Valve Springs:—Free length 1 15/16".

	Spring Pressure	Spring Length
Valve Closed	36 lbs.	1 21/32"
Valve Open	87 lbs.	1 3/8"

Valve Lifters:—Cylindrical type. Diameter 1". Operate in guide holes 1 21/32" long finished directly in block. Pressure lubricated. Lifter groove meters oil for piston and cylinder wall lubrication.
Lifter Clearance in Guide—.0005-.0015".

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 4½° BTDC. Close 47½° ALDC.
Exhaust Valves—Open 47½° BLDC. Close 4½° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .012". This valve should close with piston 4½° or .0088" past top dead center when flywheel mark 'EC-1' lines up with indicator under cover in right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #2.

SUPERCHARGER:—**Model 120 & 116.** Centrifugal type supercharger (design unchanged) located between carburetor and manifold (downdraft carburetor is mounted on top of supercharger).
See article in Mechanical Equipment Section for data.
Supercharger Removal & Drive Data:—*See Graham Special Shop Notes for data.*

LUBRICATION:—Pressure system. Gear type oil pump located in crankcase.
Normal Oil Pressure—40 lbs. at 30 M.P.H.
Oil Pressure Regulator—Located on right side of crankcase. Opens at 50 lbs. (overflow lubricates timing chain). Adjustable by adding or removing shims above spring within cover plug.
Oil Pressure Gauge—King-Seeley Electric type, K-S No. 6090 (all except Cabriolet), 6610 (Cabriolet) dash unit, No. 6125 (engine unit).
NOTE—Dash unit an assembly with gasoline gauge.
See article in Mechanical Equipment Section for data.
Crankcase Capacity—5 qts.

CLUTCH:—**Long Model 9CF-CS. Semi-centrifugal, single plate, dry disc type.**
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 5¾". O.D. 9". Thickness .125".

Adjustment:—Free movement of clutch pedal must be 1¼". To adjust, loosen locknut on left hand end of clutch pedal shaft at pedal, shift clutch pedal on shaft (pedal threaded on shaft), tighten locknut.

Removal:—Remove Transmission (see Transmission Section below), remove clutch bell housing, take out clutch housing mounting screws in flywheel, turning all screws out evenly to avoid distorting cover.

TRANSMISSION:—**Warner Model AS12-T86 Std., AS30-T86 (with Overdrive) Optional.** Helical gear, constant mesh, synchro-mesh (second and high), sliding helical gear (low and reverse).
See article in Mechanical Equipment Section for data.

Removal:—Disconnect hand brake and clutch linkage. Drop driveshaft, support engine at rear, remove transmission mounting bolts, remove rear engine mounting, pull unit back and remove.

UNIVERSAL JOINT:—**Detroit-Universal Series 4200.** Ball and trunnion type with roller bearings. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer**—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.27-1 Std., 4.7-1 (Mountain Ratio) Std. on cars with overdrive.
Backlash—.004-.008". Shim adjustment.

Removal:—Hoist rear of car, disconnect rear universal, brake line at housing, shock absorbers, remove spring U-bolts, disconnect rear spring shackles and withdraw assembly. Bleed brake lines when installing assembly.
Wheel Bearing Adjustment—None (sealed bearings).

SHOCK ABSORBERS:—**Delco**—Model 1166-K (front and rear). Two way direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Ross model T-14, Cam-and-Twin-Lever type.
See article in Mechanical Equipment Section for data.

Front Suspension:—Spicer, conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—3-4°. Adjusted by inserting wedge shims between spring and spring pad on axle.
Camber—1°.
Toe In—⅛-3/16". Adjust in usual manner by changing length of tie rod.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies independent brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 23".
Clearance—.006" heel, .010" toe, for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—With hand lever in released position, remove anchor screw locking wire, turn anchor screw to give 1/32" clearance between lining and drum, lock anchor screw with wire. Back off brake adjusting bolt nut (at top), loosen locknut on guide bolt and adjust to give 1/32" clearance for lower portion of band, tighten locknut, finally turn adjusting bolt nut to 1/32" clearance for upper portion of band (tension on guide bolt should just be relieved).
Drum Diameter—6" (all models).
Lining—Width 2". Thickness 5/32". Length 17¾".

SERIAL NUMBER:—Stamped on plate on floor inside right rear door (Sedans), on seat frame (Coupe).

	Serial Number		Engine Number	
	1938	1939	1938	1939
96	225,000	600,001	230,000	610,001
97	140,000	500,001	145,000	510,001

ENGINE NUMBER:—Stamped on plate on right side of crankcase and on Serial No. Plate (see above).

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head. Engines same for both models except that Supercharger installed on Model 97 engine only.
Bore—3¼". **Stroke** 4⅜". **Displacement** 217.8 cu. ins.
Rated Horsepower—25.35 A.M.A.
Developed Horsepower—(96) 90 at 3600 R.P.M., (97) 116 at 4000 R.P.M. with standard 6.7-1 head.
Compression Ratio—6.7-1 Al. head Std. 96 '38, 97 '38-39, Optl. 96 '39. 6.4-1, 6.6-1 Cast iron head Std. 96 '39. 7.25-1 Optl. 96, 97 '38.
Compression Pressure—120 lbs. (6.4-1, 6.6-1 hd), 130 lbs. (6.7-1 hd). at cranking speed.
Vacuum Reading—15-17" idling at 5-7 M.P.H.

PISTONS:—Bohn autothermic, aluminum alloy, cam ground, plated type with special cylinder wall lubrication system. *See Graham Shop Notes for data.*
Weight—14⅛ ozs. (stripped). **Length**—3⅝".
Removal—Pistons and rods removed from above.
Clearance—Top .024". Skirt .0025".
Replacement Pistons:—Finished pistons (with pins fitted) furnished in oversizes of 3.247" to 3.252" (in .001" steps), 3.252" to 3.274" (in .002" steps) and 3.277". NOTE—Piston size stamped on head.
Fitting New Pistons:—Use .0025" feeler ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be 10-15 lbs. at all points in cylinder.
Installing Pistons:—Install pistons with four vertical grooves on skirt toward camshaft (right side).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr.	3/32"	.007-.015"	.0015" Min.
Oil Cont.	5/32"	.007-.015"	.0015" Min.

Replacement Rings & Installation Directions:—*See Graham Shop Notes for complete data.*

PISTON PIN:—**Diameter** 13/16". **Length** 2 13/16". Pin locked in rod by clampscrew.
Pin Fit in Piston—.0005" clearance (hand push fit).
Replacement Pins:—Furnished Std. and .002", .005", .010" oversize (new pistons have fitted pins).

CONNECTING ROD:—Length 7". Bearing caps dowelled on rods and held by capscrews in blind tapped holes
Crankpin Journal Diameters—2 1/16".
Lower Bearing—Removable steel-backed, cadmium-silver-lined type (not grooved, no oil spray hole). **Clearance**—.002". **Sideplay**—.004-.006".
Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.
Installing Rods:—Lower Bearings offset. Install rod with widest half of bearing toward rear (#1, 3, 5), toward front (#2, 4, 6). Head of piston pin clampscrew should be toward camshaft on all rods.

CRANKSHAFT:—4 bearing, integral counterweights with Lanchester type Vibration dampener.
Journal Diameters—2⅜" all bearings.
Bearing Type (Front)—Cadmium-silver lined bushing inserted in hole in crankcase from forward end with bushing flange doweled to crankcase.
Bearing Type (Others)—Conventional removable steel-backed, cadmium-silver lined type.
Clearance (All Bearings)—.002".
Bearing Adjustment & Replacement:—*See Graham Shop Notes for Crankshaft Bearing data.*
End Thrust:—Taken by front bearing. Adjusted by adding or removing shims furnished .002", .008" thick. **Endplay**—.004-.006".

CAMSHAFT:—4 Bearing. Non-adjustable Chain Drive.
Journal Diameters—#1, 1⅞"; #2, 1 13/16"; #3, 1¾"; #4, 1¼". **Bearing Type**—Bronze bushings.
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
Timing Chain:—Link-Belt No. 336. Width 1". Pitch .500". Length 23" or 46 links.
Camshaft Setting:—Sprockets are marked. With #1 and #6 pistons on top dead center and marks on both sprockets on upper left side, mesh chain so there are exactly 9 links or 10 pins (inclusive of pins meshed opposite marks) between marks.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3145"	4 61/64"
Exhaust	1 21/64"	.3407"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.001-.0026"
Exhaust	45°	5/16"	.002-.0035"

Tappet Clearance:—.010" all valves, engine hot.
Valve Guides:—Length 2¾". Finished inside diameter .3164" Int., .3435" Exh. All guides counterbored to .356" for 11/32" at upper end.
Valve Springs:—Free length 1 15/16" ('38), 2" ('39).

	1938—Pressure—1939	Spring Length
Valve Closed	36 lbs.	42-46 lbs.	1 21/32"
Valve Open	87 lbs.	89-97 lbs.	1⅜"

Valve Lifters:—Cylindrical type. Diameter 1". Operate in guide holes 1 21/32" long finished in block. **Lifter Clearance in Guide**—.0005-.0015".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 4½° BTDC. Close 47½° ALDC.
Exhaust Valves—Open 47½° BLDC. Close 4½° ATDC.
To Check Timing—Set tappet clearance #6 exhaust valve at .012". This valve should close when flywheel mark 'EC-1' lines up with indicator under cover on right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

SUPERCHARGER:—**Model 97 only.** Centrifugal type. Carburetor mounted directly on top of case (Supercharger blower between carburetor and engine).
See article in Mechanical Equipment Section for data.
Supercharger Removal & Drive Data:—*See Graham Special Shop Notes for complete data.*

LUBRICATION:—Pressure system. Gear type oil pump located in crankcase.
Normal Oil Pressure:—45 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Located on right side of crankcase at rear of engine number plate. Opens at 50 lbs. Adjusted by adding or removing washers between spring and plunger.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6926 dash unit (96 '38-39, 97 '38), 7480 dash unit (97 '39). 6125 Engine Unit. NOTE—6926 stamped 'O'.
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—14 qts. (96), 15 (97).
Water Pump:—Packless type, sealed ball bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts, and remove fan and pump as an assembly.
Thermostat:—Fulton ('38), Detroit Lubricator ('39). **Setting**—Starts to open 140-145° ('38), 150° ('39). Optl. thermostat (for heaters) opens at 165-170°.
Temperature Gauge:—King-Seeley Electric. K-S No. Dash Units—6923 ('38), 7490 (96 '39), 7465 (97 '39), Tank Units—5700 ('38), 7000 ('39), NOTE—7490 stamped 'W'.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Long Model 9½CF-CS.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Chevron or Spiral wound Moulded type, 2 required. I.D. 6". O.D. 9½". Thickness .125".
Adjustment—Free movement of clutch pedal must be about 1¼". To adjust, loosen lock nut above pivot block at pedal, turn adjusting nut below pivot block on connector rod until proper clearance obtained.
Removal:—Remove Transmission (See Transmission below), take off clutch housing underpan, take out clutch mounting screws in cover flange (turning all screws out evenly, remove clutch from below.

TRANSMISSION:—**Warner.** Horizontal type (shift lever and cover on side of case). All helical gear type.
See article in Mechanical Equipment Section for data.
Overdrive Transmission:—Warner (1938-39), Model AS9-T88 with electrical 'kick-down' control (later 1939 cars).
Transmission Control:—Evans-Graham vacuum type (1938), Own remote control (1939).
See articles in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake and clutch linkage, disconnect propeller shaft at front universal, support engine at rear, remove rear engine mounting cross-member, take out transmission mounting bolts, pull transmission straight back and remove. NOTE—On cars with remote gear shift, disconnect shifter rods at side of transmission case.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200.** Ball-and-trunnion type with roller bearings, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer Model 41-2.** Semi-floating, Hypoid Gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.27-1 Std., 4.55-1 Optl.
Backlash—.004-.008" Shim adjustment.
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, brake line, and shock absorbers, remove spring U-bolts, disconnect rear spring shackles, withdraw axle assembly.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, and drum assembly. Remove shims. **Endplay** .002-.007".

SHOCK ABSORBERS:—**Delco.** Front—B1161-K ('38), 1112-J ('39), Rear—B1163-P ('38), 1120-N ('39). Direct acting, hydraulic type. NOTE—Models 1737-C, D & 1721-J, K double acting type used for Export.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Ross Model T-14, Cam-and-Twin lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Spicer, conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—3-4°. Adjusted by inserting wedge shims between spring and spring pad on axle.
Camber—1°.
Toe In—⅛". Adjust in usual manner by changing length of tie rod.

BRAKES:—**Service**—'Graham-Lockheed' hydraulic type. Hand lever applies independent shaft brake.
See article in Mechanical Equipment Section for data.
Drum—11". Centrifuse.
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 23".
Clearance—.006" heel, .010" toe, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Graham Shop Notes for data.*
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 9/16".

1938 MODELS

ENGINE HOOD AND SIDE PANELS:—**'112' only**—Hood hinged at front. Secured by handle on each side panel. To raise, turn one handle (handles interconnected), grasp hood along edge and lift forward until self-locking hinge support locks hood in raised position. Hinge support released by raising hood slightly and pushing lower half to rear.

Side Panels—When removing panels, free hood handle from tie rod at clamp bolt on one panel, remove other panel with handle and tie rod attached as an assembly.

1939 MODELS

ENGINE HOOD (BONNET) LOCK:—Hood hinged at front and secured by lock handle in driver's compartment on lower edge of instrument panel to left of steering column (operates rod on engine side of dash which engages each side of hood). To unlock hood, push down on handle. Hood can then be raised by lifting on either side at rear (press support hinge forward before releasing hood).

Hood and Support Removal—Remove front bumper. Raise hood, take out 3 cap screws and tapping plate at front hood hinge, hood support upper pin springs, pins and washers, freeing hood. Remove cotter pins and washers at ends of support lower rod, unhook springs freeing hood support.

Hood Alignment—Check alignment at cowl, side panels, and at name plate. To align, raise hood, loosen 3 cap screws at front hinge, shift hood at front end until aligned, raise hood, tighten screws.

Side Panel Removal (91, 92, 93, 95, 97)—Raise hood, remove 3 bolts at shell extension and 1 capscrew at cowl. Remove 1 capscrew attaching fender to front lower frame bonnet side panel (accessible through hole in top of radiator shell after removing horn). Loosen but do not remove capscrews on lower edge of panel (holes in panel slotted). Lift panel out. CAUTION—On cars equipped with bonnet side panel lamps, pull sockets out.

Side Panel Removal (90 & 98)—Raise hood, remove bolts at radiator shell and along lower edge. Take out screw at cowl and lift panel out.

Right Front Fender Dust Shield Removal (91, 92, 93, 95, 97)—For work on right side of engine (valves, etc.) remove shield as follows: Raise hood, remove 4 capscrews along top edge of shield (in engine compartment), 4 capscrews along front edge at radiator shell, and 3 capscrews along frame side member. Jack up front end of car and remove right front wheel. Take off fender stone guard at fender and dust shield. Pull out lower edge and remove.

Right Front Fender Dust Shield Removal (90 & 98)—Remove as follows: Raise hood, remove bolts at hood side panel, radiator shell and frame side member (in engine compartment). Jack up front end of car and remove right front wheel. Remove capscrews at fender and one dust shield fender brace bolt. Pull out lower edge of shield and remove.

1939 MODELS

RADIATOR CORE REMOVAL:—Remove bonnet and support (see *Hood and Support Removal*). Drain cooling system. Remove shell* extension-to-side panel bolts and spacers (except 90, 98) and radiator hoses. Take out shell-to-core bolts. Remove water pump, fan belt, front engine splash guard and 2 radiator anchor bolt nuts. Lift out radiator core. IMPORTANT—When reassembling, reverse procedure listed above. **Install water pump after core installed.**

1939 MODELS

ENGINE ASSEMBLY REMOVAL:—All engines can be removed as follows: Remove bonnet (see Hood and Support Removal) and radiator (see Radiator Core Removal). Disconnect generator, starter, temperature gauge and oil check valve wires. Remove wire harness along left side of engine, spark plug cables (with brackets) and distributor cap. Disconnect flexible fuel pump feed line and remove fuel line to carburetor. Disconnect throttle linkage and choke wire (if used). Remove accelerator cross shaft, carburetor and air cleaner. Disconnect exhaust pipe. Remove front motor support bolts, flywheel guard, accelerator pedal, floor mat, transmission hole cover, clutch housing-to-engine support bolts, engine ground strap and exhaust pipe bracket at rear engine support. Hoist engine out of car (move engine forward carefully to disconnect from transmission mainshaft). Finally, remove distributor, generator, fuel pump and clutch.

Installation—Reverse procedure listed above and note following points. Wrap a piece of soft wire around clutch throwout bearing oil seal with ends of wire extending up through clutch housing, lower engine in place (use care not to damage clutch driving plate assembly when engaging transmission mainshaft), pull wire out (this will prevent edge of seal from being curled by clutch cover). Install starter after engine in place.

1939 MODELS

CRANKSHAFT SIZE CODE:—Cars equipped with .010" undersize main bearing pins and connecting rods pins identified by marks stamped on left front corner of cylinder block on bottom face beside oil reservoir gasket (visible without removing oil reservoir) as follows:

MU—.010" undersize main bearing pins.
PU—.010" undersize connecting rod pins.
PMU—.010" undersize main and connecting rod pins.
NOTE—These pins require .010" undersize bearings.

1935-39 MODELS

ORIGINAL BORE SIZE:—Original production (new engine) bore size indicated by code mark stamped on lower edge of valve chamber opposite cylinders. See table below for size and code marks.

Code Mark	Cylinder Diameter	Code Mark	Cylinder Diameter
A	3.000"	AO	3.010"
B	3.0005"	BO	3.0105"
C	3.001"	CO	3.011"
D	3.0015"	DO	3.0115"
E	3.002"	EO	3.012"

Note—Recondition cylinders to size for which replacement pistons and rings available (see below).

1935-39 MODELS

REPLACEMENT PISTONS:—Standard and oversize pistons marked by letter stamped on head and furnished for **cylinder diameter sizes** listed below. See table following for piston rings.

Piston Mark	Cylinder Diameter	Piston Mark	Cylinder Diameter
B	3.000" & 3.0005"	BO	3.010" & 3.0105"
D	3.001" & 3.0015"	DO	3.011" & 3.0115"
F	3.002" & 3.0025"	FO	3.012" & 3.0125"
J	3.004"	LO	3.015"
L	3.005"	BB	3.020"
		DD	3.021"
		FF	3.022"

Piston Mark	Piston Size	Piston Mark	Piston Size
B	2.9985"	DO	3.0095"
D	2.9995"	FO	3.0105"
F	3.0005"	LO	3.0135"
J	3.0025"	BB	3.0185"
L	3.0035"	DD	3.0195"
BO	3.0085"	FF	3.0205"

Piston Weight—Stamped on piston head in ounces and ¼ ozs. Pistons in one block same weight.

1939 MODELS

PISTON RINGS:—**Compression.** 'Granoseal' treated rings used starting with car number 25000. This treatment gives hardened wearing surface and longer ring life. Rings have a dark coating and may be used on earlier cars.

Oil Ring Change—Lower oil ring (below pin) changed during production as follows: Ring width reduced to 5/32" starting with following car numbers: (90) 24626, (91) all cars, (92) 24903, (93) 24896, (95 & 97) 28659, (98) 24502. NOTE—Top oil ring width unchanged (3/16").

1935-39 MODELS

REPLACEMENT RINGS:—Use standard or oversize rings for replacement pistons listed above. Ring size and pistons for which each ring size applies listed in table below.

Ring Size	Piston Mark	Ring Size	Piston Mark
3.000"	B, D, F	3.010"	BO, DO, FO
3.003"	J	3.015"	LO
3.005"	L	3.020"	BB, DD, FF

Note—If rings filed, keep clearance at pin uniform with end gap (.005" minimum).

1938-39 MODELS

CONNECTING ROD CHANGE:—On 1938 engines starting with following car numbers: (80 and 88) 54885, (81) 53909, (82) 54165, (83) 54382, (84, 85, 87) 54616 and all 1939 engines (except early '112' which started with car number 901625) new rods used. These connecting rods are drop forged steel with thinner (.015" thick) large end bearings ('Bermax' alloy). Thrust now taken by sides of rod (formerly by bearing flanges). These rods may be used for replacement on earlier cars either singly or in sets. IMPORTANT—**Do not file rods or caps.** If bearing clearance excessive, replace rods. No shims used.

1938-39 MODELS

CONNECTING ROD PALNUTS:—Palnut (locknut) used in place of cotter pin for locking connecting rod bolt nut. Consists of single thread tempered steel nut with turned up edges.

Installation—After tightening connecting rod bolt nuts to 630 in. lbs. with tension wrench, install palnut (smooth face to nut), turn palnut on bolt with fingers until tight, then lock in place by turning with wrench an additional ¼-⅓ turn. NOTE—Manufacturer recommends use of new palnuts.

1934-39 MODELS

CRANKSHAFT REMOVAL:—**1934-38 Models.** Crankshaft must be removed for main bearing replacement. To remove shaft, remove vibration dampener (see below) and timing gear cover. Remove crankshaft gear with Gear Puller J-471, oil reservoir, transmission (see Car Model 'M' page) and clutch. Disconnect connecting rods. Remove main bearing caps (use Puller J-377 for removal of Front and Rear caps) and lower crankshaft out.

1939 Models—Remove engine (see Engine Assembly Removal), vibration dampener, timing gear cover and oil reservoir. Disconnect connecting rods and remove main bearing caps as directed above.

Installation:—Reverse procedure listed above for removal and note following points. Front and rear oil seal grooves in caps and case must be cleaned of all oil packing. After caps secured in place, drive new packing in grooves using Tool J-392 (install in horizontal groove first on front cap). See Connecting Rod Palnuts (above) for 1938-39 models. Use Tool

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

J-843 to press crankshaft gear and dampener in place. Check oil seal on timing gear cover and do not fold or damage when installing. See Checking Oiling System (following) for oil reservoir installation instructions.

1934-39 MODELS

VIBRATION DAMPENER REMOVAL:—1934-38. Remove fan belt, radiator shell, and radiator. Unscrew starting jaw. Pull dampener using Tool J-676. Install dampener using Tool J-483.

1939 Models—Dampener can be removed from beneath car without removing radiator core or shell as follows: Remove fan belt, raise front end of car, unscrew starting jaw, pull dampener using Tool J-676 (set puller tool screw in place through starting crank hole in frame cross member) and remove from below. Install dampener using Tool J-483.

Servicing—No adjustment other than replacing 2 rubber discs (drive flywheel from hub) if worn.

1934-39 MODELS

MAIN BEARINGS:—Adjustment—Laminated shims provided on top of caps. Remove caps (use Puller J-377 for front and rear caps) and remove shims until clearance is .001". See Crankshaft Installation above for bearing cap installation data.

Replacement Bearings:—Finished bearings (with attaching screws) furnished standard and .010" undersize (see Crankpin Size Code for original bearing sizes). Unfinished bearings furnished with 1/32" extra stock and must be line-reamed (see below).

Removal:—Bearing shells are removable type and are held in case and caps by screws. To replace bearings, crankshaft must be removed (see Crankshaft Removal above). With shaft out, take out screws securing shells in cap and case.

Installation:—With crankshaft removed, secure bearing shells in case and cap with machine screws. If unfinished bearings installed, line-ream as directed below. Install crankshaft (see Crankshaft Installation). Add or remove shims on bearing caps until .001" clearance obtained. Secure caps in place.

Line-Reaming Main Bearings:—Where unfinished bearings used for replacement, bearings must be line-reamed to size as follows: install bearings in cap and case, place .021" shims between case and cap and tighten cap, then line ream bearings. Thrust flange on center (Six), #3 (Eight) bearing must be faced for .006" endplay.

1939 MODELS

CAMSHAFT REMOVAL:—Remove bonnet (see Hood and Support Removal) and radiator (see Radiator Core Removal). Raise front end of engine and remove front engine guard. Remove radiator center grille (all except 112) which is attached by 8 sheet metal screws. Remove radiator shell on 112 only. Unscrew starting crank jaw. Remove vibration dampener, timing gear case cover, and camshaft gear. Remove right front wheel and fender dust shield (see Right Front Fender Dust Shield Removal). Remove valve covers, cylinder head, valves, tappets, oil pump, fuel pump, distributor, camshaft, thrust button and spring. If camshaft will not clear radiator shell splash guard, guard can be pressed down until shaft clears.

1939 MODELS

CAMSHAFT 'GRANOSEAL' TREATMENT:—All 1939 camshafts are 'Granoseal' treated. This operation gives hardened wearing surface to shaft and adds to life of shaft. This treatment leaves a somewhat rough surface and blackened appearance. IMPORTANT—All service operations same as before. Do not remove black finish from shaft surfaces.

1938-39 MODELS

VALVE TOOLS:—Valve stem diameter reduced to 11/32" on 1938-39 valves (was 3/8"). Due to this decrease in stem diameter, new pilot size necessary for valve servicing tools. Tool numbers as follows:

Tool	Tool No.
Valve Stem Guide Replacer Pilot	J883-6
Valve Stem Guide Reamer Pilot	J129-2
Valve Stem Guide Remover Pilot	J267
Valve Seat Reamer Pilot	J491-12

1934-39 MODELS

VALVE LIFTER REMOVAL:—Tappets (lifters) may be removed without removing cylinder head as follows: Remove right front fender dust shield (see above), remove valve covers (right side of engine below intake manifold), valve spring seat retainer, seat, dampener and spring, tappet adjusting screw (replace with short screw with thin head), guide clamp screw and clamp. Lift tappet and guide assembly out. NOTE—This method recommended only where one or two tappets to be removed. For removal of all lifters, time saved by removing head and valves.

1934-39 MODELS

CHECKING OILING SYSTEM:—See that oil lines securely in place and not bent or damaged. Drop oil reservoir and clean thoroughly every six months. When installing oil reservoir, check flapper valve on rear main bearing oil return tube (soldered in rear of reservoir). Valve must work freely and should be slightly open with reservoir level. Holes in gaskets between crankcase and oil dipper tray and between tray and reservoir must align with oil return tube (tube registers with hole in bearing)

1939 MODELS

1939 OILING SYSTEM CHANGES ON '112' & SIX CYLINDER ENGINES:—Oil passages from oil pump through cylinder block to front and rear of engine have been relocated. Front line now delivers oil directly to #1 trough in oil tray (formerly directed oil to timing gear compartment). Timing gears now lubricated by splash from connecting rods and higher oil level in gear compartment maintained by use of baffle on timing gear cover and elimination of oil drain hole in front main bearing cap (formerly used to supply oil to front of oil pan). Rear line from oil pump delivers oil to check valve (operates oil signal on instrument panel) which has been relocated farther forward in cylinder block allowing direct oil passage to #6 trough in oil tray.

Oil Pan Tray ('112' Engine)—New type conveyors used at front and rear ends of tray. Oil dams now used opposite #1 and #2 troughs and #5 and #6 troughs which direct oil draining from right side of cylinder block directly into #1 and #6 troughs. REPLACEMENT NOTE—1939 trays can be used on earlier cars. Old type cannot be used on 1939 cars.

Oil Pan Tray (Six Engine)—New baffles used between #1 and #2 troughs and between #5 and #6 troughs which maintain higher oil levels in #1 and #6 troughs and overflow from these troughs fed to remaining troughs. REPLACEMENT NOTE—Same as for '112' above.

Oil Suction Pipe Seal ('112' & Six Engines)—New synthetic rubber suction pipe seal fitted in counterbore in cylinder block flange at point where suction pipe passes through oil pan flange. Seal fits around pipe and oil pan gasket widened at this point. Seal compressed by pan when pan screws tightened. NOTE—Use new seal whenever pan installed.

1939 MODELS

OIL SUCTION PIPE SEAL (EIGHT ENGINE):—Same as for '112' and Six engines above.

1934-39 MODELS

CLUTCH OIL:—Servicing—Hudsonite (oil) in clutch must be renewed every 5000 miles. Turn engine over until hexagonal drain plug on front face of flywheel is visible in timing inspection hole on left side of motor rear support above starting motor. Remove drain plug (using special wrench J-472), turn engine over 1/3 revolution until star on flywheel is at inspection hole, allow engine to stand in this position one minute to drain old oil, turn engine over until filler plug is again at inspection hole, insert 1/3 pint Hudsonite (use J-485 gun), replace plug. **Capacity & Oil—1/3 pt. Hudsonite Clutch Compound.**

1938-39 MODELS

KING PIN THRUST BEARING:—King pin end thrust taken by 5 loose balls in upper bushing above king pin. Ball seat in bushing and on king pin end.

Installation—To install king pin, insert king pin from below until it enters top bushing (with keyways aligned and 'Corprene' seal in place under top bushing). Drop 5 loose balls through lubrication fitting hole on top of bushing, insert driver J-479-1 in hole to position balls, drive king pin into place (keyways aligned).

1936-39 MODELS

TORQUE ARMS:—Assembled between bracket on each frame siderail and rear of front axle. When removing axle, disconnect each torque arm at frame bracket (use Bolt Press J-885 to remove bolts from rubber grommets) and remove axle with torque arms attached. When assembling axle to springs (with torque arms mounted on axle), adjust U-bolt nuts so torque arms will fall slowly of own weight when raised at rear end, install jam nuts on U-bolts. Finally connect torque arms to frame brackets by assembling rubber grommets in eye of each arm (immerse rubber in gasoline before installing to allow bolt to enter freely), insert bolt through bracket and arm, tighten nut.

1939 MODELS

AUTOPOISE CONTROL:—Used on all 1939 Passenger Cars—New type linkage (similar to stabilizer) connecting front wheels together and helps maintain front wheels in straight ahead position. Consists of transverse bar suspended in rubber bushings mounted in brackets bolted to frame (ahead of front axle). Ends of bar curve to rear and are attached to brackets bolted to spindles by rubber bushed link at each end. In operation, bar is twisted or sprung whenever wheels turned away from straight ahead position which results in wheels being returned to straight ahead position when turning force on steering wheel released. A slight increase in force required to turn wheel results.

NOTE—Autopoise Control may be installed on all 1937-38 Hudson and Terraplane models for improvement in car control and for the elimination of wander and shimmy.

1939 MODELS

BRAKE LINING CHANGE:—Later cars have new type primary shoe lining. This lining is harder than first type and provides less sensitive brake. New lining should be installed on first cars in complete sets only (Brake Shoe and Lining Sets).

ENGINE NUMBER:—First number 2001. Stamped on left side of cylinder bank opposite #3 cylinder.

ENGINE:—Own. Six cylinder, 'L' head type.
Bore—2 15/16". **Stroke**—4¾".
Piston Displacement—193 cubic inches.
Rated Horsepower—20.7.
Developed Horsepower—73 at 3200 R.P.M. (Std. hd.), 80 at 3200 R.P.M. (Optl. high comp. head).
Compression Ratio—6.2-1 Std., 7.1-1 Optl.
Compression Pressure—116 lbs. at 220 R.P.M. (Std. 6.2-1 head), 125 lbs. at 200 R.P.M. (Optl. 7.1-1 head) when motored with all spark plugs removed and throttle wide open.
Vacuum Reading—Gauge should show steady reading of 18-19" at idling speed.
NOTE—High compression (7.1-1) engines marked by plate on left side of block and ethyl fuel must be used.

Pistons:—Own, Lo-Ex silicon-aluminum alloy, 'T' slot, cam ground type. Refinish cylinders to take finished replacement pistons (see Reconditioning).
Weight—9¼ ozs. stripped.
Removal—Pistons and rods removed from below by first removing crankshaft counterweights.
Clearance—.0015-.002" top of skirt, .0005-.001" at bottom.

Reconditioning Cylinders:—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: 'A' 2.9375", 'B' 2.938", 'C' 2.9385", 'D' 2.939", 'E' 2.9395", 'AO' 2.9475", 'BO' 2.948", 'CO' 2.9485", 'DO' 2.949", 'EO' 2.9495". Recondition cylinder to standard size for which piston and piston rings are available (see piston and ring data below).

Replacement Pistons:—Standard and oversize pistons marked by letter stamped on head furnished for cylinder bores of size indicated: 'B' 2.9375-2.938", 'D' 2.9385-2.939", 'F' 2.9395-2.940", 'J' 2.9415", 'L' 2.9425", 'BO' 2.9475-2.948", 'DO' 2.9485-2.949", 'FO' 2.9495-2.950", 'LO' 2.9525", 'BB' 2.9575", 'DD' 2.9585", 'FF' 2.9595". All pistons in same engine should be of same weight.
Fitting New Pistons—Use feeler gauge .0015-.002" thick to check clearance. It should be possible to withdraw feeler from between piston and cylinder wall on side opposite slot when grasped between thumb and forefinger (3-4 lb. pull).
Installing Pistons—Slot should be to left or away from valves.

Piston Rings:—Two compression, two oil control rings per piston, all above pin. Rings are positioned by pin in ring groove.
NOTE—Use standard or oversize rings of size indicated for replacement pistons marked as follows: 'B, D, F' 2.937", 'J' 2.940", 'L' 2.942", 'BO, DO, FO' 2.947", 'LO' 2.952", 'BB, DD, FF' 2.957".

Ring	Width	End Gap
Compression	3/64"	.009-.011"
Oil Control (#3)	⅛"	.009-.011"
Oil Control (#4)	9/64"	.009-.011"

Piston Pin:—Diameter ¾". Length 2 7/16". Pin floats in piston and rod. Held by retaining rings. Pins furnished standard and .002", .005", .010" oversize. Pin hole in connecting rod is bronze-bushed.

Connecting Rod:—Weight 28.96 ozs. Length 8 3/16".
Lower Bearing—Spun-babbitt lined type.
Clearance—.001". Sideplay .006-.010".
Adjustment—Shims (laminated type). Do not file rod or caps.
Crankpin Journal Diameter—1 15/16".
Installing Rods—Connecting rod lower bearings are offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 2, 4, and rods with left hand offset (widest half of bearing toward front) in #3, 5, 6.

Crankshaft:—3 bearing. Integral counterweights.
Journal Diameters—#1 2 11/32", #2 2⅜", #3 2 13/32".
Bearing Type—Removable bronze-backed, babbitt-lined.
Clearance—.001".
Adjustment—Laminated shims. Do not file caps.
End Thrust—Taken by #2 (center) bearing. Endplay .006-.012".

Camshaft:—Three bearing. Gear driven.
Timing Gears—Crankshaft gear Steel. Camshaft gear GE. Bakelite.
End Thrust—Taken by spring-loaded plunger in camshaft gear and thrust plate on gear cover.
Camshaft Setting:—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

Valves:—	Head Diameter	Stem Diam.	Length
All Valves	1⅜"	5/16"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003".
Exhaust	45°	11/32"	.003-.005".

Tappet Clearance—.003-.005" Intake, .005-.007" Exhaust with engine hot.
Spring Pressure—53 lbs. (valve closed).
Valve Timing—See Camshaft Setting (above).
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0528" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark 'UDC. 1-6' lines up with indicator. Reset tappet clearance at .006" with engine warm and running.

Lubrication:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears. Oscillating plunger type oil pump mounted on right side of crankcase.
Normal Oil Pressure—3 lbs.
Oil Pressure Relief Valve—Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch). *See article in Electrical Equipment Section for data.*
Capacity & Oil—5 qts. (refill), 6 qts. (dry). Use SAE, #30 (above 40°F), 20-W (40° to 0°F), #10-W (0° to —15°F.).

CLUTCH:—Own make. Single plate type operating in oil. No adjustment for wear required.
Clutch Pedal Adjustment—Free movement of clutch pedal must 1½". To adjust, loosen locknut on clutch pedal connecting link, remove clevis pin at lower end of link, turn clevis until free movement of pedal is 1½", replace pin and tighten locknut.
Clutch Lubrication—Oil in clutch should be drained and replaced at 5000-15000 mile intervals. To drain oil, turn flywheel until filler plug is visible in inspection hole in right front face of flywheel housing. Remove plug, turn flywheel so that hole is down, allow at least one minute in this position for draining, refill with mixture of 1/6 pint light engine oil, 1/6 pint kerosene, replace plug securely.
Facings—10" driven plate with cork inserts.

STEERING: — Front Suspension—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—0-1°. Adjust by inserting wedge shim between spring and spring pad on axle.
Camber—1°. No adjustment. Axle may be bent cold for minor corrections.
Toe In—⅛" measured 10" above ground. Adjust by loosening tie rod end clamp bolts and rotating tierod in direction that wheels revolve to increase, or in opposite direction to decrease toe-in.
NOTE—End thrust on kingpin is taken by five ball bearings in plug above kingpin. Bearing lower race is machined directly in kingpin end.

Steering Gear:—Gemmer Worm-and-Sector type. *See article in Mechanical Equipment Section for data.*

BRAKES:—Service—Bendix Mechanical, Duo-Servo, single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness 5/32". Length 21" per wheel.
Clearance—.008" anchor pin end, .014" adjusting screw end for each shoe.
Hand Brake:—See Service Brakes above.

ENGINE NUMBER:—First number (1932) 50,001, (1933) 63,501. Stamped on left side of cylinder block opposite #1 cylinder.

ENGINE SPECIFICATIONS:—Eight cylinder, 'L' head type.
Bore—3". Stroke 4½".
Displacement—254 cubic inches.
Rated Horsepower—28.8.
Developed Horsepower—(Std. 5.8-1 head) 101 at 3600 R.P.M. (Optl. 7.0-1 head) 110 at 3600 R.P.M.
Compression Ratio—5.8-1 Std. 7.0-1 Optl. Ratio marked by figure cast in upper surface of head casting.
Compression Pressure—80 lbs. at 125 R.P.M. (Std. head), 128 lbs. at 150 R.P.M. (Optl. 7.0-1 head).
Vacuum Reading—Gauge should show steady reading of 18-19" at idling speed.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons when reconditioning engine. See Reconditioning paragraph.
Weight—9¾ ozs. stripped. Stamped on piston head.
Length—3 3/16".
Removal—Pistons and rods removed from below by first removing crankshaft counterweights.
Clearance—Skirt Clearance .0015-.002" top, .0005-.001" bottom. See Fitting new pistons.

Reconditioning Cylinders:—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A—3.000", B—3.0005", C—3.001", D—3.0015", E—3.002", AO—3.010", BO—3.0105", CO—3.011", DO—3.0115", EO—3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).

Replacement Pistons:—Standard and oversize pistons marked by letter on head available for cylinder bores of size indicated: 'B'—3.000 & 3.0005", 'D'—3.001 & 3.0015", 'F'—3.002 & 3.0025", 'J'—3.004", 'L'—3.005", 'BO'—3.010 & 3.0105", 'DO'—3.011 & 3.0115", 'FO'—3.012 & 3.0125", 'LO'—3.015", 'BB'—3.020", 'DD'—3.021", 'FF'—3.022". All pistons installed in engine must be of same weight as indicated by mark on head.

Fitting New Pistons:—Use .0015" feeler ½" wide on side oposite slot at right angles to pin bosses to check clearance. Tension to withdraw feeler must be 3-4 lbs.

Installing Pistons:—Slot toward left or away from camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap
Comp.	3/32"	.009-.011"
Oil Cont. (#3)	⅛"	.009-.011"
Oil Cont. (#4)	9/64"	.009-.011"

NOTE—Use standard or oversize rings of size indicated for replacement pistons (see replacement piston section above): 3.000"—B, D, F; 3.003"—J; 3.005"—L; 3.010"—BO, DO, FO; 3.015"—LO; 3.020"—BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.

PISTON PIN—Diameter ¾". Length 2 7/16". Pin floats in piston and rod. Held by locking rings at each end. Pin hole in rod is bronze-bushed. Pins furnished for service standard and .002", .005", .010" oversize.
Pin Fit in Piston—Hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance. Rod should just turn in piston of own weight.

CONNECTING ROD:—Length 8 3/16". Weight 29.44 ozs.
Crankpin Journal Diameter—1 15/16".
Bearing Type—Spun babbitt lined integral with rod and cap.
Clearance—.001-.0015". Sideplay .006-.010".

Adjustment:—Shims (laminated type). Do not file rods or bearing caps.

Installing Rods:—Lower bearings offset. Install rods with right hand offset in cylinders #1, 3, 5, 7 and left hand offset in #2, 4, 6, 8.

CRANKSHAFT:—Five bearings. Integral counterwghts.
Journal Diameters—#1, 2 9/32", #2, 2 5/16", #3, 2 11/32", #4, 2⅜", #5, 2 13/32".
Bearing Type—Removable bronze- backed, babbitt-lined.
Clearance—.001-.0015".

Adjustment:—Shims (laminated type). Do not file bearing caps.

End Thrust:—Taken by #3 center main bearing. Endplay .006-.012".

CAMSHAFT:—Adjustable chain drive from crankshaft.
Timing Chain—Morse. Width 1¼". Pitch ½". Length 28½" or 57 links.
Chain Adjustment—Chain should be adjusted at 5000 mile intervals or whenever play on circumference of accessory drive shaft coupling exceeds ⅛". To adjust, loosen three mounting bolts on accessory bracket at right of engine on rear of chain case, remove inner upper and lower bolts (these pass through notches in eccentric and prevent rotation of the eccentric necessary for chain adjustment). Insert special wrench between accessory bracket and chain case, rotate eccentric clockwise (viewed from rear) until play on shaft coupling is ⅛". Insert bracket bolts and tighten securely (back off adjustment slightly, if necessary, to allow bolts to enter).
NOTE—Whenever accessory bracket is removed from engine, plug directly above shaft should be removed and ½ pint engine oil injected before engine is run.

Camshaft Setting:—Two pins on chain 20 links marked and two adjacent teeth on each sprocket also marked. Mesh chain so that marked pin is between marked teeth on both camshaft and crankshaft sprockets.

VALVES:—	Head Diam.	Stem Diam.	Length
Intake	1½"	5/16"	5 3/32" see note.
Exhaust	1⅜"	5/16"	5 3/32" see note.

NOTE—Valve length for 1932 5 1/32".

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003 - .005"

Tappet Clearance—.004" Intake, .006" Exhaust (1932), .006" Intake, .008" Exhaust (1933) with engine hot.

Valve Springs:—	Pressure	Length
Valve Closed	53 lbs.	2"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10° 40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18° 44' ATDC.
NOTE—These figures correct for .010" tappet clearance.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston .0494" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark lines up with indicator in inspection hole in right front face of flywheel housing. Reset tappet clearance at .004" ('32), .006" ('33) with engine hot.
Motor Gauge—Weidenhoff Adapter #104 (Std. head), #114 (H.C. head), Rod #2 (Std. head), #42 (Optl. head).

LUBRICATION:—Duo-flow (splash) system with positive feed to oil troughs and timing chain by oscillating plunger type pump. Pump mounted on rear face of accessory bracket at right of engine.
Normal Oil Pressure—3 pounds.
Oil Pressure Relief Valve—Operates at 3 lbs. Not adjustable. Located on right side of crankcase at rear of engine. Combined with oil pressure signal light switch.
See article in Electrical Equipment Section for data.
Capacity & Oil—8 qts. Use SAE #30 (above 40° F), #20W (40° to 0° F).

CLUTCH:—Own make. Single plate type operating in oil. No adjustment for wear required.
Facings—Driven member is 10" in diameter. Facing consists of cork inserts in plate.
Adjustment—Clearance between pedal and underside of toeboard must be ¾". To adjust, loosen stopscrew locknut and turn stopscrew. Free movement of pedal must be 1½". To adjust, remove clevis pin at forward end of clutch pedal link, loosen locknut, turn clevis on link.

STEERING:—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—0-1°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1°. No adjustment. Axle may be bent cold for minor corrections.
Toe In—0-⅛". Adjusted in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—13".
Lining—Moulded type. Width 1¾". Thickness 7/32". Length 25" per wheel.
Clearance—.008" anchor end, .014" adjusting screw end for each shoe.

Hand Brake:—See Service Brakes above.

ENGINE NUMBER:—First number ('34) 30,000, ('35) 55,000. Stamped on left side of cylinder block opposite #1 cylinder ('34), #8 cylinder ('35).

ENGINE:—**Own.** Eight cylinder, In line, 'L' head type. **Bore**—3". **Stroke**—4½".
Piston Displacement—254.47 cubic inches.
Rated Horsepower—28.8.
Developed Horsepower, Compression Ratio & Pressures—To check pressures, remove spark plugs, crank engine with wide open throttle:

Model	Ratio	Horsepower	Press. @ 150 R.P.M.
LL	5.75-1	108 @ 3200	80 lbs.
LT	6.25-1	113 @ 3800	116 lbs.
LL, LT	7.0-1	121 @ 4000	128 lbs.
HT, HU, HHU	6.0-1	113 @ 3800	110 lbs.
HT, HU, HHU	7.0-1	124 @ 4000	128 lbs.

NOTE—6.25-1 and 7.0-1 heads are aluminum composite. High octane fuel must be used with these heads.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Own Lo-Ex, silicon-aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons when reconditioning engine. See Reconditioning paragraph .
Weight—9.6 ozs. ('34), 10.88 ozs. ('35) stripped; 14.5 ozs. ('34), 12.99 ozs. ('35) with rings and pin.
Length—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Bottom .0005" ('34), .002" ('35).
NOTE—1935 pistons may be installed in 1934 engines as complete sets only.
Reconditioning Cylinders—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A-3.000", B-3.0005", C-3.001", D-3.0015", E-3.002", AO-3.010", BO-3.0105", CO-3.011", DO-3.0115", EO-3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).
Replacement Pistons—Standard and oversize pistons marked by letter on head available for **cylinder bores** of size indicated: 'B'-3.000 & 3.0005", 'D'-3.001 & 3.0015", 'F'-3.002 & 3.0025", 'J'-3.004", 'L'-3.005". 'BO'-3.010 & 3.0105", 'DO'-3.011 & 3.0115", 'FO'-3.012 & 3.0125", 'LO'-3.015", 'BB'-3.020", 'DD'-3.021, 'FF'-3.022". All pistons installed in engine must be of same weight as indicated by mark on head.
Fitting New Pistons—Use feeler stock .0015-.002" thick to check clearance. It should be possible to withdraw feeler from between piston and cylinder bore on side opposite slot when grasped between thumb and forefinger with 3-4 lbs. pull.
Installing Pistons—Slot should be to left or away from valves.

Piston Rings:—Four rings per pistons, two compression, two oil control rings ('34—all rings above pin, '35—lower oil control ring below pin). Lower ring groove drilled radially with oil drain holes. Rings are positioned by pin in piston ring groove.

1934 Piston Rings

Ring	Width	End Gap	Wall Thickness
Comp. (all)	3/32"	.006-.016"	.123"
Oil Cont. (upper)	⅛"	.006-.016"	.128"
Oil Cont. (lower)	3/16"	.006-.016"	.128"

1935 Piston Rings

Ring	Width	End Gap.	Wall Thickness
Comp.	.093"	.006-.016"	.123"
Oil Cont.	.187"	.006-.016"	.128"

NOTE—Use standard or oversize rings of size indicated for replacement pistons (see Replacement Piston section above); 3.000"—B, D, F,; 3.003"—J; 3.005"—L; 3.010"—BO, DO, FO; 3.015"—LO; 3.020"—BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.

Piston Pin:—Diameter ¾". Length 2 7/16". Pin floats in piston and rod. Held by retaining rings. Pins furnished standard, .002", .005", .010" oversize.
Pin Fit in Piston—Snug fit with piston at 200°F.
Clearance in Rod Bushing—.0003".

Connecting Rod:—Weight 28.96 ozs. Length 8 3/16".
Lower Bearing—Spun-babbitt lined type.
Crankpin Journal Diameter—1 15/16".
Clearance—.001". Sideplay, .006-.010".
Adjustment—Laminated shims. Do not file caps.
Installing Rods—Connecting rod lower bearings offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 3, 5, 7 and rods with left hand offset (widest half toward front) in cylinders #2, 4, 6, 8.

Crankshaft:—Five bearings. Eight counterweights.
Journal Diameters—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅝"; #5, 2 13/32".
Bearing Type—Removable bronze-backed, babbitt-lined.
Clearance—.001".
Adjustment—Laminated shims. Do not file caps.
End Thrust—Taken by #3 center bearing. Endplay, .006-.012".

Camshaft:—Five bearing. Gear driven.
Timing Gears—Crankshaft gear Steel. Camshaft gear GE. Bakelite.
End Thrust—Taken by spring-loaded plunger in camshaft gear and thrust plate on gear cover.
Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1½"	5/16"	5 3/32"
Exhaust	1⅜"	5/16"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh. engine hot.
Valve Springs—Cages installed on all springs at bottom. Install with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Timing—See Camshaft Setting (above).
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" before top dead center when a point in the flywheel approximately 3.97 teeth before the dead center mark 'UDC.1-8' lines up with the indicator on the housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Lubrication:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears. Oscillating plunger type oil pump mounted on right side of crankcase.
Normal Oil Pressure—3 lbs.
Oil Pressure Relief Valve—Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch). *See article in Electrical Equipment Section for data.*
Capacity and Oil—7 qts. (refill), 9 qts. (dry). Use SAE. #30 (above 40°F.), #20-W (40° to 0°F.), #10-W (0° to —15°F.).

CLUTCH:—Own make. Single plate type operating in oil. No adjustment for wear required. *See article in Mechanical Equipment Section for data.*
Clutch Pedal Adjustment—Free movement of clutch pedal must be 1½". To adjust, loosen lock nut on clutch pedal connecting link, remove clevis pin at lower end of link, turn clevis until free movement of pedal is 1½", replace pin and tighten lock nut. See adjustment for automatic clutch linkage below.
Automatic Clutch Control—On cars with automatic clutch, check control linkage whenever clutch pedal is adjusted. Depress accelerator pedal, pull back on clutch control unit cable (left side of engine), check clearance between back of slot in cable yoke and clevis pin which attaches it to operating lever. This clearance should be ⅞".
Clutch Lubrication—Oil in clutch should be drained and replaced at 5000-15000 mile intervals. To drain oil, turn flywheel until filler plug is visible in inspection hole (left hand front face of flywheel above starter), remove plug, turn flywheel until star stamped on flywheel face is visible in inspection hole, allow at least 1 minute in this position for draining, turn flywheel until filler plug is visible, insert 1/3 pint Hudsonite Clutch Compound, replace filler plug.
Clutch Facings—Driven plate is 6⅜" I.D., 9¾" O.D., .203" thick. Facing consists of 108 cork inserts mounted on driven plate.

STEERING:—Front Suspension—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs, or Axleflex articulated axle. Data and adjustment for both types are the same.
Kingpin Inclination—7° crosswise.
Caster—2½-3½° ('34), 4-4½° ('35). Adjusted by inserting wedge shims between springs and spring pad on axle.
Camber—1-1½°. No adjustment. Axle may be bent cold to correct camber.
Toe In—⅛" measured 10" from ground. Adjust by loosening tie rod end clamp bolts and rotating tie rod.
NOTE—End thrust on kingpin is taken by five ball bearings in plug above kingpin. Bearing lower race is machined directly in kingpin end.

Steering Gear:—Gemmer Worm-and-Sector type. *See article in Mechanical Equipment Section for data.*

BRAKES:—Service—Bendix mechanical, Duo-Servo, Single anchor type. Hand lever applies all service brakes. See article in Brake Section for complete adjustment procedure.
NOTE—See Hudson GH (previous article) for Service Brake specifications on Hudson 8 Models LT, LTS, HT and HU. Specifications below apply to Models LL and HHU only.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 23 13/16".
Clearance—.014" heel, .008" toe, for each shoe.

Hand Brake Adjustment:—See Service Brakes.

AUTOMATIC SHIFT: (ELECTRIC HAND):—Bendix electro-pneumatic type optional on Models HT, HU, standard on Model HHU. See article in Mechanical Equip. Section for complete description, wiring diagram and trouble shooting on 1935 Type Electric Hand.

ENGINE NUMBER:—First number, 70,000. Stamped on left side of cylinder block opposite #6 cylinder.

ENGINE:—**Own.** Six cylinder, 'L' head type.

Bore—3". **Stroke**—5".

Piston Displacement—212.058 cubic inches.

Rated Horsepower—21.6.

Developed Horsepower—93 at 3800 R.P.M. (Std. 6.25-1 head), 100 at 3800 R.P.M. (7.0-1 head).

Compression Ratio—6.25-1 (Std. cast-iron head), 7.0-1 (optl. composite aluminum-iron head).

Compression Pressure—116 lbs. at 219 R.P.M. (6.25-1 head), 127 lbs. at 207 R.P.M. (7.0-1 head) with all spark plugs removed and throttle wide open.

NOTE—High-octane type fuel must be used in engines with 7.0-1 ratio composite head.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Own, Lo-Ex silicon-aluminum alloy, 'T' slot, cam ground type. Use refinished replacement pistons when reconditioning engine. See Reconditioning paragraph.

Weight—10.88 ozs. stripped, 12.99 ozs. with rings and pin.

Length—3 3/16".

Removal—Pistons and rods removed from above.

Clearance—Top .016". Bottom .001".

Reconditioning Cylinders—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A-3.000", B-3.0005", C-3.001", D-3.0015", E-3.002", AO-3.010", BO-3.0105", CO-3.011", DO-3.0115", EO-3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).

Replacement Pistons—Standard and oversize pistons marked by letter on head available for **cylinder bores** of size indicated: 'B'-3.000 & 3.0005", 'D'-3.001 & 3.0015", 'F'-3.002 & 3.0025", 'J'-3.004", 'L'-3.005". 'BO'-3.010 & 3.0105", 'DO'-3.011 & 3.0115", 'FO'-3.012 & 3.0125", 'LO'-3.015", 'BB'-3.020", 'DD'-3.021, 'FF'-3.022". All pistons installed in engine must be of same weight as indicated by mark on head.

Fitting New Pistons—Use feeler gauge .0015-.002" thick to check clearance. It should be possible to withdraw feeler from between piston and cylinder wall on side opposite slot when grasped between thumb and forefinger with 3-4 lbs. pull.

Installing Pistons—Slot should be to left or away from valves.

Piston Rings:—Two compression rings, one oil control ring above pin, one oil control ring below pin. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp.	.093"	.006-.016"	.123"
Oil Cont.	.187"	.006-.016"	.128"

NOTE—Use standard or oversize rings of size indicated for replacement pistons (see Replacement Piston section above); 3.000"—B, D, F,; 3.003"—J; 3.005"—L; 3.010"—BO, DO, FO; 3.015"—LO; 3.020"—BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.

Piston Pin:—Diameter ¾". Length 2 7/16". Pin floats in piston and rod. Held by retaining rings.

Pin Fit in Piston—Snug fit with piston at 200°F.

Clearance in Rod Bushing—.0003".

Connecting Rod:—Weight 28.96 ozs. Length 8 3/16".

Crankpin Journal Diameter—1 15/16".

Lower Bearing—Spun babbitt-lined type.

Clearance—.001". Sideplay .006-.010".

Adjustment—Shims (laminated type). Do not file rod or caps.

Installing Rods—Connecting rod lower bearings are offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 2, 4, and rods with left hand offset (widest half of bearing toward front) in cylinders #3, 5, 6.

Crankshaft: — Three bearings. Integral counterweights.

Journal Diameters—#1 2 11/32", #2 2⅜", #3 2 13/32".

Bearing Type—Removable bronze-backed, babbitt-lined.

Clearance—.001".

Adjustment—Laminated shims. Do not file caps.

End Thrust—Taken by #2 (center) bearing. Endplay .006-.012".

Camshaft:—Three bearing. Gear driven.

Timing Gears—Crankshaft gear steel. Camshaft gear GE. Bakelite.

End Thrust—Taken by spring-loaded plunger in camshaft gear and thrust plate on gear cover.

Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

Valves:

	Head Diameter	Stem Diameter	Length
All Valves	1⅜"	5/16	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.

Valve Springs—Cages installed on all springs at bottom. Install with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Timing—See Camshaft Setting (above)

Intake Valves—Open 10°40' BTDC. Close 60° ALDC.

Exh. Valves—Open 50° BLDC. Close 18°44' ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before the dead center mark 'UDC.1-6' lines up with the pointer on the housing. No flywheel mark provided.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

Lubrication:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears. Oscillating plunger type oil pump mounted on right side of crankcase.

Normal Oil Pressure—3 lbs.

Oil Pressure Relief Valve—Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch). *See article in Electrical Equipment Section for data.*

Capacity and Oil—5 qts. (refill), 6 qts. (dry). Use SAE. #30 (above 40°F.), #20-W (40° to 0°F.), #10-W (0° to —15°F.).

CLUTCH:—**Own make.** Single plate type operating in oil. No adjustment for wear required.

See article in Mechanical Equipment Section for data.

Clutch Pedal Adjustment—Free movement of clutch pedal must 1½". To adjust, loosen lock nut on clutch pedal connecting link, remove clevis pin at lower end of link, turn clevis until free movement of pedal is 1½", replace pin and tighten lock nut. See adjustment for Automatic Clutch linkage below.

Automatic Clutch Control—On cars with Automatic Clutch, check control linkage whenever clutch pedal is adjusted. Depress accelerator pedal, pull back on clutch control unit cable (left side of engine), check clearance between back of slot in cable yoke and clevis pin which attaches it to operating lever. This clearance should be ⅞".

Clutch Lubrication—Oil in clutch should be drained and replaced at 5000-15000 mile intervals. To drain oil, turn flywheel until filler plug is visible in inspection hole (left hand front face of flywheel housing), remove plug, turn flywheel until star stamped on flywheel is visible in inspection hole, allow at least one minute in this position for draining, turn flywheel until filler plug hole is visible, insert 1/3 pint Hudsonite Clutch Compound, replace filler plug.

Clutch Facings—Driven plate is 5⅜" I.D., 8⅝" O.D., .203" thick. Facing consists of 90 cork inserts mounted on driven plate.

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs (standard), or Axle-flex articulated axle (optional). Data and adjustments for both types are the same.

Kingpin Inclination—7° crosswise.

Caster—3¼-3¾°. Adjust by inserting wedge shims between springs and spring pad on axle.

Camber—½°. No adjustment. Axle may be bent cold to correct camber.

Toe In—⅛" measured 10" above ground. Adjust by loosening tie rod end clamp bolts and rotating tie rod in direction that wheels revolve to increase toe-in, or in opposite direction to decrease toe-in.

NOTE—End thrust on kingpin is taken by five ball bearings in plug above kingpin. Bearing lower race is machined directly in kingpin end.

Steering Gear:—Gemmer Worm-and-Sector type.

See article in Mechanical Equipment Section for data.

BRAKES:—**Service**—Bendix mechanical, Duo-Servo, Single anchor type. Hand lever applies all service brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—9".

Lining—Moulded type. Width 2¼". Thickness 3/16". Length per wheel 19 3/16".

Clearance—.014" heel, .008" toe, between lining and drum for each shoe.

Hand Brake Adjustment:—See Service Brakes.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on these cars. See article in Mechanical Equipment Section on Electric Hand 1935 Type for complete description, wiring diagram, and trouble shooting.

ENGINE NUMBER:—First number—79,000. Stamped on left side of cylinder block opposite #6 cylinder.

ENGINE SPECIFICATIONS:—**Type**—6 cyl .,'L' head.
Bore—3". **Stroke**—5".
Displacement—212 cubic inches.
Rated Horsepower—21.6 (AMA).
Developed Horsepower—93 at 3800 R.P.M. (Std. 6.25-1 head), 100 at 3800 R.P.M. (Optl. 7.0-1 head).
Compression Ratio & Pressure—To check pressures, remove spark plugs, crank engine with throttle wide open.
Std. 6.25-1 Head.....116 lbs. at 219 R.P.M.
Optl. 7.0-1 Head.....127 lbs. at 207 R.PM..
Vacuum Reading—Gauge should show steady reading of 18-19" of HG. with engine idling at 350 R.P.M. or 7 M.P.H.
NOTE—High Octane fuel must be used in engines with optional high compression 7.0-1 head.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons when reconditioning engine. See Reconditioning paragraph.
Weight—10.5 ozs. stripped. Stamped on piston head.
Length—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .002". See Fitting new Pistons.
NOTE—These pistons interchangeable with 1935 and may be installed in complete sets on 1934 model.
Reconditioning Cylinders:—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A-3.000", B-3.0005", C-3.001", D-3.0015", E-3.002", AO-3.010", BO-3.0105", CO-3.011", DO-3.0115", EO-3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).
Replacement Pistons:—Standard and oversize pistons marked by letter on head available for cylinder bores of size indicated: 'B'-3.000 & 3.0005", 'D'-3.001 & 3.0015", 'F'-3.002 & 3.0025", 'J'-3.004", 'L'-3.005". 'BO-3.010 & 3.0105", 'DO'-3.011 & 3.0115", 'FO'-3.012 & 3.0125", 'LO'-3.015", 'BB'-3.020", 'DD'-3.021, 'FF'-3.022". All pistons installed in engine must be of same weight as indicated by mark on head.
Fitting New Pistons:—Use .0015" feeler ½" wide on side opposite slot at right angles to pin bosses to check clearance. Tension to withdraw feeler must be 3-4 lbs.
Installing Pistons:—Slot toward left or away from camshaft.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin per piston. Upper oil ring groove drilled with twelve 5/16" oil drain holes and two 5/16" holes to pins. Lower oil ring groove drilled with four 5/16" holes and two oil drain slots. Rings are straight cut and are positioned by pin in piston ring groove.

Ring	Width	End Gap	Wall Thickness
Comp.	3/32"	.005" Min.	.123"
Oil (both)	3/16"	.005" Min.	.128"

NOTE—Use standard or oversize rings of size indicated for replacement pistons (see replacement piston section above): 3.000"—B, D, F; 3.003"—J; 3.005"—L; 3.010"—BO, DO, FO; 3.015"—LO; 3.020"—BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.

PISTON PIN:—**Diameter ¾". Length 2 7/16".**
Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod is bronze-bushed. Pins furnished standard, .002", .005", .010" oversize.
Pin Fit in Piston—Hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance. With this clearance rod will just turn of own weight.

CONNECTING ROD:—Weight 29.4 ozs. Length 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt lined type. Rods serviced on 'exchange' basis.
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—Laminated shims. Do not file rods or caps.
Installing Rods:—Lower bearings are offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 2, 4, and rods with left hand offset (widest half of bearing toward front) in cylinders #3, 5, 6. Oil scoop on bearing must be toward camshaft on all rods.

CRANKSHAFT:—Three bearing. Integral counterw'ts. *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.*
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Removable bronze-backed, babbitt-lined. Bearings furnished for service reamed to standard size or unfinished (1/32" extra stock).
Clearance—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by flanges on #2 (center) main bearing. Endplay .006-.012". Adjusted by replacing bearing.

CAMSHAFT:—Three bearing. Gear driven.
Journal Diameters—#1, 2"; #2, 1 31/32". #3, 1½".
Bearing Clearance—.0015".
End Thrust:—Taken by spring loaded plunger in end of camshaft and thrust plate on gear case cover.
NOTE—If gear case cover removed, see that spring and plunger are in place when cover replaced.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
All Valves	1 ⅜"	⅜"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance:—.006" Intake, .008" Exhaust (hot).
Valve Guides:—Removable type. Pressed in block. Finish ream guides after installation to size giving correct clearance.
Valve Springs:—Cages installed on bottom of all springs. Springs should be installed with open side of cage toward cylinder.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Slipper type operating in individual removable guides. Lifter is prevented from turning by pin in guide.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when point on flywheel appoximately 3.94 teeth before 'UDC. 1-6/' mark lines up with indicator in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff #114 Adapter. #44 Rod.

LUBRICATION:—Duo-flow (splash) system. Force feed by oil pump to connecting rod troughs and timing gears. Splash to all other bearing points from troughs.
Normal Oil Pressure—3 lbs.
Oil Pressure Regulator—Operates at 3 lbs. Located on right side of crankcase. Not adjustable.
Crankcase Capacity—6 qts. refill.
Oil Pump:—Oscillating plunger type pump mounted on right side of crankcase and driven by gears from the camshaft.
Oil Pressure Indicator:—Consists of signal light on instrument panel and switch built in oil pressure regulator.
See article in Electrical Equipment Section for data.

CLUTCH:—**Own Make**—Single plate, cork insert type operating in oil. Driven plate can be recorked but is customarily replaced.
See article in Mechanical Equipment Section for data.
Clutch Plate—Thickness .203". Inside diameter 5.375". Outside diameter 8.625". Facing consists of 90 cork inserts.
Adjustment—Free movement of clutch pedal must be 1½" at all times. To adjust, remove clevis pin in clutch pedal link rod (between frame and leg of 'X' member below clutch pedal shaft), loosen locknut at top of clevis, turn clevis to shorten or lengthen rod as required, tighten locknut, replace clevis pin. On cars with automatic clutch control, check linkage whenever clutch is adjusted.
Automatic Clutch Linkage Adjustment—Hold accelerator pedal in depressed position, pull backward on clutch control power unit rod at left of engine. With rod in extreme rear position check clearance between back of slot in rod yoke and clevis pin which attaches it to operating lever. Clearance at this point must be ⅞".
Clutch Oil Servicing:—*See Hudson Shop Notes for data.*

STEERING:—**Steering Gear**—Gemmer Model Worm-and-Sector type. See article in Steering Section for adjustments.
NOTE—An adjustable drag link with ¾" adjustment (made by shifting shims from front to rear of pitman arm ball seat) is used on cars after #633110 (except 633153 to 633185 inclusive).
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Torque arm at each end of axle connected to frame at rear by rubber-bushed bolt maintains axle alignment.
Specifications & Adjustment—Kingpin inclination, Caster, Camber, Toe In, Steering Geometry, and Kingpin thrust bearing specifications and adjustment same as for Hudson Eight (see next page).

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, Single Anchor type. Brake pedal connected to rear wheel brakes through cable linkage for additional reserve mechanical application of brakes. Hand lever applies rear wheel brakes through this same linkage. *See article in Mechanical Equipment Section.*
Brake Drum Diameters—10 1/16".
Brake Lining—Moulded & Woven type. Width 1¾". Thickness 7/32". Length 22⅛" per wheel.
Brake Clearance—.010" heel and toe of each shoe.
Brake Pedal Adjustment:—For correct mechanical follow-up feature, adjust position of nut on connecting rod so that clearance between face of nut and end of push rod is 1 29/32" with equalizer against stop.
Hand Brake:—See Service Brakes above.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type. Optional equipment.
See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number—1000 (all models). Stamped on left side of engine block near top.

ENGINE SPECIFICATIONS:—Type—8 cyl., 'L' head.
Bore—3". **Stroke** 4½".
Displacement—254 cubic inches.
Rated Horsepower—28.8 (AMA).
Developed Horsepower—113 at 3800 R.P.M. (Std. 6.0-1 head), 124 at 4000 R.P.M. (Optl. 7.0-1 head).
Compression Ratio & Pressure—To check pressures, remove spark plugs, crank engine with throttle wide open.
Std. 6.0-1 Head.....110 lbs. at 150 R.P.M.
Optl. 7.0-1 Head .....128 lbs. at 150 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-19" of HG. with engine idling at 350 R.P.M. or 7 M.P.H.
NOTE—High Octane fuel must be used in engines with high compression 7.0-1 heads.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons when reconditioning engine. See Reconditioning Section.
Weight—10.88 ozs. stripped. Stamped on piston head.
Length—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .0015". See Fitting New Pistons.
NOTE—These pistons interchangeable with 1935 and may be installed in complete sets on 1932-33-34 models.
Reconditioning Cylinders:—Original cylinder size marking same as for Hudson Six and should be reconditioned in same manner (see previous page).
Replacement Pistons:—Furnished in same sizes as for Hudson Six (see previous page).
Fitting New Pistons:—Pistons fitted in same manner as on Hudson Six (see previous page).
Installing Pistons:—Slot toward left or away from camshaft.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin per piston. Upper oil ring groove drilled with twelve 5/16" oil drain holes and two 5/16" holes to pins. Lower oil ring groove drilled with four 5/16" holes and two oil drain slots. Rings are straight cut and positioned by pin in groove.

Ring	Width	End Gap	Wall Thickness
Comp.	3/32"	.005" Min.	.123"
Oil (both)	3/16"	.005" Min.	.128"

NOTE—See Hudson Six (previous page) for ring oversizes and pistons for which used. If rings are filed, clearance at pin must be kept uniform with end gap.

PISTON PIN:—**Diameter** ¾". **Length** 2 7/16".
Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod is bronze-bushed. Pins furnished standard, .002", .005", .010" oversize.
Pin Fit in Piston—Hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance. With this clearance rod will just turn of own weight.

CONNECTING RODS:—**Weight** 29.4 ozs. **Length** 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt lined type. Rods serviced on 'exchange' basis.
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—Laminated shims. Do not file rods or caps.
Installing Rods:—Lower bearings are offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 3, 5, 7 and rods with left hand offset (widest half of bearing toward front) in cylinders # 2, 4, 6, 8. Oil scoop on bearing cap must be toward camshaft on all rods.

CRANKSHAFT:—Five bearing. Integral counterweights. *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.*
Journal Diameters—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅜"; #5, 2 13/32".
Bearing Type—Removable bronze-backed, babbitt-lined. Bearings furnished for service reamed to standard size or unfinished with 1/32" stock to permit reaming to desired size.
Clearance—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by flanges on #3 center bearing. Endplay .006-.012". Adjusted by replacing bearing.

CAMSHAFT:—Five bearing. Gear driven.
Journal Diameters—#1, 2 1/32"; #2, 2"; #3, 1 31/32"; #4, 1 15/16"; #5, 1½".
Bearing Clearance—.0015".
End Thrust:—Taken by spring loaded plunger in end of gear and thrust plate on gear case cover.
NOTE—If gear case cover removed, see that spring and plunger are in place when cover replaced.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diam.	Stem Diam.	Length
Intake	1½"	⅜"	5 3/32"
Exhaust	1⅜"	⅜"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" intake, .008" exhaust hot.
Valve Guides:—Removable. Pressed in block. Finish ream after installation to size for correct clearance.
Valve Springs:—Cages installed on bottom of all Springs. Install springs with open side of cage toward cylinder.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Slipper type operating in individual removable guides. Lifter is prevented from turning by pin in guide.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010".' This valve should open with piston 10°40' or .0494" BTDC. when point on flywheel approximately 3.97 teeth before 'UDC. 1-8/' mark lines up with indicator in hole in left front face of flywheel housing. Reset tappet clearance at .006".
Motor Gauge—Weidenhoff #114 Adapter, #44 Rod.

LUBRICATION:—Duo-flow (splash) system. Force feed by oil pump to connecting rod troughs and timing gears. Splash to all other points from troughs.
Normal Oil Pressure—3 lbs.
Oil Pressure Regulator—Operates at 3 lbs. Not adjustable. Located on right side of crankcase at rear.
Crankcase Capacity—9 qts.
Oil Pump:—Oscillating plunger type pump mounted on right side of crankcase and driven by gears from camshaft.
Oil Presure Indicator:—Consists of signal light on instrument panel and switch built in oil pressure regulator.
See article in Electrical Equipment Section for data.

CLUTCH:—**Own Make**—Single plate, cork insert type operating in oil. Driven plate can be recorked but is customarily replaced.
See article in Mechanical Equipment Section for data.
Clutch Plate—Thickness .203". Inside diameter 6.375". Outside diameter 9.75". Facing consists of 108 cork inserts.
Adjustment:—Free movement of clutch pedal must be 1½" at all times. To adjust, remove clevis pin in clutch pedal link rod (between frame and leg of 'X' member below clutch pedal shaft), loosen locknut at top of clevis, turn clevis to shorten or lengthen rod as required, tighten locknut, replace clevis pin. On cars with automatic clutch control, check linkage whenever clutch is adjusted.
Automatic Clutch Linkage Adjustment—Hold accelerator pedal in depressed position, pull backward on clutch control power unit rod at left of engine. With rod in extreme rear position check clearance between back of slot in rod yoke and clevis pin which attaches it to operating lever. Clearance at this point must be ⅞".
Clutch Oil Servicing:—*See Hudson Shop Notes for data.*
Capacity & Oil—1/3 pt. Hudsonite Clutch Lubricant

STEERING:—**Steering Gear**—Gemmer Model Worm-and Sector type. See article in Steering Section.
NOTE—An adjustable drag link with ¾" adjustment made by shifting shims from front to rear of pitman arm ball seat is used on cars after #641008 (except 641134 to 641135 inclusive), #65374, #661791, and #671681.
***Front Suspension:**—Conventional 'I' beam section* front axle with Elliott type ends and semi-elliptic springs. Torque arm at each end of axle connected to frame by rubber-bushed bolt used to maintain axle alignment.
King Pin Inclination—7° crosswise.
NOTE—Kingpin end thrust taken by five loose balls in upper bushing above king pin. Ball seat formed in bushing and on king pin end. To install king pin, assemble sufficient shims to allow .006-.010" endplay below spindle, insert king pin until it enters top bushing, drop 5 loose balls through lubrication fitting hole on top of bushing, insert driver J-479-1 in hole to position balls, drive king pin up into place.
Caster—3½-4½°. To adjust, loosen nut on horizontal arm attaching torque arm to axle yoke, take out capscrew between arm and yoke at top, decrease shim thickness between arm and yoke to increase caster, or increase shim thickness to decrease caster. .060" difference in shim thickness changes caster 1°. Shim thickness on both sides of car must be kept equal.
Camber—1-1½°. No adjustment. Axle may be bent cold for minor corrections.
Toe In—⅛" (0-⅛"). Adjusted in usual manner by loosening clamp nuts and turning tie rod.
Steering Geometry—Inner wheel turned 20°, outer wheel 17°. Check tie rod ends and steering arms for looseness, replace steering arms if bent.

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, Single Anchor type. Brake pedal connected to rear wheel brakes through cable linkage for additional reserve mechanical application of brakes. Hand lever applies rear wheel brakes through this same linkage. *See article in Mechanical Equipment Section.*
Brake Drum Diameters—11 1/16".
Brake Lining—Moulded & Woven type. **Width** 1¾". Thickness 7/32". Length 23 15/16" per wheel.
Brake Clearance—.010" heel and toe of each shoe.
Brake Pedal Adjustment:—For correct mechanical follow-up feature. See article in Brake Section.
Hand Brake Adjustment:—See Service Brakes.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type. Optional equipment.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—First number 73101. Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 90,000. Stamped on left side of cylinder block opposite #6 cylinder.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type.
Bore—3". **Stroke** 5". **Displacement**—212 cu. ins.
Rated Horsepower—21.6 A.M.A.
Developed Horsepower—101 (Std. 6.25-1 Head), 107 (Optl. 7.0-1 head) at 4000 R.P.M.
Compression Ratio & Pressure—Check at cranking speed, spark plugs removed, throttle wide open.
Std. 6.25-1 head .....103 lbs. at 170 R.P.M.
Optl. 7.0-1 head .....119 lbs. at 170 R.P.M.
Vacuum Reading—18-21" at 350 R.P.M. or 7 M.P.H.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. stripped. **Length**—3 3/16".
Removal—Pistons and rods may be removed from above or below.
Clearance—.016" top, .002" skirt (see below).
Original Bore Size:—*See Hudson Shop Notes.*
Replacement Pistons:—*See Hudson Shop Notes.*
Fitting New Pistons:—3-4 lb. tension should be required to withdraw .0015" feeler ½" wide from between piston and cylinder wall on side opposite slot at right angles to pin bosses.
Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin. Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil (both)	3/16"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16".
Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze-bushed. Pins furnished std., .002", .005", .010" oversize.
Pin Fit in Piston—.0003" clearance or hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—Weight 29.4 ozs. **Length** 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order).
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—Laminated shims. Do not file.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.*
Journal Diameters—#1, 2 11/32; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Bronze-backed, babbitt-lined. Furnished std., and unfinished (1/32" extra stock—ream to desired undersize). **Clearance**—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing to adjust. Endplay.006-.012".

CAMSHAFT:—Three bearing. Gear driven.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1½".
Bearing Clearance—.0015".
End Thrust:—Taken by thrust washer assembled between front face of crankcase and rear side of camshaft front flange, and by spring-loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1⅜"	⅜"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.
Valve Guides:—2 9/16" long. Top 1 1/16" below top of block. Finish ream to size after installation.
Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs. Spring check (out of engine)—34 lbs. (min.). at 2".

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See camshaft setting above.
Intake Valves—Open 14° 40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" BTDC. when point on flywheel approximately 3.94 teeth before 'UDC.1-6/' mark lines up with pointer in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flow (pressure and positive splash) system.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—5 qts. (refill), 6 qts. (dry).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect two inlet and one outlet hoses, remove mounting bolts and lift off fan and pump assembly.
Thermostat:—Mounted in cylinder head water outlet.
Setting—Start to open 150-155°F. Fully open 185°F.
Water Capacity:—13 quarts.

CLUTCH:—Own make. Single plate, cork insert type, operating in oil.
See article in Mechanical Equipment Section for data.
Driven Member—Thickness .203". Inside Diameter 5.375", Outside Diam. 8.625". Facing 90 cork inserts.
Automatic Clutch Control:—Optional equipment.
See article in Mechanical Equipment Section for data.
Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis. On cars with Automatic Clutch control, check setting whenever clutch adjusted.
Clutch Oil Servicing:—*See Hudson Shop Notes for data.*
Removal:—Remove transmission (see Transmission Removal following), take out 16 clutch cover capscrews and remove clutch assembly from below.

TRANSMISSION:—Own make. Constant-mesh, helical gears with synchronizing unit (second speed only). Sliding spur gears (low and reverse). Shifter rail locks linked to clutch shaft prevent gear engagement with clutch engaged.
See article in Mechanical Equipment Section for data.
Electric Hand Transmission Control—Optional.
See article in Mechanical Equipment Section for data.
Removal:—Remove Electric Hand and Automatic Clutch Control units and wiring from transmission first, if car so equipped. See separate articles in Mechanical Equipment Section for necessary adjustments on these units when reinstalling. Disconnect transmission side bumpers, interlock straps, speedometer cable, driveshaft at front universal. Take out bell housing-to-engine mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. 1271 (front), 1278 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Semi-floating, spiral bevel gear type.
See article in Mechanical Equipment Section for data.
Ratio—4.11-1 Std., 4.56-1 Optl. 3.89-1, 3.56-1 Special.
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove rear wheel and hub assembly (use screw type hub puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate (allows cap removal without disturbing hand brake operating link), remove shims, pull wheel bearing and axle shaft, disconnect drive shaft at rear universal joint, remove 8 nuts from axle housing stud bolts, withdraw differential carrier.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—Delco Model 1175S (front), 1174T (rear). Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at each end (rubber-bushed bolt at frame).
Torque Arms—*See Hudson Special Shop Notes.*
Kingpin Inclination—7° crosswise. NOTE—Loose ball type thrust bearing used. See 1936 page for data.
Caster—1-2° and equal within ½° for both wheels. To adjust, loosen capscrews at forward end of torque arm, insert shim between arm and axle at upper screw, or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°.
Camber—1-1½°. No adjustment. Make minor corrections by bending axle cold.
Toe In—0-⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 20°. Outer 17¾°.

BRAKES:—Service—Bendix hydraulic, Duo-Servo, Single anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—10 1/16".
Lining—Moulded & woven type. Width 1¾". Thickness 7/32". Length 22⅛" per wheel.
Clearance—.010" heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optional on all models.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—First number 74101 (74), 75101 (75), 76101 (76), 77101 (77). Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 18000 (all models). Stamped on left side of block near front end.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.
Bore—3". **Stroke**—4½".
Displacement—254 cubic inches.
Rated Horsepower—28.8 A.M.A.
Developed Horsepower—122 HP. at 4200 R.P.M.
Compression Ratio—6.25-1 No Optl. Ratios.
Compression Pressure—103 lbs. at 170 R.P.M. cranking speed (plugs removed, throttle wide open).
Vacuum Reading—18-21" at 350 R.P.M. or 7 MPH.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. stripped. **Length**—3 3/16".
Removal—Pistons and rods may be removed from above or below.
Clearance—.016" top, .002" skirt (see below).
Original Bore Size: *See Hudson Shop Notes.*
Replacement Pistons:—*See Hudson Shop Notes.*
Fitting New Pistons:—3-4 lbs. tension should be required to withdraw .0015" feeler ½" wide from between piston and cylinder wall on side opposite slot at right angles to pin bosses.
Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin. Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil (both)	3/16"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16".
Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze-bushed. Pins furnished std., .002", .005", .010" oversize.
Pin Fit in Piston—.0003" clearance or hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—Weight 29.4 ozs. **Length** 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order).
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—Laminated shims. Do not file.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—5 bearing, integral counterweights.
See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.
Journal Diameters—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅜"; #5, 2 13/32".
Bearing Type—Bronze-backed, babbitt-lined. Furnished std. and unfinished (1/32" extra stock—ream to desired undersize). **Clearance**—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing to adjust. Endplay .006-.012".

CAMSHAFT:—Five bearing. Gear driven.
Journal Diameters—#1, 2 1/32"; #2, 2"; #3, 1 31/32"; #4, 1 15/16"; #5, 1½".
Bearing Clearance—.0015".
End Thrust:—Taken by thrust washer assembled between front face of crankcase and rear side of camshaft front flange, and by spring-loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1½"	⅜"	5 3/32"
Exhaust	1⅜"	⅜"	5 3/32"

	Seat Angle	Lift	Side Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003 -.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.
Valve Guides:—2 9/16" long. Top 15/16" below top of block. Finish ream to size after installation.
Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" BTDC. when point on flywheel approximately 3.97 teeth before 'UDC.1-8/' mark lines up with pointer in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flow (pressure and positive splash) system.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—7 qts. (refill), 9 qts. (dry).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect pump hoses, remove mounting bolts and lift off fan and pump assembly.
Thermostat:—Mounted in cylinder head water outlet.
Setting—Start to open 150-155°F. Fully open 185°F.
Water Capacity:—20 quarts.

CLUTCH:—Own make. Single plate, cork insert type operating in oil.
Automatic Clutch Control:—Optional equipment.
See article in Mechanical Equipment Section for data.
Driven Member—Thickness .203". Inside Diameter 6.375", Outside Diam. 9.75". Facing 108 Cork Inserts.
Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis. On cars with Automatic Clutch Control, check setting whenever clutch adjusted.
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal following), take out 16 clutch cover cap-screws and remove clutch assembly from below.

TRANSMISSION:—Own make. Constant-mesh, helical gears with synchronizing unit (second speed only), sliding spur gears (low and reverse). Shifter rail locks linked to clutch shaft prevent gear engagement with clutch engaged.
See article in Mechanical Equipment Section for data.
Electric Hand Transmission Control—Optl.
See article in Mechanical Equipment Section for data.
Removal:—Remove Electric Hand and Automatic Clutch Control units and wiring from transmission first, if cars so equipped. See separate articles in the Mechanical Equipment Section for necessary adjustments on these units when reinstalling. Disconnect transmission side bumpers, interlock straps, speedometer cable, drive shaft at front universal. Take out bell housing-to-engine mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. 1281 (front), 1278 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Semi-floating, spiral bevel gear type.
See article in Mechanical Equipment Section for data.
Ratio—4.11-1 Std., 4.56-1 Optl., 3.89-1, 3.56-1 Special.
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove rear wheel and hub assembly (use screw type hub puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate (allows cap removal without disturbing hand brake operating link), remove shims, pull wheel bearing and axle shaft, disconnect driveshaft at rear universal joint, remove 8 nuts from axle housing stud bolts, withdraw differential carrier.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. Measure endplay by dial indicator clamped to backing plate with plunger against end of axle shaft. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—Delco Model 1175S (front), 1174T (rear). Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at each end (rubber-bushed bolt at frame).
Torque Arms—*See Hudson Special Shop Notes.*
Kingpin Inclination—7° crosswise. NOTE—Loose ball type thrust bearing used. See 1936 page for data.
Caster—1-2° and equal within ½° for both wheels. To adjust, loosen capscrews at forward end of torque arm, insert shim between arm and axle at upper screw or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°.
Camber—1-1½°. Not adjustable.
Toe In:—0-⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 20°. Outer 17¾°.

BRAKES:—Service—Bendix Hydraulic, Duo-servo, Single anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—11 1/16".
Lining—Moulded & Woven type. Width 1¾". Thickness 7/32". Length 23 15/16" per wheel.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optional on all models.
See article in Mechanical Equipment Section for data.

ENGINE HOOD AND SIDE PANELS:—*See Hudson Shop Notes for complete data.*

SERIAL NUMBER:—First number 8928566. Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 8928566. Stamped on top of cylinder block between #1 and #2 exhaust manifold flanges.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type.
Bore—3". **Stroke**—4⅛".
Displacement—175 cubic inches.
Rated Horsepower—21.6 (A.M.A.)
Developed Horsepower—83 HP at 4000 R.P.M.
Compression Ratio—6.50-1 cast-iron head.
Compression Pressure—Approx. 100-105 lbs. at 170 R.P.M. Check with plugs removed and wide open throttle.
Vacuum Reading—18-21" steady at 7 M.P.H.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .002".
Original Bore Sizes & Replacement Pistons:—*See Hudson Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide in extreme right of cylinder, insert piston with slot to left and pin bosses parallel to crankshaft. Tension to withdraw feeler must be within 3-4 lbs.
Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Pinned type, 2 compression, 1 oil ring above pin, one oil ring below pin. 5/16" oil drain holes, 12 drain holes (2 to pin bosses) in upper oil ring groove, 4 holes and 2 slots drilled in lower groove. Rings positioned by pin in grooves.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil (both)	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16".
Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze bushed. Pins furnished standard and .002", .005" and .010" oversize.
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—Weight 30½ oz. **Length** 8⅝".
Crankpin Journal Diameter—1 15/16".
See Hudson Shop Notes for Connecting Rod change.
Lower Bearing—Spun-babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order).
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods. After tightening bolt nuts, install new palnut (smooth face to nut), turn palnut on bolt with fingers until tight, then lock in place by turning with wrench an additional ¼-⅓ turn.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights
See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Bronze-backed, babbitt-lined. Furnished std. and unfinished (1/32" extra stock).
Clearance—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing to adjust. **Endplay**—.006-.012".

CAMSHAFT:—Three bearing. Gear driven.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1½".
Bearing Clearance—.0025".
End Thrust:—Taken by thrust washer assembled between front face of crankcase and rear side of camshaft front flange, and by spring loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

See Hudson Shop Notes for valve tool data.
Tappet Clearance—.006" Int., .008" Exh., engine hot.
Valve Guides: 2 9/16" long. Top 1 1/16" below top of block. Finish ream to size after installation.
Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs. Spring check (out of engine)—34 lbs. (min.) at 2".

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for valve lifter removal instructions.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44'ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0441" before top dead center when a point on the flywheel approximately 3.97 teeth before dead center mark 'U.D.C.1-6/' lines up with pointer in inspection hole in front face of left rear motor support. Reset tappet clearance at .006" with engine warm.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flow (pressure and positive splash) system. Force feed by oil pump to connecting rod oil troughs and timing gears, splash to all other bearing points.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right center of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located at right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. Operated by oil pressure regulator.
See article in Electrical Equipment Section.
Checking Oiling System:—See Hudson Shop Notes.
Crankcase Capacity:—5½ qts. (dry), 4½ qts. refill).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect hoses at pump, remove mounting bolts, lift fan and pump assembly off.
Thermostat:—Mounted in cylinder head water outlet.
Setting—Start to open 150-155°F. Fully open 185°F.
Water Capacity:—12 quarts.

CLUTCH:—Own make. Single plate, cork insert type operating in oil.
See article in Mechanical Equipment Section for data.
Driven Member—Thickness .203". Inside Diameter 5.375". Outside Diam. 8.625". Facing 90 cork inserts.
Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis for proper clearance.
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal following), take out 16 clutch cover capscrews and remove clutch assembly from below.

TRANSMISSION:—Own make. Constant-mesh, helical gears with synchronizing unit (second and high speeds), sliding spur gears (low and reverse).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect speedometer cable and drive shaft at front universal. Support engine at rear and take out rear mounting bolts. Remove bell housing to engine mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. 1271 (front), 1278 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Semi-floating, spiral bevel gear type.
See article in Mechanical Equipment Section for data.
Ratio—4 1/9 Std. 4 5/9 optional.
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove rear wheel and hub assembly (use screw type puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate (allows cap removal without disturbing hand brake operating link), remove shims, pull wheel bearing and axle shaft, disconnect drive shaft at rear universal joint, remove 8 nuts from axle housing-to-carrier stud bolts, withdraw differential carrier assembly without disturbing axle housing.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. Measure endplay by dial indicator clamped to backing plate with plunger against end of axle shaft. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—Monroe—156778 (front), 156578 or 156779 (rear). Hydraulic, direct acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam front axle with Elliott ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise. See Kingpin Thrust bearing data in Hudson Shop Notes.
Caster—2-2½° and equal within ½° for both wheels. Adjusted in usual manner by wedge shims between spring seat on axle and spring.
Camber—1-1½°. No adjustment. Make minor corrections by bending axle cold.
Toe In—0-⅛". Measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Bendix Hydraulic, Duo-Servo, double anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—9 1/16".
Lining—Moulded (primary), woven (secondary). Width 1¾". Thickness 3/16". Length per wheel 19".
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.

SERIAL NUMBER:—First number 83101. Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 83101. On boss on left side of block near top front or on top of block between #1 and #2 exhaust manifold flanges.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3". **Stroke**—5". **Displacement**—212 cu. ins. **Rated Horsepower**—21.6 A.M.A. **Developed Horsepower**—101 (Std. 6.25-1 Head), 107 (Optl. 7.0-1 head) at 4000 R.P.M. **Compression Ratio & Pressure**—Check at cranking speed, spark plugs removed, throttle wide open.

Std. 6.25-1 head .....103 lbs. at 170 R.P.M.
Optl. 7.0-1 head .....119 lbs. at 170 R.P.M.

Vacuum Reading—18-21" at 350 RPM. or 7 MPH.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons. **Weight**—10.5 ozs. stripped. **Length**—3 3/16". **Removal**—Pistons and rods may be removed from above or below. **Clearance**—.016" top, .002" skirt (see below).

Original Bore Size:—*See Hudson Shop Notes.*

Replacement Pistons:—*See Hudson Shop Notes.*

Fitting New Pistons:—3-4 lb. tension should be required to withdraw .0015" feeler ½" wide from between piston and cylinder wall on side opposite slot at right angles to pin bosses.

Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin. Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil (both)	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16". Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze-bushed. Pins furnished std., .002", .005", .010" oversize.

Pin Fit in Piston—.0003" clearance or hand push fit with piston heated to 200° F.

Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—Weight—30.3 oz. **Length** 8 3/16". **Crankpin Journal Diameter**—1 15/16". *See Hudson Shop Notes for Connecting Rod change.* **Lower Bearing**—Spun-babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order). **Clearance**—.001". **Sideplay**—.006-.010".

Bearing Adjustment:—None (no shims). Replace rods. *See Hudson Shop Notes for connecting rod palnut (locknut) installation instructions.*

Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.* **Journal Diameters**—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32". **Bearing Type**—Bronze-backed, babbitt-lined. Furnished std., and unfinished (1/32" extra stock—ream to desired undersize). **Clearance**—.001".

Bearing Adjustment:—Shims. *See Hudson Shop Notes.*

End Thrust:—Taken by center bearing. Replace bearing to adjust. Endplay .006-.012".

CAMSHAFT:—Three bearing. Gear driven. **Journal Diameters**—#1, 2"; #2, 1 31/32"; #3, 1½". **Bearing Clearance**—.0025".

End Thrust:—Taken by thrust washer assembled between front face of crankcase and rear side of camshaft front flange, and by spring-loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.

Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.

Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—Lighter valves (smaller stem diameter) used, than on previous models. New pilot size necessary for servicing tools. *See Hudson Shop Notes for data.*

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.

Valve Guides:—2 9/16" long. Top 1 1/16" below top of block. Finish ream to size after installation.

Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs. Spring check (out of engine)—34 lbs. (min.). at 2".

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*

Valve Timing:—See camshaft setting above. **Intake Valves**—Open 10°40' BTDC. Close 60° ALDC. **Exhaust Valves**—Open 50° BLDC. Close 18°44' ATDC. These figures correct with .010" tappet clearance. **To Check Timing**—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" BTDC. when point on flywheel approximately 3.94 teeth before 'UDC.1-6/' mark lines up with pointer in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flow (pressure and positive splash) system.

Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase. **Normal Oil Pressure**—3 lbs. (no gauge).

Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.

Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*

Checking Oiling System:—*See Hudson Shop Notes.*

Crankcase Capacity:—5 qts. (refill), 6 qts. (dry). NOTE—Capacity decreased ½ qt. after car #43845.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type. *See article in Mechanical Equipment Section for data.* **Removal**—With water drained and fan belt removed, disconnect two inlet and one outlet hoses, remove mounting bolts and lift off fan and pump assembly.

Thermostat:—Mounted in cylinder head water outlet. **Setting**—Start to open 150-155°F. Fully open 185°F.

Water Capacity:—12½ quarts.

CLUTCH:—Own make. Single plate, cork insert type, operating in oil. *See article in Mechanical Equipment Section for data.* **Driven Member**—Thickness .203". Inside Diameter 6.375". Outside Diam. 9.75". Facing 108 cork inserts.

Automatic Clutch Control:—Optional equipment. *See article in Mechanical Equipment Section for data.*

Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis. On cars with Automatic Clutch control, check setting whenever clutch adjusted.

Clutch Oil Servicing:—*See Hudson Shop Notes for data.*

Removal:—Remove transmission (see Transmission Removal following), take out 16 clutch cover capscrews and remove clutch assembly from below.

TRANSMISSION:—Own make. Constant-mesh, helical gears with synchronizing unit (second and high speed only). Sliding spur gears (low and reverse). **Electric Hand Transmission Control**—Optl. *See article in Mechanical Equipment Section for data.*

Removal:—Remove Electric Hand and Automatic Clutch Control units and wiring from transmission first, if car model so equipped. See separate articles in Mechanical Equipment Section for necessary adjustments on these units when reinstalling. Disconnect transmission side bumpers, interlock straps, speedometer cable, driveshaft at front universal. Support engine at rear and free rear engine mounting. Take out bell housing-to-engine mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. 1271 (front), 1278 (rear). Needle bearing type. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—Own make. Semi-floating, spiral bevel type. *See article in Mechanical Equipment Section.* **Ratios**—4 1/9-1 Std. 4 5/9-1, 3 5/9-1, 3 8/9-1 Optl. **Backlash**—.0005-.003". Screw adjustment.

Removal:—Remove rear wheel and hub assembly (use screw type hub puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate (allows cap removal without disturbing hand brake operating link), remove shims, pull wheel bearing and axle shaft, disconnect drive shaft at rear universal joint, remove 8 nuts from axle housing stud bolts, withdraw differential carrier.

Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—Delco. Model 1164-S (front), 1163-T (rear). Direct acting, hydraulic type. *See article in Mechanical Equipment Section for data.*

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-Roller type. *See article in Mechanical Equipment Section for data.*

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at each end (rubber-bushed bolt at frame). **Kingpin Inclination**—7° crosswise. *See Hudson Shop Notes for Kingpin Thrust Bearing data.* **Caster**—1-2° and equal within ½° for both wheels. To adjust, loosen capscrews at forward end of torque arm, insert shim between arm and axle at upper screw, or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°. **Camber**—1-1½°. No adjustment. Make minor corrections by bending axle cold. **Toe In**—0-⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod. **Steering Geometry**—Inner wheel 20°. Outer 17¾°.

BRAKES:—Service—Bendix hydraulic, Duo-Servo, Single anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.* **Drum**—Alloy-steel. Diameter—10 1/16". **Lining**—Moulded (primary), woven (secondary). Width 1¾".Thickness 3/16". Length 22⅛" per wheel. **Clearance**—.010" heel and toe of each shoe.

Hand Brake:—See Service Brakes above.

Hill-Holder:—Optional on all models. *See article in Mechanical Equipment Section for data.*

SERIAL NUMBER:—First number 84101 (84), 85101 (85), 87101 (87). Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number same as serial number. Stamped on boss on left side of block near top front or on top of block between #1 and #2 exhaust manifold flanges.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.
Bore—3". **Stroke**—4½".
Displacement—254 cubic inches.
Rated Horsepower—28.8 A.M.A.
Developed Horsepower—122 HP. at 4200 R.P.M.
Compression Ratio—6.25-1 No Optl. Ratios.
Compression Pressure—103 lbs. at 170 R.P.M. cranking speed (plugs removed, throttle wide open).
Vacuum Reading—18-21" at 350 RPM. or 7 MPH.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. stripped. **Length**—3 3/16".
Removal—Pistons and rods may be removed from above or below.
Clearance—.016" top, .002" skirt (see below).
Original Bore Size: *See Hudson Shop Notes.*
Replacement Pistons:—*See Hudson Shop Notes.*
Fitting New Pistons:—3-4 lbs. tension should be required to withdraw .0015" feeler ½" wide from between piston and cylinder wall on side opposite slot at right angles to pin bosses.
Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin. Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil (both)	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16".
Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze-bushed. Pins furnished std., .002", .005", .010" oversize.
Pin Fit in Piston—.0003" clearance or hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—Weight 30.3 oz. **Length** 8 3/16". **Crankpin Journal Diameter**—1 15/16".
See Hudson Shop Notes for Connecting Rod change.
Lower Bearing—Spun babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order).
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods. *See Hudson Shop Notes for connecting rod palnut (locknut) installation instructions.*
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—5 bearing with integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.*
Journal Diameters—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅜"; #5, 2 13/32".
Bearing Type—Bronze-backed, babbitt-lined. Furnished std. and unfinished (1/32" extra stock—ream to desired undersize). **Clearance**—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing to adjust. Endplay .006-.012".

CAMSHAFT:—Five bearing. Gear driven.
Journal Diameters—#1, 2 1/32"; #2, 2"; #3, 1 31/32"; #4, 1 15/16"; #5, 1½".
Bearing Clearance—.0025".
End Thrust:—Taken by thrust washer assembled between front face of crankcase and rear side of camshaft front flange, and by spring-loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—Lighter valves (smaller stem diameter) used, than on previous models. New pilot size necessary for servicing tools. *See Hudson Shop Notes for data.*

	Head Diameter	Stem Diameter	Length
Intake	1½"	11/32"	5 3/32"
Exhaust	1⅜"	11/32"	5 3/32"

	Seat Angle	Lift	Side Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.
Valve Guides:—2 9/16" long. Top 15/16" below top of block. Finish ream to size after installation.
Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" BTDC. when point on flywheel approximately 3.97 teeth before 'UDC.1-8/' mark lines up with pointer in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flow (pressure and positive splash) system.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator.
See article in Electrical Equipment Section.
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—7 qts. (refill), 9 qts. (dry).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect pump hoses, remove mounting bolts and lift off fan and pump assembly.
Thermostat:—Mounted in cylinder head water outlet.
Setting—Start to open 150-155°F. Fully open 185°F.
Water Capacity:—17½ quarts.

CLUTCH:—Own make. Single plate, cork insert type operating in oil.
Automatic Clutch Control:—Optional equipment.
See article in Mechanical Equipment Section for data.
Driven Member—Thickness .203". Inside Diameter 6.375", Outside Diam. 9.75". Facing 108 Cork Inserts.
Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis. On cars with Automatic Clutch control, check setting whenever clutch adjusted.
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal following), take out 16 clutch cover capscrews and remove clutch assembly from below.

TRANSMISSION:—Own Make. Constant-mesh, helical gears with synchronizing unit (second and high speeds), sliding spur gears (low and reverse).
Electric Hand Transmission Control—Optl.
See article in Mechanical Equipment Section for data.
Removal:—Remove Electric Hand and Automatic Clutch Control units and wiring from transmission first, if car model so equipped. See separate articles in Mechanical Equipment Section for necessary adjustments on these units when reinstalling. Disconnect transmission side bumpers, interlock straps, speedometer cable, drive shaft at front universal. Support engine at rear, free rear engine mounting. Take out bell housing-to-engine mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—Spicer. 1281 (front), 1288 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Semi-floating, spiral bevel type. *See article in Mechanical Equipment Section.*
Ratios—4 1/9-1 Std. 4 5/9-1, 3 5/9-1, 3 8/9-1 Optl. **Backlash**—.0005-.003". Screw adjustment.
Removal:—Remove rear wheel and hub assembly (use screw type hub puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate (allows cap removal without disturbing hand brake operating link), remove shims, pull wheel bearing and axle shaft, disconnect driveshaft at rear universal joint, remove 8 nuts from axle housing stud bolts, withdraw differential carrier.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. Measure endplay by dial indicator clamped to backing plate with plunger against end of axle shaft. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—Delco. Model 1164-S (front), 1163-T (rear). Direct acting hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at each end (rubber-bushed bolt at frame).
Kingpin Inclination—7° crosswise. *See Hudson Shop Notes for Kingpin Thrust Bearing data.*
Caster—1-2° and equal within ½° for both wheels. To adjust, loosen capscrews at forward end of torque arm, insert shim between arm and axle at upper screw or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°.
Camber—1-1½°. Not adjustable.
Toe In:—0-⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 20°. Outer 17¾°.

BRAKES:—Service—Bendix Hydraulic, Duo-servo, Single anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—11 1/16".
Lining—Moulded (primary), woven (secondary). Width 1¾". Thick 3/16". Length 23 15/16" per wheel.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optional on all models.
See article in Mechanical Equipment Section for data.

CRANKSHAFT SIZE CODE:—*See Hudson Shop Notes.*

ENGINE BONNET LOCK, HOOD, SIDE PANEL AND DUST SHIELD REMOVAL:—*See Hudson Shop Notes*

BUSINESS CAR NOTE:—Model 90 (112" W.B.) and 98 (sedan only) use the 112 Engine (3"x4⅛"). Model 98 (119" W.B. except sedan) use the Six (3"x 5").

SERIAL NUMBER:—First number 90101 (90), 98101 (98). On plate on right front door hinge pillar post.

ENGINE NUMBER:—Same as Serial Number (above). Stamped on top of cylinder block between #1 and #2 exhaust manifold flanges.

ENGINE SPECIFICATIONS (90):—6 cylinder, 'L' head.
Bore—3". **Stroke**—4⅛".
Displacement—175 cu. ins. **Rated HP**—21.6.
Developed Horsepower—86 HP. at 4000 RPM.
Compression Ratio—6.50-1. Cast-iron head.
Compression Pressure—115 lbs. at 125 RPM.
Vacuum Reading—Steady 18-21" at 7 MPH.
See Hudson Shop Notes for Engine Assembly removal.

ENGINE SPECIFICATIONS (98):—See following page.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .001-.002".
Original Bore Sizes & Replacement Pistons:—*See Hudson Shop Notes for complete data.*
Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil rings (1 above pin, 1 below pin). Rings positioned by pin in groove. *See Hudson Shop Notes for Piston Ring change.*

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16". Floating type. Pin hole in rod bronze bushed. Pins furnished std. and .002", .005", .010" oversize.
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing:—.0003" clearance.

CONNECTING ROD:—**Weight** 30.75 ozs.(90), 30 ozs.(98).
Length—8⅝" (90), 8 3/16" (98).
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun babbitt. Exchange rods furnished std. and undersize. *See Hudson Shop Notes for Connecting Rod change and Palnut data.*
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal, Installation, Replacement Bearings and Line-reaming data.*
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Bronze-backed, 'Bermax' alloy.
Clearance—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing only adjustment. **Endplay**—.006-.012".

CAMSHAFT:—3 bearing, gear driven. *See Hudson Shop Notes for Camshaft Removal and 'Granoseal' treatment.*
Journal Diameters—#1. 2"; #2, 1 1/32"; #3, 1½".
Bearing Clearance—.0025".
End Thrust:—Thrust washer between camshaft flange and crankcase and spring loaded button in camshaft hub bearing against thrust plate on cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance:—.006" Int., .008" Exh., hot. *See Hudson Shop Notes for Front Fender Dust Shield removal.*
Valve Guides:—2 9/16" long. Install with top 1 1/16" below top of block and finish ream to size.
Valve Springs:—Free length 2 17/64". See that dampener installed on bottom of spring with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 18°44'ATDC. These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0441" (90), .0562" (98) BTDC. when point on flywheel approximately 3.95 teeth before 'UDC.1-6/' mark lines up with indicator in inspection hole in left rear motor support. Reset tappets(see above).
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flo (pressure & positive splash).
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity—4½ qts. (refill). NOTE—Install 1 qt. add'tl. oil in upper tray when pan installed.

COOLING SYSTEM:—**Capacity**—12½ quarts.
See Hudson Shop Notes for Radiator Core removal.
Water Pump:—Centrifugal, belt driven, packless type. *See article in Mechanical Equipment Section.*
Removal—Drain water, remove fan belt, disconnect pump hoses, remove mounting bolts and lift off
Thermostat:—Fulton. In cylinder head water outlet.
Setting—Start to open 150-155°F. Fully open 185°F.
Temperature Gauge:—King-Seeley Electric. K-S Nos. Dash Units—7170 (Pass. Cars), 7096 (Comm'l.), 7121 (Sta. Wagon). Engine Unit—No. 7000 (all models). *See article in Mechanical Equipment Section.*

CLUTCH:—**Own Make.** Single plate, cork insert type operating in oil. *See Mechanical Equipment Section.*
Driven Member—Thickness (cork) .244-.255".

	Inside Diam.	Outside Diam.	No. Corks
90, 98 Sedan	5⅜"	8 23/32"	90
98 (exc. Sedan)	6½"	9 27/32"	108

Adjustment:—Pedal free movement 1½". To adjust, remove clevis pin on link at throw-out shaft lever, loosen locknut, turn clevis. Check Automatic Clutch and Hill-holder. *See Mechanical Equipment Section.*
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal below), take out mounting screws in clutch cover rim, remove clutch assembly from below.
Automatic Clutch Control:—Electric type. Optl. *See article in Mechanical Equipment Section for data.*

TRANSMISSION:—**Own Make**—Constant-mesh, helical gears with synchronizing unit (second and high speeds), sliding spur gears (low and reverse).
Transmission Control:—Hudson 'Handy-Shift'. Optl. on Utility and Business cars. Std. on pass. cars. *See articles in Mechanical Equipment Section for data.*
Removal:—Disconnect 'Handy-Shift' controls at transmission and remove Automatic Clutch Control unit (if used)—see articles in Mechanical Equipment Section for adjustment of these units when re-installed. On cars with 'Handy-Shift' remove transmission cover (install temporary cover to keep transmission clean until removed from car). Disconnect speedometer cable and front universal. Remove transmission side bumpers. Raise front end of car, support engine at rear. Remove flywheel guard, rear engine mounting bolts, clutch cross shaft (2 screws in bracket), shift engine to right. Take out clutch housing-to-engine support bolts.

UNIVERSAL JOINTS:—**Spicer**—Front, 1271-01X (early 90), 1261-01X (late 90), 1281-01X (98). Rear, 1278-01X (early 90 ,all 98), 1268-01X (late 90). Needle bearing. *See Mechanical Equipment Section for data.*

REAR AXLE:—**Own Make**—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4 1/9-1 (Std. 90 pass. cars; Optl. 90, 98 Bus. Cars), 4 5/9-1 (Optl. 90 Pass.; Std. 90, 98 Bus. Cars).
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove wheel and hub assembly (use screw type puller), remove nuts on 4 bearing cap bolts, push bolts back through backing plate, remove cap (without disturbing brake link), remove shims, pull axle shaft and wheel bearing. Disconnect drive shaft at rear universal, remove nuts on housing to carrier studs, withdraw carrier.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see Removal directions above), add or remove shims equally at both wheels. **Endplay**—.002-.004".

SHOCK ABSORBERS:—**Monroe**—156778 (front—all models), 157800 (rear—pass. cars). Direct acting, hydraulic type. NOTE—Rear shocks optl. on Business Cars. *See Mechanical Equipment Section.*

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with push-pull adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Conventional 'I' beam section axle with Elliott type ends and semi-elliptic springs.
Autopoise Control—*See Hudson Shop Notes.*
Kingpin Inclination—7° crosswise. *See Hudson Shop Notes for Kingpin Thrust Bearing servicing data.*
Caster—1-2° (equal for both wheels within ½°). Adjust with wedge shims between axle and spring.
Camber—1-1½°. Bend axle cold for minor changes.
Toe-In—0-⅛". Measure on inside of rims 10" above ground. Adjust by turning tie rod.
Steering Geometry—Inner Wheel 20°. Outer 17¼°.

BRAKES:—**Service**—Bendix Hydraulic, duo-servo, Double Anchor (90 pass. cars, Utility Coach and Coupe), Single Anchor (90 others, 98) with mechanical follow-up (pedal linked to hand brake cables). Hand lever applies all four service brakes. *See articles in Mechanical Equipment Section for data.*
Drum—Alloy steel. Diameter 9 1/16"(90 pass. cars, Utility Coach & Coupe), 10 1/16" (90 others, 98).
Lining—Moulded (primary), woven (secondary). Thickness 7/32". Width 1¾". Length per wheel 19" (90 pass. cars, Utility Coach & Coupe), 22⅛" (90 others, 98).
See Hudson Shop Notes for Brake Lining change.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optl. *See Mechanical Equipment Section.*

MODEL 98 NOTE:—Engine specifications listed below include Model 98. For all other Model 98 data see Models 90, 98 on preceding page.

CRANKSHAFT SIZE CODE:—*See Hudson Shop Notes.*

ENGINE BONNET LOCK, HOOD, SIDE PANEL AND DUST SHIELD REMOVAL:—*See Hudson Shop Notes*

SERIAL NUMBER:—First No. 9132576 (91), 92101 (92,) 93101 (93). Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—Same as Serial Number (above). Stamped on top of cylinder block between #1 and #2 exhaust manifold flanges.

ENGINE SPECIFICATIONS (91, 92, 93, 98):—6 Cylinder, 'L' head. **Bore**—3". **Stroke**—5".
Displacement—212 cu. ins. **Rated HP**—21.6.
Developed Horsepower—96 HP, at 3900 RPM. (91, 92 single carb., 98), 101 @ 4000 RPM. (92 dual carb., 93).
Compression Ratio—6.25-1. Cast-iron head.
Compression Pressure—120 lbs. at 125 RPM.
Vacuum Reading—Steady 18-21" at 7 MPH.
See Hudson Shop Notes for Engine Assembly removal.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .001-.002".
Original Bore Sizes & Replacement Pistons:—*See Hudson Shop Notes for complete data.*
Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil rings (1 above pin, 1 below pin). Rings positioned by pin in groove.
See Hudson Shop Notes for Piston Ring change.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16". Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze bushed. Pins furnished standard and .002", .005" and .010" oversize.
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—**Weight** 30 ozs. **Length** 8 3/16". **Crankpin Journal Diameter**— 1 15/16".
Lower Bearing—New 'Bermax' alloy spun type. Exchange rods furnished std. and undersize. *See Hudso Shop Notes for Connecting Rod change and Palnut installation instructions.*
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None(no shims).Replace rods.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal, Installation, Replacement Bearings and Line-reaming data.*
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Bronze-backed, 'Bermax' alloy.
Clearance—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing only adjustment. **Endplay**—.006-.012".

CAMSHAFT:—3 bearing, gear driven. *See Hudson Shop Notes for Camshaft Removal and 'Granoseal' treatment.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1½".
Bearing Clearance—.0025".
End Thrust:—Thrust washer between camshaft flange and crankcase and spring loaded button in camshaft hub bearing against thrust plate on cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance—.006" Int., .008" Exh., engine hot. NOTE—Remove right front fender dust shield for access to valves. *See Hudson Shop Notes for data.*
Valve Guides:—2 9/16" long. Install with top 1 1/16" below top of block and finish ream to size.
Valve Springs:—Free length 2 17/64". See that dampener installed on bottom of spring with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 18°44'ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" BTDC. when point on flywheel approximately 3.94 teeth before 'UDC.1-6/' mark lines up with indicator in inspection hole in front face of left rear motor support. Reset tappet cl. .006" hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flo (pressure & positive splash).
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—4½ qts. (refill). NOTE—Install 1 qt. add'tl. oil in upper tray when pan installed.

COOLING SYSTEM:—**Capacity**—12½ quarts.
See Hudson Shop Notes for Radiator Core removal.
Water Pump:—Centrifugal, belt driven, packless type.
See article in Mechanical Equipment Section.
Removal—Drain water, remove fan belt, disconnect pump hoses, remove mounting bolts and lift off
Thermostat:—Fulton. In cylinder head water outlet.
Setting—Start to open 150-155°F. Fully open 185°F.
Temperature Gauge:—King-Seeley Electric. K-S Nos: Dash Unit—7121 (91, 92), 7420 (93). Engine Unit—No. 7000 (all models).
See article in Mechanical Equipment Section for data.

CLUTCH:—**Own Make.** Single plate, cork insert type operating in oil. *See Mechanical Equipment Section.*
Driven Member—Thickness (cork) .244-.255".

	Inside Diam.	Outside Diam.	No. Corks
91, 92	5⅜"	8 23/32"	90
93	6½"	9 27/32"	108

Adjustment:—Pedal free movement 1½". To adjust, remove clevis pin on link at throw-out shaft lever, loosen locknut, turn clevis. Check Automatic Clutch Control and Hill-Holder Adjustment.
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal below), take out mounting screws in clutch cover rim, remove clutch assembly from below.
Automatic Clutch Control:—Electric type. Optl.
See article in Mechanical Equipment Section for data.

TRANSMISSION:—**Own Make**—Constant-mesh, helical gears with synchronizing unit (second and high speeds), sliding spur gears (low and reverse).
Transmission Controls:—Hudson 'Handy-Shift' std. Electric Hand Transmission Control optional.
See articles in Mechanical Equipment Section for data.
Removal: *See preceding Hudson '112' Model 90 page for instructions.* Before removing transmission on cars with Electric Hand, disconnect wires, vacuum and air hoses, and remove power unit.

UNIVERSAL JOINTS:—**Spicer—1271-01X (front), 1278-01X (rear).** Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, Spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4 1/9-1 standard. 4 5/9-1 optional.
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove wheel and hub assembly (use screw type puller), remove nuts on 4 bearing cap bolts, push bolts back through backing plate, remove cap (without disturbing brake link), remove shims, pull axle shaft and wheel bearing. Disconnect drive shaft at rear universal, remove nuts on housing to carrier studs, withdraw carrier.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see Removal directions above), add or remove shims equally at both wheels. **Endplay**—.002-.004".

SHOCK ABSORBERS:—Direct acting hydraulic types.

Car Model	Make	Front	Rear
91, 92	Monroe	157400	157801
93 (Dom. & Exp.)	Delco	1113-R	1120-S
91, 92, 93 (Exp.)	Delco	1132-S	1131-T

See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model No. 305 Worm-and-Roller type with push-pull adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at side of each spring seat and held by rubber-bushed bolt at frame rail.
Autopoise Control—*See Hudson Shop Notes.*
Kingpin Inclination—7° crosswise. *See Hudson Shop Notes for Kingpin Thrust Bearing data.*
Caster—1-2° and equal within ½° for both wheels. To adjust, loosen capscrews at forward end of torque arm, insert shim between arm and axle at upper screw, or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°.
Camber—1-1½°. Bend axle cold for minor changes.
Toe In—0-⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 20°. Outer 17¼°.

BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, Single anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—10 1/16".
Lining—Moulded (primary), woven (secondary shoe). Width 1¾". Thickness 7/32". Length 22⅛" per wheel.
See Hudson Shop Notes for Brake Lining change.
Clearance—.010" heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optl. *See Mechanical Equipment Section.*

CRANKSHAFT SIZE CODE:—*See Hudson Shop Notes.*
ENGINE BONNET LOCK, HOOD, SIDE PANEL AND DUST SHIELD REMOVAL:—*See Hudson Shop Notes*
SERIAL NUMBER:—1st number 95101 (95), 97101 (97). On plate on right front door hinge pillar post.
ENGINE NUMBER:—1st number same as Serial Number (above). Stamped on top of cylinder block between #1 and #2 exhaust manifold flanges.
ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type. **Bore**—3". **Stroke**—4½". **Displacement**—254 cu. ins. **Rated Horsepower**—28.8 A.M.A. **Developed Horsepower**—122 HP. at 4200 R.P.M. **Compression Ratio**—6.25-1 cast-iron head. **Compression Pressure**—103 lbs. at 170 R.P.M. cranking speed (plugs removed, throttle wide open). **Vacuum Reading**—18-21" at 350 RPM. or 7 MPH. *See Hudson Shop Notes for Engine Assembly removal.*
PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons. **Weight**—10.5 ozs. (stripped). **Length**—3 3/16". **Removal**—Piston and rod assemblies may be removed from above or below. **Clearance**—Top .016". Skirt .001-.002".
Original Bore Sizes and Replacement Pistons:—*See Hudson Shop Notes for complete data.*
Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs.
Installing Pistons:—Slot away from camshaft.
PISTON RINGS:—2 compression, 2 oil rings, (1 above pin, 1 below pin). Rings positioned by pin in groove. *See Hudson Shop Notes for Piston Ring change.*

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*
PISTON PIN:—**Diameter**—¾". **Length**—2 7/16". Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze bushed. Pins furnished standard and .002", .005" and .010" oversize. **Pin Fit in Piston**—.0003" clearance (hand push fit) with piston heated to 200° F. **Pin Fit in Rod Bushing**—.0003" clearance.
CONNECTING ROD:—**Weight** 30 ozs. **Length** 8 3/16". *See Hudson Shop Notes for Connecting Rod change and Palnut installation instructions.* **Crankpin Journal Diameter**—1 15/16". **Lower Bearing**—New 'Bermax' (lead alloy) spun type with steel side-thrust faces. Rods with finished bearings furnished on exchange basis Std. and Undersize (special order). **Clearance**—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.
CRANKSHAFT:—5 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal, Installation, Replacement Bearings and Line-reaming data.* **Journal Diameters**—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅜"; #5, 2 13/32". **Bearing Type**—Bronze-backed, 'Bohnolloy' type. **Clearance**—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing only adjustment. **Endplay**—.006-.012".
CAMSHAFT:—5 bearing, gear driven. *See Hudson Shop Notes for Camshaft Removal and 'Granoseal' treatment.* **Journal Diameters**—#1, 2 1/32"; #2, 2"; #3, 1 31/32"; #4, 1 15/16"; #5, 1½". **Bearing Clearance**—.0025".
End Thrust:—Thrust washer between camshaft flange and crankcase and spring loaded button in camshaft hub bearing against thrust plate on cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Gears marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.
VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1½"	11/32"	5 3/32"
Exhaust	1⅜"	11/32"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance—.006" Int., .008" Exh., engine hot. NOTE—Remove right front fender dust shield for access to valves *See Hudson Shop Notes for data.*
Valve Guides:—2 9/16" long. Install with top 1 1/16" below top of block and finish ream to size.
Valve Springs:—Free length 2 17/64". See that dampener installed on bottom of spring with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 10°40' BTDC. Close 60° ALDC. **Exhaust Valves**—Open 55° BLDC. Close 18°44'ATDC. These figures correct with .010" tappet clearance. **To Check Timing**—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0494" BTDC. when point on flywheel approximately 3.97 teeth before 'UDC.1-8/' mark lines up with indicator in inspection hole in front face of left rear motor support. Reset tappet cl. .006" hot. **Motor Gauge**—Weidenhoff Adapter #114, Rod #44.
LUBRICATION:—Duo-flo (pressure and positive splash) Automatic Lubrication System.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase. **Normal Oil Pressure**—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—7 quarts (refill). NOTE—Install 2 qts. additional oil in upper tray when installing pan.
COOLING SYSTEM:—**Capacity**—17½ quarts. *See Hudson Shop Notes for Radiator Core removal.*
Water Pump:—Centrifugal, belt driven, packless type. *See article in Mechanical Equipment Section.* **Removal**—Drain water, remove fan belt, disconnect pump hoses, remove mounting bolts and lift off fan and pump assembly.
Thermostat:—Fulton. In cylinder head water outlet. **Setting**—Start to open 150-155° F. Fully open 185° F.
Temperature Gauge:—King-Seeley Electric. K-S Nos. Dash Unit—7420, Engine Unit—7000. *See article in Mechanical Equipment Section for data.*
CLUTCH:—**Own Make.** Single plate, cork insert type operating in oil. *See Mechanical Equipment Section.* **Driven Member**—Thickness (cork) .245-.255". Inside Diam. 6½". Outside Diam. 9 27/32". 108 cork inserts.
Adjustment:—Pedal free movement 1½". To adjust, remove clevis pin on link at throw-out shaft lever, loosen locknut, turn clevis. Check Automatic Clutch Control & Hill Holder adjustment. *See Mechanical Equipment Section articles for data.*
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal below), take out mounting screws in clutch cover rim, remove clutch assembly from below.
Automatic Clutch Control:—Electric type. Optl. *See article in Mechanical Equipment Section for data.*
TRANSMISSION:—**Own Make.** Constant-mesh, helical gears with synchronizing unit (second and high speeds), sliding spur gears (low and reverse).
Transmission Controls:—Hudson 'Handy-Shift' std. Electric Hand Transmission Control optional. *See articles in Mechanical Equipment Section for data.*
Removal:—*See preceding Hudson '112' Model 90 page for instructions.* Before removing transmission on cars with Electric Hand, disconnect wires, vacuum and air hoses, and remove power unit.
UNIVERSAL JOINTS:—**Spicer—1281-01X (front), 1278-01X (rear).** Needle bearing type. *See article in Mechanical Equipment Section for data.*
REAR AXLE:—**Own Make.** Semi-floating, spiral bevel gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.* **Ratio**—4 1/9-1 standard. 4 5/9-1 optional. **Backlash**—.0005-.003". Screw adjustment.
Removal:—Remove wheel and hub assembly (use screw type puller), remove nuts on 4 bearing cap bolts, push bolts back through backing plate, remove cap (without disturbing brake link), remove shims, pull axle shaft and wheel bearing. Disconnect drive shaft at rear universal, remove nuts on housing to carrier studs, withdraw carrier.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see Removal directions above), add or remove shims equally at both wheels. **Endplay**—.002-.004".
SHOCK ABSORBERS:—**Delco.** Front—1113-R, 1132-S (Export), Rear—1120-S, 1131-T (Export). Direct acting, hydraulic type. Export type adjustable. *See articles in Mechanical Equipment Section for data.*
STEERING:—**Steering Gear**—Gemmer Model No. 305 Worm-and-Roller type with push-pull adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at side of each spring seat and held by rubber-bushed bolt at frame rail. **Autopoise Control**—*See Hudson Shop Notes.* **Kingpin Inclination**—7° crosswise. *See Hudson Shop Notes for Kingpin Thrust Bearing data.* **Caster**—1-2° and equal within ½° for both wheels. To adjust, loosen capscrews at forward end of torque arm, insert shim between arm and axle at upper screw, or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°. **Camber**—1-1½°. Bend axle cold for minor changes. **Toe In**—0-⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod. **Steering Geometry**—Inner wheel 20°. Outer 17¾°.
BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, Single anchor type. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.* **Drum**—Alloy-steel. Diameter—11 1/16". **Lining**—Moulded (primary shoe), woven (secondary). Width 1¾". Thickness 7/32". Length 23 15/16" per wheel. *See Hudson Shop Notes for Brake Lining change.* **Clearance**—.010" heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optional on all models. *See article in Mechanical Equipment Section for data.*

SERIAL NUMBER:—First number, W-5001. On right hand side of dash under hood.

ENGINE NUMBER:—Stamped on left hand side of crankcase.

ENGINE:—Six cylinder, 'L' head type. Cylinders cast enbloc.
Dimensions—Bore, 3½". Stroke, 3⅞". Displacement, 224 cu. ins.
Horsepower—Rated, 29.42. Developed, 80 H.P. at 3400 R.P.M.
Compression—Std. 5.32-1. No optional compression ratios.
Compression Pressure—Approximately 92-93 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn, aluminum alloy, Invar strut, split skirt type.
Removal—Piston and rod assembly removed through top of engine.
Clearance—Skirt, .002" (see Fitting New Pistons).
Fitting New Pistons—Use .002" feeler stock to check clearance. Pull required to withdraw feeler from between piston and cylinder wall should be 6-10 lbs.
NOTE:—Install pistons with slot to left.

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings. Both oil control ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. (#1, 2)	⅛"	.007-.012"	.150"
Oil Cont. (#3, 4)	.1545-.1550"	.007-.015"	.150"

Piston Pin:—Diameter, ⅞". Length, 2 15/16". Pin floats in piston and rod.
NOTE:—Pin hole in piston is offset 1/16".

Connecting Rod:—Length, 8 7/16" (center-to-center).
Big End Bearing—Removable steel-backed, babbitt-lined type.
Clearance—.0015-.002". Sideplay .005-.010".
Adjustment—None (no shims). Replace removable bearings.
NOTE:—Connecting rod lower bearings are offset. Install rods with widest half of bearing away from nearest main bearing.

Crankshaft:—Four main bearing type with integral counterweights.
Journal Sizes—#1—2.580". #2—2.560". #3—2.540". #4—2.520".
Bearing Type—Bronze-backed, babbitt-lined type. No shims.
Clearance—.0017-.0022".
Adjustment—None (no shims). Replace bearings.
End Thrust—Taken by #2 main bearing. Endplay, .004-.005".

Camshaft:—Drive—Non-adjustable chain.
Chain—Morse. Width, 1". Length, 51 links. Pitch, .500".
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diameter	Stem Diameter	Seat Angle	Seat Width	Lift
Intake	1.651-1.661"	.3405-.3415"	45°	1/16-5/64"	11/32"
Exhaust	1.526-1.536"	.3405-.3415"	45°	3/32-7/64"	11/32"

Tappet Clearance—Running, .010" (intake), .013" (exhaust).

Valve Timing

Intake Valves Open—2° BTDC. Close—51° ALDC.
Exhaust Valves Open—44° BLDC. Close— 3° ATDC.

To Check Valve Timing:—Set tappet clearance #1 valves at .014" (intake), .021" (exhaust). With #6 piston on top dead center entering power stroke and flywheel mark 'DC/1-6' in line with finished bosses on right front face of clutch housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .010" (intake), .013" (exhaust).
Motor Gauge—Weidenhoff Adapter #104, Rod #5.

Lubrication:—Pressure type. Gear type oil pump located at front of engine.
Normal Oil Pressure—3-5 lbs. (idling), 30 lbs. at 30 M.P.H. with warm engine.
Oil Pressure Relief Valve—Adjustable type. Turn adjusting screw on relief valve cover in or clockwise to increase pressure and out or counter-clockwise to decrease pressure. Screw controls relief valve spring tension.
Capacity and Oil—6 qts. Use SAE. #30 (normal summer weather), #40 (extremely warm temperatures), #20 (winter).

CLUTCH:—**Borg & Beck Model 10A3.** Clutch Model No. 851 stamped on cover. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.
Adjustment—Free movement of clutch pedal should be ¾-1". Adjustment provided on connector link. Turn screw in or out for proper clearance.
Clutch Facings—Moulded type, 2 required. ID. 6⅛". OD. 9⅞". Thickness ⅛".

STEERING:—**Steering Gear**—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional tubular axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8½° crosswise.
Caster—1½°. Adjust by installing wedge shims between spring and spring pad on axle.
Camber—1¼°.
Toe In—1/16" plus or minus 1/16" measured at hub height.

BRAKES:—**Service**—Midland Steeldraulic, single shoe, self-energizing, internal expanding type with mechanical application. Hand lever applies all service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 28⅝".
Clearance—1/16".

Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number, J-12001. On plate on right hand side of dash under engine hood.

ENGINE NUMBER:—Stamped on left hand side of crankcase.

ENGINE:—Six cylinder, 'L' head type. Cylinders cast enbloc.

Dimensions—Bore, 3½". Stroke, 4¼". Displacement, 245.3 cu. ins.

Horsepower—Rated, 29.42. Developed, 93 H.P. at 3400 R.P.M.

Compression—Std. 5.75-1. No optional compression ratios.

Compression Pressure—Approximately 99-100 lbs. at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn, aluminum alloy, Invar strut, split skirt type.
Removal—Piston and rod assembly removed through top of engine.
Clearance—Skirt, .002" (see Fitting New Pistons).
Fitting New Pistons—Use .002" feeler stock to check clearance. Pull required to withdraw feeler from between piston and cylinder wall should be 6-10 lbs.
NOTE:—Install pistons with slot to left.

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings. Both oil control ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. (#1, 2)	⅛"	.007-.012"	.150"
Oil Cont. (#3, 4)	.1545-.1550"	.007-.015"	.150"

Piston Pin:—Diameter, ⅞". Length, 2 15/16". Pin floats in piston and rod.
NOTE:—Pin hole in piston is offset 1/16".

Connecting Rod:—Length, 8¼" (center-to-center).
Big End Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0015-.002". Sideplay .005-.010".
Adjustment—None (no shims). Replace removable bearings.
NOTE:—Connecting rod lower bearings are offset. Install rods with widest half of bearing away from nearest main bearing.

Crankshaft:—Four main bearing type with integral counterweights.
Journal Sizes—#1—2.580". #2—2.560". #3—2.540". #4—2.520".
Bearing Type—Removable bronze-backed, babbitt-lined type.
Clearance—.0017-.0022".
End Thrust—Taken by #2 main bearing. Endplay, .004-.005".

Camshaft:—Drive—Non-adjustable chain.
Chain—Morse. Width, 1". Length, 51 links. Pitch, .500".
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Seat Angle	Seat Width	Lift
Intake	1.651-1.661"	.3405-.3415"	45°	1/16-5/64"	11/32"
Exhaust	1.526-1.536"	.3405-.3415"	45°	3/32-7/64"	11/32"

Tappet Clearance—Running, .010" (intake), .013" (exhaust).

Valve Timing

Intake Valves Open—2° BTDC. Close—51° ALDC.
Exhaust Valves Open—44° BLDC. Close— 3° ATDC.

To Check Valve Timing:—Set tappet clearance #1 valves at .014" (intake), .021" (exhaust). With #6 piston on top dead center entering power stroke and flywheel mark 'DC/1-6' in line with finished bosses on right hand front face of clutch housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .010" (intake), .013" (exhaust).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure type. Gear type oil pump located at front of engine.
Normal Oil Pressure—3-5 lbs. (idling), 30 lbs. at 30 M.P.H. with warm engine.
Oil Pressure Relief Valve—Adjustable. Turn adjusting screw on relief valve cover in or clockwise to increase oil pressure and out or counter-clockwise to decrease pressure. Adjusting screw controls relief valve spring tension.
Capacity and Oil—6 qts. Use SAE. #30 (normal summer weather, #40 (extremely warm temperatures), #20 (winter).

CLUTCH:—**Borg & Beck Model 10A3.** Clutch Model No. 851 stamped on cover. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.
Adjustment—Free movement of clutch pedal should be ¾-1". Adjustment provided on connector link. Turn screw in or out for proper clearance.
Clutch Facings—Moulded type, 2 required. ID. 6⅛". OD. 9⅞". Thickness ⅛".

STEERING:—**Steering Gear**—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional tubular axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8½° crosswise.
Caster—1½°. Adjust by installing wedge shims between spring and spring pad on axle.
Camber—1¼°.
Toe In—1/16" plus or minus 1/16" measured at hub height.

BRAKES:—**Service**—Midland Steeldraulic, single shoe, self-energizing, internal expanding type with mechanical application. Hand lever applies all service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—12".
Lining—Moulded type. Width 1 31/32". Thickness .210". Length per wheel 33 3/16".
Clearance—1/16".

Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number, T-5001. On plate on right hand side of dash under engine hood.

ENGINE NUMBER:—Stamped on left hand side of crankcase.

ENGINE:—Eight cylinder, In Line, 'L' head type. Cylinders cast enbloc.
Dimensions—Bore, 3 3/16". Stroke, 4¾". Displacement, 303.2 cu. ins.
Horsepower—Rated, 32.51. Developed, 115 H.P. at 3500 R.P.M.
Compression—Std. 5.80-1. No optional compression ratios.
Compression Pressure—Approximately 100 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Ray Day, aluminum alloy, split skirt type.
Removal—Piston and rod assembly removed through bottom of engine.
Clearance—.002" (skirt)—see Fitting New Pistons.
Fitting New Pistons—Use .002" feeler stock to check clearance. Pull required to withdraw feeler from between piston and cylinder wall should be 6-10 lbs.
NOTE:—Install pistons with slot to left.

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings. Both oil ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Maximum Wall Thickness
Comp. (#1, 2)	⅛"	.007-.012"	.140"
Oil Cont. (#3, 4)	5/32"	.007-.015"	.140"

Piston Pin:—Diameter, ⅞". Length, 2 23/32". Pin floats in piston and rod.
NOTE:—Pin hole in piston is offset 1/16".

Connecting Rod:—Length, 9½" (center-to-center).
Big End Bearing—Removable, steel-backed, babbitt-lined type.
Clearance—.0015-.002". Sideplay .005-.010".
Adjustment—None (no shims). Replace removable bearings.
NOTE:—Connecting rod lower bearings are offset. Install rods with widest half of bearing away from nearest main bearing.

Crankshaft:—Five main bearing type with integral counterweights.
Journal Sizes—#1—2.705". #2—2.685". #3—2.665". #4—2.645". #5—2.625".
Bearing Type—Removable, bronze-backed, babbitt-lined type.
Clearance—.0017-.0022".
Adjustment—Shims are used. Do not file bearing caps.
End Thrust—Taken by #3 (center) main bearing. Endplay, .003-.005".

Camshaft:—Drive—Two sprocket non-adjustable chain drive.
Chain—Morse #766 double slide guide type. Width, 1¼". Length, 66 links. Pitch, .375".
Camshaft Setting—Sprockets are marked. Mesh chain so there are exactly 15 open links between marks on sprockets. With correct setting, #1 intake and exhaust valves should be closed with #8 piston on top dead center entering power stroke when flywheel mark '1o8' lines up with indicator on edge of insptction hole in flywheel housing on right hand side. Tappet clearance for checking valve timing should be .020" (intake), .026" (exhaust).

Valves:—	Head Diameter	Stem Diameter	Seat Angle	Seat Width	Lift
Intake	1.526-1.536"	.3405-.3415"	45°	1/16-5/64"	11/32"
Exhaust	1.401-1.411"	.3405-.3415"	45°	3/32-7/64"	11/32"

Tappet Clearance—Running, .018" all valves.

Valve Timing

Intake Valves Open—3° ATDC. Close—49° ALDC.
Exhaust Valves Open—41° BLDC. Close— 5° ATDC.

To Check Valve Timing:—Set tappet clearance #1 valves at .020" (intake), .026" (exhaust). With #8 piston on top dead center entering power stroke and flywheel mark '1o8' lined up with indicator on edge of inspection hole in right hand side of flywheel housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .018".
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—3-5 lbs. (idling), 30 lbs. at 50 M.P.H. with warm engine.
Oil Pressure Relief Valve—Adjustable. Turn adjusting screw on relief valve cover in or clockwise to increase oil pressure and out or counter-clockwise to decrease pressure. Adjusting screw controls relief valve spring tension.
Capacity and Oil—8 qts. Use SAE. #30 (normal summer weather), #40 (extreme warm weather), #20 (winter).

CLUTCH:—Long Model 9AB-6CI. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Adjustment—Free movement of clutch pedal should be ¾-1". Adjustment provided on connector link. Turn screw in or out for proper adjustment.
Clutch Facings—Moulded type, 2 required. ID. 5½". OD. 9¾". Thickness .137".

STEERING:—**Steering Gear**—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional tubular axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8½° crosswise.
Caster—1½°. Adjust by installing wedge shims between spring and spring pad on axle.
Camber—1¼°.
Toe In—1/16" plus or minus 1/16" measured at hub height.

BRAKES:—**Service**—Midland Steeldraulic, single shoe, self-energizing, internal expanding type with mechanical application. Hand lever applies all service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—14".
Lining—Moulded type. Width 1 31/32". Thickness .210". Length per wheel 36 5/16".
Clearance—1/16".

Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number (518-D) D-5001, (618-G) G-5001. On left hand frame side rail or on plate on right side of cowl under engine hood.

ENGINE NUMBER:—First number (518-D) D-5001, (618-G) G-5001. Stamped on left hand side of crankcase.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.

Bore—3½". Stroke—4¼".

Displacement—245.3 cubic inches.

Rated Horsepower—29.42 (AMA).

Developed Horsepower—101 at 3600 R.P.M.

Compression Ratio—5.75-1 std. cast-iron head, 6.2-1 optl. aluminum head.

Compression Pressure—5.75 Std. head, 141 lbs. at 3000 R.P.M. or 107 lbs. at 160 R.P.M. (crank'g speed).

Vacuum Reading—Gauge should show stead reading of 18-20" at idling speed.

PISTONS:—Bohn, aluminum alloy, Invar strut, split skirt type. **Length—4 3/32".**

Weight—21.7 ozs. (stripped).

Removal—Pistons and rods removed from above.

Clearance—Top .020". Skirt .002". See Fitting New Pistons.

Replacement Pistons:—Finished replacement pistons furnished in standard and .001", .002", .003", .005", .010", .020", .022", .025", .032" oversizes.

NOTE—Second standard cylinder bore size .020" larger than above.

Fitting New Pistons:—With .002" feeler stock, pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 10-13 lbs.

Installing Pistons:—Slot should be toward left or away from camshaft side. Pin hole in piston offset 1/16" toward camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Both oil ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp (all)	⅛"	.007-.012"	.150"
Oil Cont (all)	5/32"	.007-.015"	.150"

PISTON PIN:—**Diameter ⅞". Length 2 15/16".**

Pin floats in piston and rod. Held by retaining rings.

Pin Fit in Piston—Hand push fit with piston heated to 150° F.

Pin Fit in Rod Bushing—.0005" clearance.

CONNECTING ROD:—**Weight 35 ozs. Length 8¼".**

Crankpin Journal Diameter—2⅛".

Lower Bearing—Removable steel-backed, babbitt-lined type.

Clearance—.0015-.002". **Sideplay .005-.010".**

Bearing Adjustment:—**None (no shims). Replace bearings. Do not file rods or caps.**

Installing Rods:—Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing or pointing toward front of engine for #1, 3, 5 and toward rear for #2, 4, 6.

CRANKSHAFT:—4 bearing. Integral counterweights.

Journal Diameters—#1, 2.580"; #2, 2.560"; #3, 2.540"; #4, 2.520" (first cars); 2.560"—all bearings (later cars).

Bearing Types—Bronze-backed, babbitt-lined (first cars), steel-backed, babbitt-lined (later cars).

Clearance—.0015"-.002".

Adjustment—Solid shims provided on first cars. No shims used on later cars. Replace bearings when necessary. Do not file bearing caps.

End Thrust:—Taken by #2 bearing. Endplay .004-.008". No adjustment. Replace bearing.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.

Bearing Type—Bronze.

Clearance—.0015-.002".

End Thrust:—Taken by thrust plate at rear of sprocket hub. Replace plate if endplay excessive.

Timing Chain:—Morse #1886. Width 1". Pitch .500". Length 25½" or 51 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405-.3415"	4 7/16"
Exhaust	1 17/32"	.3405-.3415"	4 7/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015" max.
Exhaust	45°	11/32"	.0015" max.

Tappet Clearance—.010" Int., .013" Exh., running clearance with engine warm. Clearance for timing is .014" Int. opening, .018" Int. closing, .017" Exh. opening, .021" Exh. closing.

Valve Guides—Single piece, removable type.

Valve Springs:—	Spring Pressure	Length
Valve Closed	40 lbs.	1 13/16"
Valve Open	100 lbs.	1 15/32"

Valve Lifters:—Mushroom type, removable.

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 2° BTDC. Close 51° ALDC.

Exhaust Valves—Open 44° BLDC. Close 3° ATDC.

To Check Valve Timing—Set tappet clearance of #1 valves at .014" Int., .021" Exh. With #6 piston on top dead center entering power stroke and flywheel mark 'DC"1-6' lined up with finished bosses on right front face of flywheel housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .010" Int., .013" Exh.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure. Gear type oil pump located on right hand side of crankcase.

NOTE—Whenever oil pump is removed, turn engine over until #1 piston is at firing position (see ignition timing), mesh oil pump drive gear so that tongue and slot connection meshes without disturbing position of distributor shaft, recheck ignition timing.

Normal Oil Pressure:—3-5 lbs. idling, 30 lbs. at 30 M.P.H.

Oil Pressure Relief Valve:—Located on oil pump cover. Operates at 35-45 lbs. Adjustable by turning screw on relief valve cover in or clockwise to increase pressure, and out or counter-clockwise to decrease pressure.

Crankcase Capacity:—6 quarts (refill).

CLUTCH:—**Borg & Beck Model 10A6.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".

Adjustment—Free movement of clutch pedal should be ¾-1". Adjustment provided on connector link. Turn screw in or out for proper clearance.

Removal—Disconnect clutch linkage, remove transmission, drop clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts turning all bolts out evenly to release spring tension. Remove clutch from below. Use pilot studs when removing and installing transmission to avoid springing clutch plate.

STEERING—Steering Gear—Ross Model S14. Cam-and-lever type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—7½° crosswise.

Caster—1½° plus or minus ½°. Adjust by installing wedge shims between spring and spring pad on axle.

Camber—1°. No adjustment provided.

Toe In—1/16" plus or minus 1/16" measured at hub height.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies rear service brakes.

See article in Mechanical Equipment Section for data.

Drum Diameter—10".

Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 20⅞".

Clearance—.010" toe, .005" heel, for each shoe.

Hand Brake Adjustment:—See Service Brake.

SERIAL NUMBER:—First number (521-O) O-5001, (621-N) N-5001. Stamped on plate on right side of cowl under engine hood.

ENGINE NUMBER:—First number (521-O) O-5001, (621-N) N-5001. Stamped on left hand side of crankcase.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.

Bore—3 3/16". **Stroke** 4¾".

Displacement—303.2 cubic inches.

Rated Horsepower—32.51 (AMA).

Developed Horsepower—120 at 3500 R.P.M.

Compression Ratio—5.80-1 Std. cast-iron head. No optional ratios.

Compression Pressure—5.80-1 Std. head, 142 lbs. at 2000 R.P.M. or 113 lbs. at 160 R.P.M. (cranking speed).

Vacuum Reading—Gauge should show steady reading at 18-20" at idling speed.

PISTONS:—Bohn, aluminum alloy, Invar strut, split skirt type. **Length**—3⅞".

Weight—18.4 ounces (stripped).

Removal—Pistons and rods from below.

Clearance—Skirt .002". See Fitting New Pistons. NOTE—Second standard cylinder bore size .020" larger than above.

Fitting New Pistons:—Use .002" feeler stock to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 6-8 lbs.

Installing Pistons:—Slot should be toward left or away from camshaft side. Pin hole in piston is offset 1/16" toward camshaft.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Both oil ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp (all)	⅛"	.007-.012"	.140"
Oil Cont (all)	5/32"	.007-.015"	.140"

PISTON PIN:—**Diameter** ⅞". **Length** 2 23/32". Pin floats in piston and rod. Held by retaining rings.

Pin Fit in Piston—Hand push fit with piston heated to 150° F.

Pin Fit in Rod Bushing—.0005" clearance.

CONNECTING ROD:—**Weight** 39.4 ozs. **Length** 9½".

Crankpin Journal Diameter—2⅜".

Lower Bearing—Removable steel-backed, babbitt-lined type.

Clearance—.0015-.002". Sideplay .005-.010".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

Installing Rods:—Lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing or pointing toward front of engine for #1, 3, 5, 7 rods and toward rear for #2, 4, 6, 8.

CRANKSHAFT:—5 bearing. Integral counterweights.

Journal Diameters—2.665" (all bearings).

Bearing Type—Removable steel-backed, babbitt-lined type.

Clearance—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by #3 bearing. Endplay .004-.008". No adjustment. Replace bearing.

CAMSHAFT:—6 bearing. Non-adjustable chain drive.

Bearing Type—Bronze.

Clearance—.0015-.002".

End Thrust:—Taken by thrust plate at rear of sprocket hub. Replace plate if endplay excessive.

Timing Chain:—Morse Type 766. Width 1¼". Pitch .375". Length 24¾" or 66 links.

Camshaft Setting:—Sprockets are marked. Mesh chain so there are exactly 15 links between marks on sprockets or 16 teeth inclusive of teeth meshed opposite marks.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.3405-.3415"	5⅛"
Exhaust	1 13/32"	.3405-.3415"	5⅛"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.325"	.0015" max.
Exhaust	45°	.325"	.0015" max.

Tappet Clearance—.006" Int., .013" Exh., running clearance with engine warm. Clearance for timing is .010" Int., .017" Exh.

Valve Guides:—Single piece, removable type.

Valve Springs:—	Spring Pressure	Length
Valve Closed	40 lbs.	1-13/16"
Valve Open	100 lbs.	1 15/32"

Valve Lifters:—Removable mushroom type.

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 1° ATDC. Close 49° ALDC.

Exhaust Valves—Open 45° BLDC. Close 3° ATDC.

To Check Valve Timing—Set tappet clearance of #1 valves at .010" Int., .017" Exh. With #8 piston on top dead center entering power stroke and flywheel mark '1°8' lined up with indicater in inspection hole in right hand top face of flywheel housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .006" intake, .013" exhaust, engine warm.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

NOTE—Whenever oil pump is removed, turn engine over until #1 piston is at firing position (see ignition timing), mesh oil pump drive gear so that tongue-and-slot connection meshes without disturbing position of distributor shaft, recheck ignition timing.

Normal Oil Pressure:—3-5 lbs. idling, 30 lbs. at 50 M.P.H. with engine warm.

Oil Pressure Relief Valve:—Operates at 35-45 lbs. Located on left side of engine approximately center of crankcase. Adjustable by turning screw in or clockwise to increase pressure and out or counter-clockwise to decrease pressure.

Crankcase Capacity:—8 quarts (refill).

CLUTCH:—**Long Model 10-CF-CI.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .137".

Adjustment—Free movement of clutch pedal should be 1¼-1½". Adjustment provided on connector link. Turn screw in or out for proper clearance.

Removal—Disconnect clutch linkage, remove transmission, take off clutch bell housing, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts turning all bolts out evenly to release spring tension. Remove clutch. Use pilot studs when removing and installing transmission to avoid springing clutch plate.

STEERING:—**Steering Gear**—Gemmer Model Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—8½° crosswise.

Caster—1½° plus or minus ½°. Adjust by installing wedge shims between spring and spring pad on axle.

Camber—1¼° plus or minus 1/16°. No adjustment.

Toe In—1/16" plus or minus 1/16". Adjust in usual manner by changing length of tie rod.

Kick Shackle—Clearance between spring eye and stopscrew on kick shackle should be .125" or 2½ turns. Check if steering is unsteady or car wanders.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies rear service brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—12".

Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 24⅜".

Clearance—.010" heel, .005" toe, for each shoe.

Hand Brake Adjustment:—See Service Brake.

SERIAL NUMBER:—First number E-50001 (Deluxe & Custom '38), ES-35001 (Standard '38), E-72001 ('39). On plate on right side of dash under engine hood.

ENGINE NUMBER:—First number E-50001 ('38), E-72001 ('39). Stamped on boss on left side of crankcase in front of distributor.

ENGINE HOOD & SIDE PANELS:—To raise hood, turn lock handle to left as far as possible, raise hood slightly, reach under front edge and release safety catch.

Side Panels—To remove panels for work on engine, move locking handle (at top center inside panel) toward front of car, disengage rear end of panel, slide panel out toward rear.

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head type.
Bore—3½". Stroke—4¼".
Displacement—245.3 cubic inches.
Rated Horsepower—29.4.
Developed Horsepower—101 at 3600 R.P.M.
Compression Ratio—5.75-1 Std. No optl. ratios.
Compression Pressure—141 lbs. at 3000 R.P.M. or 107 lbs. at 160 R.P.M. cranking speed.
Vacuum Reading—18-20" steady reading at idling speed.

PISTONS:—Bohn, aluminum alloy, Invar Strut, split skirt type. **Length—4 3/32".**
Weight—21 7 ozs. without rings or pin.
Removal—Pistons and rods removed from above
Clearance—See Fitting New Pistons.
Original Bore Sizes:—Mark opposite each bore indicate original bore size as follows:

	1st Standard Marking	Cyl. Size	2nd Standard Marking	Cyl. Size
.001" under.	'A'	3.4990"	'AA'	3 5190"
.0005" under.	'B'	3.4995"	'BB'	3 5195"
Standard	'C'	3.5000"	'CC'	3 5200"
.0005" over.	'D'	3 5005"	'DD'	3.5205"
.001" over.	'E'	3 5010"	'EE'	3.5210"

Replacement Pistons:—Finished pistons furnished standard (3 499") and .001", .002", .003", .005", .010", .020", .025", .032" oversize. Semi-finished in one size only (3 542").
Fitting New Pistons:—Use .002" feeler gauge inserted between piston and cylinder wall on side opposite slot. Pull required to remove feeler must be within 10-13 lbs.
Installing Pistons:—Slot on left side (away from valves).
NOTE—Piston pin offset in piston toward right or camshaft side of engine.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.012"	.0005"
Oil Cont.	5/32"	.007-.015"	.0005"

Replacement Rings:—Furnished in standard and .005", 010", .020", .030" oversize.

PISTON PIN:—Diameter—⅞". Length—2 15/16". Pin floats in piston and rod. Held by locking ring at each end. Pin hole in connecting rod bronze bushed.
Pin Fit in Piston— 0005" clearance or hand push fit with piston heated to 212° F.
Pin Fit in Rod Bushing— 0005" clearance.
Replacement Pins:—Std. & .003", .006" oversize.

CONNECTING ROD:—Weight—35 ozs. Length—8¼".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.001- 0025". **Sideplay**—.005-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.
Replacement Bearings:—Std. and .001" undersize.
Installing Rods:—Lower bearings offset Install rods with narrow half of bearing toward nearest main bearing or pointing toward front of engine for #1, 3, 5 and toward rear for #2, 4, 6.

CRANKSHAFT:—Four bearing. Integral counterweights.
Journal Diameters—2.560" all bearings.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings Do not file bearing caps.
NOTE—Bearings may be rotated out.
Replacement Bearings:—Std. and .001" undersize.
End Thrust:—Taken by #2 main bearing. Not adjustable (replace bearing). **Endplay**—.004-.008".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters:—#1, 2.186"; #2, 2.076"; #3, 2 060", #4, 1.498".
Bearing Type—Leaded-bronze bushings.
Clearance—.001".
End Thrust—Taken by thrust plate at rear of camshaft sprocket. Adjustable by adding or removing shims. **Endplay**—.004".
Timing Chain:—Morse. Width 1". Pitch .500". Length 25½" or 51 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent & in line with straightedge across shafts.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405-.3415"	4 7/16"
Exhaust	1 17/32"	.3405-.3415"	4 7/16"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.0015"

Tappet Clearance—.010" Int., .013" Exh. running clearance with engine warm.
NOTE—Tappet clearance for timing is .014" (Intake—opening side), .018" (Intake—closing side), .017" (Exhaust—opening side), 021" (Exhaust—closing).
Valve Guides:—Pressed in block from above. To remove guides, work from lifter opening and press guides out from below.
Valve Springs:—Damper installed on all springs at top.

	Spring Pressure	Length
Valve Closed	40 lbs.	1 13/16"
Valve Open	100 lbs.	1 15/32"

Valve Lifters:—Mushroom type. Removable from below only Guides must be removed first. Lifters furnished .002", .004" oversize. Lifters must be free fit in guide at room temperature.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 51° ALDC.
Exhaust Valves—Open 44° BLDC. Close 3° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .014", #1 exhaust valve at .021". With this clearance, intake valve will open and exhaust valve will close with piston at top dead center when flywheel mark 'D-C/1-6' lines up with finished bosses on right front face of clutch housing. Reset tappets for correct running clearance (see above).

LUBRICATION:—Pressure system. Gear type oil pump located on right hand side of crankcase.
Oil Pump Installation—Whenever oil pump removed, turn engine over to firing position for #1 piston (see Ignition Timing), rotate oil pump shaft so that tongue-and-slot drive connection will mesh without disturbing distributor when pump replaced.
Normal Oil Pressure:—3-5 lb. idling, 30 lb. @ 30 MPH.
Oil Pressure Regulator:—Located on oil pump cover. Adjustable by turning screw which controls regulator valve spring tension (turn screw in to increase, or out to decrease pressure).
Crankcase Capacity—6½ qts. (dry), 6 qts. (refill).

COOLING SYSTEM:—Capacity—18 quarts.
Water Pump:—Belt-driven, adjustable packing type.
See article in Mechanical Equipment Section for data.
Removal—Drain cooling system, remove fan belt, take out pump mounting bolts. Lift off pump.
Thermostat:—Fulton. In water outlet on cyl. head.
Setting—Opening temperature 145-160°F.

CLUTCH:—Borg & Beck Model 10A7. Marked #898 on cover, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facing—Molded type (flywheel side), Molded-Woven type (pressure plate side), one of each required. 6⅛" Inside Diam., 9⅞" Outside Diam., ⅛" thick (flywheel side), .133" thick (pressure plate side).
Adjustment—Pedal free movement should be ¾-1". Adjustment provided on connecting link. Turn screw in or out for proper clearance.
Removal—Remove transmission (see Transmission Removal below), take off clutch housing pan, punch mark clutch cover and flywheel (to insure replacing in same position to maintain balance), take out mounting screws in clutch cover flange turning all screws out evenly, remove clutch from below.

TRANSMISSION:—Warner Model T-86 Std. Special transmission with Superdrive (Overdrive) Optl. Both models have helical gears for all speeds, and synchro-mesh for second and high.
See article in Mechanical Equipment Section for data.
Transmission Control:—Remote steering column type. Optional equipment on 1939 models only.
See articles in Mechanical Equipment Section for data.
Removal—Disconnect clutch linkage and drive shaft at front universal joint. Install pilot studs in upper transmission mounting bolt holes, take out lower mounting bolts and pull transmission back.

UNIVERSAL JOINTS:—Spicer Model 1281-1288. Needle bearing type, 2 used.
See article in Mechanical Equipment Section.

REAR AXLE:—Spicer Model 42. Spiral gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.545-1 Std., 4.27-1 and 4.09-1 Optl.
Backlash—.004-.007". Shim adjustment.
Removal:—Disconnect hand brake cables, brake line, and drive shaft at rear universal joint. Remove wheels, take off spring clips at axle housing, remove axle from beneath car.
Axle Shaft Removal:—Remove wheel, hub, drum and backing plate. Pull axle shaft & wheel bearing.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub and drum assembly. Remove shims to decrease endplay, add shims to increase. **Endplay**—.003-.006".

SHOCK ABSORBERS:—Gabriel Model KT. Double acting, hydraulic type with thermostatic control.
See article in Mechanical Equipment Section.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventionel 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—1½°. Adjust by installing wedge shims between spring and spring seat on axle.
Camber—1°. No adjustment provided.
Toe In—1/16-3/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Hupp-Lockheed hydraulic type. Hand lever apples rear service brakes.
See article in Mechanical Equipment Section for data.
Brake Drums—Cast-iron. **Diameter**—10".
Lining—Moulded type. Width 2". Thickness 3/16". Length 20⅞" per wheel.
Clearance—.010" toe, .005" heel for each shoe.
Hand Brake:—See service brakes above.

ENGINE HOOD & SIDE PANELS:—To raise hood, turn lock handle to left as far as possible, raise hood slightly, reach under edge, release safety catch.

Side Panels—To remove panels for work on engine, move locking handle (at top center inside panel) toward front of car, disengage rear end of panel, slide panel out toward rear.

SERIAL NUMBER:—First number H-25001('38),H-30001 ('39). On plate on right side of dash under hood.

ENGINE NUMBER:—First number H-25001('38),H-30001 ('39). Stamped on boss on left side of crankcase.

ENGINE SPECIFICATIONS:—8 Cylinder, 'L' head type.

Bore—3 3/16". **Stroke**—4¾".

Displacement—303.2 cubic inches.

Rated Horsepower—32.51.

Developed Horsepower—120 at 3500 R.P.M.

Compression Ratio—5.8-1 Std. No Optl. heads.

Compression Pressure—142 lbs. at 2000 R.P.M. or 113 lbs. at cranking speed of 160 R.P.M.

Vacuum Reading—18-20" steady at idling speed.

PISTONS:—Bohn, aluminum alloy, Invar Strut, split skirt type. **Length**—3⅞".

Weight—18.4 ozs. without rings or pin.

Removal—Pistons and rods removed from below.

Clearance—See Fitting New Pistons.

Original Bore Sizes:—Mark opposite each bore indicates original bore size as follows:

	First Standard Marking	Cyl. Size	Second Standard Marking	Cyl. Size
.001" under.	'A'	3.1865"	'AA'	3.2065"
.0005" under.	'B'	3.1870"	'BB'	3.2070"
Standard	'C'	3.1875"	'CC'	3.2075"
.0005" over.	'D'	3.1880"	'DD'	3.2080"
.001" over.	'E'	3.1885"	'EE'	3.2085"

Replacement Pistons:—Finished pistons furnished standard (3.187"), and .001", .002", .003", .005", .010", .020", .022", .025", .032" oversize. Semi-finished pistons furnished in one size only (3.230").

Fitting New Pistons:—Use .002" feeler gauge inserted between piston and cylinder wall on side opposite slot. Pull required to remove feeler must be within 6-8 lbs.

Installing Pistons:—Slot to left (away from valves). NOTE—Piston pin offset in piston toward right or camshaft side of engine.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Both oil ring grooves drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.012"	.0005"
Oil Cont.	5/32"	.007-.015"	.0005"

Replacement Rings:—Furnished in standard and .005", .010", .020", .030" oversize.

PISTON PIN:—Diameter—⅞". **Length**—2 15/16". Pin floats in piston and rod. Held by locking ring at each end. Pin hole in connecting rod bronze bushed.

Pin Fit in Piston—.0005" clearance or hand push fit with piston heated to 212°F.

Pin Fit in Rod Bushing—.0005" clearance.

Replacement Pins:—Std. & .003", .006" oversize.

CONNECTING ROD:—Weight 39.4 ozs. **Length** 9½".

Crankpin Journal Diameter—2¼".

Lower Bearing—Steel-backed, babbitt-lined type.

Clearance—.0008-.0026". **Sideplay**—.005-.010".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.

Replacement Bearings:—Std. and .001" undersize.

Installing Rods:—Lower bearings offset. Install rods with narrow half of bearing toward nearest main bearing or pointing toward front of engine for #1, 3, 5, 7 and toward rear for #2, 4, 6, 8.

CRANKSHAFT:—Five bearing. Integral counterweights.

Journal Diameters—2.665" all bearings.

Bearing Type—Steel-backed, babbitt-lined.

Clearance—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

NOTE—Bearings can be 'rotated' out without removing crankshaft.

Replacement Bearings:—Std. and .001" undersize.

End Thrust:—Taken by #3 main bearing. Not adjustable (replace bearing). **Endplay**—.004-.008".

CAMSHAFT:—Six bearing. Non-adjustable chain drive.

Journal Diameters—#1, 2.186"; #2, 2.166"; #3, 2.146"; #4, 2.126"; #5, 2.106"; #6, 1.622".

Bearing Type—Leaded-bronze bushings.

Clearance—.001".

End Thrust—Taken by thrust plate at rear of camshaft sprocket. Adjustable by adding or removing shims. **Endplay**—.004".

Timing Chain:—Morse. Width 1¼". Pitch .375". Length 23¾" or 66 links.

Camshaft Setting:—Sprockets are marked. Turn crankshaft so that keyway is straight up, mesh chain so there are exactly 15 links (or 16 teeth inclusive of teeth meshed opposite marks) between marks on sprockets.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.3405-.3415	5⅛"
Exhaust	1 13/32"	.3405-.3415	5⅛"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.325"	.0015" Max.

Tappet Clearance—.006" Int., .013" Exh. running clearance with engine warm.

NOTE—Tappet cl. for timing .010" Int., .017" Exh.

Valve Guides:—Pressed in block from above. To remove guides, work from lifter opening and press guides out from below.

Valve Springs:—Damper installed on all springs at top.

	Spring Pressure	Length
Valve Closed	40 lbs.	1 13/16"
Valve Open	100 lbs.	1 15/32"

Valve Lifters:—Mushroom type. Removable from below only. Guides must be removed first. Lifters furnished .002", .004" oversize.

Lifter Clearance in Guide—Free fit in guide at room temperature (move through guide of own weight without oil when cold).

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 1° ATDC. Close 49° ALDC.

Exhaust Valves—Open 45° BLDC. Close 3° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .010", #1 exhaust valve at .017". With this clearance, intake valve will open and exhaust valve close at top dead center when flywheel mark '1°8' lines up with indicator in inspection hole in right top face of flywheel housing. Reset tappet clearance at .006" Int., .013" Exh. with engine warm.

LUBRICATION:—Pressure type. Gear type oil pump located in crankcase (driven by vertical shaft).

Oil Pump Installation—Whenever oil pump removed, turn engine over to firing position for #1 piston (see Ignition Timing), rotate oil pump shaft so that tongue-and-slot drive connection will mesh without disturbing distributor driveshaft.

Normal Oil Pressure:—3-5 lbs. idling, 30 lbs. at 30 MPH.

Oil Pressure Regulator:—Operates at 35-45 lbs. Located on left side of crankcase at approximate center of engine. Adjustable by turning screw in (clockwise) to increase pressure, or out to decrease.

Crankcase Capacity:—8½ qts. (dry), 8 qts. (refill).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.

See article in Mechanical Equipment Section for data.

Thermostat:—Bishop & Babcock. In water outlet.

Setting—Opening temperature 145-160°F.

Cooling System Capacity—21½ quarts.

CLUTCH:—Long Model 10CF-CI. Semi-centrifugal, single plate, dry disc type.

See article in Mechanical Equipment Section for data.

Facings—Woven, spiral wound type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .125".

Adjustment—Pedal free movement should be 1¼-1½". Adjustment provided on connecting link. Turn screw in or out for proper clearance.

Removal—Remove transmission (see Transmission Removal below), take off clutch housing pan, punchmark clutch cover and flywheel (to insure replacing in same position to maintain balance), take out mounting screws in clutch cover flange turning all screws out evenly, remove clutch from below through pan opening.

TRANSMISSION:—Warner Model T-85. Superdrive (Overdrive) is standard equipment. Constant-mesh, synchro-mesh (second and high), sliding helical gear (low and reverse).

See article in Mechanical Equipment Section for data.

Transmission Control:—Own steering column type remote control. Optl. on 1939 models.

See article in Mechanical Equipment Section for data.

Removal—Disconnect clutch linkage and drive shaft at front universal joint. Install pilot studs in upper transmission mounting bolt holes, take out lower mounting bolts and pull transmission back to free clutch shaft from driven disc.

UNIVERSAL JOINTS:—Detroit (Universal Products) Series 5150. Roller bearing 'cross' type. 2 used.

See article in Mechanical Equipment Section for data.

REAR AXLE:—Spicer. Hypoid Gear, semi-floating type with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

Ratio—4.545-1 Std., 4.27-1 and 4.09-1 Optl.

Backlash—.004-.007". Shim adjustment.

Removal:—Disconnect hand brake cables, brake line, and drive shaft at rear universal joint. Remove wheels, take off spring clips at axle housing, remove axle from beneath car.

Axle Shaft Removal:—Remove wheel, hub, drum and backing plate. Pull axle shaft and wheel bearing.

Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub and drum assembly. Remove shims to decrease endplay, add shims to increase. **Endplay**—.003-.006".

SHOCK ABSORBERS:—Gabriel Model OT (front), KT (rear). Double acting, hydraulic type with thermostatic control.

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 300. Worm-and-roller type.

See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—8½° crosswise.

Caster—1½°. Adjust by installing wedge shims between spring and spring seat on axle.

Camber—1¼°. No adjustment provided.

Toe In—1/16-3/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Hupp-Lockheed hydraulic type. Hand lever applies rear service brakes.

See article in Mechanical Equipment Section for data.

Braking Power—55% Front, 45% Rear.

Brake Drum—Cast-iron. Diameter—12".

Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 24⅜".

Clearance—.010" toe, .005" heel for each shoe.

Hand Brake:—See Service Brakes above.

SERIAL NUMBER:—First number R-100501. On plate on right side of dash under engine hood.
ENGINE NUMBER:—First number R-100501. Stamped on boss on left side of crankcase in front of distributor.
ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type.
Bore—3½". **Stroke**—4¼".
Displacement—245.3 cu. ins. **Rated HP.**—29.4.
Developed Horsepower—101 at 3600 R.P.M.
Compression Ratio—5.75-1 Std. 6.2-1 Optl.
Compression Pressure—141 lbs. at 3000 RPM. or 107 lbs. at 160 RPM. cranking speed std. head. 110 lbs. at 350 RPM. optl. 6.2-1 head.
Vacuum Reading—18-20" steady at idling speed.
PISTONS:—Bohn, aluminum alloy, Invar strut, split skirt, cam ground type. **Length**—4 3/32".
Weight—21.7 ozs. (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Original Bore Sizes:—Mark opposite each bore indicate original bore size as follows:

1st Standard		2nd Standard	
Marking	Cylinder Size	Marking	Cylinder Size
(A)	3.500"	(AA)	3.520"
(B)	3.5005"	(BB)	3.5205"
(C)	3.501"	(CC)	3.521"
(D)	3.5015"	(DD)	3.5215"
(E)	3.502"	(EE)	3.522"
(F)	3.5025"	(FF)	3.5225"

Replacement Pistons:—Finished pistons furnished standard (3.499") and .001", .002", .003", .005", .010", .020", .025", .032" oversize. Semi-finished in one size only (3.542").
Fitting New Pistons:—Use .002" feeler gauge inserted between piston and cylinder wall on side opposite slot. Pull required to remove feeler must be within 13-15 lbs.
Installing Pistons:—Slot to left (away from valves). NOTE—Piston pin offset in piston toward right or camshaft side of engine.
PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.012"	.0005"
Oil Cont.	5/32"	.007-.015"	.0005"

Replacement Rings:—Furnished in standard and .005", .010", .020", .030" oversize.
PISTON PIN:—**Diameter**—⅞". **Length**—2 15/16". Pin floats in piston and rod. Held by locking ring at each end. Pin hole in connecting rod bronze bushed.
Pin Fit in Piston—.0005" clearance or easy slip fit with piston heated to 212° F.
Pin Fit in Rod Bushing—.0005" clearance.
Replacement Pins:—Std. & .003", .006" oversize.
CONNECTING ROD:—**Weight**—35 ozs. **Length**—8¼".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.001-.0025". **Sideplay**—.005-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.
Replacement Bearings:—Std. and .003" undersize.
Installing Rods:—Lower bearings offset. Install rods with narrow half of bearing toward nearest main bearing or pointing toward front of engine for #1, 3, 5 and toward rear for #2, 4, 6.
CRANKSHAFT:—Four bearing. Integral counterweights.
Journal Diameters—2.560" all bearings.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
NOTE—Bearings may be 'rotated' out without removing crankshaft.
Replacement Bearings:—Std. and .003" undersize.
End Thrust:—Taken by #2 main bearing. Not adjustable (replace bearing). **Endplay**—.004-.008".
CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2.186"; #2, 2.076"; #3, 2.060"; #4, 1.498".
Bearing Type—Leaded-bronze bushings.
Clearance—.0015".
End Thrust—Taken by thrust plate at rear of camshaft sprocket. Adjustable by adding or removing shims. **Endplay**—.004".
Timing Chain:—Morse Type 1866-N, No. 1115. Width 1". Pitch .500". Length 25½" or 51 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across shaft centers.
VALVES:—

	Head Diameter	Stem Diameter
Intake	1 21/32"	.3405-.3415"
Exhaust	1 17/32"	.3405-.3415"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.0015"

Tappet Clearance—.010" Int., .013" Exh. running clearance with engine warm.
NOTE—Tappet clearance for timing is .014" (Intake—opening side), .018" (Intake—closing side), .017" (Exhaust—opening side), .021" (Exhaust—Closing side).
Valve Guides:—Pressed in block from above. To remove guides, work from lifter opening and press guides out from below.
Valve Springs:—Damper installed on all springs at top. Free length 2 3/64".

	Spring Pressure	Length
Valve Closed	40 lbs.	1 13/16"
Valve Open	100 lbs.	1 15/32"

Valve Lifters:—Mushroom type. Removable from below only. Guides must be removed first. Lifters furnished .002", .004" oversize. Lifters must be free fit in guide at room temperature.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 2° BTDC. Close 51° ALDC.
Exhaust Valves—Open 44° BLDC. Close 3° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .014", #1 exhaust valve at .021". With this clearance, intake valve will open and exhaust valve will close with piston at top dead center when flywheel mark 'D-C/1-6' lines up with finished bosses on right front face of clutch housing. Reset tappet clearance for correct running clearance (see above).
LUBRICATION:—Pressure system. Gear type oil pump located on right hand side of crankcase.
Oil Pump Installation—Whenever oil pump removed, turn engine over to firing position for #1 piston (see Ignition Timing), rotate oil pump shaft so that tongue-and-slot drive connection will mesh without disturbing distributor drive shaft when oil pump is replaced.
Normal Oil Pressure:—3-5 lb. idling, 30 lb. @ 30 MPH.
Oil Pressure Regulator:—Located on oil pump cover. Adjustable by turning screw which controls regulator valve spring tension (turn screw in to increase, or out to decrease pressure). Opens at 35-45 lbs.
Crankcase Capacity—6½ qts. (dry), 6 qts. (refill).
COOLING SYSTEM:—**Capacity**—18 quarts.
Water Pump:—Belt-driven, adjustable packing type.
See article in Mechanical Equipment Section for data.
Removal—Drain cooling system, remove fan belt, take out pump mounting bolts. Lift off pump assembly.
Thermostat:—Fulton. In water outlet on cyl. head.
Setting—Starts to open 140° F. Fully open 145° F.
CLUTCH:—**Borg & Beck Model 9A6.** Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type (flywheel side), woven type (pressure plate side). Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Pedal free movement should be ⅜-1". Adjustment provided on linkage.
Removal:—Remove transmission (see below), take off clutch housing pan, punch mark clutch cover and flywheel (to insure replacing in same position to maintain balance), take out mounting screws in clutch cover flange turning all screws out evenly, remove clutch from below.
TRANSMISSION:—**Warner Model T-86.** All helical gear type with synchro-mesh for second and high.
Transmission Control:—Remote steering column type.
See articles in Mechanical Equipment Section for data.
Removal:—Disconnect clutch linkage, shift linkage and drive shaft at front universal joint. Support rear of engine and free rear engine mountings. Install pilot studs in upper transmission mounting bolt holes, take out lower mounting bolts and pull transmission back.
UNIVERSAL JOINTS:—**Spicer.** Needle bearing type. 2 used.
See article in Mechanical Equipment Section for data.
REAR AXLE:—**Spicer.** Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.27-1.
Backlash—.004-.007". Shim adjustment.
Removal:—Disconnect hand brake cables, brake line, and drive shaft at rear universal joint. Remove wheels, take off spring clips at axle housing, remove axle from beneath car.
Axle Shaft Removal:—Remove wheel, hub, drum and backing plate. Pull axle shaft and wheel bearing.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub and drum assembly. Remove shims to decrease endplay, add shims to increase. **Endplay**—.003-.010".
SHOCK ABSORBERS:—**Gabriel.**—Double acting, hydraulic type.
See article in Mechanical Equipment Section for data.
STEERING:—**Steering Gear.** Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—2° plus or minus ½°. Adjust by inserting wedge shims between spring and spring seat on axle.
Camber—1°. Minor corrections can be made by heating axle moderately.
Toe In—1/16" plus or minus 1/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.
BRAKES:—**Service**—Hupp-Lockheed hydraulic type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type.
Front wheel—Front cylinder 1⅜". Rear 1".
Rear wheel—Front cylinder 1¼". Rear 1".
Drums—Cast-iron. Diameter—10".
Lining—Moulded type. Width 2". Thickness 3/16". Length per shoe 10½".
Clearance—.010" toe, .005" heel, for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—See Service Brakes.

ENGINE NUMBER:—On plate on right side of crankcase at front of engine below valve cover plate.

SERIAL NUMBER:—First number (110) L-1001, (3510) L-13,701, (3610) L-23,101. On right frame side member under engine hood.

ENGINE SPECIFICATIONS:—Type—6 cyl., 'L' head.

Bore—3¼". **Stroke**—4⅜".

Displacement—217.7 cubic inches.

Rated Horsepower—25.35 (SAE).

Developed Horsepower—75(110), 80(3510), 83(3610) at 3200 R.P.M.

Compression Ratio and Pressure—5.54-1 std. cast-iron head. Pressure—125 lbs. at 350 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type.

Length—3⅞".

Weight—18¼ ounces.

Removal—Pistons and rods removed from above.

Clearance—Skirt .002". See Fitting New Pistons.

Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance.

Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Comp. All	⅛"	.010-.025"
Oil Cont. (#3)	⅛"	.010-.025"
Oil Cont. (#4)	3/16"	.010-.025"

PISTON PIN:—Diameter—⅞". Pin floats in piston and rod. Pin hole in rod is bronze bushed. Pins furnished for service standard, .001", .003", .005" oversize.

Pin Fit in Piston—Light push fit with piston heated.

Pin Fit in Rod Bushing—.0001" or light push fit with both parts at normal temperature.

CONNECTING ROD:—Length—8¾".

Weight—36¼ ounces.

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2".

Lower Bearing—Interchangeable steel-backed, babbitt-lined (110, 3510), copper-lead lined (3610) type. Shim adjustment. One shim used on camshaft side on Models 110, 3510.

Clearance—.001-.003". Sideplay .008-.012".

Bearing Adjustment:—Shims. Do not file rods or caps. Replace bearings when necessary.

CRANKSHAFT:—7 bearing. Integral counterweights.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable steel-backed, babbitt lined (110, 3510), copper-lead lined (3610).

Clearance—.002-.0025".

Bearing Adjustment:—Shims. Do not file caps. Replace bearings when necessary. Bearing upper halves can be removed without removing crankshaft.

End Thrust:—Taken by center bearing. Endplay .004-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.

Bearing Type—Removable steel-backed, babbitt-lined type.

Timing Chain:—Diamond 'double strand' roller chain. Width 9/16". Pitch ⅜". Length 22½" or 60 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Remove and install chain 'endless.' Use special gear pullers and pushers, keep sprockets lined up so as to avoid sidestrain on chain or sprockets

VALVES:—	Head Diam.	Stem Diam.	Seat Width
Intake	1 21/32"	.341"	1/16"
Exhaust	1 17/32"	.341"	1/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.002"
Exhaust	45°	5/16"	.002"

Tappet Clearance—.015" all valves—engine hot or cold.

Valve Timing:—See Camshaft Setting Above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Presure:—25 lbs., 10 lbs. idling.

Oil Pressure Relief Valve:—Located on oil pump. Operates at 25 lbs. Adjustable by turning screw.

Crankcase Capacity:—7 quarts (full).

CLUTCH:—**Borg & Beck Model 9A6.** Single plate, dry disc type. No adjustment required for wear.

Facings—Moulded type, 2 required. Inside Diam. 5¾" (110, 3510), 6⅛" (3610). Outside Diameter 9" (110, 3510), 9⅛" (3610). Thickness .133" (110, 3510), ⅛" (3610).

Adjustment—Free movement of clutch pedal must be ½-1". Adjust whenever free movement is less than ½". To adjust, loosen nut on lower end of clutch pedal. Setscrew on throwout shaft at right end of clutch housing should not contact stop on case.

Removal—Disconnect driveshaft at rear of transmission, remove transmission, drop clutch housing underpan, take out capscrews mounting clutch on flywheel turning all screws out evenly to release spring pressure. Clutch assembly can then be removed from below without removing flywheel housing.

STEERING:—Steering Gear—Gemmer Model. Worm- and Roller type. See article in Steering Section for complete adjustment procedure.

Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends (Std.), or articulated axle Optl. 110, 3510). Semi-elliptic springs used with both types.

Kingpin Inclination—7° crosswise.

Caster—1-2° (110, 3510). 2-4° (3610) according to car load. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—0-1½°. No adjustment.

Toe In—0-⅛". To adjust, loosen clamp at right end of tie rod, turn tie rod in or out of this end joint, tighten clamp.

BRAKES (110, 3510):—**Service**—Bendix duo-servo, single anchor type, mechanically operated. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.

Drum Diameter—11".

Lining—Moulded type. Width 1¾". Thickness 5/32". Length per wheel 23¾".

Clearance—.010" between lining and drum.

Hand Brake Adjustment:—See Service Brakes.

BRAKES (3610):—**Service**—Bendix hydraulic, duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.

Drum Diameter—10".

Lining—Moulded type. Width 2". Thickness 3/16". Length 22 1/16" per wheel.

Clearance—.010" between drum and lining.

Hand Brake Adjustment:—Should be adjusted whenever service brakes adjusted. Turn adjusting screw in wheel so that shoes are tight in drum. Loosen 2 bracket bolts, pull hand brake lever 'on' three notches, pull bracket forward removing all slack in cables and tighten bolts. Then with lever in released position readjust shoes to give .010" clearance in drums by checking with feeler gauge through slot in drum.

SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on right side of crankcase below water inlet. First number (345-B) 1,100,001; (345-C) 2,100,001.

ENGINE SPECIFICATIONS:— 8 cylinder, 90 degree 'Vee' 'L' head type.

Bore—3⅜". Stroke—4 15"16".

Displacement—353 cubic inches.

Rated Horsepower—36.45 (AMA).

Developed Horsepower—115 at 3000 R.P.M.

Compression Ratio—5.4-1 std. head. 5.7-1 optional high compression head.

Compression Pressure—Approximately 94 lbs. (5.4-1 head), 98 lbs. (5.7-1 optl. head) at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

PISTONS:—Cast-iron, light weight. 345-C pistons are tin-plated.

Length—3 21/32".

Weight—23.824 ozs. (stripped), 30.400 ozs. (with rings, pin, and locking screw).

Clearance—Top .0135-.0185". Bottom .002-.003".

Removal—Pistons and rods removed from below.

PISTON RINGS:—Four rings (345-B), five rings (345-C) per piston. Three compression (345-B), two compression (345-C), two oil control rings (all models). Lower ring groove drilled radially with oil drain holes.

345-B Piston Rings

Ring	Width	End Gap	Wall Thickness
Comp. (upper)	⅛"	.008"	.148"
Comp. (lower)	3/16"	.008"	.148"
Oil Control (upper)	3/16"	.008"	.148"
Oil Control (lower)	5/32"	.008"	.148"

345-C Piston Rings

Comp. (upper	⅛"	.005-.010"	.135"
Comp. (#2)	.0930"	.005-.010"	.135"
Comp. (#3)	.0930"	.005-.010"	.135"
Oil Control (upper)	3/16"	.003-.011"	.140"
Oil Control (lower)	5/32"	.003-.011"	.140"

PISTON PIN:—Diameter—⅞". Length—3 1/32". Pin is locked in piston by locking screw in one boss. Bushing is split type and must be installed loosely and then expanded with burnishing tool.

Pin Fit in Rod Bushing—.0003-.0007".

CONNECTING ROD:—Weight—32.875 ounces.

Length—10½" (center-to-center).

Crankpin Journal Diameter—2⅜".

Lower Bearing—Poured babbitt type. No shims.

Clearance—.003". Endplay .003-.006".

Bearing Adjustment:—None (no shims). Do not file caps. Replace rods.

CRANKSHAFT:—3 bearing type with four counterweights.

Journal Diameters—2⅜" all bearings.

Bearing Type—Bronze backed, babbitt lined.

Clearance—.0015".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps.

End Thrust:—Taken by rear (#3) main bearing.

End Play—.001-.005".

CAMSHAFT:—Non-adjustable chain drive.

Timing Chain:—Morse #766. Width 1¾". Pitch .500". Length 27" or 54 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—	**Head Diameter**	**Stem Diameter**	**Length**
Intake	1.660-1.666"	⅜"	6 17/32"
Exhaust	1.634-1.640"	⅜"	6½"
	Seat Angle	**Lift**	**Stem Clearance**
Intake	30°	23/64"	.0025"
Exhaust	45°	23/64"	.0025"

Tappet Clearance—.006" Int., .008" Exh., engine cold.

Valve Springs:—	**Spring Pressure**	**Length**
Valve Closed	79 lbs.	2.500"
Valve Open	160 lbs.	2.148"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 6° BTDC. Close 42° ALDC.

Exhaust Valves—Open 38° BLDC. Close 2° ATDC.

To Check Valve Timing—Set tappet clearance at .006" for intake valve #1 cylinder (second valve from radiator on right hand bank). This valve should open with #1 piston 6° (.0165") before top dead center.

Motor Gauge—Weidenhoff Adapter #104, Rod #29.

LUBRICATION:—Pressure type.

Oil Pump:—Gear type located in crankcase.

Normal Oil Pressure:—30 lbs. at 30 M.P.H.

Oil Pressure Regulator:—Relief valve opens at 10 M.P.H. with pressure of 10 lbs.

Crankcase Capacity—8 quarts.

CLUTCH:—Own make. Double plate, dry disc type. See article in Clutch Section for complete data.

Clutch Facings—Woven asbestos, 5½" Inside Diameter, 10" Outside Diameter. .135-.145" thick. Four facings required.

NOTE—Mark clutch cover and flywheel before disassembling and reassemble in same position.

STEERING:—Steering Gear—Saginaw Model Worm-and-Sector type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—7°45' crosswise.

Caster—2½-3½°.

Camber—1½°.

Toe In—⅛-¼". Adjust in usual manner by changing length of tie rod.

BRAKES:—Service—Own Make. Internal expanding, self-energizing, mechanically operated, vacuum power type. Hand lever applies rear wheel service brakes. See article in Brake Section for relining and complete adjustment procedure.

Drum Diameter—15".

Lining—Semi-moulded Latex type. Width 2". Thickness 3/16". Length per wheel 29¾".

Clearance—.007" between lining and drum for each shoe.

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—Bendix type. See article in Brake Section for complete data.

ENGINE NUMBER:—First number 2,100,001. On left top front corner of cylinder block (below head).

ENGINE:—Own Model 350. Eight cylinder, In Line, 'L' head type.

Bore—3". Stroke—4¼".

Piston Displacement—240 cubic inches.

Rated Horsepower—28.8.

Developed Horsepower—95 at 3600 R.P.M.

Compression Ratio—6.5-1 (std.), 5.75-1 (optl).

Compression Pressure—162 lbs. at 1000 R.P.M. or 183 lbs. at 2700 R.P.M. (std. head).

Vacuum Reading—Steady 18-20" at idling speed.

Pistons:—Lynite Lo-Ex, aluminum alloy, 'T' slot, cam ground type with Anodized finish (special hard oxide deposited on bearing surface). Pistons cannot be ground. Refinish cylinders to take replacement pistons furnished .003", .005", .015", .030" oversize. Piston length, 3 11/16".

Weight—12.128 ozs. (stripped), 18.192 ozs. (with rings, pin, and locking screw).

Removal—Pistons and rods removed from below.

Clearance—Top .016". Bottom .0018" (at 70°F.).

Fitting New Pistons—Check piston with micrometer at point just below and to the left of 'T' slot junction midway between pin bosses with piston at 70°F. Finish cylinder bore to size giving correct clearance. Feeler gauges can be used on side opposite slot. Piston should fall of own weight with .0015" feeler and should lock on .002" feeler.

Installing Pistons—Install pistons with slot to left (away from camshaft and valves).

Piston Rings:—Two notched or stepped compression rings, two oil control rings per piston, all above pin. Lower ring grooves drilled radially with oil drain holes. Compression rings installed with notch or step downward.

Ring	Width	End Gap	Wall Thickness
Comp. (all)	.1235-.1240"	.007-.012"	.130"
Oil Cont. (3)	.1235-.1240"	.007-.015"	.130"
Oil Cont. (4)	.1545-.1550"	.007-.015"	.130"

Piston Pin:—Diameter ⅞". Length 2 11/16". Pin is locked in piston. Heat piston in hot water to remove or install pins.

Pin Fit in Piston—Locking screw end .0005" press fit or light thumb push fit with piston at 200-210° F. Free end .0003" clearance or light thumb push fit with piston at 70°F.

Pin Clearance in Rod Bushing—.0002-.0009".

Connecting Rod:—Weight 30.448 ozs. Length 9".
Lower Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0015". Sideplay .005".
Adjustment—None. Replace bearings. Do not file rods or caps.
Installing Rods—See that oil hole in top of lower bearing is toward right (camshaft side) of engine on all rods.

Crankshaft:—Five bearings with eight counterweights.
Journal Diameters—#1—2⅜", #2—2 9/16", #3—2⅝", #4—2 11/16", #5—2¾".
Bearing Type—Removable bronze-backed, babbitt-lined type.
Clearance—.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by #1 (front) bearing. Upper half of bearing flanged and steel thrust washer installed on shaft behind sprocket. Endplay .004".

Camshaft:—Non-adjustable chain drive.
Timing Chain—Whitney #CL-205. Width, 1¼". Pitch ½". Length, 23" or 46 links.
Camshaft Setting—Sprockets are marked. Install chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	11/32"	5 9/32"
Exhaust	1 7/16"	11/32"	5 9/32"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.291"	.002"
Exhaust	30°	.289"	.003"

Tappet Clearance—Running .006" Int., .008" Exh.
Timing—.015" all valves—engine cold.

Valve Springs—	Pressure	Length
Valve Closed	43 lbs.	2.25" Int., 2.248" Exh.
Valve Open	96 lbs.	1.906" Int., 1.904" Exh.

Spring cages installed on top of valve spring exert slight pressure on springs (pressure required to withdraw cages should be 3-6 lbs.). Use new cages with new valve springs.
Valve Timing—See Camshaft Setting above.
Intake Valves open 6° ATDC. Close 37° ALDC.
Exhaust Valves open 34° BTDC. Close 5° ATDC.
To Check Valve Timing—No. 1 intake valve should open with piston on top dead center with tappet clearance set at .0118".
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Lubrication:—Pressure type. Gear type pump located in oil pan.
Oil Pressure—30 lbs. at 60 M.P.H.
Oil Pressure Relief Valve—Operates at 30 lbs.
Capacity and Oil—7 qts. Use SAE. #30 (summer), 20-W or 10-W (winter).

CLUTCH:—Borg & Beck. Single plate, dry disc type. No adjustment of clutch necessary for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement of clutch pedal should be 1-1½". Adjust by loosening lock nut and turning stop screw on auxiliary cross shaft. Clearance between pedal and under side of toeboard should be ⅜-⅝" with clutch engaged. Adjust by changing length of clutch release rod (free rod at front end, turn rod in or out of clevis).
Clutch Facings—Moulded type, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.

NOTE—Mark flywheel, cover and spring pressure plate before disassembling clutch and install in same relative position. Clutch can be removed from below after taking off clutch housing pan without disturbing clutch housing. Install driven plate with mark 'Flywheel Side' toward flywheel.

When removing transmission from car, keep transmission in high gear or install brace across face of case to hold clutch connection in position, preventing high-speed synchronizing drum from pulling out of splines in main shaft.

STEERING:—Front Suspension—Independent, linked parallelogram type with helical springs.
See article in Mechanical Equipment Section for data.
Caster—2° with car weight on wheels. To adjust, loosen retaining nuts fastening steering knuckle support yokes to upper and lower suspension arms, and clamp screw at upper end of support, remove lubrication fitting in front bushing of upper support yoke, insert Allen wrench and turn threaded pin clockwise to increase caster, or counter-clockwise to decrease caster angle, tighten yoke retaining nuts and clamp screw, replace lubrication fitting.

Camber—1° with car weight on wheels. No adjustment provided. Crosswise inclination of kingpin 4° 51'.

Toe In—⅛". To adjust, increase or decrease length of each tie rod equally. Turn tie rods in same direction that wheels revolve to increase toe-in, or in opposite direction to decrease toe-in.

Steering Gear:—Saginaw Worm-and-Double-Roller type with center steering. See article in Steering Section for adjustments.

BRAKES:—Service—Bendix Hydraulic, single anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameters: front 1 1/16", rear 15/16". No part of assembly interchangeable between front and rear wheels.
Drum Diameter—11.995-12.005". Out-of-round .007" maximum. Run out (installed) .010" maximum.
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 25⅞".
Clearance—.010" between lining and drum.
Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number 2,200,001 (1935), 2,210,001 (1936). On left hand top front corner of cylinder block below head.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3". **Stroke**—4⅜".
Displacement—248 cubic inches.
Rated Horsepower—28.8.
Developed Horsepower—105 at 3600 R.P.M. (Std. 6.25-1 head).
Compression Ratio—6.25-1 Std. cast-iron head.
NOTE—Shims for reducing compression ratio to 5.75-1 available for special operating conditions.
Compression Pressure—160 lbs. at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed for std. 6.25-1 head.
Vacuum Reading—Gauge should show steady reading of 20-21" with engine idling at 6 M.P.H.

PISTONS:—Lynite, Lo-Ex aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). Pistons cannot be ground.
Length—3 11/16". **Weight**—12.128 ozs.
Removal—Pistons and rods removed from below.
Clearance—Top .015". Bottom of Skirt .0011-.0015". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard (2.9982-3.0002") and .003" (3.0012-3.0032"), .005" (3.0032-3.0052"), .010" (3.0082-3.0102"), .015" (3.0142-3.0152") oversizes. Cylinder bores should be finished with a 500 grit wet stone.
NOTE—Cylinder bores held within .002" limits. Maximum cylinder bore out-of-round .0005".
Fitting New Pistons:—Check piston with micrometer gauge at vertical slot 1¼" below top of head and ½" above lower edge of skirt. Using ⅜-½" feeler gauges inserted between piston and cylinder wall on side opposite slot to check clearance, piston should drop of its own weight with .0015" feeler and should hold its own weight with .002" feeler.
Installing Pistons:—Slot should be toward left or away from camshaft

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Lower ring grooves drilled radially with oil drain holes.
NOTE—A narow heat deflector groove located above top compression groove. No ring fitted in this groove.

Ring	Width	End Gap	Side Clear.
Comp. (all)	⅛"	.007-.012"	.0015-.0028"
Oil Cont (#3)	⅛"	.007-.015"	.0013-.0026"
Oil Cont. (#4)	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits on all rings .025" (End gap) and .004" (Side Clearance).

PISTON PIN:—Diameter 55/64". Length 2 11/16". Pin is locked in one piston boss by locking screw. Split-type bushing used in pin hole in rod. See Note below.
Pin Fit in Piston—.0001" clearance or free fit (no play) at room temperature 70° F. (free end), .0003" press fit (locking pin end).
Pin Fit in Rod Bushing—.0002-.0008" (new), .0015" maximum (worn).
Removal:—Remove lockscrew, place piston in boiling water for one minute, then push pin out by hand from locking screw side (to install, proceed as mentioned, except that the pin is pushed in from the opposite direction).
NOTE—In removing and installing split-type bushing an arbor press and special tool kit (Tool No. HM-250) are necessary. Bushings must be pressed in, expanded, then burnished to give correct clearance.

CONNECTING ROD:—Weight 32.336 ozs. Length 9".
Crankpin Journal Diameter—2¼".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.0025" (new), .006" max. (worn). Sideplay .003-.006".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods:—Oil hole in lower bearing upper half must be toward right or camshaft side on all rods.
NOTE—Crankpin out of round .002" maximum.

CRANKSHAFT—5 bearing. Integral counterweights.
Journal Diameters—#1, 2⅜"; #2, 2 9/16"; #3, 2⅝"; #4, 2 11/16"; #5, 2¾".
NOTE—Journal out-of-round .002" maximum.
Bearing Type—Removable steel-backed, babbitt-lined shells. New bearings need no line-reaming.
Clearance—.002" (new), .004" (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves of bearings can be removed and installed by rotating crankshaft with 'T' shaped cotter pin installed in oil passage.
NOTE—When reinstalling rear main bearing cap use new wooden plugs in grooves.
End Thrust:—Taken by flange on front (#1) bearing and steel washer behind timing sprocket. Endplay .001-.004" (new), .010 max. (worn).

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2.3095-2.3100"; #2, 2.2470-2.2475"; #3, 2.1845-2.1850"; #4, 2.1220-2.1225"; #5, 2.0595-2.0600"; #6, 1.8095-1.8100".
Bearing Type—Removable bronze bushings.
Clearance—.002-.004" (new), .005" (worn limit).
End Thrust:—Taken by spring-loaded plunger or thrust button in forward end of camshaft. No end-play permissible.
Timing Chain:—Whitney #CL-205. Width 1¼". Pitch ½". Length 23" or 46 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diam.	Stem Diam.	Length
Intake	1.562"	.3415-.3425"	5 9/32"
Exhaust	1.421"	.3405-.3415"	5 9/32"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.006" (worn limit)
Exhaust	45°	5/16"	.005" (worn limit)

Tappet Clearance—.006" Int., .009" Exh. Hot.
Valve Guides:—Removable. Pressed in block with long stepped end down and finish reamed to provide clearance of .001-.002" Int., .001-.003" Exh.
Valve Springs:—Install springs with close coils below. Free spring length 2 9"16".

	Spring Pressure	Length
Valve Closed	40-46 lbs.	2¼"
Valve Open	112-120 lbs.	1 15/16"

Valve Lifters:—Mushroom type. Clearance in Lifter Guide .0003-.0008" (new), .005" (worn).
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 37° ALDC.
Exhaust Valves—Open 34° BLDC. Close 5° ATDC.
To Check Valve Timing—No. 1 intake valve opens with piston on top dead center with .0118" tappet clearance.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

LUBRICATION:—Pressure system from oil pump in crankcase through main oil channel in right hand crankcase wall.
Oil Pump:—Gear type located in crankcase. Ignition timing not disturbed by oil pump removal.
Oil Pump Drive Clearances—Drive gear endplay .003-010" (new), .015" (worn limit). Drive gear backlash must not exceed .018". Clearance between bushing and drive shaft .001-.0025" (new), .010" (worn limit).
Oil Pump Gear Clearances—Clearance between pump gears and pump housing .0025-.0085" (new), .010" (worn limit). Pump gear endplay .0025-.0055" (new), .015" (worn limit).
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 60 M.P.H.
Oil Pressure Regulator:—Operates at 25 lbs. Mounted on oil pump. Not adjustable.
Crankcase Capacity:—7 qts. (refill).

CLUTCH:—**Borg & Beck Model 10A4 with Long Driven Member (10CF-CI).** Single plate dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .137".
Adjustment—Free movement of clutch pedal should be ⅞-1⅛". Adjust by loosening locknut and turning stopscrew on auxiliary cross shaft. Clearance between pedal and underside of toeboard should be ⅜-⅝". Adjust by changing length of clutch release rod. Free rod at front end, turn rod in or out. Pedal should touch toeboard when clutch fully released. Adjust clutch release rod (as above) if necessary.
Removal—Disconnect front universal joint, remove transmission, drop clutch housing pan, remove clutch release yoke retaining screw, prick punch clutch cover, spring pressure plate and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension. Remove clutch from below.
NOTE—Keep transmission in high gear or install brace across face of case to hold clutch connection in position, preventing high-speed synchronizing drum from pulling out of splines in main shaft.

STEERING:—**Steering Gear:** Saginaw worm-and-double roller type with center steering. See article in Steering Section for adjustments.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for description and adjustment procedure.
Kingpin Inclination—4°51' crosswise.
Caster—1½-2°.
Camber—¼-1° with car weight on wheels.
Toe In—0-1/16".
Steering Geometry—Inner wheel turned 21¾-23¼°, outer wheel 20°. Check tie rod ends and kingpins for looseness.

BRAKES:—Bendix Hydraulic, single anchor type. Hand lever applies rear wheel service brakes. See article in Brake Section for complete data.
Wheel Cylinders—Diameters: front 1 1/16", rear 15/16". No part of assembly is interchangeable between front and rear wheels.
Drum Diameter—11.995-12.005". Out-of-round .007" maximum. Run out (installed) .010" maximum.
Lining—Primary (front) shoe moulded. Secondary (rear) shoe woven. Length front wheel (front shoe 10⅛", rear shoe 13"), rear wheel (each shoe 13"). Width 2". Thickness 3/16". Length per wheel 23⅛" (front), 26" (rear).
Clearance—.010" between lining and drum.
Hand Brake Adjustment:—See Service Brake.

SERIAL NUMBER:—Same as engine number below.

ENGINE NUMBER:—First number 2230001. Stamped on left side of crankcase at rear of left cylinder block.

ENGINE SPECIFICATIONS:—Own. 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast enbloc. **Bore**—3⅜". **Stroke**—4½".
Displacement—322 cu. ins. **Rated HP.**—36.45.
Developed Horsepower—125 at 3400 R.P.M.
Compression Ratio—6.25-1 Std. 5.75-1 Optl.
Compression Pressure—155 lbs. at 1000 R.P.M. or approx. 105-110 lbs. at cranking speed (std. head).
See Cadillac Special Shop Notes for cylinder head installation instructions, head gasket identification, and changing compression ratios.
Vacuum Reading—Steady 20-21" at idle speed.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛".
Weight—18.30 oz. stripped. 25.13 oz. complete.
Removal—Pistons and rods removed from above.
Clearance—Skirt .0019". See Fitting New Pistons.

Replacement Pistons:—Finished anodized pistons furnished Std. (3.3726-3.3746"), .003" (3.3761-3.3776"), .005" (3.3781-3.3796"), .010" (3.3831-3.3846"), .015" (3.3881-3.3896").
NOTE—Hold all cylinders in same block within .002" size limits. Max. out-of-round .0005".

Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide) used, insert feeler next to T-slot. Piston should fall of own weight with .002" feeler, hold tight on .0025" feeler.

Installing Pistons:—Slot to left, for all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compression	1/8"	.007-.012"	.0015-.0028"
Oil Control	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits .025" (gap), .004" (side clear.).
Replacement Rings: .003",.005",.010",.015",.030" oversize.

PISTON PIN:—Diameter ⅞". **Length** 2 15/16". Pin floats in piston and rod. Held by locking rings.
See Cadillac Shop Notes for special pin removal and installation instructions.
Pin Fit in Piston—.0004" press fit (ribbed end), .0001" clearance or free fit at 70° F. (plain end).
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0015" (worn limit).

CONNECTING ROD:—Weight 37.472 oz. **Length** 8¾".
Crankpin Journal Diameter—2.460".
Lower Bearing—Steel-backed, babbitt-lined.
Clearance—.0015" (new), .006" Max. (worn).
Sideplay—.003-.006".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
See Cadillac Special Shop Notes for connecting rod data and bearing installation.

Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—3 bearing. 6 counterweights.
Journal Diameters—2½" all bearings.
Bearing—Steel or bronze backed, babbitt-lined.
Clearance—.0015" (new), .004" (worn limit).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing shaft.
See Cadillac Special Shop Notes for main bearing removal instructions.

End Thrust:—Taken by center bearing. Endplay .001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearings. Non-adjustable chain drive.
Journal Diameters—#1 and 2, 2.4071-2.4078"; #3, 2.0009-2.0016".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0027-.0037" (new), .005" (worn limit).
See Cadillac Special Shop Notes for Camshaft Bushing removal and installation instructions.

End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.

Timing Chain:—Morse Type C #3682-RX Side guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use tool J-836 to pilot camshaft sprockets.

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with straightedge across centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.001-.0023"
Exhaust	45°	.345"	.002-.0033"

NOTE—Worn limit for valve stem-to-guide clearance .006" Intake, .005" Exhaust.
See Cadillac Special Shop Notes for valve removal and installation instructions.

Tappet Clearance:—None (automatic take-up used).
See article in Mechanical Equipment Section.

Valve Guides:—Pressed in block with long stepped end down and reamed to correct size.

Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Lifters are mushroom type operating in removable guide brackets.
See article in Mechanical Equipment Section.
Clearance—.001-.0025" (new), .005" (worn).

Valve Springs:—	Pressure	Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close at 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
To Check Timing—Intake valve for #1 cylinder opens with piston on top dead center when 'C.1/6' on crankshaft pulley lines up with pointer.

LUBRICATION:—Pressure system with gear type oil pump located in crankcase.
See Cadillac Special Shop Notes for oil pump data and lubrication system servicing.
Normal Oil Pressure—30 lbs. at 60 MPH. 15 lbs. idle.
Oil Pressure Regulator—Located on oil pump. Operates at 30 lbs. Not adjustable.
Crankcase Capacity—7 qts. (refill).

COOLING SYSTEM:—Water Pump. Centrifugal type. Belt-driven in tandem with generator.
See article in Mechanical Equipment Section.

Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 148-153°F., fully open at 170°F. (High Reading Type—use with heaters). Starts to open 163-168°F. Fully open 185°F.
Shutter Adjustment—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.

CLUTCH:—Long Model 11CF-10½CI. Semi-centrifugal, single plate dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required. Inside Diam. 6½". Outside Diam. 10½". Thickness .137".

Adjustment:—Free movement of pedal should be ⅞-1⅛". To adjust, turn nut on forward end of connector link in front of clutch fork.

Removal:—Remove transmission (see Transmission Section below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel to insure correct installation, take out 6 mounting bolts in cover flange, remove clutch from below.

TRANSMISSION:—Own Make. Constant-mesh helical gear (second), synchro-mesh (second and high), sliding helical gear (low and reverse).
See article in Mechanical Equipment Section for data.

Removal:—With car on blocks, remove floor boards, disconnect drive shaft at front universal joint, support engine with jack under oil oan (use wooden block to avoid damage to pan), free transmission extension at rear support cross-member, disconnect exhaust pipe brace, free cross-member carrying engine rear support (4 bolts at each end), disconnect speedometer cable. Take out transmission mounting capscrews, pull transmission straight back (plug clutch connection shaft bearing drain hole as soon as it is accessible to prevent lubricant loss). NOTE—When installing, shift transmission in reverse and remove plug.

UNIVERSAL JOINTS:—Mechanics Model 3-C. Needle bearing type, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier Assembly be returned to factory for servicing.
Ratio—3.92-1 Std. No optional ratios.
Backlash—.004-.008". Screw adjustment.

Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on differential carrier flange, pull carrier assembly out without disturbing axle housing.
Axle Shaft Removal—Jack up car, remove rear wheels, pull wheel hub and brake drum assembly, disconnect brake line and remove backing plates (bleed brake line when re-installed). Use tool J-838, pull shaft and bearing assembly out.
NOTE—Early axle shafts have no locating shoulder for wheel bearing. Install bearing with 5/32" clearance between inner edge of hub and bearing.

Wheel Bearing Adjustment:—None (sealed type).

SHOCK ABSORBERS:—Delco Model 1946C, D (front) 1751A, B (rear). Double acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-roller type.
See article in Mechanical Equipment Section for data.

Front Suspension:—Independent linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4°51'.
Caster—¼-1° with car weight on wheels. Must be equal within ¼° at both wheels.
Camber—¼-1°. Equal within ¼° at both wheels.
Toe In—1/16-3/32" (at rest), 0-1/16" (in motion).
Steering Geometry—Inner wheel turned 21¾-23¼°. Outer wheel 20°.

BRAKES:—Service—Bendix hydraulic, Duo-servo, Single Anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—12". Centrifuse type. Drum out-of-round .007" max. Run-out (installed) .010" max. Drum turn down limit .030" cut.
Lining—Molded type. Width 2¼" (front wheels), 2" (rear wheels). Thickness 3/16". Length per shoe 12 15/16".
Clearance—.010" for all shoes.

Hand Brake:—See Service Brake above.

ENGINE HOOD & SIDE PANEL REMOVAL:—*See Cadillac Special Shop Notes for complete instructions.*

SERIAL NUMBER:—Same as Engine No. below.

ENGINE NUMBER:—First number 2,270,001. Stamped on left side of crankcase at rear of left cylinder block and on left frame side member at rear of front engine support.

ENGINE SPECIFICATIONS:—Own. 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast enbloc. **Bore**—3⅜". **Stroke**—4½".
Displacement 322 cu. ins. **Rated HP.**—36.45.
Developed Horsepower—125 at 3400 RPM.
Compression Ratio—6.25-1 Std., 5.75-1 Optl.
See Cadillac Special Shop Notes for cylinder head identification and interchangeability data.
Compression Pressure—155 lbs. at 1000 R.P.M. or approx. 105-110 lbs. at cranking speed (std. head).
Vacuum Reading—20-21" steady at 6 M.P.H.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛".
Weight—16.88 oz. stripped. 25.13 oz. complete.
Removal—Pistons and rods removed from above
Clearance—Skirt .0019". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished Std. (3.3726-3.3746"), .003" (3.3761-3.3776"), .005" (3.3781-3.3796"), .010" (3.3831-3.3846"), .015" (3.3881-3.3896").
NOTE—Hold all cylinders in same block within .002" size limits. Max. allowable out-of-round .0005".
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide) used, insert feeler at high point of piston next to T slot. Piston should fall of own weight on .0015" feeler and hold tightly on .002" feeler.
Installing Pistons:—Slot toward left (viewed from drivers seat) for all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin (no ring in narrow top heat deflector groove).

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.012"	.0015-.0028"
Oil Control	5/32"	.007-.015"	.0013-.0026"

NOTE—Worn limits .025" (end gap), .004" (side cl.).
Replacement Rings:—Rings furnished .003", .005", .010", .015", .030" oversize.

PISTON PIN:—Diameter ⅞". **Length** 2 15/16". Pin floats in piston and rod. Held by locking rings.
See Cadillac Shop Notes for special pin removal and installation instructions.
Pin Fit in Piston—.0004" press fit (ribbed end), .000" clearance or free fit at 70° F. (plain end).
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0015" (worn limit).

CONNECTING ROD:—Weight 37.472 ozs. **Length** 8¾".
Crankpin Journal Diameter—2.460".
Lower Bearing—Steel-backed, babbitt-lined.
Clearance—.0015" (new), .006" Max. (worn).
Sideplay—.003-.006".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
NOTE—Use new lockwashers under bearing cap bolts. Use only 12" wrench to tighten (Tool J-835).
Installing Rods:—Number on rods and bearing caps on same side and installed in same numbered cylinders with numbers down toward oil pan.

CRANKSHAFT:—3 bearing, 6 counterweights.
Journal Diameters—2½" all bearings.
Bearing—Bronze or steel-backed, babbitt-lined.
Clearance—.0015" (new), .004" (worn limit).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing shaft.
See Cadillac Special Shop Notes for Rear Main Bearing oil seal renewal (new type).
End Thrust:—Taken by center bearing. Endplay .001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearing. Non-adjustable chain drive.
Journal Diameters—#1 and 2, 2.4071-2.4078"; #3, 2.0009-2.0016".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0027-.0037" (new), .005" (worn limit).
See Cadillac Special Shop Notes for Camshaft Bushing removal and installation instructions.
End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.
Timing Chain:—Morse Type C #3682-R Side Guide type. Width 1⅛". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use tool J-836 to pilot camshaft sprocket
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.001-.0023"
Exhaust	45°	.345"	.002-.0033"

NOTE—Worn limit for valve stem-to-guide clearance .006" Intake, 005" Exhaust.
See Cadillac Special Shop Notes for valve removal and installation instructions.
Tappet Clearance:—None (automatic take-up used).
See article in Mechanical Equipment Section for data.
Valve Guides:—Pressed in block with long stepped end down and reamed to correct size.
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Lifters are mushroom type operating in removable guide brackets.
See article in Mechanical Equipment Section.
Clearance—.001-.0025" (new), .005" (worn limit).

Valve Springs:—	Pressure	Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
To Check Timing—Intake valve for #1 cylinder opens with piston on top dead center when mark 'C.1/6' on crankshaft pulley lines up with pointer.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure system with gear type oil pump located in crankcase.
See Cadillac Special Shop Notes for oil pump data.
Normal Oil Pressure—25 lbs. at 30 M.P.H.
Oil Pressure Regulator—Located on oil pump. Operates at 30 lbs. Not adjustable.
Crankcase Capacity—7 qts. (refill).

COOLING SYSTEM:—Water Pump. Centrifugal type. Belt-driven in tandem with generator.
See article in Mechanical Equipment Section for data.
Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 148-153°F., fully open at 170°F. (High Reading Type—use with heaters). Starts 163-168°F. Fully open 185°F.
Shutter Adjustment—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.

CLUTCH:—Long Model 11CF-10½CI. Semi-centrifugal, single plate dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven joined type, 2 required. Inside Diam. 6½". Outside Diam. 10½". Thickness .125".
Adjustment:—Free movement of pedal should be ⅞-1⅛". To adjust, turn nut on forward end of connector link in front of clutch fork.
Removal:—Remove transmission (see Transmission Section below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel to insure correct installation, take out mounting bolts in cover flange, remove clutch from below.

TRANSMISSION:—Own make. Constant-mesh helical gear (second), synchro-mesh (second and high), sliding helical gear (low and reverse).
Transmission Control—Own make. Remote control, type with shift lever mounted on steering column.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shifter rods at levers on left hand side of case, disconnect drive shaft at front universal joint, support engine with jack under oil pan (use wooden block to avoid damage to pan), free transmission extension at rear support crossmember, disconnect engine support stabilizer on right hand (take out pin at forward end), disconnext exhaust pipe brace, disconnect speedometer cable. Take out transmission mounting capscrews, pull transmission straight back (plug clutch connection shaft bearing drain hole as soon as it is accessible to prevent lubricant loss).

UNIVERSAL JOINTS:—Mechanics Model 3-C. Needle bearing type, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier Assembly be returned to factory for servicing.
Ratio—3.92-1 Std. No optional ratios.
Backlash—.004-.008". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Jack up car, remove rear wheels, pull wheel hub and brake drum assembly, disconnect brake line and remove backing plates. Use tool J-838, pull shaft and bearing assembly out.
Wheel Bearing Adjustment:—None (sealed type).

SHOCK ABSORBERS:—Delco Model 1946-E, F (front), 1751-E, F (rear). Double acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-roller type. *See data in Mechanical Equip. Section.*
Front Suspension:—Independent linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4°51' crosswise.
Caster—Neg. ¼° to Neg. 1¼° at curb weight (gasoline tank full). Adjustable.
Camber—Neg. ¼° to Pos. ½°. Adjustable.
Toe In—1/32-3/32" (at rest), 0-1/16" (in motion).
Steering Geometry (Toe out on turns)—Inner wheel turned 23½°, outer wheel 20°.

BRAKES:—Service—Bendix hydraulic, Duo-Servo, Single Anchor type. Hand lever applies rear brakes.
See article in Mechanical Equipment Section for data.
Braking Power—54½% Front, 45½% Rear).
Drum Diameter—12". Centrifuse type. Drum out-of-round .007" max. Run-out (installed) .010" max.
Lining—Molded type. Width 2¼" (front wheels), 2" (rear wheels), Thickness 3/16". Length per shoe 12 15/16".
Clearance—.010" for all shoes.
Hand Brake:—See Service Brake above.

ENGINE HOOD & SIDE PANEL REMOVAL:—*See Cadillac Shop Notes for complete instructions.*

SERIAL & ENGINE NUMBER:—1st number 2290001. Stamped on left side of crankcase at rear of left cylinder block and left frame side member opposite steering gear.

ENGINE SPECIFICATIONS:—**Own.** 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast enbloc. **Bore**—3⅜". **Stroke**—4½".
Displacement—322 cu. ins. **Rated HP.**—36.45.
Developed Horsepower—125 at 3400 R.P.M.
Compression Ratio—6.25-1 Std., 5.75-1 Optl.
See Cadillac Shop Notes for Head installation, head gasket data, and for changing compression ratios.
Compression Pressure—155 lbs. at 1000 R.P.M. or approx. 105-110 lbs. at cranking speed (std. head).
Vacuum Reading—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, "T" slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛".
Weight—18.30 ozs. (stripped), 25.13 ozs. (complete).
Removal—Pistons and rods removed from above.
Clearance—Skirt .0019". See Fitting New Pistons.
Replacement Pistons:—*See Cadillac Shop Notes.*
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜x½" wide, 7-10" long) used, insert feeler next to T-slot. Piston should fall through bore of own weight on .0015" feeler, and hold on .002" feeler. NOTE—Cylinder bore out-of-round .0005" max., taper .0003".
Installing Pistons:—Slot to left, for all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.012"	.0023-.0041"
Comp. (#2)	⅛"	.007-.012"	.0013-.0026"
Oil Control	5/32"	.007-.015"	.0013-.0026"

Replacement Rings:—.003", .005", .010", .015", .030" O.S.

PISTON PIN:—**Diameter**—⅞". **Length**—2 15/16". Pin floats in piston and rod. Held by locking rings.
See Cadillac Shop Notes for special pin removal and installation instructions.
Pin Fit in Piston—.0004" press fit (ribbed end), .0000" clearance or free fit at 70° F. (plain end).
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0018" (worn limit).

CONNECTING ROD:—**Weight** 37.472 ozs. **Length** 8¾".
Crankpin Journal Diameter—2.4590-2.4595".
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.0015-.0025" (new), .0045" Max. (worn).
Sideplay—.008-.014".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rod or caps. *See Cadillac Shop Notes for connecting rod and bearing installation data.*
Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down to oil pan.

CRANKSHAFT:—3 bearing. 6 counterweights.
See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.
Journal Diameters—2½" all bearings.
Bearings—Steel or bronze backed, babbitt-lined.
Clearance—.0015-.0025" (new), .005" (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing crankshaft.
End Thrust:—Taken by center (#2) bearing.
Endplay—.001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearing, non-adjustable chain drive.
See Cadillac Shop Notes for Camshaft Bushing data.
Journal Diameters—#1 and #2, 2.4071-2.4078"; #3, 2.0009-2.0016".
Bearing Type—Steel-backed, babbitt-lined.
Clearance .0015-.0033" (new), .0045" (worn).
End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.
Timing Chain:—Morse Type C #3682-R Side Guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use Tool J-836 to pilot camshaft sprocket.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.0012-.0032"
Exhaust	45°	.345"	.0022-.0042"

NOTE—Worn limit for stem clearance .005" (all valves). Valve heads not slotted.
See Cadillac Shop Notes for Valve Servicing data.
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Press in block (long stepped end down).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Lifters are mushroom type operating in removable guide brackets.
See article in Mechanical Equipment Section for data.
Clearance—.0010-.0024" (new), .0035" (worn).
Valve Springs:—Free length 2.210".

	Spring Pressure	Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
To Check Timing—#1 cylinder (front—left bank) intake valve should open with piston at TDC and mark 'C.1/6' on crankshaft pulley aligned with chain case cover pointer.

LUBRICATION:—Pressure (gear type oil pump in crankcase). *See Cadillac Shop Notes for oil pump data.*
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 30 MPH.
Oil Pressure Regulator:—Opens at 30 lbs. On oil pump. Non-adjustable type.
Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—**Capacity**—25 quarts.
See Cadillac Shop Notes for radiator core removal and fan pulley replacement instructions.
Water Pump:—Self-adjusting packing type.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove pump belt, hose and pump mounting screws. Lift pump out.
Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 148-153°F., fully open at 170°F. (High Reading Type—use with Heaters) Starts to open 163-168°F. Fully open 185°F.
Shutter Adjustment—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.
Temperature Gauge:—AC. Electric. #1510773 (dash unit), #1510774 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH:—Long Model 11CF-10½CI (before engine unit 2-D-701), 10CF-CI (after engine unit 2-D-700). Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven joined type, 2 required. Inside Diam. 6½" (early), 6" (late). Outside Diam. 10½" (early), 10" (late). Thickness .123-.127".
Adjustment:—Free movement f pedal should be ⅞-1⅛" (adjusting nut on connector link at fork).
Removal:—Remove transmission (see below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel (re-install to these marks), remove 6 cover screws (release tension evenly), remove assembly. *See Cadillac Shop Notes for clutch balancing.*

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh, all helical gear (sliding gear, low & reverse). *See article in Mechanical Equipment Section.*
Transmission Control:—Remote steering col. shift.
See articles in Mechanical Equipment Section for data.
Removal:—Support engine with jack under rear end of oil pan (use wooden block to avoid damage to pan), remove propeller shaft (disconnect front and rear universals), free transmission extension at engine rear support, remove crossmember with engine rear support, disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove from car. *NOTE—See Mechanical Equipment Section for shifter linkage adjustment when re-installing.*

UNIVERSAL JOINTS:—**Mechanics Model 3C.** Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier Assembly be returned to factory for servicing.
Ratio—3.92-1.
Backlash—.004-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Remove rear wheels, take off axle shaft nut, pull wheel hub and brake drum, disconnect brake line and remove backing plate. Pull shaft and bearing assembly out (use Tool J-838).
Wheel Bearing Adjustment:—None (sealed type).

SHOCK ABSORBERS:—**Delco.** Front 1946-G (right), H (left). Rear 1751-V (right), W (left). Double acting, hydraulic.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type. *See Mechanical Equipment Section.*
NOTE—New type steering linkage with idler arm attached to right frame sidemember.
Front Suspension:—Independent linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5°6' crosswise.
Caster—Neg. ¼° to Neg. 2¼°. Adjustable.
Camber—Neg. ¼° to Pos. ¾°. Adjustable.
Toe In—1/32-3/32" (at rest), 0-1/16" (in motion).
NOTE—Adjusting sleeve at wheel end of each tie rod provided for toe in adjustment.
Steering Geometry (Toe out on turns)—Inner wheel turned 22¼-23¾°. Outer wheel 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type (no eccentric adjustment). Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Centrifuse. Diameter—11.995-12.005". Drum out-of-round .007", turn down limit .030".
Lining—Moulded. Length per shoe—Front 11 17/32", Rear 12 31/32". Width 2". Thickness 3/16".
Clearance—.015" both ends of secondary shoe.
Braking Power—45½% rear, 54½% front.
Hand Brake:—See Service Brakes.

ENGINE NUMBER:—Stamped on left hand side of crankcase below #1 cylinder.

ENGINE:—Twelve cylinder, 65° Vee, 'L' head type. Cylinders for each bank cast Enbloc and separate from crankcase.
Dimensions—Bore 3¼". Sroke 4½". Displacement 448 cubic inches.
Horsepower—Rated 50.7. Developed 150 at 3400 R.P.M.
Compression—5.25-1. Pressure approximately 90-95 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Lynite, aluminum alloy, split skirt type. Pistons have oxidized surface.
Weight—14 ozs. stripped (without rings, pin, or locking screw).
Length—4".
Removal—Piston and rod assembly removed through bottom of engine.
Clearance—(Top) .015-.018", (skirt) .002".

Installing Pistons—Slot should be toward left (viewed from drivers seat) for pistons in both banks.

Piston Rings:—Four rings per piston, #1 and 2—compression rings, #3 and 4—oil control rings.

Ring	Width	End Gap
Comp. (both)	⅛"	.007-.012"
Oil Cont. (both)	5/32"	.007-.012"

Piston Pin:—Diameter, ⅞". Pin is clamped in piston.
Pin Fit in Rod—Tight thumb push fit.

Connecting Rod:—Weight 34 ozs. Length 11⅞". Two type used—see note.
NOTE—Rod for pistons in left bank is 'forked' type and carries the crankpin bearing. Rod for pistons in right bank oscillates on bearing in forked rod.
Big End Bearing—Diameter, 2½". Length, 1".
Bearing Type—Removable bronze-backed, babbitt-lined type in forked rod.
Clearance—.0015". Endplay .006-.015".
Adjustment—Shims used in straight rod for right bank. This rod can be adjusted by removing shims. No adjustment possible for forked rod and bearings must be replaced. Do not file rods or caps (filing forked rod will increase clearance of straight rod).

Crankshaft:—Seven bearing type. Integral counterweights.
Journal Sizes—2½" all bearings.
Bearing Type—Bronze-backed, babbitt-lined type. Shims used.
Clearance—.0015".
Adjustment—Shims provided on all bearings. Do not file bearing caps.
End Thrust—Taken by #7 rear main bearing. Endplay .004-.008.

Camshaft:—Seven bearing type. Camshaft driven by chain with automatic idler take-up. See Equipment Section for data on Morse automatic take-up.
Chain—Morse. Width, 1½". Length, 104 links. Pitch, ⅜".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. See Equipment Section for data on assembly and setting of automatic idler sprocket.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angle
All Valves	2"	⅜"	6⅝"	45°

Valve Lift—11/32" (1932), 5/16" (1933).
Tappet Clearance—.003" (intake), .005" (exhaust) cold.
Valve Springs—Pressure should be 75-80 lbs. at 2 15/16" with valves closed, and 175-180 lbs. at 2 19/32" with valves open.

Valve Timing

Intake Valves Open—21° Before TDC.	Close—47° after LDC.
Exhaust Valves Open—57° Before LDC.	Close—11° After TDC.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Oil Pressure—40 lbs. with engine at normal temperature.
Oil Pressure Relief Valve—Operates at 40 lbs. Located under plug on right hand side of crankcase. Not adjustable.

NOTE—Oil Pressure Relief Valve on 1932 model consisted of a ball-check by-pass valve and an adjustable metering pin. Oil pressure for idling and ordinary driving speeds was adjustable by loosening the packing nut on the metering pin stem and turning the pin clockwise (to increase pressure) or counter-clockwise (to decrease pressure). This adjustment should only be made after engine warmed up to running temperature. Pressure should be 5-10 lbs. idling and 50 lbs. maximum. By-pass valve spring also adjustable.
Capacity & Oil—12 qts. Use SAE #40 (summer), #30 (winter).

CLUTCH:—**Long Model 29-A.** Double plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven type, 4 required. Thickness .130". Inside Diameter 6¼". Outside Diameter 9¾".
Adjustment—Clutch pedal free movement should be 1". To adjust, loosen lock-scre and turn pedal adjusting screw on clutch throw-out fork at lower end of clutch pedal. Clearance between pedal and toeboard controlled by stopscrew on bracket above shaft.
NOTE—Center driving must be centered when clutch is installed on car and may require adjustment in service. To adjust, turn each of three slotted adjusting screws on rim of cover to right until they bottom on plate, then back each screw off exactly ½ turn or three 'clicks.'

STEERING:—**Steering Gear**—Gemmer special Worm-and-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—2°. Adjusted by inserting wedge shims between spring and spring pad on axle.
Camber—1°. No adjustment provided. Manufacturer does not recommend bending of axle to correct camber.
Toe In—0-⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Bendix Mechanical, Duo-Servo, double anchor type with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—16".
Lining—Woven type (primary shoe), moulded type (secondary shoe). Width 2½". Thickness ¼". Length 34" per wheel.
Clearance—.008" anchor pin end, .014" adjusting screw end for each shoe.

Hand Brake:—See Service Brake adjustment above.

Power Cylinder:—Bendix plain type vacuum cylinder linked to brake cross-shaft and controlled by valve linked in brake pedal rod. See article in Brake Section for complete data.

ENGINE NUMBER:—Stamped on left hand side of crankcase below center of block.

ENGINE:—Twelve cylinder, 67° Vee, 'L' head type. cylinder bank cast Enbloc and separate from crankcase.
Bore—3" (1933), 3⅛" (1934-35). **Stroke**—4½".
Displacement—381.7 cu. ins. ('33), 414 cu. ins. ('34-'35).
Rated Horsepower—43.2 ('33), 46.8 ('34-35).
Developed Horsepower—125 at 3400 R.P.M. ('33), 150 at 3400 R.P.M. ('34-35).
Compression Ratio—5.5-1 ('33), 6.38-1 ('34-35). Cylinder head on 1934-35 models is aluminum.
Compression Pressure—Approximately 95 lbs. ('33), 105-110 lbs. ('34-35) at cranking speed.
Vacuum Reading—Steady reading of 18-20" at idling speed.

Pistons:—Lynite, aluminum alloy, 'T' slot, elliptically (cam) ground, with oxidized bearing surface (special hard oxide deposited on skirt). Pistons cannot be ground. Refinish cylinders to take standard replacement pistons furnished .0025", .015", .030" oversize.
Weight—12½ ozs. (without rings, pin or locking screw).
Removal—Pistons and rods removed at bottom.
Clearance—Top Land .025". Bottom .002".
Fitting New Pistons—Use .002" feeler gauge to check clearance when fitting new pistons. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 3-4 lbs.
Installing Pistons—Install pistons with slot to left (viewed from drivers seat) in both banks.

Piston Rings:—Three compression rings ('33) two compression rings (all others), two oil control rings (all models) per piston.

Ring	Width	End Gap	Wall Thickness
Comp. (all)	⅛"	.008-.013"	.140"
Oil Cont. (all)	5/32"	.008-.013"	.140"

Piston Pin:—Diameter ⅞". Length 3". Pin is locked in piston.
Clearance in Rod Bushing—.0005".

Connecting Rod:—Weight 38 ozs. Length 10⅞".
Journal Diameter—2½".
Lower Bearing—Removable bronze- backed, babbitt-lined ('33), copper-lead type (1934-35).
Clearance—.002". Sideplay .006-.015" (both bearings).
Adjustment—Shims provided on 1933 model. No adjustment on 1934-35 model. Replace bearings. Do not file bearing caps.

Crankshaft:—Four bearing type with integral counterweights.
Journal Diameters—2⅝" (all bearings).
Bearing Type—Bohn Copper-lead type (except #4 which is bronze-backed, babbitt-lined type).
Clearance—.002".
Adjustment—Solid shims are used. Do not file caps.
End Thrust—Taken by #4 (rear) main bearing. Endplay .004-.007".

Camshaft:—Five bearing type. Duplex chain drive with automatic idler sprocket take-up. See Equipment Section for data on Morse automatic take-up idler.
Bearing Type—Babbitt-lined type.
Bearing Diameters—#1, 1½"; #2, 3, 4, 2¼"; #5, 1¼".
Timing Chain—Morse Duplex. Width 1½". Pitch ⅜". Length 104 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diam.	Stem Diam.	Length
All valves ('33-34)	1 11/16"	5/16"	6¼"
All valves ('35)	1 11/16"	5/16"	6¾"

	Seat Angle	Lift	Stem Clearance
All valves ('33-34)	45°	5/16"	.003-.004"
All valves ('35)	45°	11/32"	.003-.004"

Tappet Clearance—.004" Int., .006" Exh. cold.
Valve Springs:—Spring pressure 70-75 lbs. with valve closed (1933). Pressures for 1934-35 as follows:

Valve Closed	60-66 lbs.	2 11/16"
Valve Open	187-199 lbs.	2 11/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 21° BTDC. Close 49° ALDC.
Exhaust Valves—Open 57° BLDC. Close 11° ATDC.
NOTE—Intake valve closing point is 47° ALDC. for 1933.
To Check Valve Timing—No flywheel marks provided. No. 2 intake valve opens when a point on the flywheel approximately 6.77 teeth before dead center mark 'D2/12C' lines up with indicator on housing.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Lubrication:—Pressure. Gear type pump located in crankcase. Harrison oil temperature regulator located on right hand side of crankcase.
Normal Oil Pressure—40 lbs. at 50 M.P.H.
Oil Pressure Relief Valve—Located on outlet pipe from temperature regulator at right of crankcase. Operates at 40 lbs. Not adjustable. A second bypass valve is located in the crankcase on the oil header.
Capacity & Oil—11 qts. ('33), 13 qts. ('34), 12 qts. ('35). Use SAE #40 (summer), #20W (winter).

CLUTCH:—(1933)—**Long Model 29-A.** Double plate, dry disc type. (1934-35) **Long Model 12-CB.** Single plate dry disc type. See article in Clutch Section for relining and assembling directions.
Facings (29-A)—Woven type, 4 required. Thickness .130". Inside Diameter 6¼". Outside Diameter 9¾".
Facings (12-CB)—Woven type, 2 required. Thickness .137". Inside Diameter 7". Outside Diameter 12".
Clutch Pedal Adjustment—Free movement of clutch pedal should be 1". To adjust, loosen locknut and turn pedal adjusting screw on clutch arm below pedal shaft. Clearance between pedal and underside of toeboard is controlled by pedal stop screw on bracket above pedal shaft.
NOTE—On Model 29-A, center driving plate should be centered when clutch is installed and may require adjusting in service. To adjust, turn each of three slotted screws on rim of cover to right until they bottom on center plate, then back each screw off exactly ½ turn or 3 clicks.

STEERING:—**Steering Gear**—Gemmer Special Worm-and-Roller type. See article in Steering Section for complete adjustment directions.
Front Axle—Timken, 'I' beam section, reverse Elliot type ends.
Kingpin Inclination—7½° crosswise.
Caster—1½°. Use wedge shims inserted between spring and spring pad on axle to correct caster.
Camber—1°. Bending of axle to correct camber not recommended.
Toe In—1/16-⅛". To adjust, loosen clamps at each end of tie rod, turn rod (right and left hand threads).

BRAKES:—**Service**—Bendix Mechanical, Duo-Servo, Double-anchor type (1933), Single anchor type (1934-35) with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section on each type for complete adjustment instructions.
Drum Diameter—16".
Lining—Woven type (primary shoe), moulded type (secondary shoe). Width 2½". Thickness ¼". Length 34" per wheel.
Clearance—.008" anchor pin end, .014" adjusting screw end for each shoe.

Hand Brake:—See Service Brake adjustment above.

Power Cylinder:—Bendix plain type vacuum cylinder linked to cross-shaft and controlled by valve connected in pedal rod. See article in Brake Section for complete data.

ENGINE NUMBER—Stamped on left hand side of crank case below center of block. First number 5501.

ENGINE SPECIFICATIONS:—12 cylinder, 67° Vee, 'L' head type. Cylinder block for each bank cast enbloc and separate from crankcase.

Bore—3.125". **Stroke**—4.50".

Displacement—414 cubic inches.

Rated Horsepower—46.8 (SAE).

Developed Horsepower—150 at 3400 R.P.M.

Compression Ratio—6.38-1 Std. aluminum head.

Compression Pressure—138 lbs. at 1000 R.P.M. or 105-110 lbs. at 100 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

PISTONS:—Lynite, aluminum alloy, 'T' slot, Cam ground with oxidized bearing surface (special hard oxide deposited on skirt). Pistons cannot be ground.

Weight—12½ ozs. (without rings, pin or locking screw).

Length—3.87".

Removal—Pistons and rods removed at bottom.

Clearance—Top land .025". Bottom .002". See Fitting New Pistons (below).

Replacement Pistons:—Finished replacement pistons furnished in standard and .0025", .015", .030" oversizes.

Fitting New Pistons:—Use .002" feeler gauge to check clearance when fitting new pistons. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be between 3-4 lbs.

Installing Pistons:—Install pistons with slot to left (viewed from driver's seat) in both banks.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin. Lower ring groove drilled with oil drain holes.

Ring	Width	End Gap	Wall Thick.
Comp. (all)	.1235-.1240"	.008-.015"	.125"
Oil Cont. (all)	.1545-.1550"	.007-.015"	.140"

PISTON PIN:—Diameter—.875". **Length**—3".

Pin is locked in piston.

Pin Fit in Rod Bushing—.0005" clearance.

CONNECTING ROD:—Weight—38 ounces.

Length—10.875" (center-to-center).

Crankpin Journal Diameter—2.500".

Lower Bearing—Removable copper-lead type.

Clearance—.0015-.003". Sideplay .006-.015". (Total for both rods).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Installing Rods:—Number on rod and cap must correspond and should be installed in same numbered cylinder with marks pointing down toward pan.

CRANKSHAFT:—4 bearing. Integral counterweights.

Journal Diameters—2.625" (all bearings).

Bearing Type—Bohn copper-lead type.

Clearance—.001-.003".

Bearing Adjustment:—Solid shims are used. Do not file caps.

End Thrust:—Taken by rear (#4) main bearing. Endplay .004-.007". No adjustment. Replace bearing.

CAMSHAFT:—5 bearing. Duplex chain drive with automatic idler sprocket take up. See Equipment Section for data on Morse automatic take-up idler.

Journal Diameters—#1, 1.500"; #2, 3, 4, 2.250"; #5, 1.250".

Bearing Type—Babbitt-lined type.

Clearance—.002".

NOTE—Front bearing must be removed to remove camshaft.

End Thrust:—Taken by front bearing. Replace bearing.

Timing Chain:—Morse Duplex. Width 1½". Pitch ⅜". Length 104 links or 39".

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.687"	.3125"	6.750"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.343"	.003-.004"

Tappet Clearance—.004" Int., .006" Exh., cold.

NOTE—High tungsten chrome alloy steel inserts used in exhaust valve seats.

Valve Guides:—Press-fit. Finish ream to give correct stem clearance (above).

Valve Springs:—

	Spring Pressure	Length
Valve Closed	60-66 lbs.	2.687"
Valve Open	187-199 lbs.	2.343"

Valve Lifters:—Roller type, cylindrical. Diameter 1.122-1.1225". Lifter guides single piece, flanged top, removed from above.

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 21° BTDC. Close 49° ALDC.

Exhaust Valves—Open 57° BLDC. Close 11° ATDC.

To Check Valve Timing—No flywheel marks are provided. No. 2 intake valve opens when a point on the flywheel approximately 6.77 teeth before dead center mark 'D2/12C' lines up with indicator on housing.

Motor Gauge—Weidenhoff Adapter #113, Rod #37.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—40 lbs. at 50 M.P.H.

Oil Pressure Relief Valve:—Located on outlet pipe from temperature regulator at right of crankcase. Operates at 40 lbs. Not adjustable. A second bypass valve is located in the crankcase on the oil header.

Oil Temperature Regulator:—Harrison. Located on right hand side of crankcase.

Oil Pressure Gauge:—King-Seeley Electric type, K-S Part No. 5760 (dash unit), 5460 (motor unit). Dash unit identified by letter 'O' stamepd on edge.

See article in Mechanical Equipment Section for data.

Crankcase Capacity:—12 quarts (refill).

CLUTCH:—Long Model 12 CB-CL. Single plate, dry disc type. See Clutch Section for relining and assembling directions.

Facings—Woven type, 2 required. Inside Diam. 7". Outside Diam. 12". Thickness .137".

Adjustment—Free movement of clutch pedal should be 1". To adjust, losen locknut and turn pedal adjusting screw on clutch throwout fork below pedal shaft. Clearance between pedal and underside of toeboard is controlled by pedal stopscrew on bracket above pedal shaft.

Removal—Slide rear end and transmission to rear as a unit (clutch housing unit with transmission case). Take out capscrews mounting clutch on flywheel, turning all screws out evenly to release clutch spring tension. Remove clutch assembly.

STEERING:—Steering Gear—Gemmer Worm-and-Double-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends. Left spring shackled both front and rear.

Kingpin Inclination—7½° crosswise.

Caster—1½° (normal load). Limits 1-2°. Use wedge shims inserted between spring and spring pad on axle to correct caster.

Camber—1°. Limits ½-1°. Bending of axle to correct camber not recommended.

Toe In—1/16-⅛". To adjust, loosen clamps at each end of tie rod, turn rod (right and left hand thrds.).

Steering Geometry—Inner wheel turned 22¾° (136"), 22⅛° (145"), outer wheel turned 20° both cars). Allowable variation ½°. Check tie rod ends and kingpins for looseness.

BRAKES:—Service—Bendix Mechanical, Duo-Servo, Single anchor type, mechanically operated, Vacuum power Brake. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—15.125". Forged steel type.

Lining—Moulded type. Width 2.50". Thickness .25". Length 33.50" per wheel.

Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—Bendix plain type vacuum cylinder mounted on right front leg of 'X' member and linked to brake cross-shaft. Control valve connected in brake linkage between pedal and cross-shaft. Regulating valve located at base of steering column and controlled by lever on instrument board. See article in Brake Section for complete data.

SERIAL NUMBER:—On plate on front of dash.
ENGINE NUMBER:—Stamped on left side of crankcase at center. 1st number K-7500 ('37), K-9000 ('38).
ENGINE SPECIFICATIONS:—Own. 12 cylinder, 67° Vee, 'L' head type. Cylinder block for each bank cast enbloc and separate from crankcase.
Bore—3.125". **Stroke**—4.50".
Displacement—414 cubic inches.
Rated Horsepower—46.8 S.A.E.
Developed Horsepower—150 at 3400 R.P.M.
Compression Ratio—6.38-1 Std. aluminum head.
Compression Pressure—138 lbs. at 1000 R.P.M. or 105-110 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady reading with engine idling at 5-7 M.P.H.

PISTONS:—Lynite, aluminum alloy, T slot, Cam ground type with oxidized bearing surface (hard oxide formed on outer surface). Recondition engines to take finished replacement pistons. **Length**—3.87". **Weight**—12.5 ozs. (less rings, pin, locking screw).
Removal—Pistons and rods removed from below.
Clearance—.025" top, .002" bottom. See Fitting New Pistons.
Replacement Pistons:—Finished pistons furnished standard and .0025", .015", .030" oversize.
Fitting New Pistons:—Use .003" feeler inserted between piston and wall on side opposite slot at right angles to pin bosses to check clearance. Pull required to withdraw feeler must be within 2-4 lbs.
Installing Pistons:—Slot toward left (viewed from drivers seat) for all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Lower ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. Top	.1235-.1240"	.008-.015"	.0025"
Comp. #2	.1235-.1240"	.008-.015"	.0015"
Oil Cont.	.1545-.1550"	.007-.015"	.0015"

Replacement Rings:—Std. and .002", .015", .030" oversize.

PISTON PIN:—Diameter—.875". **Length**—3". Pin locked in piston by locking screw in one boss.
Pin Fit in Rod Bushing—.0005" clearance.

CONNECTING ROD:—Weight—38 ozs. **Length**—10.875".
Crankpin Journal Diameter—2.500".
Lower Bearing—Steel-backed, copper-lead lined.
Clearance—.0015-.003". Sideplay .006-.015" (total).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Bearings furnished .020" undersize.
Installing Rods:—Number on rod and cap must correspond. Install in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—4 Bearing. Integral counterweights.
Journal Diameters—2.625" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001-.003".
Bearing Adjustment:—Shims. Do not file caps.
Replacement Bearings:—Furnished .020" undersize.
End Thrust:—Taken by rear main bearing. Endplay .004-.007". No adjustment (replace bearing).

CAMSHAFT:—Five bearing. Duplex chain drive with automatic idler sprocket take-up. See article in Mechanical Equipment Section for data.
Journal Diameters—#1, 1.500"; #2, 3, 4, 2.250"; #5, 1.250". Front bearing must be removed to take out camshaft.
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0015-.003".
End Thrust:—Taken by front bearing. Endplay .004-.006". No adjustment (replace bearing).
Timing Chain:—Morse Duplex. Width 1½". Pitch ⅜". Length 104 links or 39".
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across shaft centers. See article in Mechanical Equipment Section for instructions on assembling and setting automatic idler sprocket.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1.687"	.3125"	6.750"

	Seat Angle	Lift	Stem Clearance
All valves	45°	.343"	.003-.004"

Tappet Clearance:—None in service (hydraulic tappet take-up used).
Valve Guides:—Press fit in block. Finish ream to size for correct stem clearance.
Valve Lifters:—Mushroom type with hydraulic tappet take-up built in lifter body. Diameter .750".
See article in Mechanical Equipment Section for data.

Valve Springs:—	Pressure	Length
Valve Closed	55-60 lbs.	2.687"
Valve Open	130-140 lbs.	2.343"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 21° BTDC. Close 49° ALDC.
Exhaust Valves—Open 57° BLDC. Close 11° ATDC.
To Check Timing—No flywheel marks provided. No. 2 intake valve (front cylinder, right hand bank) opens when a point on the flywheel approximately 6.77 teeth before dead center mark 'D2/12C' lines up with indicator on housing.
NOTE—Hydraulic tappet clearance take-up makes it impossible to determine valve opening except by removing cylinder head and using dial indicator to check valve movement.

LUBRICATION:—Pressure system. Gear type oil pump mounted in crankcase at rear of engine. Harrison type oil temperature regulator mounted on right side of crankcase.
Normal Oil Pressure—40 lbs. at 50 M.P.H.
Oil Pressure Regulator—Located on outlet header near oil temperature regulator on right side of crankcase. Operates at 40 lbs. Not adjustable. Additional non-adjustable by-pass valve located at forward end of oil header in crankcase.
Crankcase Capacity—12 quarts.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6255, Lincoln No. K-13116D (dash unit), K-S No. 5460, Lincoln No. 48-9278 (engine unit).
See article in Mechanical Equipment Section.

COOLING SYSTEM:—Water Pump:—Centrifugal type with adjustable packing. Mounted on rear of generator.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator, disconnect hose couplings, oil temperature regulator lines, drive coupling, take out water pump mounting screws.
Radiator Shutter Thermostat:—In radiator top tank, connected to shutters by rod and levers. Should be practically closed at 145°F., open at 160°F.
Water Capacity—32 quarts.
Drain Valves:—One only, at lower inlet elbow of water pump.

CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type. *See article in Mechanical Equipment Section.*
Facings—Woven type, 2 required. Inside Diam. 7", Outside Diam. 12". Thickness .137".
Adjustment:—Free movement of clutch pedal should be 1". To adjust, loosen locknut and turn adjusting screw on clutch throw-out fork below pedal shaft. Clearance between pedal and underside of toeboard controlled by stopscrew above pedal shaft.
Removal:—Disconnect speedometer cable, rear brake cables, shock absorber links, spring clips on axle housing. Take out clutch housing mounting screws (housing integral with transmission case), slide entire transmission and rear axle assembly to rear to expose clutch. Take out clutch mounting screws in cover flange on flywheel.

TRANSMISSION:—Own make. All helical gears. Constant mesh, synchro-mesh (second and high), sliding gears (low & reverse). NOTE—'Blocker' type synchronizer used on 1938-39 models.
See article in Mechanical Equipment Section for data.
Removal:—Remove rear axle or slide assembly back to free transmission (see Rear Axle Section below). Take out clutch housing mounting screws (integral with transmission case), pull transmission straight back and remove.

UNIVERSAL JOINT:—Spicer. One joint mounted within ball housing at rear of transmission case (torque tube drive).
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Full floating, spiral bevel gear type with straddle-mounted pinion and Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.58-1. **Backlash**—.010". Screw adjustment.
Removal:—Disconnect speedometer cable, rear brake cables, shock absorber links, spring clips on axle housing. Take out universal joint ball housing bolts, pull rear axle to rear to free drive shaft at splined joint at universal.
Axle Shaft Removal—Axle shaft flange bolted to wheel at outer end (under dustcap). To remove shaft, take out flange screws, pull shaft out (does not disturb wheel bearings).
Wheel Bearing Adjustment:—Remove axle shaft, unscrew locknut within wheel hub, take off lockwasher, turn up adjusting nut until bearing clearance is hardly perceptible, replace lockwasher, locknut and axle shaft.

SHOCK ABSORBERS:—Houde (Houdaille), Type 'ALG'. Double acting hydraulic, automatic thermostatic valve type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Own make, Gemmer Model 215 design. Worm-and-roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—1½° (normal load). Limits 1-2°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1°. Limits ½-1°. Bending of axle to correct camber not recommended.
Toe In—1/16-⅛". Adjusted in usual manner by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel turned 22¾° (136" WB), 22 1/3° (145" WB), outer wheel 20° (all cars). Allowable variation ½°.

BRAKES:—Service—Bendix Mechanical, Duo-Servo, Single anchor type with Vacuum Power operation. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—15.125". Cast-iron, steel-web type.
Lining—Molded (all '37, primary '38-39), woven (secondary '38-39). Width 2.5". Thickness .25". Length per wheel 33.50".
Clearance—.010" at heel and toe of each shoe.
Braking Power—50% Front, 50% Rear.
Hand Brake:—See Service Brakes above.
Power Unit:—Bendix plain type vacuum cylinder mounted on right front leg of 'X' member and linked to brake cross-shaft. Control valve connected in linkage between brake pedal and cross-shaft.
See article in Mechanical Equipment Section for data.

1936-39 MODELS

RECONDITIONED ENGINES & CYLINDER BLOCKS:—Reconditioned engines (complete with heads and oil pan) and cylinder blocks (with fitted pistons) are furnished as follows:

Reconditioned Engines
Model 901H ('36), HB ('37)

.015" Oversize	Part Number	.030" Oversize
HB-6012-A		HB-6012-B

Model 86H (1938)

86H-6012-A		86H-6012-B

Model 96H (1939)

96H-6012-A		96H-6012-B

Cylinder Block & Pistons
Part Numbers
Model 901H (1936)

Standard	.015" Oversize	.030" Oversize
H-6014-A	H-6014-B	

Model HB (1937)

HB-6014-A	HB-6014-B	HB-6014-C

Model 86H (1938)

86H-6014-A	86H-6014-B	86H-6014-C

Model 96H (1939)

96H-6014-A	96H-6014-B	96H-6014-C

1936-39 MODELS

REPLACEMENT PISTONS:—Finished pistons are furnished in Standard Size and Oversizes as listed below with each size graded in four steps as follows:

Standard Pistons
Model 901H ('36), HB ('37)

Part Number	Size
H-6110-C1	2.7470-2.7475"
H-6110-C2	2.7482-2.7485"
H-6110-C3	2.7487-2.7490"
H-6110-C4	2.7493-2.7496"

Model 86H ('38), 96H ('39)

86H-6110-A1	2.7477-2.7480"
86H-6110-A2	2.7482-2.7485"
86H-6110-A3	2.7487-2.7490"
86H-6110-A4	2.7493-2.7496"

.002" Oversize
Model 901H ('36), HB ('37)

H-6110-C5	2.7499-2.7502"
H-6110-C6	2.7505-2.7508"
H-6110-C7	2.7511-2.7514"
H-6110-C8	2.7517-2.7520"

Model 86H ('38), 96H ('39)

86H-6110-A5	2.7499-2.7502"
86H-6110-A6	2.7505-2.7508"
86H-6110-A7	2.7511-2.7514"
86H-6110-A8	2.7517-2.7520"

.015" Oversize
All Models

86H-6110-B1	2.7627-2.7630"
86H-6110-B2	2.7632-2.7635"
86H-6110-B3	2.7637-2.7640"
86H-6110-B4	2.7643-2.7646"

.030" Oversize
All Models

86H-6110-C1	2.7777-2.7780"
86H-6110-C2	2.7782-2.7785"
86H-6110-C3	2.7787-2.7790"
86H-6110-C4	2.7793-2.7796"

1939 MODELS

PISTON RINGS & EXPANDERS:—Sealed Power and Muskegon Piston Rings and Expanders (see note below) are furnished in Standard Size and Oversize as sets in cartons and singly as follows:

Sets in Cartons

Part Number	Size
86H-6149-D (3/16" oil ring)	Standard
86H-6149-E (3/16" oil ring)	.015" Oversize
86H-6149-F (3/16" oil ring)	.030" Oversize

Standard Size

Part Number	Type	Make
H-6150-B	Upper Compr.	
86H-6155-A	Lower Compr.	Muskegon
86H-6155-B	Lower Compr.	Sealed Power
86H-6156-A	Oil Control	Muskegon
86H-6156-B	Oil Control	Sealed Power

.015" Oversize

H-6150-C	Upper Compr.	
86H-6155-C	Lower Compr.	Muskegon
86H-6155-D	Lower Compr.	Sealed Power
86H-6156-C	Oil Control	Muskegon
86H-6156-D	Oil Control	Sealed Power

.030" Oversize

H-6150-D	Upper Compr.	
86H-6155-E	Lower Compr.	Muskegon
86H-6155-F	Lower Compr.	Sealed Power
86H-6156-E	Oil Control	Muskegon
86H-6156-F	Oil Control	Sealed Power

IDENTIFICATION NOTE—May be identified by differences in design as follows: **Lower Compression Ring**—Has word 'TOP' 42° above slot (Muskegon), 25° below slot (Sealed Power). **Oil Ring**—Has 9 slots (Muskegon), 8 slots (Sealed Power). Top compression ring is plain type.

Ring Expanders

Part Number	Make	Used With:
86H-6151-A	Muskegon	Lower Compr.
86H-6151-B	Sealed Power	Lower Compr.
86H-6154-A	Muskegon	3/16" Oil Ring
86H-6154-B	Sealed Power	3/16" Oil Ring

IDENTIFICATION NOTE—Expanders may be identified by differences in design as follows: **Muskegon**—6 Crimps (Lower Compression Ring), 6 Crimps & 5 Slots (Oil Ring). **Sealed Power**—7 Crimps (Lower Compression Ring), 7 Crimps and 6 Slots (Oil Ring).

1936-38 MODELS

PISTON RINGS (NEW TYPE) FOR EARLIER MODELS: New type piston rings (with expanders) can be installed on earlier Lincoln-Zephyr models as follows:

Model 86H (1938)—All rings same size as for 1939 models, and 1939 parts (as shown in tables above) can be used.

Models 901 (1936), HB (1937)—Upper & Lower Compression rings same size as for 1939 model, and 1939 parts (single rings & expanders—not sets) as shown in table above can be used. Oil Ring was narrower (5/32") and special Oil Ring, Expander, and Ring Sets available for these models as follows:

Sets in Cartons

Part Number	Size
H-6149-C (5/32" oil ring)	Standard
H-6149-D (5/32" oil ring)	.015" Oversize

5/32" Oil Rings

Part Number	Make	Size
H-6156-A	Muskegon	Standard
H-6156-B	Sealed Power	Standard
H-6156-C	Muskegon	.015" Oversize
H-6156-D	Sealed Power	.015" Oversize

IDENTIFICATION:—Same as 1939 rings (above).

1936-39 MODELS

PISTON PIN FITTING:—**Steel Pistons.** Pins can be removed and installed without heating pistons. Pins, pistons, and rod bushings held to close limits so that no fitting required. Clearances can be checked as follows:

Pin Fit in Piston—With piston and pin at same temperature and clean, pin should drop through pin hole in piston (total clearance not to exceed .0007").

Pin Fit in Rod Bushing—With pin installed, hold pin so that rod hangs vertically, then rotate pin. Lower end of rod should move upward through arc not greater than ½" before dropping back to vertical position.

1936-39 MODELS

VALVE SERVICING:—Complete valve assembly (valve, spring, guide) should be removed from the engine and dismantled on the bench as follows:

Valve Assembly Removal—Use special bar type lifter, VZ-185, inserting end of lifter through spring coils to engage flanged lower end of guide, pull guide down slightly to release retaining 'C' washer, pull 'C' washer out, lift valve assembly out through top of block.

Valve Assembly Dismantling—Use special bench fixture to compress valve spring so that spring retainer can be removed, then remove spring, separate guide halves and remove valve. Re-assemble valves in same manner.

Valve Installation Note—Intake valve guides have relief groove cut on one edge of each guide half. Install guides with this relief groove up.

Valve Seat Insert Grinding:—Manufacturer recommends use of eccentric grinding equipment to reface seat inserts (inserts are high-tungsten, chrome-alloy steel and are exceedingly hard).

1936-37 MODELS

Tappet Clearance Checking:—Use special two-step feeler to check clearance with valve lifter on heel of cam. First .0125" step of feeler should be 'go', second .0135" step of feeler should be 'no go'.

1938-39 MODELS

Hydraulic Valve Lifter Servicing:—When lifters removed they should be installed dry (will fill with oil and become quiet more rapidly than if installed with oil film between plunger and cylinder which will trap air in unit). Whenever lifters removed from engine, service as follows:

Lifter Installation—Remove plunger from lifter body, wash out all oil, dry with air, re-install plunger in lifter body and install in engine.

CAUTION—Plunger is selective fit in lifter body and must not be interchanged. Make certain that each plunger re-installed in same lifter from which removed.

Lifter Clearance—Clearance between plunger and valve stem must be .030-.070" with no oil in unit and plunger and spring fully compressed. To check this clearance, see that lifter is on heel of cam, use screwdriver to fully depress plunger in lifter body, check clearance with feeler gauge.

See article in Mechanical Equipment Section for complete Wilcox-Rich 'Zero-lash' hydraulic lifter servicing data.

NOTE:—Engine Hood—Hinged at cowl and lifts from forward end. Free hood latch by turning radiator ornament.

Engine Removal—All service work except on main bearings and crankshaft can be performed with engine in car. To remove engine, remove hood, radiator splash pan, grille and brace rods, remove radiator. Remove transmission cover in front compartment, disconnect transmission, lift engine out.

Oil Pan Removal—To remove pan for work on engine, disconnect radius rod rear connection, hoist car frame at front end.

ENGINE NUMBER:—First number H-1. Stamped on top of clutch housing and on left side of front frame cross-member.

ENGINE SPECIFICATIONS:—Own Model H. 12 cylinder, 75° Vee, 'L' head type. Both cylinder banks and crankcase cast Enbloc.
Bore—2.75". **Stroke**—3.75".
Displacement—267.28 cubic inches.
Rated Horsepower—36.39 S.A.E.
Developed Horsepower—110 at 3900 R.P.M.
Compression Ratio—6.7-1 Std. Aluminum head.
Compression Pressure—146 lbs. at 1000 R.P.M. or 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady reading with engine idling at 5 M.P.H.

PISTONS:—New type special heat-treated steel-alloy, Cam ground type. Length 3.245-3.305".
Weight—326 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Lincoln-Zephyr Shop Notes for complete data.*
Fitting New Pistons:—Use .002" feeler stock inserted between piston and wall at right angles to pin bosses. Tension required to withdraw feeler must be within 5-8 lbs.

PISTON RINGS:—Two compression, one oil ring per piston, all above pin. Oil ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp.	.093-.0935"	.008-.013"	.003" (top)
Oil Cont.	.1545-.155"	.008-.013"	.0015"

Replacement Rings:—*See Lincoln-Zephyr Shop Notes for complete data and new expander type rings.*

PISTON PIN:—Diameter .7501-.7504". **Length** 2.482".
Pin floats in piston and rod. Held by locking ring at each end. Not furnished oversize.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance.
See Lincoln-Zephyr Shop Notes for pin fitting.

CONNECTING ROD:—Weight 638 grams. **Length** 7.400".
Crankpin Journal Diameter—2.126".
Lower Bearing—Removable steel-backed, copper-lead lined bearing shells in each rod.
Bearing Dimensions—Thickness .0855". Length .787". Bearing bore in rod 2.298" diameter.
Clearance—.0015-.003" (total diametrical), .010-.022" (total sideplay).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.
Installing Rods:—Rods and caps marked 'R1', 'L1', etc. Assemble with marks together, install in same numbered cylinders with marks pointing down on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2.401" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by rear main bearing. Endplay .002-.006". Adjusted by replacing bearing cap.

CAMSHAFT:—Four bearing. Helical gear drive.
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitt-lined bushings pressed in block. **Clearance**—.002".
End Thrust:—Taken by front bearing and gear hub and by gear hub and cover plate. Endplay .004-.008". Adjusted by replacing bearing or front plate.
Timing Gears:—Crankshaft gear Cast-steel. Camshaft gear Bakelized Fabric.
Camshaft Setting:—Gears marked. Mesh crankshaft gear tooth marked '0' with space between teeth on camshaft gear marked '/' (this mark in line with mark on gear hub).

VALVES:—	Head Diam.	Stem Diam.	Length
All valves	1.537"	.3105-.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All valves	45°	.292"	.0015-.0035"

NOTE—Valve seat inserts used for exhaust valves.
See Lincoln-Zephyr Shop Notes for Valve Assembly Removal and valve servicing directions.
Tappet Clearance:—.0125-.0135" all valves. No adjustment. Use special two-step feeler gauge, .0125" step 'Go', .0135" step 'No Go'. Replace valves if clearance too great, grind off end of stem if insufficient.
Valve Guides:—Cast-iron split type. Held in place by 'C' washer and valve spring. *See Lincoln-Zephyr Shop Notes for Valve Assembly Removal.*
Valve Lifters:—Barrel type hollow-cast alloy iron. Operate in reamed holes in block.
Diameter—.999-.9995". **Clearance**—.0005-.001".
Valve Springs:—Free length 2 42".

	Spring Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 19°30' BTDC. Close 54°30' ALDC.
Exh. Valves—Open 57°30' BLDC. Close 16°30'ATDC.
To Check Valve Timing—No flywheel marks or other means provided to check timing. If dead center point for any piston established on flywheel, intake valve opening for this cylinder should be approximately 6 2/3 teeth before this point with piston .1334" BTDC.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

LUBRICATION:—Pressure system. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure—40-45 lbs. at 2000 R.P.M.
Oil Pressure Regulator—Between cylinder banks at front of engine. Opens at 30 lbs. Not adjustable.
Crankcase Capacity—6 qts.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. (1936) H-9273 dash unit, 48-9278 (motor unit). (1937) HB-9273 (dash unit—1st 5500 cars, black markings), HB-9273B (dash unit—next 10,000 cars, red-brown markings), HB-9273C (dash unit—later cars, brown-gray markings). No. 48-9278 (engine unit all). *See article in Mechanical Equipment Section.*

CLUTCH:—Long Model 10CF-CI. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Clutch Facings—Moulded type, 2 required. Inside Diam. 6.00". Outside Diam. 10.00". Thickness .140".
Pedal Adjustment:—Free movement should be 1½-2". To adjust, remove clevis pin on adjusting rod at clutch pedal lever, loosen locknut, turn clevis (lengthen rod to increase free movement).
Removal:—Remove transmission cover in front compartment, disconnect speedometer cable, remove shift lever. Disconnect rear brake cables and shock absorber links, disconnect rear spring at center mounting on body. Support engine, take out rear engine mounting bolts, take out clutch housing flange mounting screws (housing integral with transmission case), slide entire drive unit to rear exposing clutch. Take out clutch mounting screws on flywheel.

TRANSMISSION:—Own Make. 3 speed, helical gears (all speeds), Constant-mesh, Synchro-mesh (second and high).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear spring at center mounting on body, disconnect speedometer cable, take out mounting bolts in front universal ball housing, slide rear end to rear. Remove transmission cover in front compartment, remove shift lever. Support engine, take out rear engine mounting bolts, take out clutch housing flange mounting screws, pull transmission to rear.

UNIVERSAL JOINT:—Spicer. 1 joint mounted at rear of transmission (within torque tube ball housing).
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. ¾ floating, spiral bevel type with Torque Tube drive and straddle mounted pinion. *See Mechanical Equipment Section for data.*
Ratio—4.33-1 (1936), 4.44-1 (1937) Std.
Backlash—.006-.010".
Wheel Bearing Adjustment—None.
Removal:—Disconnect rear shock absorbers and brake cables, disconnect rear spring at center connection on body, disconnect speedometer cable, take out mounting bolts in universal joint ball housing, pull axle assembly back to free shaft at splined joint at universal.
Axle Shaft Removal:—Axle housing must be separated at pinion mounting and shafts removed from inner end (differential side gear integral with shaft).

SHOCK ABSORBERS:—Ford (Houde). Hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Worm-and-Roller Model 330.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott type ends and transverse cantilever springs.
Kingpin Inclination—8° ('36), 4° ('37) crosswise.
Caster—9° Max., 4½° Min. ('36), 6° Max., 1½° Min. ('37). Must be alike within ½° for both wheels. Axle may be bent cold to correct caster if proper tools used (wedges and blocks to prevent crushing flange).
Camber—¾° (¾° Max., ¼° Min.). Both wheels must be alike within ¼°, right wheel must not exceed left. Correct in same manner as caster.
Toe In—1/16-⅛". Adjust in usual manner by loosening tie rod clamp bolts and turning rod.
Steering Geometry (Toe Out)—Inner wheel turned 23°, outer wheel 20°. Allowable variation ½°.

BRAKES:—Service—Bendix Duo-Servo, single anchor, mechanical type. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—12" Cast alloy iron type.
Lining—Moulded (primary), Woven (secondary). Width 1.75". Thickness .21". Length per shoe 11.95".
Hand Brake:—See Service Brakes above.

ENGINE HOOD & ENGINE REMOVAL:—Turn radiator ornament counter-clockwise to free latch, lift hood up at front end. To remove hood, take out hood hinge capscrews.

Engine Removal:—Detach water hoses and heat indicator wire, take out radiator mounting screws, remove radiator (right and left grille sections can be removed if required). Disconnect all engine wires and controls, and fuel line. Disconnect exhaust pipe at manifolds. Disconnect transmission from engine, free engine mountings, lift engine out.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left side of front cross-member.

ENGINE SPECIFICATIONS:—Own Model 86H. 12 Cylinder, 75° Vee, L head type. Both blocks and crankcase cast together.

Bore—2.75". **Stroke**—3.75". **Displ'mt.** 267.28 cu. ins.
Rated Horsepower—36.39.
Developed Horsepower—110 at 3900 R.P.M.
Compression Ratio—6.7-1 Std. No Optl. ratios.
Compression Pressure—146 lbs. at 1000 R.P.M., 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady at 5 M.P.H.

PISTONS:—Special heat-treated steel alloy, cam-ground type. **Length** 3.245-3.305".
Weight—326 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.

Replacement Pistons:—*See Lincoln-Zephyr Shop Notes for complete data.*

Fitting New Pistons:—Use .002" feeler stock inserted between piston and wall at right angles to pin. Pull to withdraw feeler must be within 5-8 lbs.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr.	.093-.0935"	.008-.013"	.0025-.003"
Oil Cont.	.186-.1865"	.008-.013"	.0015-.002"

Replacement Rings:—*See Lincoln-Zephyr Shop Notes for complete data and new expander type rings.*

PISTON PIN:—Diameter .7501-.7504". **Length** 2.482". Pin floats in piston and rod, held by locking ring at each end. Pins not furnished oversize.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance.
See Lincoln-Zephyr Shop Notes for Pin Fitting.

CONNECTING ROD:—Weight 638 grams. **Length** 7.400".
Crankpin Journal Diameter—2.126".
Lower Bearing—Removable steel-backed, copper-lead lined bearing shells in each rod.
Bearing Dimensions—Thickness .0855". Length .787". Bearing bore in rod 2.298" diameter.
Clearance—.0015-.003" (diam.), .006-.015" (endplay).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.

Replacement Bearings:—Furnished Std. and .0015" undersize. NOTE—Special bearings furnished for crankshafts .020" and .040" undersize.

Installing Rods:—Assemble rods with marks on rod and cap together. Install in same numbered cylinder with marks pointing toward pan.

CRANKSHAFT:—4 Bearing. Integral counterweights. NOTE—Crankshafts furnished Std. and .020", .040" undersize.
Journal Diameters—2.401" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings.

End Thrust:—Taken by rear main bearing. Adjusted by replacing bearing cap. **Endplay**—.002-.006".

Replacement Bearings:—Furnished Std. and .0015" Undersize. NOTE—Special bearings furnished for .020" and .040" undersize crankshafts.

CAMSHAFT:—Four bearing. Helical Gear Drive.
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbit-lined bushings pressed in block. **Clearance**—.002".

End thrust:—Taken by gear hub and coverplate. Adjusted by replacing coverplate. **Endplay** .004-.008"

Timing Gears:—Crankshaft gear cast-steel. Camshaft gear Bakelized Fabric.

Camshaft Setting:—Mesh marked crankshaft gear tooth with camshaft space between teeth marked by straight line (in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3105-.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

NOTE—Special seat inserts for exhaust valves.
See Lincoln-Zephyr Shop Notes for Valve Assembly Removal and valve servicing directions.

Tappet Clearance:—None (Hydraulic type lifters).

Valve Guides:—Cast-iron split type retained by 'C' washer and valve spring. *See Lincoln-Zephyr Shop Notes for Valve Assembly Removal.*

Valve Lifters:—Barrel type with hydraulic tappet take-up (Wilcox-Rich Zero-lash type).
Diameter—.9995".
See article in Mechanical Equipment Section.

Valve Springs:—Free length 2.42".

	Spring Pressure	Length
Valve Closed	51-57 lbs.	2.13"
Valve Open	111-121 lbs.	1.84"

Valve Timing:—See Camshaft Setting aboye.
Int. Valves—Open 10.42° BTDC. Close 35.58° ALDC.
Exh. Valves—Open 50.92° BLDC. Close 8.08° ATDC.
To Check Valve Timing—No flywheel marks provided to check timing. If dead center position for any piston established on flywheel, intake valve for this cylinder should open approx. 3.24 flywheel teeth before this point with piston .0389" BTDC.
Motor Gauge—Weidenhoff Adapter #114. Rod #40.

LUBRICATION:—Pressure system. Gear type oil pump mounted in crankcase. System changed to include oil-relief valve on oil pump, and channel for each row of hydraulic valve lifters in block (fed through metering hole from oil channel at rear of engine, excess oil flows to pressure regulator at front end).
Normal Oil Pressure—40-45 lbs. at 2000 R.P.M.
Oil Pressure Regulator—Between cylinder banks at front of engine. Opens at 50 lbs. Non-adjustable.
Crankcase Capacity—5 quarts.

Oil Pressure Gauge:—King-Seeley Electric. Ford No. 86H-9273 (dash unit), 48-9278 (engine unit).
See article in Mechanical Equipment Section.

COOLING SYSTEM:—Water Pump—Centrifugal, packless type, 2 used (one pump for each bank, belt driven). *See article in Mechanical Equipment Section.*
Removal—Slack off drive belt, disconnect hose couplings, take out mounting screws in pump flange.

Thermostat:—In Upper radiator hose. NOTE—On first cars with thermostat at lower (engine) end of hose, reverse hose to provide additional clearance for drive belt **thermostat must be reversed in hose when this change made.** Later cars have thermostat at upper end.

Temperature Indicator:—King-Seeley Electric. Ford No. 86H-10833 (dash unit), H-8586 (radiator unit).
See article in Mechanical Equipment Section.

Water Capacity—30 quarts.
Drain Valves—One in left hand water outlet elbow, one at each front lower corner of engine block.

CLUTCH:—Long Model 10CF-CI. Single plate, semi-centrifugal, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, chevron or spiral wound, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .125". NOTE—Before 11/30/37, facings were .137 or .140" thick, woven joined type.

Adjustment:—Pedal free movement 1½-2". To adjust, loosen locknut and turn clevis on connector link.

Removal:—Slide transmission and rear axle to rear as a unit (see Transmission Removal below), take out mounting screws in clutch cover flange.

TRANSMISSION:—Own Make. All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (Low and reverse) with new 'Blocker' type Synchronizer. *See Mechanical Equipment Section.*

Removal:—Disconnect rear spring at center mounting on body, disconnect speedometer cable, brake cables, shock absorber links, take out mounting bolts in universal joint ball housing, slide axle assembly to rear. Remove side panel on shift lever housing, remove pin at lower end of shift lever, free lever from transmission. Support engine, take out rear engine mounting bolts, remove clutch housing mounting screws, pull transmission to rear.
NOTE—On cars before Eng. No. 47980 (without plate over rear bearing) use extreme care to prevent transmission mainshaft and rear main bearing pulling out of case when removing transmission which will allow synchronizer balls to drop out. Cars after 11/24/37 have bearing retained by plate.

UNIVERSAL JOINT:—Spicer. 1 used (at rear of transmission). *See article in Mechanical Equipment Section*

REAR AXLE:—Own Make. New Hypoid Gear, 3/4 floating type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.44-1 Std. **Backlash**—.002-.004".

Removal:—Disconnect shock absorber links, brake cables, rear spring at center connection on body, speedometer cable. Take out mounting bolts in universal joint ball housing, pull axle assembly back to free drive shaft at splined joint.
Axle Shaft Removal—Axle housing must be separated at pinion mounting and shafts removed from inner end (diff. side gear integral with shaft).

SHOCK ABSORBERS:—Houde (Houdaille) No. BBLCE (front), BBCU (rear). Adjustable, hydraulic type.
See article in Mechanical Equipment Section.

STEERING:—Steering Gear—Gemmer Model 330. Worm and Roller type. *See Mechanical Equipment Section.*

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—4° crosswise.
Caster—4° (6° Max., 1½° Min.). Must be alike within ½° for both wheels. Axle may be bent cold to correct caster if correct tools used (wedges and blocks to prevent crushing axle flange).
Camber—¾° (¾° Max., ¼° Min.). Must be alike within ¼° for both wheels. Correct in same manner as caster.
Toe In—1/16-⅛". Adjust in usual manner by loosening tie rod clamp bolts and turning rod.
Steering Geometry (Toe out on turns)—Inner wheel turned 23°, outer 20°. Allowable variation ½°.

BRAKES:—Service—Bendix, Duo-servo, Single anchor, mechanical type. Hand lever applies all service brakes. *See Mechanical Equipment Section for data.*
Drums—Cast alloy iron. Diameter 12".
Braking Power—50% front, 50% rear.
Lining—Moulded (primary), Woven (secondary). Width 1.75". Thickness .21". Length per shoe 11.95".

Hand Brakes:—See Service Brake above.

ENGINE HOOD NOTE:—Turn radiator ornament counter-clockwise to free latch, lift hood up at forward end.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left side of front frame cross-member.

ENGINE SPECIFICATIONS:—**Own Model 96H.** 12 cylinder 75° Vee, L head type. Both blocks and crankcase cast enbloc.
Bore—2.75". **Stroke**—3.75".
Rated Horsepower—36.39. **Displ'mt.**—267.28 cu. in.
Developed Horsepower—110 at 3900 R.P.M.
Compression Ratio—6.7-1 Std. aluminum head.
Compression Pressure—146 lbs. at 1000 RPM. or 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady idling at 5 M.P.H.

PISTONS:—Steey alloy, light weight, cam-ground, with slipper type skirt. Recondition cylinders for finished replacement pistons.
Weight—360 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Lincoln-Zephyr Shop Notes for replacement piston and reconditioned block data.*
Fitting New Pistons:—Use .002" feeler, .50" wide, inserted between piston and cylinder wall at right angles to pin. Feeler should withdraw with 5-8 lbs. pull.

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes. NOTE—Expander used with #2 Compr. and oil ring. Install this #2 Compr. ring with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr.	.093-.0935"	.008-.013"	.0025-.003"
Oil Cont.	.1845-.185"	.008-.013"	.0015-.002"

Replacement Rings:—*See Lincoln-Zephyr Shop Notes for complete Ring and Expander size data.*

PISTON PIN:—**Diameter** .7501-.7504". **Length** 2.482". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod—.0001" clearance.
See Lincoln-Zephyr Shop Notes for pin fitting data.

CONNECTING ROD:—**Length** 7.40". **Weight** 638 grams.
Crankpin Journal Diameter—2.126".
Bearing Type—Steel-backed, copper-lead lined bearing halves clamped in each rod.
Clearance—.0015-.003". **Sideplay**—.006-.015".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. NOTE—Engage tang on bearing in groove in rod and cap. See that long and short bearing cap bolts installed on correct side of rod (rod split at an angle, bolts are unequal length).
Replacement Bearings:—Furnished Std. and .0015", .020", .040" undersize.
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—Four bearing with integral counterweights. NOTE—Crankshafts furnished Std. and .020", .040" undersize.
Journal Diameters—2.401" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. NOTE—See that tang on bearing engages groove in block and bearing cap.
Replacement Bearings:—Furnished Std. and .0015", .020", .040" undersize.
End Thrust:—Taken by rear main bearing. To adjust, replace bearing. **Endplay**—.002-.006".

CAMSHAFT:—Four bearing. Helical gear drive.
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitt-lined bushings pressed in block. **Clearance**—.002".
End Thrust:—Taken by gear hub and coverplate. Adjusted by replacing coverplate. **Endplay**—.004-.008".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric (camshaft). **Backlash**—.004" Max.
Camshaft Setting:—Mesh marked tooth of crankshaft gear with space marked by line on camshaft gear (this line must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

NOTE—Valve Seat Inserts used for exhaust valves.
See Lincoln-Zephyr Shop Notes for Valve Servicing data.
Tappet Clearance:—None (hydraulic type lifters).
Valve Guides:—Cast iron, split type. Retained by 'C' washer and valve spring. *See Lincoln-Zephyr Shop Notes.*
Valve Lifters:—Barrel type, hydraulic tappet take-up (Wilcox-Rich Zero-lash type). Diameter .9995".
See article in Mechanical Equipment Section for data.

Valve Springs:—	Pressure	Length
Valve Closed	51-57 lbs	2.13"
Valve Open	111-121 lbs	1.84"

Valve Timing:—See Camshaft Setting above.
Int. Valves—Open 10.42° BTDC. Close 35.58° ALDC.
Exh. Valves—Open 50.92° BLDC. Close 8.08° ATDC.
To Check Timing—No flywheel marks provided. If dead center position for any cylinder established on flywheel, intake valve for this cylinder should open approx. 3.24 teeth before this point with piston .0389" before top dead center.
Motor Gauge—Weidenhoff Adapter #114. Rod #40.

LUBRICATION:—Pressure type with gear type oil pump in crankcase at rear of engine.
Normal Oil Pressure—40-45 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Above crankshaft bearing between cylinder banks at front end of engine. Opens at 50 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. 96H-9273 (dash unit), No. 48-9278 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 qts.

COOLING SYSTEM:—**Capacity**—30 qts.
Water Pump:—Packless type, 2 used (1 for each bank).
See article in Mechanical Equipment Section for data.
Removal—Slack off drive belt, disconnect hose couplings, take out mounting screws on pump.
Thermostat:—In outlet hose for each bank (2 used).
Setting—Starts to open at 145°F. Fully open 180°F.
Temperature Gauge:—King-Seeley Electric. Ford No. 96H-10883 (dash unit), 99A-10884 (engine unit).
See article in Mechanical Equipment Section for data.
Drain Valves:—One at each front lower corner of engine block and at right front lower corner of radiator.

CLUTCH:—**Long Model 10CF-CI.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, chevron or spiral wound, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .125".
Adjustment:—Pedal free movement must be 1.5-2.0". To adjust, loosen locknuts, turn clevis on connector link.
Removal:—Slide transmission and rear axle to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in clutch cover.

TRANSMISSION:—**Own Model.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take off universal joint ball housing nuts, slide axle assembly to rear. Remove side panel on shift lever housing in front compartment, remove pin at lower end of shift lever, free lever from transmission. Support engine at rear, take out rear engine mounting bolts, remove clutch housing mounting screws, pull transmission straight back.

UNIVERSAL JOINT:—**Spicer Model 8115-SF.** Needle-bearing type, one used (in ball housing at rear of transmission).
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Model.** ¾ floating, Hypoid Gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.44-1. **Backlash**—.002-.004".
Optl. Axle:—Columbia Two-speed type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection, take out universal joint ball housing bolts, pull axle assembly to free shaft at splined joint.
Axle Shaft Removal—Axle assembly must be dismantled and shafts removed at inner end.
See Rear Axle article in Mechanical Equipment Section for directions.

SHOCK ABSORBER:—**Houde (Houdaille) Model BBLCE (front), BBCU (rear).** Hydraulic, adjustable, double-acting.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model 335. Worm-and-roller type with push-pull adjustments.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional I-beam section axle with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods and strut rod (anti-sway bar).
Kingpin Inclination—4° crosswise.
Caster—1½° Min., 6° Max. Must be equal for both wheels within ½°. No adjustment.
Camber—¼° Min., ¾° Max. Must be equal for both wheels within ½°, right wheel must not exceed left. No adjustment.
Toe In—1/16-⅛". Set at 10-1 ratio to camber. To adjust, loosen clamp bolts, turn tie rod.
Steering Geometry (Toe out on turns)—Inner wheel turned 23°, outer 20°. Allowable variation ½°.

BRAKES:—**Service**—Bendix Hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameter 1.125" (front), 1.00" (rear). Not interchangeable from one wheel to another.
Drums—Diameter 12".
Lining—Molded (primary or forward shoe), Woven (secondary shoe). Width 1.75". Thickness .21", Length per shoe 11.95".
Clearance—.010" at each end of each shoe.
Hand Brake:—See Service Brakes above.

ENGINE HOOD NOTE:—To raise hood, release lock by pulling up on latch handle at front of hood above grille, raise hood slightly, press down on safety latch handle (to right of latch under hood).

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame member in front of dash bracket.

ENGINE SPECIFICATIONS:—Own 95. 8 Cylinder, 90° Vee, L head. Both banks & crankcase cast enbloc.
Bore—3.187". **Stroke**—3.75".
Rated Horsepower—32.5. Displacement—239 cu. ins.
Developed Horsepower—95 at 3600 R.P.M.
Compression Ratio—6.15-1 Std. cast-iron head.
Compression Pressure—145 lbs. at 2200 R.P.M. max., 100 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—Steady 18-20" at 5 M.P.H.

PISTONS:—Steel alloy, light wgt., cam ground type. Reconditioned engine for finished replacement pistons.
Weight—360 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .0025" feeler, .50" wide, inserted between piston and cylinder wall at right angles to pin. Pull to withdraw feeler—7-12 lbs.

PISTON RINGS:—Two compression, one slotted oil ring, all above pin. Oil ring groove drilled with drain holes.
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. 1#	.0915-.0920"	.012-.017"	.003"
Compr. #2	.0915-.0920"	.012-.017"	.0015"
Oil Cont.	.1535-.1540"	.012-.017"	.0015"

Replacement Rings:—Furnished (sets in carton only) Std. and .005", .015", .030", .045", .060" oversize.

PISTON PIN:—**Diameter** .7501-.7504". **Length** 2.985". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting directions.*

CONNECTING ROD:—**Length** 7.00". **Weight** 488 grams.
Crankpin Journal Diameter—2.139" (connecting rod diameter on crankpin—2.360").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on both inner and outer face.
Bearing Dimensions—Length 1.747". Thickness .1095". These bearings do not have end flanges.
Clearance—.0005-.0025" (total diametrical).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for oversize rods and undersize crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2.499" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.0005-.0025".
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long main bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.
Bearing Diameters—1.797" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjust by replacing coverplate. Endplay—.004-.008".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric (camshaft). **Backlash**—.004" max.
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Seat inserts used for all valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve springs. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
To Check Valve Timing—No flywheel marks provided. Intake valve opens with piston on top dead center.

LUBRICATION:—Pressure. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. 99-A-9273 (dash unit), 48-9278 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 qts.

COOLING SYSTEM:—**Capacity** 22 qts.
Water Pump:—Packless type, 2 used (1 for each bank).
See article in Mechanical Equipment Section for data.
Removal—Slack off drive belt, support engine at forward end, remove front engine mounting bolts, take out mounting screws in pump body.
Thermostat:—In each cylinder head outlet (2 used).
Setting—Starts to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford No. 99-A-10883 (dash unit), 99-A-10884 (engine unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads 212° (hot) when turned off.
Drain Valves:—One. At lower right front corner of radiator.

CLUTCH:—**Long Model 9CF-CS.** Single, plate, dry disc, semi-centrifugal type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 5.76". Outside Diameter 9". Thickness .137".
Adjustment:—Pedal free movement must be 1.5-1.75". To adjust, remove pin at throw-out shaft lever end of connecting link, turn clevis on link rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (See Transmission Removal below), take out mounting screws in clutch cover.

TRANSMISSION:—**Own Model 91-A.** Constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line (at torque tube connection—bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, remove clutch housing screws, pull transmission straight back.

UNIVERSAL JOINT:—**Spicer Model 6454-SF.** Steel bushing, 1 used (in ball housing at rear of transmission).
See article in Mechanical Equipment Section for data.

REAR AXLE—Own make. ¾ floating, Spiral Bevel gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—3.54-1 Std., 3.78-1 Optl.
Backlash—.010" max.
Optional Axle:—Columbia Two-speed type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line (at torque tube connection—bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, pull axle assembly to rear to disengage drive shaft at splined joint.
Axle Shaft Removal—Axle assembly must be dismantled as follows: Remove wheels and hubs, disconnect spring, remove mounting screws in differential housing, remove housing, dismantle differential assembly, pull axle shafts out at inner end (integral with differential side gear).

SHOCK ABSORBERS:—**Houde (Houdaille) Model BBDK (frt.), BBDW (rear).** Hydraulic, double-acting, adjustable. *See data in Mechanical Equipment Section.*

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise.
Caster—9° Max., 4½° Min. Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.
Camber—1° Max., ¼° Min. Must be equal within ¼°, right wheel must not exceed left. Adjust in same manner as for caster (see caster data above).
Toe In—1/16". Set at 10-1 ratio to camber. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry (Toe Out on Turns)—Outer wheel turned 20°, Inner wheel 23⅓°. No adjustment.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor non-energizing type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drum—Cast iron. Diameter 12".
Wheel Cylinders—Stepped type with larger end of cylinder actuating forward shoe in each wheel as follows: Front Wheel—1.25" (front), 1.00" (rear). Rear Wheel—1.125" (front), 1.00" (rear).
Lining—Woven type (forward shoe, each wheel), Moulded type (rear shoe, each wheel). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoe, each wheel), 10.1" (rear shoe, each wheel).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

SERIAL NUMBER:—First number R-274,300. On right hand frame side rail under engine hood.

ENGINE NUMBER:—On plate on right hand side of crankcase below valve cover plate at rear of engine.

ENGINE:—Six cylinder, 'L' head type. Cylinders cast Enbloc.
Dimensions—Bore, 3¼". Stroke, 4⅜". Displacement, 217.7 cu. ins.
Horsepower—Rated, 25.35. Developed, 75 (110), 80 (3510) at 3200 R.P.M.
Compression—Ratio 5.3-1. Pressure approximately 90-95 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type.
Weight—18¼ ounces.
Removal—Piston and rod assembly removed through top of engine.
Clearance—.002" (skirt). Use feeler stock to check clearance.
Installing Pistons—Slot should be toward left or away from valves.

Piston Rings:—Four rings per pistion, #1 and 2, compression rings; #3 and 4, oil control rings.

Ring	Width	End Gap
Comp. (1 and 2)	⅛"	.010-.025"
Oil Cont. (3)	⅛"	.010-.025"
Oil Cont. (4)	3/16"	.010-.025"

Piston Pin:—Diameter, ⅞". Pin floats in piston and rod. Piston pin hole in connecting rod is bronze-bushed.
Pin Fit in Piston—Light push fit with piston heated.
Pin Fit in Rod—Light push fit.

Connecting Rod:—Weight, 36½ ozs. Length, 8¾" (center-to-center).
Crankpin Journal Diameter—2".
Big End Bearing—Removable steel-backed, babbitt-lined type.
Clearance—.001-.003". Sideplay .008-.012".
Adjustment—One shim used on camshaft side of bearing only. Replace bearings. Do not file bearing caps.

Crankshaft:—Seven main bearing type with integral counterweights.
Journal Sizes—2 31/64" diameter (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by #4 (center) main bearing. Endplay, .004-.007"

Camshaft:—Six bearing type. Camshaft drive, non-adjustable chain.
Bearing Type—Removable steel-backed, babbitt-lined type.
Timing Chain—Diamond 'double strand' Roller chain. Width 9/16". Pitch ⅜". Length 19½" or 52 links.
Camshaft Setting—Remove and install chain endless. Use gear pullers and pushers, keep sprockets lined up so as to avoid sidestrain on chain and sprockets. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across shaft centers.

Valves:—	Head Diam.	Seat Angles	Seat Width	Lift
Intake	1 21/32"	45°	1/16"	5/16"
Exhaust	1 17/32"	45°	1/16"	5/16"

Tappet Clearance—.008" all valves, engine hot or cold.
Valve Timing—See Camshaft Setting above.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—20 lbs. at 20 M.P.H.
Oil Pressure Relief Valve—Opens at 20 lbs.
Capacity and Oil—7 qts. Use SAE. #30 (summer normal temperatures), #40 (summer—very hot weather), #20-W (winter).

CLUTCH:—**Borg & Beck Model 10A1**—Single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.
Facings—Moulded type, 2 required. Thickness ⅛". Inside Diameter 6¾". Outside Diameter 9⅞".
Adjustment—Free movement of pedal should be ½-1½". Adjust by lengthening connector link between pedal and clutch throw-out fork.

STEERING:—**Steering Gear**—Ross Cam-and-Lever type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—2½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1½°. No adjustment provided.
Toe In—0-⅛". Adjust by loosening clamp bolt at right end of tie rod and turning end joint in or out of tie rod.

BRAKES:—**Service**—Midland Steeldraulic, four wheel,, internal expanding type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length 29" per wheel.
Clearance—1/16" at anchor and primary ends of shoe, .025" at eccentric.

Hand Brake:—See Service Brakes and Service Brake Adjustment.

SERIAL NUMBER:—First number (1180 '33) B-70,021, (1280 '34) B-70,801. On right hand frame side rail under engine hood.

ENGINE NUMBER:—On plate on right hand side of crankcase.

ENGINE:—Eight cylinder, 'In Line', valve-in-head, twin-ignition type.

Dimensions—Bore, 3⅛". Stroke, 4¼". Displacement, 260.8 cu. ins.

Horsepower—Rated, 31.25. Developed, 100 H.P. at 3400 R.P.M.

Compression—Std. 5.25-1. No optional compression ratios.

Compression Pressure—Approximately 90-95 lbs. at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Aluminum alloy, Invar strut, split skirt type.

Weight—16 ounces (stripped).

Removal—Piston and rod assembly removed through bottom of engine.

Clearance—.002" (skirt). See Fitting New Pistons.

Fitting New Pistons—Use .002" feeler stock to check clearance.

Installing Pistons—Slot away from valve side of engine.

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings.

Ring	Width	End Gap
Comp. (#1, 2)	⅛"	.010-.025"
Oil Cont. (#3)	⅛"	.010-.025"
Oil Cont. (#4)	3/16"	.010-.025"

Piston Pin:—Diameter, ⅞". Pin floats in piston and rod.

Pin Fit in Piston—Light push fit with piston heated.

Pin Fit in Rod—Light push fit with both parts cold.

Connecting Rod:—Weight, 34 ozs. Length, 8¾" (center-to-center).

Crankpin Journal Diameter—2".

Lower Bearing Type—Spun babbitt integral with rod and cap (1933), removable steel-backed, babbitt-lined (1934).

Clearance—.002". Sideplay .006-.012".

Adjustment—None (no shims). Replace rods (1933), bearings (1934). Do not file rods or caps.

Crankshaft:—Nine main bearing type.

Journal Diameters—2¼" (1933), 2 31/64" (1934) all bearings.

Bearing Type—Bronze-backed (1933), steel-backed (1934), babbitt-lined.

Clearance—.002".

Adjustment—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust—Taken by #5 (center) main bearing. Endplay, .004-.007".

Camshaft:—Drive—Double strand roller chain.

Timing Chain—Diamond 'double strand' Roller Chain. Width ⅞". Pitch ⅜". Length 23¼" or 62 links.

Camshaft Setting—Remove and install chain endless. Use special gear pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diameter	Seat Angle	Seat Width	Lift
Intake	1 21/32"	45°	1/16"	11/32"
Exhaust	1 15/32"	45°	1/16"	11/32"

Tappet Clearance—.012" (1933), .015" (1934) all valves with engine hot and idling.

Valve Timing—See Camshaft Setting above.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—25 pounds.

Oil Pressure Relief Valve—Operates at 25 lbs. Located on oil pump cover. Adjustable by turning screw.

Capacity and Oil—8 qts. Use SAE. #30 (summer), #20-W (winter).

CLUTCH:—**Borg & Beck Model 10A1 (1180), 10A3 (1280).** Single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions. **Facings**—Moulded type, 2 required. Thickness ⅛". Inside Diameter 6¾" (10A1), 6⅛" (10A3). Outside Diameter 9⅞".

Adjustment—Clutch pedal free movement should be ½-1½". To adjust, take out clevis pin at forward end of connector link, turn clevis on rod (1933) or loosen transverse bolt at lower end of pedal (1934). On 1934 models, starter cable control must be adjusted when clutch adjusted.

STEERING:—**Steering Gear**—Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.

NOTE—Independently sprung, articulated axle optional in 1934. All specifications for this type same as for standard axle.

Kingpin Inclination—7° crosswise.

Caster—0-1°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—0-1½°. No adjustment provided.

Toe In—0-⅛". Adjust by loosening clamp bolt at right end of tie rod and turning end joint in or out of tie rod.

BRAKES:—**Service**—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—13" (1933), 11" (1934).

Lining (1933)—Width 2". Thickness 3/16". Length 27½" per wheel.

Lining (1934)—Width 2¼". Thickness 5/32". Length 23⅛" per wheel.

Hand Brake:—See Service Brakes and Service Brake Adjustment.

SERIAL NUMBER:—First number (1190 '33) 521,191, (1290 '34) 521,801. On right hand frame side rail under engine hood.

ENGINE NUMBER:—On plate on right hand side of crankcase.

ENGINE:—Eight cylinder, 'In Line', valve-in-head, twin-ignition type.

Dimensions—Bore, 3⅜". Stroke, 4½". Displacement, 322 cu. ins.

Horsepower—Rated, 36.45. Developed, 125 H.P. at 3600 R.P.M.

Compression—Std. 5.25-1. No optional compression ratios.

Compression Pressure—Approximately 90-95 lbs. at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Nelson Bohnalite,.aluminum alloy, Invar strut, split skirt type.

Weight—19⅛ ounces (stripped).
Removal—Piston and rod assembly removed through bottom of engine.
Clearance—.002" (skirt). See Fitting New Pistons.
Fitting New Pistons—Use .002" feeler stock to check piston clearance.
Installing Pistons—Slot to left or opposite side of engine from valves.

Piston Rings:—Four rings per piston, all above pin. #1 and 2—compression rings, #3 and 4—oil control rings.

Ring	Width	End Gap
Comp. (#1, 2)	⅛"	.010-.025"
Oil Cont. (#3)	⅛"	.010-.025"
Oil Cont. (#4)	3/16"	.010-.025"

Piston Pin:—Diameter, ⅞". Pin floats in piston and rod.
Pin Fit in Piston—Light push fit with piston heated.
Pin Fit in Rod—Light push fit with both parts cold.

Connecting Rod:—Weight, 32 ozs. Length, 9 1/16" (center-to-center).
NOTE:—Connecting rod is aluminum alloy with steel bearing cap.
Crankpin Journal Diameter—2⅛".
Lower Bearing Type—Spun babbitt integral with rod and cap.
Clearance—.002". Sideplay .006-.012".
Adjustment—None (no shims). Replace bearings. Do not file rods or caps.

Crankshaft:—Nine main bearing type.
Journal Sizes—2⅜" diameter (all bearings).
Bearing Type—Removable bronze-backed, babbitt-lined type.
Clearance—.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by #5 (center) main bearing. Endplay, .004-.007".

Camshaft:—Drive—Roller chain.
Timing Chain—Diamond 'Triple strand' Roller Chain. Width 1 3/16". Pitch ⅜". Length 24¾" or 66 links.
Camshaft Setting—Remove and install chain endless. Use special gear pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diameter	Seat Angle	Seat Width	Lift
Intake	1 24/32"	45°	1/16"	11/32"
Exhaust	1 19/32"	45°	1/16"	11/32"

Tappet Clearance—.012" (1933), .015" (1934) all valves with engine hot and idling.
Valve Timing—See Camshaft Setting above.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—25 pounds.
Oil Pressure Relief Valve—Operates at 25 lbs. Located in oil pump cover. Adjustable by turning screw.
Capacity and Oil—10 qts. Use SAE. #30 (summer), #20-W (winter).

CLUTCH:—**Borg & Beck Model 11N (1190 '33), 11A3 (1290 '34).** Single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.
Facings (11N)—Moulded type, 2 required. Thickness ⅛". Inside Diameter 6¾". Outside Diameter 10⅞".
Facings (11A3)—Moulded type, 2 required. Thickness ⅛". Inside Diameter 6⅛". Outside Diameter 11".
Adjustment (1933)—Adjust whenever free movement of clutch pedal decreases to ½". Remove clutch pan, loosen all clutch cover screws in rim of flywheel, depress clutch pedal about 2", use hammer to jar clutch cover about ½" to right, release clutch pedal, tighten cover screws, check distance from front edge of release bearing to clutch cover. Should be 9/16". Increase distance by turning clutch cover to right, decrease this distance by turning clutch cover to left. Loosen pedal hub adjusting bolt, shift pedal forward to limit of slot, adjust throw-out lever adjusting screw at right end of shaft on clutch housing until distance from front edge of throw-out lever pins to clutch cover is 1/16". Pull pedal back until pedal pad just touches toeboard, tighten adjusting bolt. These adjustments should provide ½" of pedal free movement.
Adjustment (1934)—Free movement of clutch pedal should be ½-1½". To adjust, loosen transverse bolt at lower end of pedal and shift position. Starting switch cable control must be adjusted whenever clutch pedal is adjusted.

STEERING:—**Steering Gear**—Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
NOTE—Independently sprung articulated type axle optional in 1934. All specifications same as for standard type.
Kingpin Inclination—6° crosswise.
Caster—0°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1½°. No adjustment provided.
Toe In—0-⅛". Adjust by loosening clamp bolt at right hand end of tie rod and turning end joint in or out of tie rod.

BRAKES:—**Service**—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—16" (1933), 14" (1934).
Lining (1933)—Moulded type. Width 2". Thickness 3/16". Length 33¾" per wheel.
Lining (1934)—Moulded type. Width 2¼". Thickness ¼". Length 29 7/16" per wheel.

Hand Brake:—See Service Brakes and Service Brake Adjustment.

SERIAL NUMBER:—First number R-278,901 (1220), R-294,725 (3520). On right hand frame side rail under engine hood.

ENGINE NUMBER:—On plate on right side of crankcase.

ENGINE:—**Own.** Six cylinder, valve-in-head, twin-ignition type. Cylinders cast enbloc.

Bore—3⅜". **Stroke**—4⅜".

Piston Displacement—234 cubic inches.

Rated Horsepower—27.34 S.A.E.

Developed Horsepower—88 (1220), 90 3520) at 3200 R.P.M.

Compression Ratio—5.25-1. No optional ratios.

Compression Pressure—Approximately 92 lbs. at cranking speed.

Pistons:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type. Length, 3⅞".

Weight—19⅛ ounces.

Removal—Pistons and rods removed from above.

Clearance—Skirt .002" (see Fitting Pistons).

Fitting New Pistons—Use .002" feeler stock to check clearance.

Installing Pistons—Slot should be toward left or opposite side from camshaft.

Piston Rings:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Comp. All	⅛"	.010-.025"
Oil Cont. (3)	⅛"	.010-.025"
Oil Cont. (4)	3/16"	.010-.025"

Piston Pin:—Diameter ⅞". Pin floats in piston and rod. Pin hole in rod is bronze-bushed.

Pin Fit in Piston—Light push fit with piston heated.

Pin Clearance in Rod Bushing—.0001" or light push fit with both parts at normal temperature.

Connecting Rod:—Weight 35 ozs. Length 8¾".

Crankpin Journal Diameter—2".

Lower Bearing Type—Interchangeable steel-backed, babbitt-lined. One shim on camshaft side.

Clearance—.002". Sideplay .006-.012".

Adjustment—One shim. Replace bearings. Do not file rods or caps.

Crankshaft:—Seven bearing. Integral counterwts.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.

Clearance—.002".

Adjustment—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust—Taken by center bearing. Endplay .004-.007".

Camshaft:—Non-adjustable double roller chain drive.

Timing Chain—Diamond double roller chain. Pitch ⅜". Length 22½" or 60 links.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed endless. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

Valves:—

	Head Diameter	Seat Angle	Seat Width
Intake	1¾"	45°	1/16"
Exhaust	1 19/32"	45°	1/16"

Tappet Clearance—.015" with engine hot. Set clearance with engine idling.

Valve Timing—See Camshaft Setting above.

Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter plus No. X4615 collar), Rod #37.

Lubrication:—Pressure type. Gear type oil pump located in crankshaft.

Normal Oil Pressure—25 pounds.

Oil Pressure Relief Valve—Located on oil pump cover. Operates at 25 lbs. Adjustable by turning screw.

Capacity & Oil—7 qts. Use SAE. #30 (warm and hot temperatures), #20W (cold temperatures).

CLUTCH:—**Borg & Beck Models 10A3 (Early 1220), 10A6 (Late 1220,** All 3520). Single plate dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.

Clutch Pedal Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt in link directly behind pedal and above clutch pedal shaft and shifting position of pedal. Setscrew on lever end of throw-out shaft at right of transmission must not contact stop on clutch housing. Check starting switch cable adjustment after adjusting clutch pedal.

Starting switch cable adjustment—Starting switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch is not completely released (car will tend to move) or if pedal travel is excessive, adjust by loosening two clamp bolts on clutch throw-out shaft lever to which switch cable is attached and move cable clamp in (for later engagement) or out (for earlier engagement) of starter.

Clutch Facings—Moulded type, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.

NOTE—Mark clutch cover, flywheel and pressure plate before disassembling and replace in same position. Install driven plate assembly with mark 'Flywheel side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Reverse-Elliott ends, or 'Articulated' type independent springing. Semi-elliptic springs used with both type axles. Specifications for both types are same.

Kingpin Inclination—7° crosswise.

Caster—0-2½° (1220), 0-1½° (3520). Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—0-1½°. No adjustment.

Toe In—0-⅛". Adjust in usual manner by changing length of tie rod.

Steering Gear:—Gemmer Model, Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Bendix Mechanical (1220), Hydraulic (3520). Duo-Servo, single anchor type. Hand lever applies rear service brakes. See separate articles on each type of brake in Brake Section for relining and complete adjustment procedure.

Lining—Moulded type. Width 1¾". Thickness 5/32". Length per wheel 23¾" (1220), 23 13/16" (3520).

Clearance—.010" between lining and drum.

Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number, B-75010. On right frame siderail under engine hood.

ENGINE NUMBER:—On plate on right side of crankcase.

ENGINE:—Eight cylinder, Valve-in-head, Twin-Ignition type.

Bore—3⅛". **Stroke**—4¼".

Piston Displacement—260.8 cubic inches.

Rated Horsepower—31.25 S.A.E.

Developed Horsepower—102 at 3200 R.P.M.

Compression Ratio—5.25-1. No optional ratios.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type. Length 3 11/16".

Weight—19 ounces.

Removal—Pistons and rods removed from below.
Clearance—Skirt .002". See Fitting Pistons.
Fitting New Pistons—Use .002" feeler gauge to check clearance.
Installing Pistons—Slot should be toward left or opposite side from camshaft.

Piston Rings:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Comp. All	⅛"	.010-.025"
Oil Cont. (#3)	⅛"	.010-.025"
Oil Cont. (#4)	3/16"	.010-.025"

Piston Pin:—Diameter ⅞". Pin floats in piston and rod. Pin hole in rod is bronze-bushed.

Pin Fit in Piston—Light push fit with piston heated.

Pin Clearance in Rod Bushing—.0001" or light push fit with both parts at normal temperature.

Connecting Rod:—Weight 34 ozs. Length 8¾".

Crankpin Journal Diameter—2".
Lower Bearing Type—Interchangeable steel-backed, babbitt-lined. One shim on camshaft side.
Clearance—.002". Sideplay .006-.012".
Adjustment—One shim. Replace bearings. Do not file rods or caps.

Crankshaft:—9 bearing. Integral counterweights.
Journal Diameters—2 31/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined. No shims.
Clearance—.002".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by center bearing. Endplay .004-.007".

Camshaft:—Non-adjustable roller chain drive.
Timing Chain—Diamond double roller chain. Pitch ⅜". Length 22½" or 60 links.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed endless. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

Valves:—	Head Diameter	Seat Angle	Seat Width
Intake	1 21/32"	45°	1/16"
Exhaust	1 15/32"	45°	1/16"

Tappet Clearance—.015" with engine hot. Set clearance with engine idling.
Valve Timing—See Camshaft Setting above.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter and X4615 collar) Rod #37.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—25 pounds.
Oil Pressure Relief Valve—Located on pump cover. Operates at 25 pounds. Adjustable by turning screw.

Capacity & Oil—7 qts. Use SAE. #30 (warm and hot temperatures), #20-W (cold temperatures).

CLUTCH:—**Borg & Beck Model 10A6.** Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.

Clutch Pedal Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt directly behind pedal and above clutch pedal shaft and shifting position of pedal. Setscrew on lever on end of throw-out shaft at right of clutch housing must not contact stop on housing. Check starting switch cable adjustment after adjusting clutch pedal.

Starting Switch Cable Adjustment—Starting switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch is not entirely released (car will tend to move), or if pedal travel is excessive, adjust by loosening two clamp bolts on clutch throw-out shaft lever to which switch cable is attached and move cable clamp in (for later engagement) or out (for earlier engagement of starter).

Clutch Facings—Moulded type, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.

NOTE—Mark clutch cover, flywheel, and pressure plate before disassembling clutch and replace in same position. Install driven plate assembly with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Reverse-Elliott ends, or 'Articulated' type independent springing. Semi-elliptic springs are used with both axles. Specifications for both types are the same.

Kingpin Inclination—7° crosswise.
Caster—0-1½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1½°. No adjustment.
Toe In—0-⅛". Adjust in usual manner by changing length of tie rod.

Steering Gear:—Gemmer Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, single anchor type. Hand lever applies rear service brakes. See article in Brake Section for relining and complete adjustment procedure.

Drum Diameter—11".
Lining—Moulded type. Width 2¼". Thickness 3/16". Length per wheel 23 13/16".
Clearance—.010" between drum and lining.

Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number (3540) C-1001, (3640A) C-9501. On right frame side rail under engine hood and on Caution Plate on left front door corner plate.

ENGINE NUMBER:—Stamped on plate on right front of crankcase below valve cover plate.

ENGINE SPECIFICATIONS:—Own 'Monitor Sealed Motor.' Six cylinder, 'L' head type. Cylinders cast enbloc. No intake manifold is used and intake passage is formed within the head and block castings. NOTE—Some models equipped with engine hood and radiator grille in one unit which is hinged at the cowl. It is lifted up at the front end to expose the motor.

Bore—3⅜". **Stroke**—4⅜".

Displacement—234 cubic inches.

Rated Horsepower—27.34 (SAE).

Developed Horsepower—90 at 3400 R.P.M.

Compression Ratio and Pressure—5.58-1 std. cast-iron head. Presure—125 lbs. at 350 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

PISTONS:—Bohnalite, aluminum alloy, Invar strut, split skirt type.

Length—3⅞".

Weight—19⅛ ounces.

Removal—Pistons and rods removed from above.

Clearance—Skirt .002". See Fitting New Pistons.

Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance.

Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Comp. All	⅛"	.010-.025"
Oil Cont. (#3)	⅛"	.010-.025"
Oil Cont. (#4)	3/16"	.010-.025"

PISTON PIN:—**Diameter**—⅞". Pin floats in piston and rod. Pin hole in rod is bronze-bushed. Pins furnished for service standard, .001", .003", .005" oversize.

Pin Fit in Piston—Light push fit with piston heated.

Pin Fit in Rod Bushing—.0001" or light push fit with piston and rod cold.

CONNECTING ROD:—**Length**—8¾" (center-to-center).

Weight—36¼ ounces.

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2".

Lower Bearing—Interchangeable, steel-backed, babbitt or copper-lead lined type. Shims used.

Clearance—.002-.003". Sideplay .008-.012".

Bearing Adjustment:—Shims. Do not file rods or caps. Replace bearings when necessary.

CRANKSHAFT:—7 bearing. Integral counterweights.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable, steel-backed, babbitt or copper-lead lined. shims used.

Clearance—.002-.0025".

Bearing Adjustment:—Shims. Do not file caps. Replace bearings when necessary.

End Thrust:—Taken by center (#4) bearing. Endplay .004-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.

Journal Diameters—#1, 1⅞"; #2, 2 13/64"; #3, 2 11/64"; #4, 2 9/64"; #5 2 7/64; #6, 1¾".

End Thrust:—Taken by front bearing (shoulder formed on shaft behind bearing, and shoulder in front of bearing formed by sprocket hub when bolted on camshaft). Adjusted by replacing bearing.

Timing Chain:—Whitney. Double strand roller chain. Width 9/16". Pitch ⅜". Length 22½" or 60 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off engine.

VALVES:—	Head Diam.	Stem Diam.	Seat Width
Intake	1 21/32"	.341"	1/16"
Exhaust	1 17/32"	.341"	1/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.002"
Exhaust	45°	5/16"	.002"

Tappet Clearance—.015" all valves with engine hot or cold.

Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—25 lbs. (10 lbs. idling).

Oil Pressure Relief Valve:—Located on oil pump. Operates at 25 lbs. Adjustable by turning screw.

Crankcase Capacity:—7 qts. (refill).

CLUTCH:—**Borg & Beck Model 9A6.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Woven (pressure plate side), molded (flywheel side), 2 required. Inside Diam 5⅝". Outside Diam. 9¼". Thickness .133".

Adjustment—Free movement of clutch pedal must be ½-1". Adjust whenever free movement is less than ½". To adjust, loosen transverse bolt at lower end of clutch pedal, shift pedal position, tighten bolt.

Removal—Disconnect driveshaft at rear of transmission, remove transmission, drop clutch housing underpan, take out capscrews mounting clutch on flywheel turning all screws out evenly to release spring pressure. Clutch assembly can then be removed from below without removing flywheel housing.

STEERING:—**Steering Gear**—Gemmer Model. Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Camber—0-1½°. No adjustment.

Caster—0-1°. Adjust by inserting wedge shims between spring and spring pad on axle.

Toe In—0-⅛". Adjust by loosening clamp bolt at right end of tie rod and screwing tie rod in or out of end joint. Tighten clamp bolt.

Tread—58" (front), 60¼" (rear).

BRAKES:—**Service**—Bendix Hydr., Duo-Servo, single anchor type. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*

Drum Diameter—10".

Lining—Moulded type. Width 2". Thickness 3/16". Length 22 1/16" per wheel.

Clearance—.010" between drum and lining.

Hand Brake Adjustment:—Should be adjusted whenever service brakes adjusted. Turn adjusting screw in wheel so that shoes are tight in drum. Loosen two bracket bolts, pull hand brake lever on three notches, pull bracket forward removing all slack in cables and tighten bolts. Then with lever in released position readjust shoes to give .010" clearance in drums by checking with feeler gauge through slot in drum.

ENGINE NUMBER:—On plate on right hand side of crankcase. Serial number (R-303301 up) on right hand frame side rail under engine hood.

ENGINE SPECIFICATIONS:—Type—6 cylinder, valve-in head, twin-ignition type.

Bore—3⅜". Stroke—4⅜".

Displacement—234 cubic inches.

Rated Horsepower—27.34 (SAE).

Developed Horsepower—93 at 3400 R.P.M.

Compression Ratio and Pressure—5.25-1 std. cast-iron hd., no optl. **Pressure**—125 lbs at 350 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type.

Length—3⅞".

Weight—19⅛ ounces.

Removal—Pistons and rods removed from above.

Clearance—Skirt .002". See Fitting Pistons.

Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance.

Installing Pistons:—Slot should be toward left hand side of engine or away from camshaft.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Comp. All	⅛"	.010-.025"
Oil Cont. (3)	⅛"	.010-.025"
Oil Cont. (4)	3/16"	.010-.025"

PISTON PIN:—Diameter—⅞". Length—2 51/64". Pin floats in piston and rod. Pin hole in rod is bronze-bushed. Pins furnished for service standard, .001" .003", .005" oversize.

Pin Fit in Piston—Light push fit with piston heated.

Pin Fit in Rod Bushing—.0001" or light push fit with both parts at normal temperature.

CONNECTING ROD:—Length—8¾". Weight—36¼ ozs.

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2".

Lower Bearing—Interchangeable steel-backed, copper-lead lined type. Shims used.

Clearance—.002-.0025". Sideplay .006-.012".

Bearing Adjustment:—Shims. Do not file rods or caps. Replace bearings when necessary.

CRANKSHAFT:—7 bearing. Integral counterweights.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable steel-backed, copper-lead lined. Shims used.

Clearance—.002-.0025".

Bearing Adjustment:—Shims. Do not file caps. Replace bearings when necessary.

End Thrust:—Taken by center (#4) bearing. Endplay .004-.007".

CAMSHAFT:—Non-adjustable double-roller chain drive.

End Thrust:—Taken by front bearing. Adjusted by replacing bearing.

Timing Chain:—Diamond double roller chain. Width ⅞". Pitch ⅜". Length 22½" or 60 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed endless. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

VALVES:—

	Head Diam.	Stem Diam.	Length
Intake	1¾"	.372"	5 17/32"
Exhaust	1 19/32"	.372"	5 17/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.002"
Exhaust	45°	11/32"	.002"

Tappet Clearance—.015" with engine hot. Set clearance with engine idling.

Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—25 pounds.

Oil Pressure Relief Valve:—Located on oil pump cover. Operates at 25 lbs. Adjustable by turning screw.

Crankcase Capacity:—7 qts. (refill).

CLUTCH:—Borg & Beck Model 10A6. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".

Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt in link directly behind pedal and above clutch pedal shaft and shifting position of pedal. Setscrew on lever end of throw-out shaft at right of transmission must not contact stop on clutch housing. Check starting switch cable adjustment after adjusting clutch pedal.

Starting Switch Cable Adjustment—Starting switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch is not completely released (car will tend to move) or if pedal travel is excessive, adjust by loosening two clamp bolts on clutch throw-out shaft lever to which switch cable is attached and move cable clamp in (for later engagement) or out (for earlier engagement) of starter.

Removal—Disconnect driveshaft at rear of transmission, remove transmission, drop clutch housing underpan, take out capscrews mounting clutch on flywheel turning all screws out evenly to release spring pressure. Clutch assembly can then be removed from below without removing flywheel housing.

STEERING:—Steering Gear—Gemmer Model. Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends, or 'Articulated' type independent springing. Semi-elliptic springs used with both axles. Specifications for both types are the same.

Kingpin Inclination—7° crosswise.

Camber—0-1½°. No adjustment.

Caster—0-1½°. Adjusted by inserting wedge shims between spring and spring pad on axle.

Toe In—0-⅛". Adjust in usual manner by changing length of tie rod.

Tread—58" (front), 60" (rear).

BRAKES:—Service—Bendix Hydr., Duo-Servo, single anchor type. Hand lever applies rear service brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—11".

Lining—Moulded type. Width 1¾". Thickness 3/16". Length 23 13/16" per wheel.

Clearance—.010" between drum and lining.

Hand Brake Adjustment: See Service Brakes.

ENGINE NUMBER:—On plate on right hand side of crankcase. Serial number (B-77325) on right hand frame side rail under engine hood.

ENGINE SPECIFICATIONS:—Type—8 cylinder, valve-in head, twin ignition type.

Bore—3⅛". Stroke—4¼".

Displacement—260.8 cubic inches.

Rated Horsepower—31.25 (SAE).

Developed Horsepower—102 at 3400 R.P.M.

Compression Ratio and Pressure—5.25-1 std. cast-iron hd., no optl. **Pressure**—110 lbs. at 350 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type.

Length—3 11/16".

Weight—19 ounces.

Removal—Pistons and rods removed from below.

Clearance—Skirt .002". See Fitting New Pistons.

Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance.

Installing Pistons:—Slot should be toward left or away from camshaft.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Comp. All	⅛"	.010-.025"
Oil Cont. (#3)	⅛"	.010-.025"
Oil Cont. (#4)	3/16"	.010-.025"

PISTON PIN:—Diameter—⅞". Length—2 9/16".

Pin floats in piston and rod. Pin hole is bronze-bushed. Pins furnished for service standard, .001", .003", .005" oversize.

Pin Fit in Piston—Light push fit with piston heated.

Pin Fit in Rod Bushing—.0001" or light push fit with both parts at normal temperature.

CONNECTING ROD:—Length—8¾". Weight—34 ozs.

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2".

Lower Bearing—Interchangeable steel-backed, copper-lead lined type. Shims used.

Clearance—.002-.0025". Sideplay .006-.012".

Bearing Adjustment:—Shims. Do not file rods or caps. Replace bearings when necessary.

CRANKSHAFT:—9 bearing. Integral counterweights.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable steel-backed, copper-lead lined. Shims used.

Clearance—.002-.0025".

Bearing Adjustment:—Shims. Do not file caps. Replace bearing when necessary.

End Thrust:—Taken by center (#5) bearing. Endplay .004-.007".

CAMSHAFT:—Non-adjustable roller chain drive.

Timing Chain:—Diamond double roller chain. Width 9/16". Pitch ⅜". Length 62 links or 23¼".

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed endless. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

VALVES:—

	Head Diam.	Stem Diam.	Seat Width
Intake	1 21/32"	.372"	1/16"
Exhaust	1 15/32"	.372"	1/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.002"
Exhaust	45°	11/32"	.002"

Tappet Clearance—.015" with engine hot. Set clearance with engine idling.

Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—25 pounds.

Oil Pressure Relief Valve:—Located on oil pump cover. Operates at 25 lbs. Adjustable by turning screw.

Crankcase Capacity:—7 quarts (refill).

CLUTCH:—Borg & Beck Model 10A6. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".

Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt directly behind pedal and above clutch pedal shaft and shifting position of pedal. Setscrew on lever end of throw-out shaft at right of clutch housing must not contact stop on housing. Check starting switch cable adjustment after adjusting clutch pedal.

Starting Switch Cable Adjustment—Starting switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch is not entirely released (car will tend to move), or if pedal travel is excessive, adjust by loosening two clamp bolts on clutch throw-out shaft lever to which switch cable is attached and move cable clamp in (for later engagement) or out (for earlier engagement of starter).

Removal—Disconnect driveshaft at rear of transmission, remove transmission, drop clutch housing underpan, take out capscrews mounting clutch on flywheel turning all screws out evenly to release spring pressure. Clutch assembly can then be removed from below without removing flywheel housing.

STEERING:—Steering Gear—Gemmer Model. Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends, or 'Articulated' type independent springing. Semi-elliptic springs used on both axles. Specifications for both axles are the same.

Kingpin Inclination—7° crosswise.

Camber—0-1½°. No adjustment.

Caster—0-1½°. Adjust by inserting wedge shims between spring and spring pad on axle.

Toe In—0-⅛". Adjust in usual manner by changing length of tie rod.

Tread—58" (front), 60" (rear).

BRAKES:—Service—Bendix Hydr., Duo-Servo, single anchor type. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*

Drum Diameter—11".

Lining—Moulded type. Width 2¼". Thickness 3/16". Length 23 13/16" per wheel.

Clearance—.010" between drum and lining.

Hand Brake Adjustment:—See Service Brakes.

ENGINE CODE NOTE:—Consists of three letters stamped on Engine Number Plate to indicate original size of Cylinder Bore (first letter), Main Bearings (second letter), Crankpin & connecting rod bearings (third letter) as follows: 'A'—Standard, 'B'—.010" Undersize, 'C'—.010" Oversize, 'D'—.015" Oversize, 'E' .020" Oversize.

SERIAL NUMBER:—First number—R-309311 (3720), R-324111 (3820). Stamped on plate on right frame side member under engine hood.

ENGINE NUMBER:—1st No.—RE-77104(3820). Stamped on plate on right hand side of engine block.

ENGINE SPECIFICATIONS:—Type—6 cylinder, valve-in head. Twin Ignition type.

NOTE—3820 models use the 'Iso-thermal' fuel intake system (intake manifold cast in cylinder head and surrounded by cooling water for temp. control).

Bore—3⅜". Stroke—4⅜".

Displacement—234 cu. ins. **Rated HP.**—27.34.

Developed Horsepower—93 ('37), 105 ('38) at 3400 R.P.M.

Compression Ratio—5.67-1 (3720), 6.0-1 (3820).

Compression Pressure—Approximately 100-105 lbs. at cranking speed. All cylinders equal within 10 lbs.

Vacuum Reading—Steady reading of approximately 18-20" with engine idling at 7-9 M.P.H.

PISTONS:—Nash, aluminum alloy, Invar strut, split skirt type. See Engine Code Note above for original bore and piston sizes. **Length**—3⅞".

Weight—19⅛ ounces.

Removal—Pistons and rods removed from above.

Clearance—.0015-.002". See Fitting New Pistons.

Replacement Pistons:—Finished pistons furnished Std. and .001", .002", .003", .005", .010", .012", .015", .020" oversize. Semi-finished pistons .050" oversize.

Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance. Pull required to withdraw feeler should be 10 lbs.

Installing Pistons:—Piston pin offset toward camshaft side of engine and trademark (within piston) toward front.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Compression (All)	1/8"	.010"
Oil Control (#3—1937)	1/8"	.010"
Oil Control (#4—1937)	3/16"	.010"
Oil Control (All—1938)	5/32"	.010"

Replacement Rings:—Furnished .010", .020" oversize.

PISTON PIN: —Diameter—⅞". Length—2 51/64". Pin floats in piston and rod, retained by locking rings. Pin hole in piston offset toward camshaft side of engine, pin hole in rod bronze-bushed.

Pin Fit in Piston—Light push fit with piston heated to 200°F.

Pin Fit in Rod Bushing—.0001" or light push fit with both parts at normal temperature.

Replacement Pins:—Furn. 001", .002", .005" oversize.

CONNECTING ROD:—Length—8¾". Weight—36¼ ozs.

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2".

Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.

Clearance—.002". **Sideplay** .004" Max.

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Replacement Bearings:—Furnished .010" undersize.

CRANKSHAFT:—7 bearing, integral counterweights.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.

Clearance—.002".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be 'rotated' out without removing crankshaft by using pin installed in oil hole in shaft and rotating shaft.

Replacement Bearings:—Furnished .010" undersize.

End Thrust:—Taken by center (#4) bearing. End-play .004". No adjustment (replace bearing).

CAMSHAFT:—Non-adjustable double-roller chain drive.

End Thrust:—Taken by front bearing. Replace front bearing to take up excessive endplay.

Timing Chain:—Double-roller chain. Width 9/16". Pitch ⅜". Length (3720—22½" or 60 links 3820—23¼" or 62 links).

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed endless. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

VALVES:—	**Head Diameter**	**Seat Angle**	**Stem Clear.**
Intake	1¾"	45°	.003"
Exhaust	1 19/32"	45°	.003"

Tappet Clearance:—.008" (Intake '37), .015" (Exhaust '37—All valves '38), engine hot and idling. NOTE—On 1938 cars driven consistently at less than 50 M.P.H., intake valves can be set at .008".

Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—25-35 lbs. at normal temp.

Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6730 (dash unit, firt cars—ball type pointer), 7070 (dash unit, later cars—bar type pointer), No. 6125 (motor unit, all cars). This data for 3820 only.

See article in Mechanical Equipment Section for data.

Oil Pressure Relief Valve:—Located on oil pump cover. Operates at 30 lbs. Screw adjustment.

Crankcase Capacity:—7 quarts (refill).

COOLING SYSTEM:—Water Pump. Centrifugal, adjustable packing. Driven by generator extension shaft.

See article in Mechanical Equipment Section for data.

Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.

Thermostat:—Dole. In water outlet on cyl. head.

Setting—Thermostat opens at 160°F.

Water Capacity:—17 qts. (3720), 16 qts. (3820).

Drain Valves:—One only—at bottom of radiator.

CLUTCH:—Borg & Beck Mod. 10A7. Mod. #902 stamped on cover. Single plate, dry disc type.

See article in Mechanical Equipment Section for data.

Facings (37)—Moulded type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness ⅛".

Facings (38)—Molded-woven, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness ⅛".

Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt in link directly below clutch pedal shaft and positioning pedal in slot. Clearance between pedal and toeboard should be ⅜". On cars with 'NoRol,' check operation whenever clutch adjusted and, if necessary, adjust as follows:

NoRol Adjustment—Loosen locknut and turn adjusting nut at rear end of connecting rod (at NoRol lever) in for later brake release, out for earlier.

Removal:—Remove transmission (see Transmission Removal below), remove clutch housing underpan, take out clutch mounting bolts evenly, remove assembly from below.

TRANSMISSION:—Own Make. Constant-mesh, synchromesh, helical gear (second and high), sliding helical gear (low and reverse).

See article in Mechanical Equipment Section for data.

Cruising Gear (Overdrive):—Warner Model AS6-R6 optional. In separate case at rear of transmission.

See article in Mechanical Equipment Section for data.

Vacuum Gear Shift (Transmission Control):—Evans Nash Vacuum type. Optional on Model 3820.

See article in Mechanical Equipment Section for data.

Removal:—Disconnect driveshaft. Disconnect shift linkage (on cars with Vacuum Gear Shift). Take off nuts on transmission mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Mechanics—Model 2C. Roller bearing type. 2 used.

See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Semi-floating, spiral bevel gear type with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

Ratio—4 1/9 to 1 Std.

Removal:—Block up rear of car, remove wheels and axle shafts, disconnect brake lines and cables, shock absorber links, drive shaft at rear universal joint. Free axle from springs by disconnecting spring bolts, remove axle assembly from under car.

Axle Shaft Removal—Remove wheel, take out mounting screws in retainer, remove retainer, oil seal, brake backing plate, bearing adjusting shims. Use puller to remove shaft and bearing assembly.

Wheel Bearing Adjustment—Controlled by shims at flanged end of housing. To adjust, remove brake backing plate and add or remove shims. **Endplay—**.003-.006".

SHOCK ABSORBERS:—Nash (Delco or Gabriel design), double acting (3720), direct acting (3820).

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Mod. 305. Worm- and Roller type with 'push-pull' adjustment.

See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Camber—½-1½°. No adjustment.

Caster—2½° ('37), 1½° ('38). Shim adjustment. Install shims between spring and spring pad on axle.

Toe In—0-1/16". Adjust by loosening clamp bolt at right hand end of tie rod and turning rod in or out of end fitting.

Steering Shock Eliminator—Consists of rubber bumper mounted on underside of left frame siderail just in front of left front spring rear shackle. Adjust to give 1/16" clearance between spring and bumper with normal load.

BRAKES:—Bendix Duo-Servo, Single Anchor type or Lockheed type hydraulic brakes. Hand lever applies rear wheel service brakes. NoRol optional (3820).

See article in Mechanical Equipment Section for data.

Drum Diameter—10" (3720). 10 1/16" (3820).

Lining—Woven (primary), moulded (secondary). Width 2" ('37), 2 1/16" ('38). Thickness 3/16". Length per wheel 22 1/16" ('37), 22" ('38).

Clearance (Bendix)—.010" at heel & toe (each shoe)

Clearance (Lockheed)—.005" heel, .010" toe (each shoe).

Braking Power—53% front, 47% rear.

NoRol:—Optional. Consists of a clutch pedal controlled valve in the brake line by which brakes held 'on' when car stopped on up-grade until clutch is engaged.

See article in Mechanical Equipment Section for data.

Hand Brake:—See Service Brakes above.

ENGINE CODE NOTE:—Consists of three letters stamped above Engine Number Plate to indicate original size of Cylinder Bore (first letter), Main Bearings (second letter), Crankpin & connecting rod bearings (third letter) as follows: 'A'—Standard, 'B'—.010" Undersize, 'C'—.010" Oversize, 'D'—.015" Oversize, 'E'—.020" Oversize.

SERIAL NUMBER:—1st No. B-80031 ('37), B-86031 ('38). On plate on right frame side member under hood.

ENGINE NUMBER:—1st No. B-100640 ('38). Stamped on plate on right hand side of engine block.

ENGINE SPECIFICATIONS:—8 cylinder, valve-in-head, Twin-ignition type.
NOTE—3880 models use 'Iso-thermal' fuel intake system (Intake manifold cast in cylinder head and surrounded by cooling water for temp. control).
Bore—3⅛". Stroke—4¼".
Displacement—260.8 cu. ins. **Rated HP.**—31.25.
Developed HP.—105 ('37), 115 ('38) @ 3400 RPM.
Compression Ratio—5.46-1 ('37). 6.0-1 ('38).
Compression Pressure—Approx. 90 lb. ('37), 100-105 lb.('38) at cranking speed. All cyl. equal within 10 lb.
Vacuum Reading—Steady 18-20" idling at 7-9 MPH.

PISTONS:—Nash, aluminum alloy, Invar strut, split skirt type. See Engine Code Note above for original bore and piston sizes.
Removal—Pistons and rods removed from below.
Clearance—.0015-.002". See Fitting New Pistons.
Replacement Pistons:—Finished pistons furnished Std. and .001", .002", .003", .005", .010", .012",. 015", .020" oversize. Semi-finished pistons .050" oversize.
Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance. Pull required to withdraw feeler should be 10 lbs.
Installing Pistons:—Piston pins offset toward camshaft side of engine and trademark (within piston) toward front.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Compression (All)	1/8"	.010"
Oil Control (#3—1937)	1/8"	.010"
Oil Control (#4—1937)	3/16"	.010"
Oil Control (All—1938)	5/32"	.010"

Replacement Rings:—Furnished .010",. 020" oversize.

PISTON PIN:—Diameter—⅞". Length—2 9/16".
Pin floats in piston and rod, retained by locking rings. Pin hole in piston offset toward camshaft side of engine, pin hole in rod bronze-bushed.
Pin Fit in Piston—Light push fit (piston @ 200°F).
Pin Fit in Rod Bushing—.0001" or light push fit with both parts at normal temperature.
Replacement Pins:—Furn. .001", .002", .005" oversize.

CONNECTING ROD:—Length—8¾". Weight—34 ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.
Clearance—.002". **Sideplay** .004" Max.
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Replacement Bearings:—Furnished .010" undersize.

CRANKSHAFT:—9 bearing. Integral counterweights.
Journal Diameters—2 31/64" all bearings.
Bearing Type:—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be 'rotated' out without removing crankshaft by using pin installed in oil hole in shaft and rotating shaft.
Replacement Bearings:—Furnished .010" undersize.
End Thrust:—Taken by center (#5) bearing. Endplay .004". No adjustment (replace bearing).

CAMSHAFT:—Non-adjustable roller chain drive.
Timing Chain:—Double-roller chain. Width 9/16". Pitch ⅜". Length 23¼" or 62 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed endless. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

VALVES:

	Head Diam.	Seat Angle	Stem Clearance
Intake	1 21/32"	45°	.003"
Exhaust	1 15/32"	45°	.003"

Tappet Clearance:—.008" (Intake '37), .015" (Exhaust '37—All valves '38), engine hot and idling. NOTE—On 1938 cars driven consistently at less than 50 M.P.H., intake valves can be set at .008".
Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure:—25-35 lbs. at normal temp.
Oil Pressure Relief Valve:—Located on oil pump cover. Operates at 30 lbs. Adjustable by turning screw.
Crankcase Capacity:—7 quarts (refill).
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6730 (dash unit, first cars—ball type pointer), 7070 (dash unit, later cars—bar type pointer), No. 6125 (motor unit, all cars). This data for 3880 only.
See article in Mechanical Equipment Section.

COOLING SYSTEM:—Water Pump:—Centrifugal type, driven through flexible coupling by extension of generator armature shaft.
See article in Mechanical Equipment Section.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Dole. In water outlet on cyl. head.
Setting—Thermostat opens at 160°F.
Water Capacity:—18 qts (3780), 17 qts. (3880).
Drain Valves—At bottom of radiator. Drain plug also located at lower left rear corner of engine block.

CLUTCH:—Borg & Beck Mod. 10A6. Mod. #883 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings:—Moulded-woven type. 2 required. Inside Diam. 6". Outside Diam. 10". Thickness ⅛".
NOTE—Woven facings used on 3780.
Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt in link directly behind pedal and above clutch pedal shaft and positioning pedal in slot. Clearance between pedal and toeboard should be ⅜". Check Starting Switch adjustment and 'NoRol' setting whenever clutch adjusted and adjust if necessary.
NoRol Adjustment—Loosen locknut and turn adjusting nut at rear end of connecting rod (at NoRol lever) in for later brake release, out for earlier release. Brakes should release just as clutch engages.
Starting Switch Adjustment—Starting switch lever should have ⅛" free movement. Adjust by turning lever stopscrew on side of switch case. Switch should close just after clutch is completely disengaged. Adjust by loosening two clampscrews attaching switch cable to lever on right end of clutch throw-out shaft, move clamp toward shaft for later starter engagement, out for earlier.
Removal:—Remove transmission (see Transmission Removal below), remove clutch housing underpan, take out clutch mounting bolts evenly, remove assembly from below.

TRANSMISSION:—Own Make. Constant-mesh, synchro-mesh, helical gear (second and high), sliding helical gear (low and reverse).
See article in Mechanical Equipment Section for data.
Cruising Gear (Overdrive):—Warner Model AS7-R1 (3780), AS6-R6 (3880). Optional equipment.
See article in Mechanical Equipment Section for data.
Vacuum Gear Shift (Transmission Control):—Evans Nash vacuum type. Optl. on Model 3880 only.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect driveshaft. Disconnect shift linkage (on cars with Vacuum Gear Shift). Take off nuts on transmission mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Mechanics Model 3C. Roller bearing type. Two used.
See Article in Mechanical Equipment Section.

REAR AXLE:—Own—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 Std.
Removal:—With axle shafts removed, drop driveshaft, remove carrier mounting bolts and remove assembly from car without removing housing.
Axle Shaft Removal—Remove wheel, take out mounting screws in retainer, remove retainer, oil seal, brake backing plate, bearing adjusting shims. Use puller to remove shaft and bearing assembly.
Wheel Bearing Adjustment—Controlled by shims at flanged end of housing. To adjust, remove brake backing plate and add or remove shims.
Endplay—.003-.006".

SHOCK ABSORBERS:—Nash (Delco or Gabriel design), double acting (3780), direct acting (3880).
See articles in Mechanical Equipment Section.

STEERING:—Steering Gear—Gemmer Mod. 335. Worm-and Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Camber—½-1½°. No adjustment.
Caster—2° ('37), 1½° ('38). Shim adjustment. Install shims between spring and spring pad on axle.
Toe In—0-1/16". Adjust by loosening clamp bolt at right hand end of tie rod and turning rod in or out of end fitting.
Steering Shock Eliminator—Consists of rubber bumper mounted on underside of left frame siderail just in front of left front spring rear shackle. Adjust to give 1/16" clearance between spring and bumper with normal load.

BRAKES:—Service. Bendix Duo-servo, Single Anchor type, or Lockheed type, Hydraulic brakes. Hand lever applies rear wheel service brakes. NoRol optional equipment on 3880 only.
See article in Mechanical Equipment Section for data.
Drum Diameter—11" ('37), 11 1/16" ('38).
Lining—Woven (prim. '38), Moulded (all '37—secondary '38). Width 2¼" ('37), 2 1/16" ('38). Thickness 3/16". Length per wheel 23 13/16" ('37).
Clearance (Bendix)—.010" at heel & toe (each shoe).
Clearance (Lockheed)—.005" heel, .010" toe (each shoe).
Braking Power—53% front, 47% rear.
NoRol:—Optional. Consists of a clutch pedal controlled valve in the brake line by which brakes held 'on' when car stopped on up-grade until clutch is engaged.
See article in Mechanical Equipment Section for data.
Hand Brake:—See Service Brakes above.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Hood latch handle located at lower edge of radiator grille (safety catch at top of grille).

ENGINE CODE NOTE:—Consists of three letters stamped on Engine Number Plate to indicate original size of Cylinder Bore (first letter), Main Bearings (second letter), Crankpin & connecting rod bearings (third letter) as follows: 'A'—Standard, 'B'—.010" Undersize, 'C'—.010" Oversize, 'D'—.015" Oversize, 'E' .020" Oversize.

SERIAL NUMBER:—1st number R-331400. Stamped on plate on right frame side member under hood.

ENGINE NUMBER:—1st number E-33900 (See Note). On boss on right front upper corner of block.
Engine No. Change Note—Beginning with Serial No. R-331967, engine numbering changed so that number is 500 less than serial number on same car (Serial No. R-331967, Engine No. E-331467).

ENGINE SPECIFICATIONS:—6 cylinder, valve-in-head, Twin Ignition type. NOTE—'Iso-thermal' fuel intake system used (intake manifold cast in cylinder head—water cooled for temp. control).
Bore—3⅜". **Stroke**—4⅜".
Displacement—234.8 cu. ins. **Rated HP.**—27.34.
Developed Horsepower—105 HP. at 3400 R.P.M.
Compression Ratio—6.0-1 cast-iron head.
Compression Pressure—125 lbs. @ 350 RPM. or approx. 100-105 lbs. at cranking speed (160 RPM).
Vacuum Reading—18-20" steady idling at 7-8 MPH.

PISTONS:—Nelson-Bohnalite, aluminum alloy, Invar strut, tin plated, split skirt type. See Engine Code Note above for original bore and piston sizes.
Weight—19¼ ounces. **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Top .027-.030". Skirt .001-.002".

Replacement Pistons:—Std. & .001", .002", .003", .005", .010", .012", .015", .020" O.S. Semi-finished .050" O.S.

Fitting New Pistons:—Insert .002" feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 10 lbs.

Installing Pistons:—Pin offset to camshaft side of engine. Trademark (within piston) to front.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Wall Thickness
Compression	.123-.124"	.010-.020"	.150"
Oil Control	.1545-.1550"	.010-.018"	.150"

Replacement Rings:—Furnished .010", .020" oversize.

PISTON PIN:—**Diameter** .8745-.8748". **Length** 2.799-2.809". Floating type. Retained by locking rings. Pin hole in piston offset to camshaft.
Pin Fit in Piston—Light push fit (piston @ 200°F.)
Pin Fit in Rod Bushing—Select fit to .0001" or light push fit at normal temperature.

Replacement Pins:—Furn. .001", .002", .005" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—36¼ ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.0015-2.0025".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.
Clearance—.0015-.0025". **Sideplay**—.008-.012".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Replacement Bearings:—Furnished .010" undersize.

CRANKSHAFT:—7 bearing, 4 counterweights.
Journal Diameters—2 31/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined. No shims. See Engine Code Note (above) for original bearing sizes. **Clearance**—.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Upper halves can be 'rotated' out without removing crankshaft by using pin in oil hole in shaft, turn shaft.
Replacement Bearings:—Furnished .010" undersize.
End Thrust:—At #4 bearing. **Endplay**—.004".

CAMSHAFT:—Non-adjustable double-roller chain drive.
End Thrust:—Taken by front bearing. Replace bearing to take up excessive endplay.
Timing Chain:—Whitney No. 49205. Width 9/16". Pitch ⅜". Length 60 links or 22½".
Camshaft Setting:—Sprockets marked. Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 3/4"	.3715-.3725"	5 17/32"
Exhaust	1 19/32"	.3715-.3725"	5 17/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.002-.004"

Tappet Clearance:—.008" Int., (.015" for high speed operation), .015" Exh. Set with engine warm and idling.
Valve Guides:—Press fit in head.
Valve Springs:—Double springs on all valves. Spring free length 1 21/32" (inner), 2" (outer).

	Inner Spring		Outer Spring	
	Pressure	Length	Pressure	Length
Closed	19-23 lbs.	1 3/8"	35½-40½ lbs.	1 11/16"
Open	48-54 lbs.	1 1/32"	92-98 lbs.	1 11/32"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 24½° BTDC. Close 70½°ALDC.
Exhaust Valves—Open 49½° BLDC. Close 5° ATDC.
Valve Timing Check—With regular running tappet clearance of .015", Exhaust valve should close with piston 5° or .0104" after top dead center.
Motor Gauge—Weidenhoff Adapter #113, Rod #37.

LUBRICATION:—Gear type pump in crankcase.
Normal Oil Pressure:—30 lbs. at 20 M.P.H.
Oil Pressure Relief Valve:—On oil pump cover. Opens at 30 lbs. Screw adjustment.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7270 (dash unit), 6125 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—7 qts. (6 qts. refill).

COOLING SYSTEM:—**Capacity**—16 quarts.
Water Pump:—Centrifugal, adjustable packing type. Driven by generator extension shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Dole. In water outlet on cyl. head.
Setting—Starts to open at 160°F.
Temperature Gauge:—King-Seeley Electric. K-S No. 7275 (dash unit), 7000 (engine unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads '212' with ignition 'Off'.

CLUTCH:—**Borg & Beck Model 10A7.** #902 or #934 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .125".
Adjustment:—Pedal free movement ½-1¼" (loosen transverse bolt in link below pedal shaft, position pedal in slot). Pedal toeboard clearance ⅜". Check 'No-Rol' operation (if car so equipped).
Removal:—Remove transmission (see below), clutch housing underpan, clutch cover mounting bolts (release tension evenly), lower assembly out.

TRANSMISSION:—**Own Make.** Constant-mesh (all speeds), synchro-mesh (second & high), all helical gear.
Cruising Gear (Overdrive):—Warner Model AS6-R6 optional. In separate case at rear of transmission.
Transmission Control:—Mechanical type steering column mounted gear shift, optional.
See articles in Mechanical Equipment Section for data.
Removal:—Disconnect driveshaft. Disconnect shift linkage (cars with steering column shift). Remove transmission mounting stud nuts and lift out.

UNIVERSAL JOINTS:—**Mechanics.** Type 2C. Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive (spiral bevel on Coupe).
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 Std. 4 4/9-1 Optl.
Backlash—.005-.007". Shim adjustment.
Removal:—Block up rear of car, remove wheel and drum assemblies, axle shafts, disconnect brake lines and cables, shock absorbers, drive shaft at rear universal. Free axle from springs by disconnecting spring bolts, withdraw axle.
Axle Shaft Removal—Remove wheel and drum, take out retainer mounting bolt nuts, remove retainer, oil seal, brake backing plate, bearing adjusting shims. Pull shaft and bearing out.
Wheel Bearing Adjustment—Shims at flanged end of housing. To adjust, remove brake backing plate, add or remove shims. **Endplay**—.004-.006".

SHOCK ABSORBERS:—**Delco.** Front 1112-P, Rear 1117-DD. Direct acting, hydraulic type. 1723-L, M, N, P (double acting) Export.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott end and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Camber—½-1½° and equal at both wheels.
Caster—1½°. Shim adjustment. Install shims (furnished in 1½° and 3° angles) between spring and spring pad on axle.
Toe In—0-1/16". Adjust by loosening clamp bolt at right end of tie rod and turning tie rod.
Steering Shock Eliminator—Consists of spring and rubber bumper bracket at rear of left front spring. Adjust lower nut to give ⅛" clearance between upper rubber cushion and frame. Adjust spring cushion (ahead of spring rear shackle) to 1/16" clearance between cushion and spring.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter 10 1/16".
Lining—Moulded. Width 2". Thickness 7/32". Length per wheel 22".
Clearance—.010" at heel and toe of each shoe.
Braking Power—53% front wheels, 47% rear.
Hand Brake:—See Service Brakes.
No-Rol:—Optl. *See Mechanical Equipment Section.*

NOTE:—Engine hood hinged at cowl and lifts from forward end. Hood latch handle located at lower edge of radiator grille (safety catch at top of grille).

ENGINE CODE NOTE:—Consists of three letters stamped on Engine Number Plate to indicate original size of Cylinder Bore (first letter), Main Bearings (second letter), Crankpin & connecting rod bearings (third letter) as follows: 'A'—Standard, 'B'—.010" Undersize, 'C'—.010" Oversize, 'D'—.015" Oversize, 'E' .020" Oversize.

SERIAL NUMBER:—1st number B-89000. Stamped on plate on right frame side member under hood.

ENGINE NUMBER:—Stamped on boss on right front upper corner of block.
Engine No. Change Note—Beginning with Serial No. B-103201, engine numbering changed so that number is 500 less than serial number on same car (Serial No. B-103201, Engine No. B-102701).

ENGINE SPECIFICATIONS:—8 cylinder, valve-in-head, Twin Ignition type. NOTE—'Iso-thermal' fuel intake system used (intake manifold cast in cylinder head—water cooled for temp. control).
Bore—3⅛". **Stroke**—4¼".
Displacement—260.8 cu. ins. **Rated HP**—31.25.
Developed Horsepower—115 HP. at 3400 R.P.M.
Compression Ratio—6.0-1 cast-iron head.
Compression Pressure—110 lbs. at 350 RPM. or approx. 110 lbs. at cranking speed (160 RPM.).
Vacuum Reading—Steady 18-20" idling at 7-8 MPH.

PISTONS:—Nelson-Bohnalite, aluminum alloy, Invar strut, tin plated, split skirt type. See Engine Code Note above for original bore and piston sizes.
Weight—16 ounces. **Length**—3 11/16".
Removal—Pistons and rods remove from below.
Clearance—Top .018-.022". Skirt .001-.002".
Replacement Pistons:—Std. & .001", .002", .003", .005", .010", .012", .015", .020" O.S. Semi-finished .050" O.S.
Fitting New Pistons:—Insert .002" feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 10 lbs.
Installing Pistons:—Pin offset to camshaft side of engine. Trademark (within piston) to front.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Wall Thickness
Compression	.1235-.124"	.010-.015"	.130"
Oil Cont. (#3)	.1235-.1240"	.010-.018"	.140"
Oil Cont. (#4)	.1860-.1865"	.010-.018"	.140"

Replacement Rings:—Furnished .010", .020" oversize.

PISTON PIN:—**Diameter**—.8745-.8748". **Length**—2.564-2.576". Floating type. Retained by locking rings. Pin hole in piston offset toward camshaft.
Pin Fit in Piston—Light push fit (piston @ 200°F.)
Pin Fit in Rod Bushing—Select fit to .0001" or light push fit at normal temperature.
Replacement Pins:—Furn. .001", .002", .005" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—34 ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.0015-2.0025".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.
Clearance—.0015-.0025". **Sideplay**—.008-.012".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Replacement Bearings:—Furnished .010" undersize.

CRANKSHAFT:—Nine bearing type.
Journal Diameters—2 31/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined. No shims. See Engine Code Note (above) for original bearing sizes. **Clearance**—.002".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Upper halves can be 'rotated' out without removing crankshaft by using pin in oil hole in shaft, turn shaft.
Replacement Bearings:—Furnished .010" undersize.
End Thrust:—At #5 bearing. **Endplay**—.004".

CAMSHAFT:—Non-adjustable double-roller chain drive.
Timing Chain:—Diamond. Width 9/16". Pitch ⅜". Length 62 links or 23¼".
Camshaft Setting:—Sprockets marked. Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3715-.3725"	5½"
Exhaust	1 15/32"	.3715-.3725"	5½"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.002-.004"

Tappet Clearance:—.008" Int., (.015" for high speed operation), .015" Exh. Set with engine warm and idling.
Valve Guides:—Press fit in head.
Valve Springs:—Double springs on all valves. Spring free length 1 21/32" (inner), 2" (outer).

	Inner Spring		Outer Spring	
	Pressure	Length	Pressure	Length
Closed	19-23 lbs.	1 3/8"	35½-40½ lbs.	1 11/16"
Open	48-54 lbs.	1 1/32"	92-98 lbs.	1 11/32"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 20° BTDC. Close 74° ALDC.
Exhaust Valves—Open 45° BLDC. Close 10° ATDC.
Valve Timing Check—With regular running tappet clearance of .015", Exhaust valve should close with piston 10° or .0400" after top dead center.
Motor Gauge—Weidenhoff Adapter #113, Rod #37.

LUBRICATION:—Gear type pump in crankcase.
Normal Oil Pressure:—30 lbs. at 20 M.P.H.
Oil Pressure Relief Valve:—On oil pump cover. Opens at 30 lbs. Screw adjustment.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7270 (dash unit), 6125 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—7 qts. (dry or refill).

COOLING SYSTEM:—**Capacity**—17 quarts.
Water Pump:—Centrifugal, adjustable packing type. Driven by generator extension shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Dole. In water outlet on cyl. head.
Setting—Starts to open at 160°F.
Temperature Gauge:—King-Seeley Electric. K-S No. 7275 (dash unit), 7000 (engine unit).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads '212' with ignition 'Off'.

CLUTCH:—**Borg & Beck Model 10A7.** #919 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .125".
Adjustment:—Pedal free movement ½-1¼". (loosen transverse bolt in link below pedal shaft, position pedal in slot). Pedal toeboard clearance ⅜". Check Starting Switch adjustment (below) and 'No-Rol' (if car so equipped).
Starting Switch Adjustment—Starting switch lever should have ⅛" free movement. Adjust by turning lever stopscrew on side of switch case. Switch should close just after clutch is completely disengaged. Adjust by loosening two clampscrews attaching switch cable to lever on right end of clutch throw-out shaft, move clamp toward shaft for later starter engagement, out for earlier.
Removal:—Remove transmission (see below), clutch housing underpan, clutch cover mounting bolts (release tension evenly), lower assembly out.

TRANSMISSION:—**Own Make.** Constant-mesh (all speeds), synchro-mesh (second & high), all helical gear.
Cruising Gear (Overdrive):—Warner Model AS6-R6 standard. In separate case at rear of transmission.
Transmission Control:—Mechanical type steering column mounted gear shift, optional.
See articles in Mechanical Equipment Section for data.
Removal:—Disconnect driveshaft. Disconnect shift linkage (cars with steering column shift). Remove transmission mounting stud nuts and lift out.

UNIVERSAL JOINTS:—**Mechanics.** Type 3C. Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive (spiral bevel on Coupe).
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 standard
Backlash—.005-.007". Screw Adjustment.
Removal:—Block up rear of car, remove wheel and drum assemblies, axle shafts, disconnect brake lines and cables, shock absorbers, drive shaft at rear universal. Free axle from springs by disconnecting spring bolts, withdraw axle.
Axle Shaft Removal—Remove wheel and drum, take out retainer mounting bolt nuts, remove retainer, oil seal, brake backing plate, bearing adjusting shims. Pull shaft and bearing out.
Wheel Bearing Adjustment—Shims at flanged end of housing. To adjust, remove brake backing plate, add or remove shims. **Endplay**—.004-.006".

SHOCK ABSORBERS:—**Delco** 1112-M (front), 1117-DD (rear). Direct acting, hydraulic type.
Export Note—Double acting 1723-L, M, N, P used.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model 335. Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Camber—½-1½° and equal at both wheels.
Caster—1½°. Shim adjustment. Install shims (furnished in 1½° and 3° angles) between spring and spring pad on axle.
Toe In—0-1/16". Adjust by loosening clamp bolt at right end of tie rod and turning tie rod.
Steering Shock Eliminator—Consists of spring and rubber bumper bracket at rear of left front spring. Adjust lower nut to give ⅛" clearance between upper rubber cushion and frame. Adjust spring cushion (ahead of spring rear shackle) to 1/16" clearance between cushion and spring.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter 11 1/16".
Lining—Moulded. Width 2¼". Thickness 7/32". Length per wheel 24".
Clearance—.010" at heel and toe of each shoe.
Braking Power—53% front wheels, 47% rear.
Hand Brake:—See Service Brakes.
No-Rol:—Optl. *See Mechanical Equipment Section.*

ENGINE CODE NOTE:—Consists of three letters stamped on Engine Number Plate to indicate original size of Cylinder Bore (first letter), Main Bearings (second letter), Crankpin & Connecting Rod Bearings (third letter) as follows: 'A'—Standard, 'B'—.010" Undersize, 'C' .010" Oversize, 'D'—.015" Oversize, 'E'—.020" Oversize.

SERIAL NUMBER:—First number H-1001 & L-50781 ('37), H-10501 & L-106281 ('38). Stamped on plate on right frame side member under engine hood.

ENGINE NUMBER:—1st number—('38) HE-10510 & LE-107912. Stamped on plate on right hand side of engine block.

ENGINE SPECIFICATIONS:—Own 'Monitor Sealed' motor. Six cylinder, 'L' head. Cylinders cast enbloc. No intake manifold used, intake passage formed within head and block castings.

Bore—3⅜". Stroke—4⅜".

Displacement—234.8 cubic inches.

Rated Horsepower—27.34 (SAE).

Developed HP.—90 ('37), 95 ('38) @ 3400 RPM.

Compression Ratio—5.61-1 ('37). 5.83-1 ('38).

Compression Pressure—Approximately 100 lbs. at cranking speed. Cylinders must be equal within 10 lbs.

Vacuum Reading—Steady reading of approximately 18-20" with engine idling at 7-9 M.P.H.

PISTONS:—Nash, aluminum alloy, Invar strut, split skirt type. See Engine Code Note above for original bore and piston sizes.

Removal—Pistons and rods removed from above.

Clearance—.0015-.002". See Fitting New Pistons.

Replacement Pistons:—Finished pistons furnished Std. and .001", .002", .003", .005", .010", .012", .015", .020" oversize. Semi-finished pistons .050" oversize.

Fitting New Pistons:—Use .002" feeler stock inserted between piston and cylinder wall on side opposite slot to check clearance. Pull required to withdraw feeler should be 10 lbs.

Installing Pistons:—Piston pin offset toward camshaft side of engine and trademark (within piston) toward front.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap
Compression (All)	1/8"	.010"
Oil Control (#3—3710)	3/16"	.010"
Oil Control (#4—3710)	5/32"	.010"
Oil Control (All—3810)	5/32"	.010"

Replacement Rings:—Rings furnished .010", .020" oversize.

PISTON PIN:—Diameter—⅞". Pin floats in piston and rod, retained by locking rings. Pin hole in piston offset toward camshaft side of engine, pin hole in rod bronze-bushed.

Pin Fit in Piston—Light push fit with piston heated to 200°F.

Pin Fit in Rod Bushing—.0001" or light push fit with piston and rod cold.

Replacement Pins:—Furnished .001", .002", .005" oversize.

CONNECTING ROD:—Length—8¾" (center-to-center).

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2".

Lower Bearing—Removable, steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.

Clearance—.002". **Sideplay**—.004" max.

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Replacement Bearings:—Furnished .010" undersize.

CRANKSHAFT:—7 bearing. Integral counterweights.

Journal Diameters—2 31/64" all bearings.

Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.

Clearance—.002".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be 'rotated' out without removing crankshaft by using pin installed in oil hole in shaft and rotating shaft.

Replacement Bearings:—Furnished .010" undersize.

End Thrust:—Taken by center (#4) bearing. Endplay .004". No adjustment (replace bearing).

CAMSHAFT:—6 bearing. Non-adjustable chain drive.

End Thrust:—Taken by front bearing (shoulder formed on shaft behind bearing, and shoulder in front of bearing formed by sprocket hub when bolted on camshaft). Adjusted by replacing bearing.

Timing Chain:—Double-roller chain. Width 9/16". Pitch ¼". Length (3710—22½" or 60 links, 3810—23¼" or 62 links).

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off engine.

VALVES:—

	Head Diameter	Seat Angle	Stem Clear.
Intake	1 21/32"	45°	.003"
Exhaust	1 17/32"	45°	.003"

Tappet Clearance—.015" all valves with engine hot or cold.

Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—25-35 lbs. at normal temp.

Oil Pressure Relief Valve:—Located on oil pump. Operates at 30 lbs. Adjustable by turning screw.

Crankcase Capacity—6 qts. (refill).

Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6730 (dash unit, first cars—ball type pointer), 7070 (dash unit, later cars—bar type pointer), No. 6125 (motor unit, all cars).

See article in Mechanical Equipment Section for data.

COOLING SYSTEM:—Water Pump. Centrifugal type with adjustable packing. Impeller driven through flexible coupling by extension of generator shaft.

See article in Mechanical Equipment Section for data.

Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.

Thermostat:—Dole. Located in water outlet elbow on cylinder head.

Setting—Thermostat opens at 160°F.

Water Capacity:—20 quarts.

Drain Valves:—One only—at bottom of radiator.

CLUTCH:—Borg & Beck Model 9A6. Model No. 906 stamped on cover. Single plate, dry disc type.

See article in Mechanical Equipment Section for data.

Facings—Moulded-Woven type, 2 required. Inside Diam. 5⅝". Outside Diam. 9¼". Thickness ⅛".

NOTE—Woven facings used on Model 3710.

Adjustment—Free movement of clutch pedal must be ½-1½". Adjust by loosening transverse bolt in slot below clutch pedal shaft and positioning pedal in slot. Clearance between pedal and toeboard should be ⅜". Check 'NoRol' setting whenever clutch adjusted and adjust if necessary.

NoRol Adjustment—Loosen locknut and turn adjusting nut at rear end of connecting rod (at NoRol lever) in for later brake release, out for earlier release. Brakes should release just as clutch engages.

Removal:—Remove transmission (see Transmission Removal below), remove clutch housing underpan, take out clutch mounting bolts evenly, remove assembly from below.

TRANSMISSION:—Own Make. Constant-mesh, synchro-mesh, helical gear (second and high), sliding helical gear (low and reverse).

See article in Mechanical Equipment Section for data.

Cruising Gear (Overdrive):—Warner Model AS2-R6 (3710), AS6-R6 (3810) optional.

See article in Mechanical Equipment Section for data.

Vacuum Gear Shift (Transmission Control):—Evans Nash vacuum type. Optional on Model 3810.

See article in Mechanical Equipment Section for data.

Removal:—Disconnect drive shaft. Disconnect shift linkage (on cars with Vacuum Gear Shift). Take off nuts on transmission mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Mechanics—Model 2C. Roller bearing type. 2 used.

See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Semi-floating, spiral bevel gear type with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

Ratio—4 1/9-1 Standard.

Removal:—Block up rear of car, remove wheels and axle shafts, disconnect brake lines and cables, shock absorber links, drive shaft at rear universal joint. Free axle from springs by disconnecting spring bolts, remove axle assembly from under car.

Axle Shaft Removal—Remove wheels, take out mounting screws in retainer, remove retainer, oil seal, brake backing plate, bearing adjusting shims. Use puller to remove shaft and bearing assembly.

Wheel Bearing Adjustment—Controlled by shims at flanged end of housing. To adjust, remove brake backing plate and add or remove shims.

Endplay—.003-.006".

SHOCK ABSORBERS:—Nash (Delco or Gabriel design), double acting (3710), direct acting (3810).

See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment.

See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Camber—½-1½°. No adjustment.

Caster—2½° ('37), 1½° ('38). Shim adjustment. Install shims between spring and spring pad on axle.

Toe In—0-1/16". Adjust by loosening clamp bolt at right hand end of tie rod and turning rod in or out of end fitting.

Steering Shock Eliminator—Consists of rubber bumper mounted on underside of left frame siderail just in front of left front spring shackle. Adjust to give 1/16" clearance between spring and bumper with normal load.

BRAKES:—Service. Bendix Duo-Servo, Single Anchor type, or Lockheed type, Hydraulic brakes. Hand lever applies rear wheel service brakes. NoRol optional equipment.

See article in Mechanical Equipment Section for data.

Drum Diameter—10" ('37), 10 1/16" ('38).

Lining—Woven (primary '38), Moulded (all '37—secondary '38). Width 2". Thickness 3/16". Length per wheel 22 1/16" ('37).

Clearance (Bendix)—.010" at heel & toe (each shoe).

Clearance (Lockheed)—.005" heel, .010" toe (each shoe).

Braking Power—53% front, 47% rear.

NoRol:—Optional. Consists of a clutch pedal controlled valve in the brake line by which brakes held 'on' when car stopped on up-grade until clutch is engaged.

See article in Mechanical Equipment Section for data.

Hand Brake:—See Service Brakes above.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Hood latch handle located at lower edge of radiator grille (safety catch at top of grille).

ENGINE CODE NOTE:—Consists of three letters stamped on Engine Number Plate to indicate original size of Cylinder Bore (first letter), Main Bearings (second letter), Crankpin & Connecting rod bearings (third letter) as follows: 'A'—Standard, 'B'—.010" Undersize, 'C'—.010" Oversize, 'D'—.015" Oversize, 'E' .020" Oversize.

SERIAL NUMBER:—1st number H-19450. Stamped on plate on right frame side member under hood.

ENGINE NUMBER:—1st number HE-18950. Stamped on boss on upper left hand side of engine block above front water jacket cover plate. NOTE—Engine No. for each car is 500 less than serial number.

ENGINE SPECIFICATIONS:—Own Make. 6 cylinder, 'L' head type. Cylinders cast enbloc. No intake manifold used, intake passage formed within head and block castings.
Bore—3⅜". **Stroke**—4⅜".
Displacement—234.8 cu ins. **Rated HP.**—27.34.
Developed Horsepower—99 HP. at 3400 R.P.M.
Compression Ratio—6.3-1 cast-iron head.
Compression Pressure—110 lbs. at cranking speed (160 R.P.M.).
Vacuum Reading—18-20" steady idling at 7-8 MPH.

PISTONS:—Nelson-Bohnalite, aluminum alloy, Invar strut, tin plated, split skirt type. See Engine Code Note above for original bore and piston sizes.
Weight—19¼ ounces. **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Top .027-.030". Skirt .001-.002".

Replacement Pistons:—Std. & .001", .002", .003", .005", .010", .012", .015", .020" O.S. Semi-finished .050" O.S.

Fitting New Pistons:—Insert .002" feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 10 lbs.

Installing Pistons:—Pin offset to camshaft side of engine. Trademark (within piston) to front.

PISTON RINGS:—Two compression rings, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Wall Thickness
Compression	.123-.124"	.010-.020"	.150"
Oil Control	.1545-.1550"	.010-.018"	.150"

Replacement Rings:—Furnished .010", .020" oversize.

PISTON PIN:—Diameter .8745-.8748". **Length** 2.799-2.809". Floating type. Retained by locking rings. Pin hole in piston offset to camshaft.
Pin Fit in Piston—Light push fit (piston at 200°F).
Pin Fit in Rod Bushing—Select fit to .0001" or light push fit at normal temperature.

Replacement Pins:—Furn. 001", .002", .005" oversize.

CONNECTING ROD:—Length—8¾". **Weight**—36¼ ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.0015-2.0025".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. See Engine Code Note (above) for original bearing sizes.
Clearance—.0015-.0025". **Sideplay**—.008-.012".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Replacement Bearings:—Furnished .010" undersize.

CRANKSHAFT:—7 bearing, 4 counterweights.
Journal Diameters—2 31/64" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined. No shims. See Engine Code Note (above) for original bearing sizes. **Clearance**—.002".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Upper halves can be 'rotated' out without removing crankshaft by using pin in oil hole in shaft, turn shaft.

Replacement Bearings:—Furnished .010" undersize.

End Thrust:—At #4 bearing. **Endplay**—.004".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
End Thrust:—Taken by front bearing. Replace bearing to take up excessive endplay.

Timing Chain:—Whitney No. 49205. Width 9/16". Pitch ⅜". Length 60 links or 22½".

Camshaft Setting:—Sprockets marked. Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3402-.3412"	5 55/64"
Exhaust	1 17/32"	.3402-.4312"	5 55/64"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.002-.004"

Tappet Clearance:—.015" all valves, hot or cold.

Valve Guides:—Press fit in block.

Valve Springs:—Free length 2½".

	Spring Pressure	Spring Length
Valve Closed	65-70 lbs	2"
Valve Open	111-118 lbs	1 11/16"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 21½° BTDC. Close 71° ALDC.
Exhaust Valves—Open 71° BLDC. Close 36½° ATDC.
Valve Timing Check—With regular running tappet clearance of .015", Intake valve should open with piston 21½° or .1891" BTDC., and Exhaust valve close with piston 36½° or .5118" ATDC.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

LUBRICATION:—Gear type pump in crankcase.
Normal Oil Pressure:—30 lbs. at 20 M.P.H.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7270 (dash—Deluxe), 7070 (dash—Special), 6125 (engine unit—all models).
See article in Mechanical Equipment Section for data.
Oil Pressure Relief Valve:—On oil pump cover. Opens at 30 lbs. Screw adjustment.
Crankcase Capacity:—6 qts.

COOLING SYSTEM:—Capacity—20 quarts.
Water Pump:—Centrifugal, adjustable packing type. Driven by generator extension shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Dole. In water outlet on cyl. head.
Setting—Starts to open at 160°F.
Temperature Gauge:—King-Seeley Electric. K-S No. 7275 (dash—Deluxe), 7295 (dash—Special), 7000 (engine unit—all models).
See article in Mechanical Equipment Section for data.
NOTE—Gauge reads '212' with ignition 'Off'.

CLUTCH:—Borg & Beck Model 9A6. #932 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven. 2 required. Inside Diam. 5⅝". Outside Diam. 9¼". Thickness .125".
Adjustment:—Pedal free movement ½-1¼" (loosen transverse bolt in link below pedal shaft, position pedal in slot). Pedal toeboard clearance ⅜". Check 'No-Rol' operation (if car so equipped.)
Removal:—Remove transmission (see below), clutch housing underpan, clutch cover mounting bolts (release tension evenly), lower assembly out.

TRANSMISSION:—Own Make. Constant-mesh (all speeds), syncro-mesh (second & high), all helical gear.
Cruising Gear (Overdrive):—Warner Model AS6-R6 optional. In separate case at rear of transmission.
Transmission Control:—Mechanical type steering column mounted gear shift, optional.
See articles in Mechanical Equipment Section for data.
Removal:—Disconnect driveshaft. Disconnect shift linkage (cars with steering column shift). Remove transmission mounting stud nuts and lift out.

UNIVERSAL JOINTS:—Mechanics. Type 2C. Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Make. Semi-floating, hypoid gear type with Hotchkiss drive (spiral bevel on Coupe).
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 Std. 4 4/9-1 Optl.
Backlash—.005-.007". Shim adjustment.
Removal:—Block up rear of car, remove wheel and drum assemblies, axle shafts, disconnect brake lines and cables, shock absorbers, drive shaft at rear universal. Free axle from springs by disconnecting spring bolts, withdraw axle.
Axle Shaft Removal—Remove wheel and drum, take out retainer mounting bolt nuts, remove retainer, oil seal, brake backing plate, bearing adjusting shims. Pull shaft and bearing out.
Wheel Bearing Adjustment—Shims at flanged end of housing. To adjust, remove brake backing plate, add or remove shims. **Endplay**—.004-.006".

SHOCK ABSORBERS:—Delco. Front 1112-N (Special), Q (Deluxe). Rear 1117-DD. Direct acting, hydraulic type, 1723-L, M, N, P (double acting) Export.
See articles in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Camber—½-1½° and equal for both wheels.
Caster—1½°. Shim adjustment. Install shims (furnished in 1½° and 3° angles) between spring and spring pad on axle.
Toe In—0-1/16". Adjust by loosening clamp bolt at right end of tie rod and turning tie rod.
Steering Shock Eliminator—Consists of spring and rubber bumper bracket at rear of left front spring. Adjust lower nut to give ⅛" clearance between upper rubber cushion and frame. Adjust spring cushion (ahead of spring rear shackle) to 1/16" clearance between cushion and spring.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter 10 1/16".
Lining—Moulded. Width 2". Thickness 7/32". Length per wheel 21".
Clearance—.010" at heel and toe of each shoe.
Braking Power—53% front wheels, 47% rear.
Hand Brake:—See Service Brakes.
No-Rol:—Optl. *See Mechanical Equipment Section.*

1939 MODELS

F-39 '60' & G-39 '70' ENGINE NOTE:—Some parts on these engines are not identical and must not be interchanged (though similar in appearance), other parts are identical for both engines as follows:

Identical Parts:—Following parts same for F and G engines: Cylinder Blocks, Flywheel, Main Bearings, Pistons, Timing Chain and Sprockets, Valve Springs, Valve Guides, Valve Lifters, Oil Pump, Water Pump, Water Thermostat, and Carburetor.

Dissimilar Parts:—Following parts are not identical and must not be interchanged:

Cylinder Head—Marked by numeral cast in head: '216'—F-39, '230'—G-39 (early G-39 heads unmarked). Heads must not be interchanged.

Crankshaft—Marked by letter cast on largest counterweight: 'F'—F-39, 'G'—G-39. Throw greater on G-39.

Camshaft—Letter 'F' cast in shaft near GM trademark for F-39 camshaft only. G-39 shaft longer and unmarked.

Connecting Rod—Round Boss in center of rod I-beam section on F-39 rod only. G-39 connecting rod ⅛" shorter and unmarked (serviced by 'L' rods).

1937 MODELS

HOOD SIDE PANEL REMOVAL:—Disconnect 3 headlamp wires from junction block on hood side panel bracket to rear of radiator. Remove three cap screws on top side of panel (two at rear on cowl, one at radiator harness), one nut from through bolt at rear of headlamp.

1938 MODELS

RIGHT FRONT FENDER FILLER PLATE REMOVAL:—Remove headlamp wiring junction block, six (on Six), eight (on Eight) bolts along upper edge of plate, capscrews (one at rear, two at front) at ends of plate, lift off.

1937-38 MODELS

FRONT END DISMANTLING FOR TIMING CHAIN REMOVAL:—**1937.** To dismantle front end proceed as follows: Drain cooling system, remove Hood Side Panels (see directions above), remove one bolt at each end of hood center hinge and bolt for each hood holder on rear of hood, lift hood off. Remove 4 bolts on underside of fender at rear, remove 2 bolts body-to-fender brace (in line with front of dash), remove radiator center anchor bolt nut (under car), remove front bumper. Disconnect radiator hoses. Slide entire assembly to front and remove. Then remove 2 nuts from top of front engine mounting and remove oil pan. Jack up front end of engine until timing chain cover clears frame

1938. To dismantle front end assembly proceed as follows: Remove Front End Sheet Metal Assembly by removing hood, draining cooling system, removing 5 capscrews at rear of fender (1 to filler plate, 4 to body), disconnect wiring harness from junction block and free from 4 clips (on each filler plate), disconnect radiator hoses, remove center radiator anchor bolt nut (under car), radiator brace rods at cowl, slide entire assembly to front and remove. Then remove 2 nuts from top of front engine mounting and remove oil pan. Jack up front end of engine until chain cover clears frame member.

1939 MODELS

FRONT END SHEET METAL ASSEMBLY REMOVAL:—May be removed to facilitate work on front of engine as follows: Drain radiator, disconnect radiator hose, disconnect wires at headlamp junction block, free wiring harness from clips on radiator core and along side panel. Take out capscrew in hood ledge filler plate on top of frame (each side), hood ledge filler plate-to-body capscrews (4—Sixes, 5—Eight, on each side), disconnect fender to frame brace at fender, remove nut from center radiator support, bumper, sheet metal and radiator core assembly.

1938-39 MODELS

CYLINDER HEAD SERVICING:—Steel-asbestos cylinder head gasket used. **This gasket cannot be reused.** When installing new gasket, coat both sides with thin coat of P.O.B. Perfect Gasket Seal with room temperature of approximately 70° F. (edges at cylinder bore holes must be wiped clean). Plain washers used under cylinder head bolts to prevent leakage at front end. Car manufacturer recommends use of torque wrench (if J-1264 torque wrench used, reading should be 65-70 lbs. ft.).

L-39 Note—Install new neoprene grommet in pump by-pass hole in head, when head removed.

1939 MODELS

OIL PAN REMOVAL:—Steering linkage must be lowered to allow pan removal. Disconnect Pitman arm from Pitman arm shaft and steering idler arm support (on right side) from frame. Then lower steering relay rod. Holes provided for removal of pan screws at front cross member. Car manufacturer recommends that 5 capscrews at front of pan be removed from above with box socket wrench.

1936-39 MODELS

PISTON PINS:—Servicing—Standard size pins only furnished for service. Pin bosses in pistons electrolited and must not be reamed. Replacement pistons (standard and oversize) furnished with pins fitted.

Removal:—To remove pin, take out lockscrew, place assembly in boiling water for one minute. With Tool HM-535 push pin out through plain boss end. NOTE—Piston Heater and Pin Assembly Fixture No. J-849 consisting of piston and pin heater compartments and piston holder available.

Fitting:—Pin fit in piston .0001" loose to .0002" tight (plain boss), .0002-.0005" tight (lock screw boss). Pin fit in rod bushing .0003-.0006". If rod bushing worn, press new bushing place, burnish with Tool HM-587E and line ream with Reamer HM-586 to .8558-.8562".

Installing:—To install pin, heat piston and pin (as for Removal above), dip pin in hot light engine oil, start pin through plain boss end of piston and through rod (make sure lock screw hole in pin and boss will be aligned), then with Tool HM-535 lightly push pin in place until hole in pin and boss aligned (use punch in hole to correct slight mis-alignment). IMPORTANT—Pin must not be forced (if heavy push required, indicates piston has cooled, disassemble and reheat piston and pin). After pin in place, coat screw with graphite and tighten.

1935-39 MODELS

MAIN BEARING UPPER HALVES:—Removal—May be removed without removing crankshaft by removing bearing cap and inserting pin (Tool HM-J-173) in oil hole in shaft. With tang on pin engaging plain end of bearing shell, rotate shaft, turn shell out.

L-39 Note—Front of engine must be raised to remove upper half of front bearing.

Installation—Remove sharp edge from plain end of bearing, insert this end at indented side of support and rotate in place, using pin in oil hole.

1939 MODELS

CRANKSHAFT END THRUST:—Taken by front (#1) bearing. A bronze or steel-backed bronze thrust washer plate (.1205-.1245" thick) is doweled to each face of bearing cap. A steel thrust collar is assembled between front thrust plate and crankshaft gear. IMPORTANT—If steel-backed thrust plates used (use 2 plates of same type), assemble with steel side against bearing cap face.

1937-38-39 MODELS

REAR MAIN BEARING OIL SEAL:—Consists of oil slinger on crankshaft to rear of bearing with asbestos covered wiper seal held by retainer fitted in groove (forms channel for oil slinger). Wiper seal must be renewed whenever crankshaft removed.

1939 Six—Seal held in separate groove at rear.

Installation—With crankshaft out of engine and bearing cap off, crowd seal in bearing support in rear groove (F,G-39), to rear of retainer (others) by hand. Then using seal compressor tool J-955 over seal, tap tool 3 or 4 times to seat seal. With tool resting on seal, cut ends flush at each end. Repeat operation for bearing cap. Seal must entirely fill groove and be trimmed flush to prevent oil leaks.

1939 MODELS

OIL PUMP:—Gear type pump. Six and Eight pump identical except for gear faces which are ¼" wider on Eight. When assembling pump gear on shaft, press shaft on gear flush with outer end of gear (Six), with gear extending ¼" beyond end of shaft (Eight—Use Tool J954 which properly positions gear on shaft). Pump drive gear must be assembled with Feeler Gauge J-954-1 between inner face of gear hub and pump body to give proper end clearance for pump shaft. Use new gasket between pump body and cylinder block.

Installation—Set engine in firing position for #1 cylinder on Six, #6 cylinder on Eight, with rotor opposite #1 segment in distributor cap on Six, opposite #6 segment on Eight. Note position of distributor shaft tongue for proper oil pump drive gear mesh, then raise distributor and mesh pump drive gear with camshaft gear. Replace distributor in position and reset ignition timing.

1939 MODELS

CLUTCH REINFORCING PLATE:—Used on 'G' and 'L' models instead of gasket (3/16" steel plate which is bolted between clutch housing and underpan). 2 capscrews hold plate on housing while 12 used to bolt pan on housing (through plate).

NOTE—F-39 housing has 12 screw holes, (only 8 used with regular gasket). No reinforcing plate used.

Installation—Whenever clutch underpan removed, take off reinforcing plate and coat both sides of plate with Permatex (no gasket used).

1937-38-39 MODELS

PROPELLER SHAFT CENTER BEARING:—Removal—Split both propeller shafts at front companion flanges, remove 4 bolts (at frame) freeing intermediate bearing support and remove front propeller shaft. Place shaft in vise and remove cap screw from rear of shaft. Remove companion flange from shaft with arbor press. Take off slinger, pull bearing support housing and bearing assembly from rear of shaft, slide rubber retainer from bearing support. Wash all parts (except bearing and rubber retainer) in kerosene, wipe bearing and retainer clean (shielded type bearing used).

NOTE—Used on 'G' and 'L' models only with Self-Shifting Transmission.

Installation—With rubber retainer on bearing, install bearing on shaft (lip of retainer to rear), install bearing support over retainer (coat with soap to allow support sliding in place) with flat portion of housing to front, put slinger in place with flange over lip of retainer, press companion flange on shaft with slinger clamped tight against bearing inner race, install cap screw (use both plain washer and lock washer in place under screw). Bolt intermediate bearing support to frame and attach shafts in place at front companion flanges.

ENGINE NUMBER:—First number (F-32) F-302,001, (F-33) F-316,568. On car serial number plate on right hand side of front compartment floor.

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head type.

Bore—3 5/16" (F-32), 3⅜" (F-33), **Stroke**—4⅛".

Displacement—213.3 cubic inches (F-32), 221.4 cubic inches (F-33).

Horsepower (F-32)—Rated 26.35. Developed 71 at 3200 R.P.M.

Horsepower (F-33)—Rated 27.34. Developed 80 at 3200 R.P.M.

Compression Ratio—5.8-1 (F-32), 5.3-1 (F-33).

Compression Pressure—Approximately 100 lbs. (F-32), 90-95 lbs. (F-33) at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18" at idling speed.

Pistons:—Electro-plated cast-iron. Pistons are tin-plated after being finished and cannot be ground. Replacement pistons furnished in standard oversizes of .003", .005", .0075", .010", .015", .020", .025", .030". Cylinders must be reconditioned to standard oversize. Piston length, 3⅞".

Weight—28 ozs. (stripped), 34 ozs. (with bushings, pin and rings).

Removal—Piston and rod assembly removed from top of engine.

Clearance—.0085" top, .0015-.0025" skirt. See Fitting New Pistons.

Fitting New Pistons—Use .002" feeler stock ½" wide to check piston clearance. Pull required to withdraw feeler stock from between piston and cylinder wall should be 4-15 lbs.

NOTE:—Piston pin hole in piston is offset 3/32". Install pistons with this offset away from valves with mark 'VS' on piston head toward valve side.

Piston Rings:—Three rings per piston, #1 and 2—compression rings, #3— oil control ring. Lower ring groove is drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Compression (#1, 2)	.125"	.007-.012"	.170"
Oil Control (#3)	.1865"	.007-.012"	.190"

Piston Pin:—Diameter .8559-.8562". Length 3 1/16". Pin is locked in piston by locking screw in one boss. Pin hole in rod is bronze-bushed.

Pin Fit in Piston—Press fit.

Pin Fit in Rod—.0001-.0008" clearance.

Connecting Rod:—Weight 30½ ounces. Length 9" (center-to-center).

Crankpin Journal Diameter—1⅞".

Lower Bearing Type—Spun-babbitt lined integral with rod and cap (F-32), Removable steel-backed, babbitt-lined (F-33). No shims.

Clearance—.0015-.003". Sideplay .006-.010".

Adjustment—None (no shims). Replace rods (F-32), bearings (F-33). Do not file rods or caps.

Crankshaft:—Four bearing. Bolted-on type counterweights.

Journal Diameters (F-32)—#1, 2¼"; #2, 2 5/16"; #3, 2 7/16"; #4, 2½".

Journal Diameters (F-33)—#1, 2 31/64"; #2, 2 35/64"; #3, 2 43/64"; #4, 2 47/64".

Bearing Type—Removable bronze-backed (F-32), steel-backed (F-33), babbitt-lined type. No shims.

Clearance—.001-.003".

Adjustment—No shims used. Replace bearings.

End Thrust—Taken by #1 front main bearing. Endplay .003-.006".

Camshaft:—Camshaft drive—Non-adjustable chain.

Chain—Whitney. Width, 1¼". Length, 23½" or 47 links. Pitch, .500".

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅝"	11/32"	5⅜"	30°	.320"
Exhaust	1½"	⅜"	5⅜"	30°	.320"

Stem-to-Guide Clearance—.00125-.00325" (intake), .00225-.00425" (exhaust).

Tappet Clearance—.008" (intake), .010" (exhaust) cold, running clearance.

Valve Springs—	Pressure	Length
Valve Closed	43 lbs.	2¼"
Valve Open	96 lbs.	1 29/32"

Valve Timing

Intake Valves Open—At TDC. Close—50° ALDC.
Exhaust Valves Open—40° BLDC. Close—10° ATDC.

NOTE:—Timing figures correct with .010" tappet clearance.

To Check Valve Timing:—Set tappet clearance #1 intake valve at .012". This valve should open with piston on top dead center when mark (TDC. Line) on vibration dampener at front of engine lines up with pointer on chain case. Reset tappet clearance at .008".

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure type. Gear type oil pump located on lower end of inclined accessory shaft (right of crankcase).

Oil Pressure—30-35 lbs. (normal driving speeds).

Oil Pressure Relief Valve—Operates at 33 lbs. Not adjustable.

Capacity and Oil—6 qts. (refill). Use SAE. #30 (summer—normal driving 32°-80°F.), #40 (summer—high speed driving—above 80°F.), #20-W (winter 32° to 0°F.), #10-W (winter 0° to —15°F.).

CLUTCH:—**Borg & Beck. Model 9A1 (F-32), 10A1 (F-33).** Clutch marked 555 (9A1), 618 (10A1) on cover. Single plate dry disc type. See article in Clutch Section for complete relining and assembling directions.

Facings—Moulded type, 2 required. Thickness ⅛". Inside diameter 6⅛". Outside diameter 8⅞" (F-32), 9⅞" (F-33).

Adjustment—Free movement of clutch pedal should be 1-1½". To adjust, loosen locknut, turn adjusting nut at lower end of clutch pedal.

STEERING:—**Steering Gear**—Jacox (Saginaw) Worm-and-Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.

Kingpin Inclination—9½° crosswise.

Caster—2¾-3°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1¾°. No adjustment provided.

Toe In—⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Bendix Mechanical, Duo-Servo, Single anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—12".

Lining—Moulded type. Width 1¾". Thickness 3/16". Length 25 5/16" (F-32), 25 25/32" (F-33) per wheel.

Clearance—.005" anchor pin end, .015" adjusting screw end of each shoe.

Hand Brake:—See Service Brakes above.

ENGINE NUMBER:—First number (L-32) 1001, (L-33) 6557. On car serial number plate on right hand side front compartment floor or on door sill under mat.

ENGINE:—Eight cylinder, 'L' head type. Cylinders cast enbloc.

Dimensions—Bore, 3". Stroke, 4¼". Displacement, 240.3 cu. ins.

Horsepower (L-32)—Rated 28.8. Developed 82 H.P. at 3200 R.P.M.

Horsepower (L-33)—Rated 28.8. Developed 90 H.P. at 3350 R.P.M.

Compression Ratio—5.90-1 (L-32), 5.50-1 (L-33).

Compression Pressure—Approximately 102 lbs. (L-32), 95 lbs. (L-33) at cranking speed.

Vacuum Reading—Gauge should show steady reading of 18" at idling speed.

Pistons:—Electro-plated cast-iron. Piston are tin plated after being finished and cannot be ground. Replacement pistons furnished in standard oversizes of .003", .005", .0075", .010", .015", .020", .025", .030". Recondition cylinders to standard oversize. Piston length, 3 11/16".

Weight—24½ ozs. (stripped), 30 ozs. (with bushings, rings and pin).

Removal—Piston and rod assembly removed at bottom of engine.

Clearance—.0085" top, .0015-.0025" skirt. See Fitting New Pistons.

Fitting New Pistons—Use .002" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall should be 4-15 lbs.

NOTE:—Piston pin hole in piston is offset 3/32". Install pistons with this offset toward left side of engine and mark 'VS' on head toward valve side.

Piston Rings:—Four rings per piston, #1 and 2—compression rings, #3 and 4—oil control rings. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness	Groove Depth in Piston
Comp. (#1, 2)	.124"	.007-.012"	.135"	.155"
Oil Cont. (#3)	.124"	.007-.015"	.135"	.170"
Oil Cont. (#4)	.1865"	.007-.015"	.135"	.170"

NOTE—Groove depth for 1932 pistons was .130" (compression rings), .120" (oil rings) and maximum wall thickness of rings was .120".

Piston Pin:—Diameter, .8558-.8554". Length, 2 11/16". Pin is locked in piston and oscillates in connecting rod.

Pin Fit in Piston—Press fit.

Pin Fit in Connecting Rod—.0003-.0007" clearance.

Connecting Rod:—Weight, 32 ozs. Length, 9" (center-to-center).

Crankpin Journal Diameter—2¼".

Lower Bearing Type—Spun babbitt integral with rod and cap. (L-32), removable steel-backed, babbitt-lined (L-33). No shims.

Clearance—.0015-.003". Sideplay .006-.010".

Adjustment—None (no shims). Replace rods (L-32), bearings (L-33). Do not file rods or caps.

Crankshaft:—Five main bearing type with integral counterweights.

Journal Diameters—#1, 2¼"; #2, 2 7/16"; #3, 2½"; #4, 2 9/16"; #5, 2⅝".

Bearing Type—Bronze-backed (L-32), steel-backed (L-33), babbitt-lined.

Clearance—.001-.003".

Adjustment—None (no shims used). Replace removable bearings.

End Thrust—Taken by #1 (front) main bearing. Endplay, .003-.006".

Camshaft:—Camshaft drive—Non-adjustable chain.

Chain—Whitney. Width, 1¼". Length, 23" or 46 links. Pitch, .500".

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angles	Lift
Intake	1 9/16"	11/32"	5 9/32"	30°	.300"
Exhaust	1 7/16"	⅜"	5 9/32"	30°	.300"

Stem-to-Guide Clearance—.00125-.00325" (intake), .00225-.00425" (exhaust).

Tappet Clearance—.008" (intake), .010" (exhaust) cold running clearance.

Valve Springs—	Spring Pressure	Spring Length
Valve Closed	43 lbs.	2¼"
Valve Open	96 lbs.	1 29/32"

Valve Timing

Intake Valves Open—At TDC. Close—42° ALDC.
Exhaust Valves Open—40° BLDC. Close—10° ATDC.

NOTE:—Timing figures correct with .010" tappet clearance.

To Check Valve Timing:—Set tappet clearance #1 intake valve at .012". This valve should open with piston on top dead center when second mark (TDC. line) on vibration dampener at front of engine lines up with pointer on chain case. Reset tappet clearance at .008".

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—30-35 lbs.

Oil Pressure Relief Valve—Opens at 35 lbs. Not adjustable.

Capacity and Oil—7 qts (refill). Use SAE. #30 (summer—normal driving—32°-80°F.), #40 (summer—high speed driving above 80°F.), #20-W (winter 32° to 0°F.), #10-W (winter 0° to —15°F.).

CLUTCH:—Borg & Beck Model 10A1. Marked 618 on cover. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type. Thickness ⅛". Inside Diameter 6⅛". Outside Diameter 9⅞".

Adjustment—Free movement of clutch pedal should be 1-1½". To adjust, loosen locknut and turn adjusting nuts at lower end of clutch pedal.

STEERING:—Steering Gear—Jacox (Saginaw) Worm-and-Sector type. See article in Steering Section for complete adjustment directions.

Front Suspension—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.

Kingpin Inclination—9½° crosswise.

Caster—2¾-3°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1¾°. No adjustment provided.

Toe In—⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—12".

Lining—Moulded type. Width 1¾". Thickness 3/16". Length 25 5/16" (L-32), 25 29/32" (L-33) per wheel.

Clearance—.005" anchor pin end, .015" adjusting screw end for each shoe.

Hand Brakes:—See Service Brakes above.

SERIAL NUMBER:—First number (F-34) 51,001. On plate on right hand side front compartment floor in front seat (sedans), or under seat (coupes). (F-35) F103001. On frame siderail.

ENGINE NUMBER:—F-35 first number F405001. F-34 on car serial plate.

ENGINE:—Own make. 6 cylinder, 'L' head type.
Bore—3 5/16". **Stroke**—4⅛".
Piston Displacement—213.3 cu. ins.
Rated Horsepower—26.3 (SAE).
Developed Horsepower—F-34, 84 at 3200 R.P.M. F-35, 90 at 3400 R.P.M.
Compression Ratio—5.7-1 (F-34), 6.2-1 (F-35). No optional ratios.
Compression Pressure—Approximately 98 lbs. (5.7-1 hd.) or 106 lbs. (6.2-1 hd.) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Electro-plated cast-iron. Pistons are tin-plated after finishing and cannot be ground. Refinish cylinders to take replacement pistons furnished .003", .005", .0075", .010", .015", .020", .025", .030" oversize. Oversize pistons held to same weight as standard. Piston length 3⅞" (F-34), 3 15/16" (F-35).
Weight—28 ozs. (F-34), 26.84 ozs. (F-35), stripped; 34 ozs. (F-34), 33.19 ozs. (F-35), with rings, pin, and lockscrew.
Removal—Pistons and rods removed from above.
Clearance—Top .013-.020" F-34, .0235-.0305" F-35. Bottom .0015-.0025" (all).
Fitting New Pistons—Pistons and bore should be round within .0005". Use .002" feeler stock ½" wide inserted between piston and wall, spring tension required to withdraw feeler must be 4-15 lbs.
Installing Pistons—Pin hole in piston offset 3/32". Install pistons with mark 'V.S.' toward valve side.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled with oil return holes. Compression rings installed with groove toward bottom.

Ring	Width	End Gap	Side Clearance	Wall Thickness
Comp. (all)	⅛"	.007-.012"	.0015-.003"	.148"
Oil Cont.	3/16"	.007-.012"	.001-.0025"	.145"

NOTE—1934 rings have end gap of .009-.014" and wall thickness of .145".

Piston Pin:—Diameter, .8554-.8558". Length, 3 1/32". Pin length for 1934 model (F-34) is 3 1/16". Pin is locked in piston (opposite end slotted to allow boss to slide freely on pin).
Pin Fit in Piston—Press fit (see below).
Pin Fit in Rod Bushing—.0003-.0007" clearance.
Fitting Pins—Use special tool HM-412 to install pins (tool checks pressure required to press pin into place). Insert pin from lockpin side (slotted end first). Pressure should be 200-250 lbs. (first boss), 300-350 lbs (second boss). Check piston for out-of-round after pin is installed (maximum allowable, .0005").

Connecting Rod:—Weight 29 ozs. (F-34), 30.7 ozs. (F-35). Length 7 13/16".
Upper Bearing—Split bushed type. New bushings should be burnished and then line-reamed to inside diameter of .8559-.8564". Oil hole in bushing must line up with rifle-drilled oil passage in rod.
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.001-.003". Sideplay .0055-.0105".
Adjustment—No shims used. Replace bearings. Do not file rod or cap faces. Bearings assembled with slight projection above faces to insure contact.

Crankshaft:—Four bearings. Integral counterweights.
Journal Diameters—#1—2.478-2.479". #2—2.5405-2.5415", #3—2.6655-2.6665", #4—2.728-2.729".
Bearing Type—Interchangeable steel-backed, babbitt-lined type. Bearings halves are interchangeable (upper and lower) except rear (#4).
Clearance—.001-.003".
Adjustment—No shims used. Replace bearings. Do not file bearing caps. Bearing upper halves can be removed without removing crankshaft by using tool HM-J-173. This is a flat headed plug which is slipped into oil hole in crankshaft. The head engages the edge of the bearing and turns bearing out as crankshaft is rotated. Install new bearings in same manner (insert plain edge of bearing on indented side of upper bearing support).
End Thrust F-34—Taken by second main bearing. Endplay .0035-.0075".
End Thrust F-35—Taken by #1 front bearing. Endplay .004-.007". A bronze thrust plate .1205-.1235" thick (selective) is assembled at each end of front main bearing and is dowelled to bearing cap. There is a steel thrust collar on the crankshaft behind the crankshaft gear.

Camshaft:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1—1.9975-1.9970", #2—1.9350 1.9345", #3—1.8725-1.8720", #4—1.8100-1.8095".
Bearing Type—Metal-backed, babbitt-lined.
Clearance—.002-.004".
End Thrust—Taken by spring loaded plunger in front end of camshaft and thrust plate on cover.
Timing Chain—Whitney. Width, 1¼". Pitch, .500". Length, 23½" or 47 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Use Sprocket Gauge HM-408-O.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	11/32" (.3425-.3415")	5 51/64"
Exhaust	1 7/16"	11/32" (.3415-.3405")	5 55/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.00125-.00325"
Exhaust	30°	.300"	.00225-.00425"

NOTE—F-34 valve length 5 27/32" (all valves).
Tappet Clearance—.008" Int., .010" Exh., warm.
Installing New Guides—Install guides with turned portion toward bottom and finish ream to .34375-.34475" (inside diameter) after assembly. Top of guide must be 15/16" below top of block.
Valve Springs—F-35 are new type with three close coils at top (No spring cages—see Note below).

	Pressure	Length F-34	Length F-35
Valve Closed	43 lbs.	2¼"	2 9/32"
Valve Open	116 lbs.	1 29/32"	1 15/16"

NOTE—1935 springs interchangeable (intake and exhaust) and may be used for service on 1933 and 1934 models by discarding cages used previously.
Valve Timing—See Camshaft Setting above.

1934—Model F-34

Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.

1935—Model F-35

Intake Valves—Open at TDC. Close 50° ALDC.
Exhaust Valves—Open 40° BLDC. Close 10° ATDC.
To Check Valve Timing, F-34—Set tappet clearance #1 intake valve at .010". This valve should open with piston on top dead center when flywheel mark "TDC/' lines up with indicator. Reset tappet clearance at .008" with engine hot.
F-35—#1 intake valve should open with #1 piston .0163" before top dead center when a point on the flywheel approximately 2 teeth before dead center mark 'TDC/' lines up with indicator.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Lubrication:—Pressure. Gear type oil pump on right hand side of crankcase. Use new gasket whenever pump is taken off engine.
Normal Oil Pressure—30-35 lbs. (F-34), 25-30 lbs. (F-35) at all speeds.
Oil Pressure Relief Valve—Operates at 33 lbs. (F-34), 27 lbs. (F-35). Not adjustable. Located on oil pump Cover plate.
Capacity and Oil—6 qts. (refill). Use SAE. #30 (summer—32 to 80°F—average driving), #40 (summer—above 80°—high speed driving), #20-W (winter 32° to 0°F.), #10-W (winter 0° to —15°F.).

CLUTCH:—Borg & Beck Models 9A3 (F-34), 9A6 (F-35). Model No. stamped on cover 9A3 (857), 9A6 (873). Single plate, dry disc type. No adjustment for wear required See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment—Loosen locknut on lower end of clutch pedal pullrod, turn adjusting nut until lash or free movement of pedal is 1-1½", tighten locknut.
Clutch Facing—Woven type, 2 required. 5⅝" I. D., 9" O. D., .133" thick.
Clutch Assembly—Clutch can be removed from bottom without taking off flywheel housing. Cover and pressure plate should be punchmarked and installed in same position. In installing clutch assembly, place cover cap screws with longer shank in second hole on each side from locating dowel (these holes have deeper counterbore).

STEERING:—Steering Gear—Saginaw Model, Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for adjustments.
Kingpin Inclination—6° (F-34), 5° (F-35) crosswise.
Caster—1½—2¼°. To adjust, loosen nuts holding yokes to upper and lower support arms, remove lubrication fitting on front bushing of upper support arm yoke, insert Allen wrench, turn clockwise to increase or counter-clockwise to decrease caster, tighten nuts holding support arm yokes, replace fittings.
Camber—⅛-1°. Camber is affected by caster adjustment and must be checked when caster angle is changed. To adjust, place shims between upper control arm yoke and upper control arm to increase camber, or between lower control arm yoke and lower control arm to decrease camber. A 1/16" shim will change camber approximately 1/3°.
Toe-in—⅛-3/16". To adjust, increase or decrease length of each tie rod equally.
NOTE—Before checking caster, camber, or toe-in, see that tires are properly inflated, check front wheel run-out (allowable maximum ⅛"), check front tire run-out (allowable maximum ⅛"), check front wheel balance, set front wheels in straight-ahead position, raise and lower front of car several times to allow frame to assume normal level.

BRAKES:—Service—Bendix hydraulic, Duo-Servo, single anchor type. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*
Drum Diameter—11" F-34, 11 1/16" F-35.
Lining—Front primary shoe—woven. All other shoes moulded. F-34—Lining width 1¾", thickness 5/32", length per wheel 23.7". F-35—Lining width 2", thickness 3/16", length per wheel 23.7".
Clearance—.008" toe, .010" heel, for each shoe.
Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number (L-34) 18,001. On plate on right hand side front compartment floor in front of seat (sedans), or under seat (coupes). (L-35) On frame siderail.

ENGINE NUMBER:—L-34 on car serial plate. L-35 first number L-45001.

ENGINE:—Own Make. 8 cylinder, 'L' head type.
Bore—3". **Stroke**, 4¼".
Piston Displacement—240.3 cubic inches.
Rated Horsepower—28.8 (SAE).
Developed Horsepower—90 at 3200 R.P.M. L-34, 100 at 3400 L-35.
Compression Ratio—L-34, 5.7-1 std. head. L-35, 6.2-1 std head. No optional ratios.
Compression Presure—Approximately 98 lbs. (5.7-1 hd.) or 106 lbs. (6.2-1 hd.) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Electro-plated cast-iron. Pistons are tin-plated after finishing and cannot be ground. Refinish cylinders to take replacement pistons furnished .003", .005", .0075", .010", .015", .020", .025", .030" oversize. Oversize pistons held to same weight as standard. Piston length 3 11/16" (L-34), 3¾" (L-35).
Weight—24.5 ozs. (L-34), 24.18 ozs. (L-35), stripped; 30 ozs. (L-34), 30.08 ozs. (L-35), with rings, pin, and lockscrew.
Removal—Pistons and rods removed from below. Rotate crankshaft so that counterweights are crosswise and opposite to camshaft.
Clearance—Top .012-.019" (L-34), .022-.029" (L-35). Bottom .0013-.0025".
Fitting New Pistons—Pistons and bore should be round within .0005". Use .002" feeler stock inserted between piston and wall, pull required to withdraw feeler must be within 4-15 lbs.
Installing Pistons—Pin hole in piston offset 3/32". Install pistons with mark 'V.S.' toward valve side.

Piston Rings:—Two compression, two oil control rings per piston, all above pin. Both oil ring grooves drilled with oil return holes. Compression rings installed with groove toward bottom.

Ring	Width	Side End Gap Clearance	Wall Thickness
Comp. (all)	⅛"	.007-.012"	.0015-.003"	.135"
Oil Cont. (3)	⅛"	.007-.015"	.0015-.003"	.138"
Oil Cont. (4)	3/16"	.007-.015"	.001-.0025"	.138"

NOTE—L-34 oil rings have wall thickness of .135".

Piston Pin:—Diameter .8554-.8558". Length 2 11/16". Pin is locked in piston (opposite end slotted to allow boss to slide freely on pin).
Pin Fit in Piston—Press fit (see below).
Pin Fit in Rod Bushing—.0003-.0007" clearance.
Fitting Pins—Use special tool HM-412 to install pins. See Model F-34, 35 for complete instructions.

Connecting Rod:—Weight 32 ozs. (L-34), 34.5 ozs. (L-35). Length 9".
Upper Bearing—Split bushed type. New bearings should be burnished and then line reamed to inside diameter of .8559-.8564". Oil hole in bushing must line up with rifle-drilled oil passage in rod.
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.0015-.003" (L-34), .001-.003" (L-35). Sideplay .006-.010" (L-34), .0055-.0015" (L-35).
Adjustment—No shims used. Replace bearings. Do not file rod or cap faces. Bearings assembled with slight projection to insure contact.

Crankshaft:—Five bearing. Integral counterweights.
Journal Diameters—#1—2.373-2.374", #2—2.5605-2.5615", #3—2.623-2.624", #4—2.6855-2.6865", #5—2.748-2.749".
Bearing Type—Interchangeable steel-backed, babbitt-lined type. Upper and lower bearing halves not interchangeable.
Clearance—.001-.003".

Adjustment—No shims used. Replace bearings. Do not file bearing caps. See Models F-34, 35 for bearing removal.
End Thrust—#1 front bearing. Endplay .003-.006" L-34. .004-.007" L-35. Bronze thrust plate .1205-.1235" thick (selective) is assembled at each end of front bearing and dowelled to bearing cap. There is a steel thrust washer on the crankshaft behind the crankshaft gear.

Camshaft:—Six bearing. Non-adjustable chain drive.
Bearing Type—Metal-backed, babbitt-lined type.
Clearance—.002-.004".
End Thrust—Taken by spring-loaded plunger in forward end of camshaft and thrust plate on chain case cover.
Timing Chain—Whitney. Width, 1¼". Pitch, .500". Length, 23" or 46 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Use Sprocket Gauge HM-408-0.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	11/32" (.3425-.3415")	5 9/32"
Exhaust	1 7/16"	11/32" (.3415-.3405")	5 11/32"

NOTE—L-34 exhaust valve length 5 9/32".

	Seat Angle	Lift	Stem-to-Guide Clearance
Intake	30°	.300"	.00125-.00325"
Exhaust	30°	.300"	.00225-.00425"

Tappet Clearance—.008" Int., .010" Exh., warm.
Installing New Guides—Install guides with longer turned portion toward bottom and finish ream to .34375-.34475" inside diameter after assembly. Top of guide must be 15/16" below top of block.
Valve Springs—L-35 are new type with three close coils at top. No valve cages used (see Note below).

	Pressure	Length L-34	Length L-35
Valve Closed	43 lbs.	2¼"	2 9/32"
Open	96('34) 116('35) lbs.	1 29/32"	1 15/16"

NOTE—1935 springs interchangeable for both intake and exhaust valves. May be used on 1933-34 models if old spring cages discarded.
Valve Timing—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 40° BLDC. Close 10° ATDC.
To Check Valve Timing—Set .010" tappet clearance #1 intake valve. This valve should open with #1 piston on top dead center when flywheel mark 'TDC.#1' lines up with pointed end of inspection hole cover screw (left front face of housing. Reset tappet clearance at .008" with engine warm.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure. Gear type oil pump located in oil pan.
Normal Oil Pressure—30-35 lbs. (L-34), 25-30 lbs. (L-35) at all speeds.
Oil Pressure Relief Valve—Operates at 35 lbs.(L-34), 27 lbs. (L-35). Not adjustable. Located in oil pump body.
Capacity and Oil—7 qts. (refill). Use SAE. #30 (summer 32 to 80°F.—average driving), #40 (summer above 80°F.—high speed driving), #20-W (winter 45° to 10°F), #10-W (10° to —15°F).

CLUTCH:—**Borg & Beck Model 10A4.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment—Loosen lock nut on lower end of clutch pedal pullrod, turn adjusting nut until lash or free movement of pedal is 1½", tighten lock nut.
Clutch Facing—Woven type, 2 required, 6⅛" I.D., 9⅞" O.D., .133" thick.
NOTE—New driven plates are recommended rather than relining. Facings are riveted individually (rivet goes through plate and one facing only). Each facing is riveted at outer row of holes (six) on convex side of plate segments, and at inner row of holes (six) to horseshoe tongues. Insert rivets with heads on plate side (if split) or on facing side (if rolled). Drill out old rivets (punching out rivets may damage tongues).
Clutch Assembly—Clutch can be removed from bottom without removing flywheel housing. Cover and pressure plate should be punchmarked and installed in same position. In installing clutch assembly, place cover cap screws with longer shank in second hole on each side from locating dowel

STEERING:—**Steering Gear**—Saginaw Model. Worm- and Roller type. See article in Steering Section for complete adjustments.

Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for adjustments.
Kingpin Inclination—6° (L-34), 5° (L-35) crosswise.
Caster—1½-2¼°. To adjust, loosen nuts holding yokes to upper and lower support arms, remove lubrication fitting on front bushing of upper support arm yoke, insert Allen wrench, turn clockwise to increase, or counter-clockwise to decrease caster angle, tighten nuts holding support arm yokes, replace fittings.
Camber—¼-1°. Camber is affected by caster adjustment and must be checked when caster angle is changed. To adjust, place shims between upper control arm yoke and upper control arm to increase camber, or between lower control arm yoke and lower control arm to decrease camber. A 1/16" shim will change camber approximately 1/3°.
Toe-in—⅛-3/16". To adjust, increase or decrease length of each tie rod equally.
NOTE—Before checking caster, camber, or toe-in, see that tires are properly inflated, check front wheel run-out and front tire run-out (allowable maximum ⅛" in each case), check front wheel balance, set front wheels in straight-ahead position, raise and lower front end of car several times to allow frame to assume normal level.

BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, single anchor type. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*
Drum Diameter—12".
Lining—Front wheel (primary shoe) woven, all others moulded. Width 1¾" (L-34), 2" (L-35). Thickness 3/16". Length per wheel 25.90".
Clearance—.008" toe, .010" heel, for each shoe.

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number—F506,001. Stamped on ledge on top of block beside head at left front corner.

ENGINE SPECIFICATIONS:—**Type**—6 cyl. 'L' Head.
Bore—3 5/16". **Stroke**—4⅛".
Displacement—213.3 cubic inches.
Rated Horsepower—26.3 (SAE).
Developed Horsepower—90 at 3400 R.P.M.
Compression Ratio & Pressure—6.0-1 Std. cast-iron head. No optl. ratios. Pressure 106-116 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—Gauge should show steady reading of 17" of HG. minimum with engine idling at 350 R.P.M. or 6 M.P.H.

PISTONS:—Aluminum alloy, 'T' slot, Cam Ground type with Electrolite (hard oxide) bearing surface. Skirt is elliptical with .007-009" greater diameter at right angles to pin bosses. Pistons cannot be ground. Use finished replacement pistons.
Weight—15.4 ozs. (stripped). **Length**—3 5/16".
Removal—Pistons and rods removed from above.
Clearance—.0013-.0018" measured ⅜" up on skirt and ⅜" below lower ring groove at right angles to pin holes for new pistons. See Fitting new Pistons.
Replacement Pistons:—Finished pistons with pins fitted furnished in .003", .005", 010", .015" and .030" over size. Oversize pistons held to same weight as standard.
Fitting New Pistons:—With pin removed, check clearance by inserting .002" feeler ½" wide between piston and cylinder wall on pressure or camshaft side at right angles to pin hole. Piston should be inverted with slot away from camshaft. Pressure to withdraw feeler must be 4-11 lbs. with piston and block at 70° F.
Installing Pistons:—Mark 'V-S' on piston head must be toward valves (slot on side away from valves). Pin hole in piston offset 3/32" toward left (slotted side).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Both oil ring grooves drilled radially with oil drain holes. Piston rings furnished in .010", .020", .030" oversizes.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.012"	.0015-.003"
Oil Cont.	3/16"	.007-.015"	.001 -.0025"

NOTE—Install compression rings with groove or step downward.

PISTON PIN:—**Diameter**—.8554-.8557". **Length**—3 1/32". Pin is locked in piston by lock screw in one boss. Opposite end slotted to allow boss to slide freely on pin.
Pin Fit in Piston—.0001" loose to .0002" tight in plain boss end, .0002-.0005" tight in lock boss end.
Pin Fit in Rod Bushing—Clearance .0002"-.0005". Pins selected to give this clearance. New rod bushings are burnished and reamed to inside diameter of .8557-.8561".
NOTE—Replacement pistons furnished with pins fitted. Pin bosses in piston are Electrolited and cannot be reamed. Pins not furnished oversize.
Fitting Pins—Place piston and pin in boiling water for one minute. With special tool HM-535 insert pin in plain boss end and push lightly until lockscrew hole in pin and boss are aligned. Install lockscrew. Skirt taper with pin installed must not exceed. 0005".

CONNECTING ROD:—**Weight**—29½ozs.
Length—7 13/16".
Crankpin Journal Diameter—2".
Lower Bearing—Steel-backed, babbitt-lined, interchangeable type.
Clearance—.001-.003". Sideplay .0055-.0105".
Bearing Adjustment:—None (no shims). Replace bearing shells. Do not file rod or cap faces. Bearings assembled with slight projection above faces to insure contact.
Installing Rods:—Oil spit hole in lower bearing upper half must be toward camshaft. Grooves in rod and cap bolt boss must be on same side as part number.
NOTE—Ground bolts used for cap and rod assembly. Common bolts must not be used.

CRANKSHAFT:—Four bearings. Integral count'rw'ghts.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.6655-2.6665"; #4, 2.728-2.729".
Bearing Type—Interchangeable steel-backed, babbitt-lined. Bearing halves interchangeable (upper and lower) except #4 (rear).
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be removed without removing crankshaft by using tool HM-J-173. This is a flat headed plug which is slipped into oil hole in crankshaft. The head engages the edge of the bearing and turns it out as crankshaft is rotated. Install bearings in same manner (insert plain edge of bearing on indented side of upper bearing support).
End Thrust:—Taken by #1 (front) bearing. Endplay .004-.008". A bronze thrust plate .1205-.1235" thick is assembled at each end of front main bearing and is dowelled to bearing cap. There is a steel thrust collar on the crankshaft behind the crankshaft gear.

CAMSHAFT:—Four bearing. Non-adjust'ble chain drive.
Journal Diameters—#1, 1.9970-1.9975"; #2, 1.9345-1.9350; #3, 1.8720-1.8725"; #4, 1.8095-1.8100".
Bearing Type—Metal-backed, babbitt-lined.
Clearance—.002-.004".
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft and thrust plate on chain case cover.
Timing Chain:—Whitney. Width—1¼". Pitch—.500". Length 47 links or 23½".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Use Sprocket Guage HM-408-0.

VALVES:

—Head Diameter	Stem Diameter	Length
Intake 1 9/16"	.3415-.3425"	5 51/64"
Exhaust 1 27/64"	.3405-.3415"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.00125-.00325"
Exhaust	45°	.300"	.00225-.00425"

Tappet Clearance—.008" Int., .010" Exh., warm.
Valve Guides:—Cast-iron. Install with turned portion below and finish ream to .34375-.34475" (inside diameter) after assembly. Guide must be 15/16" below top of block.
Valve Springs:—Free length 2 9/16". Install springs with three close-coils at top. No spring cages used.

	Spring Pressure	Spring Length
Valve Closed	43 lbs.	2 9/32"
Valve Open	116 lbs.	1 15/16"

NOTE—Springs are interchangeable (intake and exhaust, and for 6 and 8 engines) and can be used on '33-'35 engines. Discard spring cages on '33-'34 engines.
Valve Lifters:—Single piece cast-iron with core openings in side wall. Operate directly in reamed holes in block. Clearance .0008". Serviced by reaming out holes and installing new lifters furnished standard, .002", .005" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 5° or .0163" before top dead center when point on flywheel approximately 2 teeth before top dead center mark (steel ball insert) on flywheel lines up with pointed end of inspection hole cover screw in left front face of housing.
Motor Gauge—Weidenhoff #104 Adapter, #40 Rod.

LUBRICATION:—Pressure type. Gear type oil pump located on right side of crankcase.
NOTE—Use new gasket whenever oil pump taken off engine. See that holes in gasket line up with oil leads in block.
Normal Oil Pressure:—25-30 lbs.
Oil Pressure Regulator:—On oil pump cover. Operates at 27 lbs. Not adjustable.
Crankcase Capacity:—6 qts. refill.

CLUTCH:—**Borg & Beck Model 9A6.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven type, 2 required. Inside Diam. 5⅝". Outside Diam. 9". Thickness .133".
Adjustment—Free movement of clutch pedal must be 1-1½". To adjust, loosen locknut and turn adjusting screw at lower end of inner lever on clutch throwout auxiliary shaft in front of clutch pedal.
Removal—Disconnect propeller shaft, remove transmission, take off clutch housing pan, take out six capscrews mounting clutch on flywheel turning all screws out evenly to release spring pressure. Clutch can be removed from below without removing flywheel housing.
NOTE—A locating dowel is mounted on the flywheel and the second clutch mounting screw hole on each side is counterbored deeper than the remaining holes. When mounting clutch, use the two screws with short thread and longer shank in these holes.

STEERING:—**Steering Gear**—Saginaw Worm-and-Roller type with center steering. See article in Steering Section for adjustments.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for description and adjustment procedure.
NOTE—Before checking front end, check tire inflation, front wheel balance, front wheel and tire runout (not to exceed ⅛"), bounce car up and down several times to allow frame to assume normal height.
King Pin Inclination—5°51' crosswise.
Caster—1½-2¼°. Adjustable. Caster affected by camber adjustment but not outside limits as given.
Camber—⅛-1°. Adjustable.
Toe In—⅛-3/16". Adjustable. Both tie rods must be turned equally.
Steering Geometry—Inner wheel turned 23° 10', outer wheel 20°.

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, Single anchor type. Hand lever applies rear brakes. *See article in Mechanical Equipment Section for data.*
Brake Drum Diameter—11 1/16".
Brake Lining—Moulded and woven type. Width 2". Thickness 3/16". Length 23.7" per wheel.
Brake Clearance—.008" toe, .010" heel on each shoe.
Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER—First number—L202,001. Stamped on ledge on top of block beside head at left front corner.

ENGINE SPECIFICATIONS:—Type—8 cyl., 'L' head.
Bore—3". **Stroke**—4¼".
Displacement—240.3 cubic inches.
Rated Horsepower—28.8 (SAE).
Developed Horsepower—100 at 3400 R.P.M.
Compression Ratio & Pressure—6.2-1 Std. cast-iron head. Pressure 116-126 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—Gauge should show steady reading of 17" of HG. minimum with engine idling at 300 R.P.M. or 6 M.P.H.

PISTONS:—Aluminum alloy, 'T' slot, Cam Ground type with Electrolite (hard oxide) bearing surface. Skirt is elliptical with .006-.008" greater diameter at right angles to pin bosses. Pistons cannot be ground. Use finished replacement pistons.
Weight—12.8 ozs. (stripped). **Length**—3¾".
Removal—Pistons and rods removed from below. Rotate crankshaft so that counterweights are crosswise and on opposite side from camshaft.
Clearance—.0013-.0018" measured ⅜" up on skirt and ⅜" below lower ring groove at right angles to pin hole for new pistons. See Fitting New Pistons.
Replacement Pistons:—Finished pistons with pins fitted furnished in .003", .005", .010", .015", .030" oversizes. Oversize pistons held to same weight as standard.
Fitting New Pistons:—With pin removed, check clearance by inserting .002" feeler ½" wide between piston and cylinder wall on pressure or camshaft side at right angles to pin hole. Piston should be inverted with slot away from camshaft. Pressure to withdraw feeler must be 4-11 lbs. with piston and block at 70° F.
Installing Pistons:—Mark 'V-S' on piston head must be toward valves (slot away from valves). Pin hole in piston offset 3/32" toward left (slotted side).

PISTON RINGS:—Two compression, two oil control rings per piston, all above the pin. Both oil ring grooves drilled radially with oil drain holes. Piston rings furnished in .010", .020", .030" oversizes.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.012"	.0015-.003"
Oil Cont.	3/16"	.007-.015"	.001-.0025"

NOTE—Install compression rings with groove or step downward.

PISTON PIN:—Diameter .8554-.8557". **Length** 2 23/32". Pin is locked in piston by lockscrew in one boss. Opposite end slotted to allow boss to slide freely on pin.
Pin Fit in Piston—.0001" loose to .0002" tight in plain boss end, .0002-.0005" tight in lock boss end.
Pin Fit in Rod Bushing—Clearance .0002-.0005". Pins selected to give this clearance. New rod bushings burnished and reamed to inside diameter of .8557-.8561."
Fitting Pins—Place piston and pin in boiling water for 1 minute. With special tool HM-535 insert pin in plain boss end and push lightly until lockscrew hole in pin and boss are aligned. Install lockscrew. Skirt taper with pin installed must not exceed .0005".
NOTE—Replacement pistons furnished with pins fitted. Pin bosses in piston are Electrolited and cannot be reamed. Pins not furnished oversize.

CONNECTING ROD:—Weight 33 ozs. **Length** 9".
Crankpin Journal Diameter—2¼".
Lower Bearing—Steel-backed, babbitt-lined, interchangeable type.
Clearance—.001-.003". Sideplay—.0055-.0105".
Bearing Adjustment:—None (no shims). Replace bearing shells. Do not file rod or cap faces. Bearings assembled with slight projection above faces to insure contact.
Installing Rods:—Oil spit hole in lower bearing upper half must be toward camshaft. Grooves in rod and cap bolt boss must be on same side as part number NOTE—Ground bolts used for cap and rod assembly. Common bolts must not be used.

CRANKSHAFT:—Five bearing. Integral counterweights.
Journal Diameters—#1, 2.373-2.374"; #2, 2.5605-2.5615"; #3, 2.623-2.624; #4, 2.6855-2.6865; #5, 2.748-2.749".
Bearing Type—Interchangeable steel-backed, babbitt-lined. Upper and lower halves not interchangeable.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be removed without removing crankshaft by using tool HM-J-173. This is a flat headed plug which is slipped into oil hole in crankshaft. The head engages the edge of the bearing and turns it out as crankshaft is rotated. Install bearings in same manner (insert plain edge of bearing on indented side of upper bearing support).
End Thrust:—Taken by #1 (front) bearing. Endplay .004-.008". A bronze thrust plate .1205-.1235" thick is assembled at each end of front main bearing and is dowelled to bearing cap. There is a steel thrust collar on the crankshaft behind the crankshaft gear.
NOTE—In removing fan drive pulley sheet metal rim on hub must not be damaged.

CAMSHAFT:—Six bearings. Non-adjustable chain drive.
Journal Diameters—#1, 2.3095-2.3100"; #2, 2.2470-2.2475"; #3, 2.1845-2.1850"; #4, 2.1220-2.1225; #5, 2.0595-2.0600"; #6, 1.8095-1.8100".
Bearing Type—Metal-backed, babbitt-lined.
Clearance—.002-.004".
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft and thrust plate on chain case cover.
Timing Chain:—Whitney. Width 1¼". Pitch .500". Length 46 links or 23".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straigtedge across the shaft centers. Use Sprocket Gauge HM-408-0.

VALVES:—Head Diameter Stem Diameter Length

Intake	1 9/16"	.3415-.3425"	5 9/32"
Exhaust	1 27/64"	.3405-.3415"	5 9/32"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.00125-.00325"
Exhaust	45°	.300"	.00225-.00425"

Tappet Clearance—.008" Int., .010" Exh., warm.
Valve Guides:—Cast-iron. Install with turned portion below and finish ream to .34375-.34475" (inside diameter) after assembly. Guide must be 15/16" below top of block.
Valve Springs:—Free length 2 9/16". Install springs with three close-coils at top. No spring cages used.

	Spring Pressure	Spring Length
Valve Closed	43 lbs.	2 9/32"
Valve Open	116 lbs.	1 15/16"

NOTE—Springs are interchangeable (intake and exhaust, and 6 and 8 engines). Can be used on '33-35 engines. On '33 and '34 engines discard spring cages.
Valve Lifters:—Single piece cast-iron with core openings in sidewalls. Operate in removable guides in block. Clearance .0008". Serviced by renewing guides and installing standard lifters.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 40° BLDC. Close 10° ATDC.
To Check Valve Timing—Check tappet clearance #6 intake valve. This valve should open with piston on top dead center when flywheel mark 'TDC/' lines up with pointed end of inspection hole cover screw in left front face of housing.
Motor Gauge—Weidenhoff #104 Adapter, #2 Rod.
NOTE—Steel ball insert in flywheel does not indicate top dead center point as on the six cylinder engine.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase. Ignition timing not disturbed by removal of oil pump.
Normal Oil Pressure—25-30 lbs.
Oil Pressure Regulator—Mounted on oil pump. Operates at 27 lbs. Not adjustable.
Crankcase Capacity—7 qts. refill.

CLUTCH:—Borg & Beck Model 10A4. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Woven type, 2 required. Inside Diam. 6⅛". Outside Diam. 9⅞". Thickness .125".
Adjustment—Free movement of clutch pedal must be 1-1½". To adjust, loosen locknut and turn adjusting screw at lower end of inner lever on clutch throwout auxiliary shaft in front of clutch pedal.
Removal—Disconnect propeller shaft, remove transmission, take off clutch housing pan, take out six capscrews mounting clutch on flywheel turning all screws out evenly to release spring pressure. Clutch can be removed from below without removing flywheel housing.
NOTE—A locating dowel is mounted on the flywheel and the second clutch mounting screw hole on each side is counterbored deeper than the remaining holes. When mounting clutch, use the two screws with short thread and longer shank in these holes.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering. See article in Steering Section for adjustments.
Front Suspension:—Independent, linked parallelogram type with coil springs. See article in Steering Section for complete data.
NOTE—Before checking front end, check tire inflation, front wheel balance, front wheel and tire runout (not to exceed ⅛"), bounce car up and down several times to allow frame to assume normal height.
King Pin Inclination—5°51' crosswise.
Caster—1½-2¼°. Adjustable. Caster affected by camber adjustment but not outside limits as given.
Camber—⅛-1°. Adjustable.
Toe In—⅛-3/16". Adjustable. Both tie rods must be turned equally.
Steering Geometry—Inner wheel turned 23°, outer wheel 20°.

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, Single anchor type. Hand lever applies rear wheel brakes. See article in Brake Section for complete data.
Brake Drum Diameter—12".
Brake Lining—Molded & woven type. Width 2". Thickness 3/16". Length 25.9" per wheel.
Brake Clearance—.008" toe, 010" heel, each shoe.
Hand Brake Adjustment:—See Service Brake Adjustment.

SERIAL NUMBER:—On left frame side member under hood. First number F-372,001 (1937) and numbers for each plant for 1938 models as follows:
Lansing, Michigan .....F-600,001 and up
South Gate, California.....CF-504,001 to CF-540,000
Linden, New Jersey .....LF-545,001 to LF-600,000

ENGINE NUMBER:—First number F-670,001 ('37), F-828,001 ('38). On boss on left side of engine behind water pump. '38 motors with Auto. Transmission carry prefix 'FA'.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4⅛".
Displacement—229.7 cu. ins. **Rated HP.**—28.4.
Developed Horsepower—95 at 3400 R.P.M.
Compression Ratio—6.1-1 Std. cast-iron head.
Compression Pressure—146 lbs. at 1000 RPM. or 102-112 lbs. at 320 RPM. (cranking speed).
NOTE—New steel-asbestos cyl. head gasket used. Cannot be re-used. Use new gasket.
Vacuum Reading—17" min. @ 400 RPM. or 6 MPH.

PISTONS:—Aluminum alloy, 'T' slot, Cam Ground type with Electrolite (hard oxide) bearing surface.
Weight—17.35 ozs. (stripped). **Length**—4 1/32".
Removal—Pistons and rods removed from above.
Clearance—Skirt .0013-.0018".
Replacement Pistons:—Finished pistons with pins fitted furnished in .003", .005", .010", .015" and .030" oversize. Held to same weight as standard.
Fitting New Pistons:—With pin removed, check clearance by inserting .002" feeler ½" wide between piston and cylinder wall on camshaft side at right angles to pin hole. Invert piston with slot away from camshaft 4-11 lbs. pull required to withdraw feeler with piston and block at 70° F.
Installing Pistons:—Mark 'V-S' on piston head must be toward valves. Pin hole in piston offset 3/32" toward left (slotted side).

PISTON RINGS:—Two compression, two oil control rings per piston above pin. Oil ring grooves drilled with eighteen 5/32" oil drain holes. Ring oversizes—.010", .020", .030".

Ring	Width	End Gap	Side Clearance
Comp.	.1235-.1240"	.009-.014"	.002-.0035"
Oil	.1860-.1865"	.009-.014"	.0025"

NOTE—Install comp. rings with groove down.

PISTON PIN:—Diameter—.8554-.8557". **Length**—3 5/32". Pin locked in piston boss by lockscrew. Free end slotted to allow boss to slide freely in pin.
Pin Fit in Piston—.0001" loose to .0002" tight in plain boss end, .0002-.0005" tight in lock boss end.
Pin Fit in Rod Bushing—Clearance .0003-.0006". New rod bushings burnished and reamed to inside diameter of .8558-.8562".
Fitting Pins—*See Oldsmobile Shop Notes.*

CONNECTING ROD:—Weight 26.17 oz. **Length** 7 13/16". NOTE—8 cylinder rods furnished in service for six. Select rod to weight within ¼ oz. of other rods.
Crankpin Journal Diameter—2.123-2.124".
Lower Bearing—Removable steel-backed, babbitt.
Clearance—.001-.003" ('37), .0005-.002" ('38).
Sideplay—.0055-.0105".
Bearing Adjustment:—None. Replace bearings. Do not file rods or cap faces.
Installing Rods:—Oil spit hole in lower bearing upper half must be toward camshaft. Grooves in rod and cap bolt boss must be on same side as part number. NOTE—Ground bolts used for rod and cap assembly.

CRANKSHAFT:—4 bearing, integral counterweights.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.6655-2.6665"; #4, 2.6855-2.6865.
Bearing Type—Interchangeable steel-backed, babbitt-lined. Bearing halves interchangeable (upper and lower) except #1 (front).
Clearance—.001-.003" ('37), .0005-.002" ('38).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Oldsmobile Shop Notes for main bearing and oil seal data.*
End Thrust:—Taken by #1 (front) bearing. A bronze thrust plate .1205-.1245" thick is assembled at each end of bearing and is dowelled to bearing cap. Steel thrust collar between front bronze thrust plate and crankshaft gear. **Endplay**—.004-.008".

CAMSHAFT:—4 bearing, non-adjustable chain drive.
Journal Diameters—#1, 1.9975-1.9970"; #2, 1.9350-1.9345"; #3, 1.8725-1.8720"; #4, 1.8100-1.8095".
Bearing Type—Bronze bushings.
Clearance—.002-.004".
End Thrust:—Spring and plunger in front end of camshaft and steel plate on chain case cover.
Timing Chain:—Whitney. Width 1". Pitch .500". Length 23½" or 47 links.
See Oldsmobile Shop Notes for front end assembly dismantling for timing chain removal.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Use Sprocket Gauge HM-408-0.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.0012-.0032"
Exhaust	45°	.300"	.00245-.00425"

See Oldsmobile Shop Notes for Hood Side Panel Removal (1937), Fender Plate Removal (1938).
Tappet Clearance—.008" Int., .011" Exh., warm.
Valve Guides:—Cast-iron. Exhaust guide taper counterbored on inside diameter for ⅜" at top. Install ⅝" below top of block. Ream inside diam. to .34375-.34475" ('37), .34425-.34525" ('38). Lgth. 3 15/32".
Valve Springs:—Free length 2⅝". Interchangeable for either valve and on 6 & 8. Spring dampers used inside of spring at top. **Pressure & Length as follows:**

	Valve Closed	Valve Open
1937	46 lbs. at 2 9/32"	94 lbs. at 1 31/32"
1938	50½ lbs. at 2 1/4 "	95½ lbs. at 1 15/16"

Valve Lifters:—Mushroom type. Length 2½". Head Diam. 1¼". Body Diam. .6235-.6240". Clearance .0003-.0007". Furnished std., .002", .005" oversize.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Valve Timing:—Check tappet clearance #1 intake valve. This valve should open with piston 5° or .0163" before top dead center when a point on the flywheel approximately 2 teeth before top dead center mark (steel ball insert) lines up with pointer in inspection hole in left front face of housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

LUBRICATION:—Pressure type. Gear type oil pump located on right side of crankcase.
NOTE—New gasket aligned with oil holes in block must be used when oil pump assembled to engine.
Normal Oil Pressure:—25-30 lbs. ('37), 28-33 lbs. ('38).
Oil Pressure Regulator:—On oil pump cover. Operates at 27 lbs. Not adjustable.
Crankcase Capacity:—6 quarts, refill.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, three pump mounting capscrews, lift fan and pump assembly off.
Thermostat:—Harrison. In cyl. hd. water outlet.
Setting—Start to open 145°F. ('37), 152°F. ('38).
Water Capacity:—16 qts. ('37), 17 qts. ('38).

CLUTCH:—Borg & Beck Model 9A6. Single plate, dry disc type. Model No. 895 stamped on clutch cover.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven, 2 required. Inside Diam. 5⅝". Outside Diam. 9¼". Thickness ⅛".
NOTE—Special spiral-grooved facings used with Self-Shifting Transmission (not interchangeable).
Pedal Adjustment—Free travel ¾-1". Free adjustable link at release lever end. Loosen locknut, adjust lever length.
Removal—Remove transmission (see Transmission Removal below), take off clutch underpan, take out six clutch cover mounting screws evenly, remove assembly from below.
NOTE—When mounting clutch, use two screws with short thread and longer shanks in second hole on either side of locating dowel.

TRANSMISSION:—Own—Helical gear type with Synchro Mesh on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front propeller shaft at transmission, remove 4 bolts at bearing support, slide bearing assembly to left, remove mounting bolts and withdraw transmission.

SELF-SHIFTING TRANSMISSION:—Optl. on F-38.
See article in Mechanical Equipment Section for complete Removal and Adjustment instructions.

UNIVERSAL JOINTS:—Mechanics—Model 2C, roller bearing type, three used.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—See Oldsmobile Shop Notes for servicing data.

REAR AXLE:—Own make. Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.37-1 or 4.33-1 Std. '37. 4.37-1 Std. '38. 3.55-1 Auto. Transmission. 4.62-1 Optional (all).
Backlash—.004-.008". Screw adjustment.
Removal:—Remove wheel, drum, free backing plate (4 nuts), static collector, pull bearing retainer away from backing plate without disturbing plate, pull shaft and bearing (Tool J-942), secure plate with one nut. Disconnect rear universal joint remove ten capscrews freeing carrier from housing, lift carrier out. NOTE—Left wheel nuts front and rear have left hand threads.
Wheel Bearing Adjustment—None (shielded type).

SHOCK ABSORBERS:—Delco. Model 1947A, B (front), 1713-E-F (rear). Double acting, piston type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Level frame by inserting 2" blocks between upper support arm and frame. Check following:
Kingpin Inclination—4° 51' 10" crosswise.
Caster—¼-1° pos. ('37). 0-¾° reverse ('38).
Camber—⅛-1°. Adjustable. Set Caster first.
Toe In—⅛-3/16". Adjust length of tie rods.
Steering Geometry—Inner w. 22½-23½°. Outer 20°

BRAKES:—Service—Bendix Hydraulic, Duo-Servo, single anchor type. Hand lever applies rear brakes.
See article in Mechanical Equipment Section for data.
Drum—Cast-iron. Diameter—11".
NOTE—Drum turn down limit .030" cut.
Lining—Prim.-molded.Sec.-woven&compressed.Width 1¾". Thick 3/16". Length (P) 9 11/32", (S) 11 31/32"
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brake above.

SERIAL NUMBER:—On left frame side member under hood. First number L-146,001 (1937) and numbers for each plant for 1938 models as follows:
Lansing, Michigan .....L-212,001 and up
South Gate, California.....CL-187,001 to CL-195,000
Linden, New Jersey.....LL-197,001 to LL-212,000

ENGINE NUMBER:—First number L-250,001 ('37), L-296,001 ('38). On boss on left side of engine behind water pump. '38 motors built with Auto. Transmission carry prefix 'LA'.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—3⅞".
Displacement—257.1 cubic inches.
Rated Horsepower—33.8 (S.A.E.)
Developed Horsepower—110 HP. at 3600 RPM.
Compression Ratio—6.2-1 Std. cast-iron head.
Compression Pressure—152 lbs. at 1000 RPM. or 104-114 lbs. at 310 RPM. (cranking speed).
NOTE—New steel-asbestos cyl. head gasket used. Cannot be re-used. Use new gasket.
Vacuum Reading—17" min. at 6 MPH.

PISTONS:—Aluminum alloy, 'T' slot, Cam Ground type with Electrolite (hard oxide) bearing surface.
Weight—15.75 ozs. (stripped). **Length**—3 15/16".
Removal—Pistons and rods removed from above.
Clearance—.0013-.0018" at skirt.

Replacement Pistons:—Finished pistons with pins fitted furnished in .003", .005", .010", .015" and .030" oversize. Held to same weight as standard.

Fitting New Pistons:—With pin removed, check clearance by inserting .002" feeler ½" wide between piston and cylinder wall on camshaft side at right angles to pin hole. Invert piston with slot away from camshaft. 4-11 lbs. pull required to withdraw feeler with piston and block at 70° F.

Installing Pistons:—Mark 'V-S' on piston head must be toward valves. Pin hole in piston offset 3/32" toward left (slotted side).

PISTON RINGS:—Two compression, two oil control rings per piston above pin. Oil ring grooves drilled with eighteen 5/32" oil drain holes. Ring oversizes —.010", .020", .030".

Ring	Width	End Gap	Side Clearance
Comp. ('37)	...1235-.1240"	.....009-.014"	.....002-.0035"
Comp. ('38)	...0930-.0935"	.....009-.014"	.....002-.0035"
Oil (all)	.....1860-.1865"	.....009-.014"	.....001-.0025"

NOTE—Install '37 comp. ring with groove down. '38 comp. ring taper faced (greater diameter at bottom). Install '38 comp. ring with side marked TOP to top.

PISTON PIN:—Diameter—.8554-.8557". **Lgth**—2 31/32". Pin locked in piston boss by lockscrew. Free end slotted to allow boss to slide freely on pin.
Pin Fit in Piston—.0001" loose to .0002" tight in plain boss end, .0002-.0005" tight in lock boss end.
Pin Fit in Rod Bushing—Clearance .0003-.0006". New rod bushings burnished and reamed to inside diameter of .8558-.8562".
Fitting Pins—*See Oldsmobile Shop Notes.*

CONNECTING ROD:—Weight 26.17 oz. **Length** 7 13/16".
Crankpin Journal Diameter—2.123-2.124".
Lower Bearing—Removable steel-backed, babbitt.
Clearance—.001-.003" ('37), .0005-.002" ('38).
Sideplay—.0055-.0105".

Bearing Adjustment:—None. Replace bearings.

Installing Rods:—Oil spit hole in lower bearing upper half must be toward camshaft. Grooves in rod and cap bolt boss must be on same side as part number.
NOTE—Ground bolts used for rod & cap assembly.

CRANKSHAFT:—5 bearing, integral counterweights.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.603-2.604"; #4, 2.6655-2.6665"; #5, 2.6855-2.6865".
Bearing Type—Interchangeable steel-backed, babbitt-lined. Bearing halves interchangeable (upper and lower).
Clearance—.001-.003" ('37), .0005-.002" ('38).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Oldsmobile Shop Notes for main bearing and oil seal data.*

End Thrust:—Taken by #1 (front) bearing. A bronze thrust plate .1205-.1245" thick is assembled at each end of bearing and is dowelled to bearing cap. Steel thrust collar between front bronze thrust plate and crankshaft gear. **Endplay**—.004-.008".

CAMSHAFT:—5 bearing, non-adjustable chain drive.
Journal Diameters—#1, 2.0600-2.0595"; #2, 1.9975-1.9970"; #3, 1.9350-1.9345"; #4, 1.8725-1.8720"; #5, 1.8100-1.8095".
Bearing—Bronze bushings. **Clearance**—.002-.004".

End Thrust:—Spring and plunger in front end of camshaft and steel plate on chain case cover.

Timing Chain:—Link-Belt. Width 1". Pitch .500" Length 23½" or 47 links.
See Oldsmobile Shop Notes for front end assembly dismantling for timing chain removal.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Use Sprocket Gauge HM-408-0.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.0012-.0032"
Exhaust	45°	.300"	.00225-.00425"

See Oldsmobile Shop Notes for Hood Side Panel Removal (1937), Fender Plate Removal (1938).

Tappet Clearance—.008" Int., .011" Exh., warm.

Valve Guides:—Cast-iron. Exhaust guide taper counterbored on inside diameter for ⅜" at top. Install ⅝" below top of block. Ream inside diam. to .34375-.34475" ('37), .34425-.34525" ('38). Lgth. 3 15/32".

Valve Springs:—Free length 2⅝". Interchangeable for either valve and on 6 and 8. Spring dampers used inside of spring at top.

	Valve Closed	Valve Open
1937	.....46 lbs. at 2 9/32"	.....94 lbs. at 1 31/32"
1938	.....50½ lbs. at 2 1/4 "	.....95½ lbs. at 1 15/16"

Valve Lifters:—Mushroom type. Length 2½". Head diam. 1¼". Body diam. .6235-.6240". Clearance .0003-.0007". Furnished std., .002", .005" oversize.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 35° ALDC.
Exhaust Valves—Open 45° BLDC. Close 10° ATDC.

To Check Timing:—Check tappet clearance #1 intake valve. This valve should open with piston on top dead center (.000"), when flywheel mark 'TDC/' (NOT steel ball insert) lines up with pointed end of the inspection hole cover screw (left side).
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

LUBRICATION:—Pressure type. Gear type oil pump located on right side of crankcase.
NOTE—New gasket aligned with oil holes in block must be used when oil pump assembled to engine.

Normal Oil Pressure:—25-30 lbs. ('37), 28-33 lbs. ('38).

Oil Pressure Regulator:—On oil pump cover. Operates at 27 lbs. Not adjustable.

Crankcase Capacity:—7 quarts, refill.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, three pump mounting capscrews, lift fan and pump assembly off.

Thermostat:—Harrison. In cyl. hd. water outlet.
Setting—Start to open 145°F. ('37), 152°F. ('38).
Water Capacity:—20 qts. ('37), 21 qts. ('38).

CLUTCH:—Borg & Beck Model 10A7. Single plate, dry disc type. Model No. 897 stamped on Clutch Cover.
See article in Mechanical Equipment Section for data.
Facings—Molded-woven, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness ⅛".
NOTE—Special spiral-grooved facings used with Self-Shifting Transmission (not interchangeable).
Pedal Adjustment—Free travel ¾-1". Free adjustable link at release lever end. Loosen locknut, adjust lever length.
Removal—Remove transmission (see Transmission Removal below), take off clutch underpan, take out clutch cover mounting screws evenly, remove assembly from below.
NOTE—When mounting clutch, use two screws with short thread and longer shanks in second hole on either side of locating dowel.

TRANSMISSION:—Own—Helical gear type with Synchro Mesh on second and high gears.
See article in Mechanical Equipment Section for data.

Removal:—Disconnect front propeller shaft at transmission, remove 4 bolts at bearing support, slide bearing assembly to left, remove mounting bolts and withdraw transmission.

SELF-SHIFTING TRANSMISSION:—Optl. (all models).
See article in Mechanical Equipment Section for complete Removal and Adjustment instructions.

UNIVERSAL JOINTS:—Mechanics—Model 2C, roller bearing type, three used.
See article in Mechanical Equipment Section for data.

Propeller Shaft Center Bearing:—See Oldsmobile Shop Notes for servicing data.

REAR AXLE:—Own make. Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.37-1 or 4.33-1 Std. '37. 4.37-1 Std. '38. 3.55-1 Auto. Transmission. 4.62-1 Optional (all).
Backlash—.004-.008". Screw adjustment.

Removal:—Remove wheel, drum, free backing plate (4 nuts), static collector, pull bearing retainer away from backing plate without disturbing plate, pull shaft and bearing (Tool J-942), secure plate with one nut. Disconnect rear universal joint, remove ten capscrews freeing carrier from housing, lift carrier out. NOTE—Left wheel studs have reverse threads.
Wheel Bearing Adjustment—None (shielded type).

SHOCK ABSORBERS:—Delco—Model 1947-A, B (front) 1713-E, F (rear). Double acting, piston type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.

Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Level frame by inserting 2" blocks between upper support arm and frame. Check following:
Kingpin Inclination—4° 51' 10" crosswise.
Caster—¼-1° pos. ('37). 0-¾° reverse ('38).
Camber—⅛-1°. Adjustable. Set Caster first.
Toe In—⅛-3/16". Adjust length of tie rods.
Steering Geometry—Inner w. 22½-23½°. Outer 20°.

BRAKES:—Service—Bendix Hydraulic, Duo-Servo, single anchor type. Hand lever applies rear brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diam. Front 1 3/32", Rear 1".
Drum—Cast-iron. Diameter—12".
NOTE—Drum turn down limit .030" cut.
Lining—Prim.-molded.Sec.-woven&compressed.Width 1¾. Thick 3/16". Length (P) 10 3/32". (S) 12 61/64"
Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

F-60 & G-70 ENGINES:—*See Shop Notes for differences.*

ENGINE HOOD NOTE:—To raise hood, turn latch handle at bottom of grille, raise hood slightly and release safety catch.

FRONT END SHEET METAL ASSEMBLY AND OIL PAN REMOVAL:—*See Oldsmobile Shop Notes.*

SERIAL NUMBER:—On left frame side member under hood. 1st No. as follows:

	F-60	G-70
Lansing, Mich.	F-663001	G-300001
South Gate, Calif.	CF-511001	CG-10001
Linden, N. J.	LF-551301	LG-100001

ENGINE NUMBER:—First number (F-60) F-905501, (G-70) G-10001. On left front side of engine.
Self-Shifting Transmission Cars—Engine number prefix is FA (F-60), GA (G-70) instead of F or G.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—3⅞" (F-60). 4⅛" (G-70).
Displacement—216 cu. ins. (F-60), 229.7 (G-70).
Rated Horsepower—28.4
Developed Horsepower—90 (F-60 Std. Hd), 85 (F-60 LC), 95 (G-70 Std.), 90 (G-70 LC) at 3400 RPM.
Compression Ratio—6.2-1 (Std. F-60), 6.1-1 (Std. G-70), 5.67-1 (Optl. F-60), 5.61-1 (Optl. G-70).
Compression Pressure—151 lbs. (F-60 Std. Hd.), 146 lbs. (G-70 Std. Hd.), 120 lbs. (All—Optl. LC. Hd.) at 1000 RPM. or approx. 102-112 lbs. at cranking speed. *See Oldsmobile Shop Notes for Cylinder Head Servicing.*
Vacuum Reading—Steady 17" min. at 6 MPH.

PISTONS:—Aluminum alloy, 'T' slot, cam ground type with hard oxide bearing surface.
Weight—17.75 ozs. (stripped). **Length**—4 1/32".
Removal—Pistons and rods removed from above.
Clearance—Top .026". Skirt .0013-.0018".
Replacement Pistons:—Finished pistons (pins fitted) .003", .005", .010", .015", .030" oversize (Std. Weight).
Fitting New Pistons:—Insert .002"x½" feeler between piston and cylinder wall on valve side with piston (pin out) inverted and 'T' slot on opposite side from feeler. Pull to withdraw feeler must be 4-11 lbs. (at 70° F., low lbs. pull below 70°, high above 70°).
Installing Pistons:—Mark 'V-S' on head toward valves (slot away from valves). Pin hole offset 3/32" to left.

PISTON RINGS:—2 compression (tapered, O.D. .001" larger at bottom), 2 oil control rings per piston, all above pin. All rings are coated.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.007-.012"	.001-.003"
Oil	.1860-.1865"	.007-.015"	.001-.0025"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter**—.8554-.8557". **Length**—3 5/32". Pin locked in one piston boss by lockscrew (opposite end slotted). Pin bosses are plated.
Pin Fit in Piston—.0001" loose to .0002" tight (plain boss end), .0002-.0005" tight (lock boss end).
Pin Fit in Rod Bushing—.0003-.0006" clearance. *See Oldsmobile Shop Notes for Pin Fitting directions.*

CONNECTING ROD:—**Weight**—27.9 ozs. (F-60), 28.0 ozs. (G-70) complete except for bearing insert.
Length—7 15/16" (F-60), 7 13/16" (G-70).
Crankpin Journal Diameter—2.123-2.124".
Lower Bearing—Removable, steel-backed, babbitt.
Clearance—.0005-.0025". **Sideplay**—.0055-.0105".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil spit hole at lower end toward valves and grooves on rod and cap bolt bosses (part number side) matched. Special ground bolts used.

CRANKSHAFT:—4 bearing. 7 integral counterweights.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.6655-2.6665"; #4, 2.6855-2.6865".
Bearings—Removable, steel-backed, babbitt. Upper and lower halves interchangeable except #1 (front).
Clearance—.0005-.002" (rear), .001-.003" (all others).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Tighten bolts to 135-145 ft.lbs. with J-1264 torque wrench. **Endplay** .004-.008". *See Oldsmobile Shop Notes for main bearing removal, end thrust and oil seal data.*

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1.9970-1.9975"; #2, 1.9345-1.9350"; #3, 1.8720-1.8725"; #4, 1.8095-1.8100". *See Oldsmobile Shop Notes for finished bushing sizes.*
Bearings—Bronze bushings. **Clearance** .0015-.0035".
End Thrust:—Spring-loaded steel plunger in front of camshaft bearing against steel plate on chain cover.
Timing Chain:—Whitney #4112239. Width 1". Pitch .500". Length 47 links or 23½". *See Oldsmobile Shop Notes for Front End Sheet Metal Assembly Removal.*
Camshaft Setting:—Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers (Gauge J-1248, F-60; HM-408-0, G-70).

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

Seat Angle	Lift: (F-60)	(G-70)	Stem Clearance
Intake	30°	.286"	.303"	.00175-.00375"
Exhaust	45°	.313"	.298"	.00245-.00425"

Tappet Clearance:—.008" Intake, .011" Exh. hot.
Valve Guides:—Length 3 7/32" (¼" shorter at top over '38. May be used on '37 and '38 models). Press guides in so top end ⅞" below top of block (Tool J-1042). Ream to .34425-.34525".
Valve Springs:—Free Length 2⅝". Damper used in top of each spring.

	Spring Pressure	Length
Valve Closed	50½ lbs.	2¼"
Valve Open	95½ lbs.	1 15/16"

Valve Lifters:—Mushroom type. Body Diam. .6235-.6240". Serviced by installing lifters furnished .001", .0015", .002", .005", .010" oversize.
Clearance—.0005-.0008".
NOTE—Lifter holes have bearing-ized finish. Fit lifters without reaming holes wherever possible.
Valve Timing:—See Camshaft Setting above.

F-60
Intake Valves—Open 5° BTDC. Close 30° ALDC.
Exhaust Valves—Open 50° BLDC. Close 5° ATDC.
G-70
Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Valve Timing Check—Set tappet clearance #1 intake valve at .0124". This valve should open with piston 5° or .0074" (F-60), .0163" (G-70) before top dead center when a point on the flywheel approximately 2 teeth before TDC mark (steel ball insert) lines up with pointer (inspection hole left front face of housing). Reset tappet clearance at .008" hot.

LUBRICATION:—Pressure. Gear type oil pump on right side of crankcase. *See Oldsmobile Shop Notes for data.*
Normal Oil Pressure—28-33 lbs. **Regulator** On pump cover. Opens at 27 lbs. Not adjustable.
Crankcase Capacity—5 quarts.

COOLING SYSTEM:—**Capacity**—17 quarts.
Water Pump:—Packless, sealed bearing type. *See article in Mechanical Equipment Section for data.*
Removal—Remove fan belt, 3 pump mounting capscrews, and lower radiator hose. Lift pump out.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open at 152° F. Fully open 173° F.
Temperature Gauge:—AC#1510796 Std.#1510830 RHD. *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Borg & Beck Model 9A6 (First G-70), 9A7 (Later G-70, All F-60).** Cover marked #895 (9A6), #924 (9A7). Single plate, dry disc type. *See article in Mechanical Equipment Section for data.*
Facings—Molded-woven, 2 required. Inside Diam. 5⅝" (First G-70), 6" (Later G-70, F-60 with S-S Trans.), 6¼" (F-60 Std. Trans.). Outside Diam. 9" (F-60 Std. Trans.), 9¼" (all others). Thickness .125"
Adjustment:—Pedal free movement 1-1½" (adjusting clevis and locknut on link at clutch fork).
NOTE—Arm on auxiliary shaft has 2 holes for pedal pushrod link. Use rear hole only.
Removal:—Remove transmission (see below), take off clutch underpan and re-inforcing plate (G-70 only), mark clutch and flywheel, take out six mounting screws in clutch cover flange. NOTE—Install two mounting screws with long shank in second hole on each side of locating dowel when installing clutch. *See Oldsmobile Shop Notes for re-inforcing plate data.*

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with new remote shift control.
Transmission Control:—Oldsmobile 'Handi-shift' type. *See articles in Mechanical Equipment Section for data.*
Removal:—Disconnect lower control rod at transmission, disconnect selector cable from cable anchor bracket, unscrew cable from shaft, remove selector shaft lever (with helper springs) and speedometer cable. Remove propeller shaft (disconnect rear U-joint and pull shaft out), remove mounting bolts, pull transmission straight back and remove.

SELF-SHIFTING TRANSMISSION:—Optl. (all models). *See article in Mechanical Equipment Section for data.*

UNIVERSAL JOINTS:—**Mechanics Type 2C.** Roller bearing type, 2 used (3 on G-70 with Optl. S-S Trans.). *See article in Mechanical Equipment Section for data.*
Propeller Shaft Center Bearing:—On G-70 with Optl. S-S Trans. only. *See Oldsmobile Shop Notes.*

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque taken through 2 support arms. *See article in Mechanical Equipment Section for data.*
Ratio—4.3-1 Std. 3.636-1 Self-Shift Tr. 4.55-1 Mt.
Backlash—.004-.008". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Hoist rear end, remove wheel, brake drum, backing plate mounting nuts, static collector, bearing retainer (do not allow backing plate to shift or damage brake line). Pull shaft and bearing with puller J-942 (do not allow shaft to drag on oil seal), replace one backing plate nut.
Rear Suspension:—Quadri-coil type (support arms). *See article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—**Delco.** Front—Model 1947-C (right), 1947-D (left). Rear—1751-U (right), 1751-T (left). Double acting hydraulic type. Rear shocks are new parallel cylinder type. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Saginaw Worm-and-Roller type with new steering linkage. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4°51'10".
Caster—0-¾° reverse.
Camber—⅛° to 1°. Adjustable.
Toe In—⅛-3/16". Adjust each end tie rod.
Steering Geometry (Toe out on turns)—Inner wheel turned 23° plus or minus ½°. Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*
Drums—Cast-iron. Diameter 11".
Lining—Molded. Width 1¾". Thickness 3/16". Length—Primary Shoe 9 11/32". Secondary 11 31/32".
Clearance—.015" both ends of secondary shoe.
Hand Brake:—See Service Brakes above.

FRONT END SHEET METAL ASSEMBLY AND OIL PAN REMOVAL:—*See Oldsmobile Shop Notes.*

ENGINE HOOD NOTE:—To raise hood, turn handle at bottom of grille, raise hood slightly and release safety catch.

SERIAL NUMBER:—On left frame side member under hood. First number L-228201 (Lansing, Mich.), CL-189001 (California), LL-199001 (Linden).

ENGINE NUMBER:—1st number L-316001. On left side of engine behind water pump. **Self-Shifting Transmission Cars**—Carry prefix 'LA'.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—3⅞".
Displacement—257.1 cu. ins. **Rated HP**—33.8.
Developed Horsepower—110 HP. (Std. Hd.), 105 HP. (Optl. LC. Hd.) at 3600 R.P.M.
Compression Ratio—6.2-1 Std., 5.8-1 Optl.
Compression Pressure—152 lbs (Std. Hd.), 145 lbs. (Optl. Hd) at 1000 R.P.M. or approximately 104-114 lbs. at cranking speed for Std. head.
See Oldsmobile Shop Notes for cylinder head servicing.
Vacuum Reading—Steady 17" min. at 6 MPH.

PISTONS:—Aluminum alloy, 'T' slot, cam ground type with hard oxide bearing surface.
Weight—15.75 ozs. (stripped). **Length**—3 15/16".
Removal—Pistons and rods removed from above.
Clearance—Top .026". Skirt .0013-.0018".
Replacement Pistons:—Finished pistons (pins fitted) .003", .005", .010", .015", .030" oversize. Same wt. as std.
Fitting New Pistons:—Insert .002" x ½" x 12" feeler between piston and cylinder wall on valve side with piston (pin out) inverted and 'T' slot on opposite side from feeler. Pull to withdraw feeler must be 4-11 lbs. (piston and block at 70°F.—low lbs. pull below 70°, high lbs. above 70°).
Installing Pistons:—Mark 'V-S' on head to valves (slot away from valves). Pin hole offset 3/32" to left.

PISTON RINGS:—2 compression (tapered. O.D. .001" larger at bottom), 2 oil control rings per piston, all above pin.
NOTE—Install comp. rings with mark TOP to top.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.009-.014"	.001-.003"
Oil	.1860-.1865"	.009-.014"	.001-.0025"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter**—.8554-.8557". **Length** 2 31/32". Pin locked in 1 piston boss by lockscrew. Free end slotted (allows boss to slide on pin). Bosses plated.
Pin Fit in Piston—.0001" loose to .0002" tight in plain boss end, .0002-.0005" tight in lock boss end.
Pin Fit in Rod Bushing—Clearance .0003-.0006".
Fitting Pins—*See Oldsmobile Shop Notes.*

CONNECTING ROD:—**Length** 7 13/16". **Weight** 28.0 ozs. (complete except less bearing inserts).
Crankpin Journal Diameter—2.123-2.124".
Lower Bearing—Removable steel-backed, babbitt.
Clearance—.0005-.0025". **Sideplay**—.0055-.0105".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil spit hole in lower bearing upper half to valves. Grooves in rod and cap bolt boss on part number side must be matched. Ground bolts used (tighten to 30-35 ft. lbs. with J-1264 torque wrench).

CRANKSHAFT:—5 bearing. 8 integral counterweights.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.603-2.604"; #4, 2.6655-2.6665"; #5, 2.6855-2.6865".
Bearings—Removable steel-backed, babbitt-lined. Upper and lower halves interchangeable.
Clearance—.001-.003" (#1, 2, 3, 4), .0005-.002" (#5).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. Tighten bolts to 135-145 ft. lbs. with J-1264 torque wrench. **Endplay**—.004-.008". *See Oldsmobile Shop Notes for main bearing removal, end thrust and oil seal data.*

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2.0600-2.0595"; #2, 1.9975-1.9970"; #3, 1.9350-1.9345"; #4, 1.8725-1.8720"; #5, 1.8100-1.8095". *See Oldsmobile Shop Notes for reamed bushing sizes.*
Bearings—Bronze bushings. **Clearance** .0015-.0035".
End Thrust:—Spring-loaded steel plunger in front of camshaft bearing against steel plate on chain cover.
Timing Chain:—Link-Belt #365. Width 1". Pitch .500". Length 47 links or 23½". *See Oldsmobile Shop Notes for front end sheet metal assembly removal.*
Camshaft Setting:—Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers (or use Gauge HM-408-0).

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.286"	.00175-.00375"
Exhaust	45°	.313"	.00245-.00425"

Tappet Clearance:—.008" Intake, .011" Exh. hot.
Valve Guides:—Length 3 7/32" (¼" shorter at top over '38. May be used on '37 and '38 models). Press guides in so top end ⅞" below top of block (Tool J-1042). Ream to .34425-.34525".

Valve Springs:—Free length 2⅝". Damper used in top of each spring.	Spring Pressure	Length
Valve Closed	50½ lbs.	2 1/4"
Valve Open	95½ lbs.	1 15/16"

Valve Lifters:—Mushroom type. Body Diam. .6235-.6240". Serviced by installing lifters furnished .001", .0015", .002", .005", .010" oversize.
Clearance—.0005-.0008".
NOTE—Lifter holes have bearing-ized finish. Fit lifters without reaming hole wherever possible.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 35° ALDC.
Exhaust Valves—Open 45° BLDC. Close 10° ATDC. These figures correct with tappet clearance of .0124" Intake and .0155" Exhaust.
Valve Timing Check—Set tappet clearance #1 intake valve at .0124". This valve should open with piston on top dead center (.000") when flywheel mark 'TDC/' (NOT steel ball insert) lines up with pointed end of the inspection hole cover screw in left front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

LUBRICATION:—Pressure (gear type oil pump on right of engine). *See Oldsmobile Shop Notes for pump data.*
Normal Oil Pressure:—28-33 lbs.
Oil Pressure Regulator:—On pump. Opens at 27 lbs. Non-adjustable type.
Crankcase Capacity:—6 quarts.

COOLING SYSTEM:—**Capacity**—24 quarts.
Water Pump:—Packless, sealed bearing type.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, 3 pump mounting capscrews, and lower radiator hose. Lift pump out.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 152° F. Fully open 173° F.
Temperature Gauge:—AC #1510796, 1510830 RHD.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 10A7.** Marked 897 (first cars), 927 (later cars). Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded-woven, 2 required. Inside Diameter 6" (897), 7" (927), Outside Diameter 10" (all), Thickness .125" (all).
Adjustment:—Pedal free movement 1-1½" (adjusting clevis and locknut on link at clutch fork).
NOTE—Arm on auxiliary shaft has 2 holes for pedal push rod link. Use front hole only.
Removal:—Remove transmission (see below), take off clutch underpan and reinforcing plate, mark clutch and flywheel take out 6 mounting screws in cover NOTE—Use 2 mounting screws with long shank in second hole on each side of locating dowel.
See Oldsmobile Shop Notes for re-inforcing plate data.

TRANSMISSION:—**Own make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with new remote shift control.
Transmission Control:—Oldsmobile 'Handi-shift' type.
See articles in Mechanical Equipment Section for data.
Removal:—Disconnect lower control rod at transmission and selector cable from cable anchor bracket, unscrew cable from shaft, remove selector shaft lever (with helper springs) and speedometer cable. Remove propeller shaft (disconnect rear U-joint and pull shaft out), and take out 4 transmission mounting bolts, pull transmission straight back.

SELF-SHIFTING TRANSMISSION:—Optional.
See article in Mechanical Equipment Section for data.

UNIVERSAL JOINTS:—**Mechanics Type 2C.** Roller bearing type. 2 used (3 with Self-Shift Trans.).
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on cars with Self-Shifting Transmission.
See Oldsmobile Shop Notes for servicing data.

REAR AXLE:—**Own make.** Semi-floating, hypoid gear type with torque taken through 2 support arms.
See article in Mechanical Equipment Section for data.
Ratio—4.3-1 Std. 3.636-1 Self-Shift Tr. 4.55-1 Mt.
Backlash—.004-.008". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Hoist rear of car, remove wheel, brake drum and 4 nuts securing backing plate to housing, remove static collector and bearing retainer (avoid shifting backing plate so as not to damage brake line). Pull shaft (Puller J-942). Do not drag shaft on seal. Secure backing plate with one nut. **Wheel Bearing Adjustment**—None.
Rear Suspension:—Coil springs with 2 support arms.
See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS:—**Delco.** Front—Model 1947-C (right), 1947-D (left). Rear—1751-U (right), 1751-T (left). Double acting, hydraulic type. Rear shocks are new parellel cylinder type.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Saginaw Worm-and-Double Roller type with new Relay Arm and Rod linkage.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4°51'10".
Caster—0-¾° reverse.
Camber—⅛-1°. Adjustable.
Toe In—⅛-3/16". Adjust each tie rod.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 23° plus or minus ½°. Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter 12".
NOTE—Drum turn down limit .030" cut.
Lining—Primary—molded. Secondary—woven and compressed. Width 1¾". Thickness 3/16". Length—Primary 8 27/32" (front), 10 3/32" (rear); Secondary 12 61/64" (all).
Clearance—.010. at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.

1937-38-39 MODELS

FRONT END REMOVAL:—For work on front of engine, remove radiator and fender assembly as a unit as follows: drain cooling system, remove fender-to-body bolts, fender-to-running board bolts, fender to brace bolts, disconnect radiator hoses, free radiator tie rods, free radiator anchor bolt on frame remove running board molding from fender and lift entire assembly off.

1938-39 MODELS

ORIGINAL BORE & PISTON SIZES:—Piston size indicated by mark stamped on head of each piston. Cylinder bore size indicated by mark stamped on top left face of cylinder block at Cylinder #4 (Six), #8 ('120' Eight), #1 (Super Eight), #1 of Right Hand Bank (Twelve). Piston and cylinder marks should correspond (AA piston in AA bore, etc) as shown in following tables:

SIX

Mark	Piston Size	Cylinder Size
AA	3.49825-3.49850"	3.49950-3.49975"
A	3.49850-3.49875"	3.49975-3.50000"
BB	3.49875-3.49900"	3.50000-3.50025"
B	3.49900-3.49925"	3.50025-3.50050"
CC	3.49925-3.49950"	3.50050-3.50075"
C	3.49950-3.49975"	3.50075-3.50100"
DD	3.49975-3.50000"	3.50100-3.50125"
D	3.50000-3.50025"	3.50125-3.50150"

'120' EIGHT

Mark	Piston Size	Cylinder Size
AA	3.24825-3.24850"	3.24950-3.24975"
A	3.24850-3.24875"	3.24975-3.25000"
BB	3.24875-3.24900"	3.25000-3.25025"
B	3.24900-3.24925"	3.25025-3.25050"
CC	3.24925-3.24950"	3.25050-3.25075"
C	3.24950-3.24975"	3.25075-3.25100"
DD	3.24975-3.25000"	3.25100-3.25125"

DD	3.43725-3.43750"	3.43850-3.43875"
D	3.43750-3.43775"	3.43875-3.43900"

1937-38-39 MODELS

CYLINDER BLOCK REMOVAL (SUPER EIGHT):—Remove head, remove valves 1, 8, 9, 16 (for access to crankcase stud nuts), remove nuts on all crankcase studs. NOTE—Block may be re-installed with pistons and rods installed in cylinder bores by pulling pistons up until pins exposed and passing a length of rod or wire through all pins.

1938-39 MODELS

CYLINDER HEADS (SIX, '120' EIGHT, SUPER 8):—Cast iron heads used in 1939 and on 1938 Six (std. head). Aluminum heads used on all other 1938 cars. Each head marked by part number on front end (and letters 'HC' for optl. high compression heads).

Car	Standard	High Compression
Six (1938)	324285	335664
Six (1939)	324285	317725
Eight (1938)	327564	317737
Eight (1939)	330812	341344
Super 8 ('38)	221400 or 237994	239001
**Super 8 ('39)	242511	335618

**—Low compression iron head marked 338960.

Replacement Note—Cast iron heads only available for replacement. Use copper ferruled gaskets with cast iron hds., terne ferruled gaskets with alumin'm.

Head Installation—Coat machined face of cylinder head and lower face of gasket with Perfect Seal (Grade A). Coat studs with grease. Tighten head cold to 740-760 in. lbs. (Six, Eight), 700-720 in. lbs. (Super 8). Recheck to these figures when warm.

1937-38-39 MODELS

CYLINDER HEADS (TWELVE):—Heads are aluminum. Standard compression head unmarked, Low Compression head marked 'L.C.', High Compression head marked 'H.C.' on top of head at rear end.

Head Installation—Coat machined face of head and lower face of gasket with Perfect Seal (Grade A), coat studs with grease. Tighten head cold to 740-760 in. lbs. and recheck when warm.

1937-38-39 MODELS ('120' 1935-39)

REPLACEMENT PISTONS:—Finished Autothermic, Cam-ground, Tin-plated type pistons (as furnished for installation on 1939 and previous car models) are stamped on head with decimal figure (.005, .010, etc.) indicating nominal oversize and one or two letters (AA, A, BB, B, CC, C, DD, D) which indicates the actual variation of the piston (in .00025" steps) from the indicated nominal oversize. See tables below for oversizes and size variations for each letter. This system of marking makes it possible to order a finished piston (using number and letter) for any particular finished bore size within these limits.

Piston Oversizes
(Figure Stamped on Piston Head)

Six & Eight	Super Eight	Twelve
Standard	Standard	Standard
.005" Oversize	.003" Oversize	.003" Oversize
.010" "	.005" "	.005" "
.020" "	.010" "	.010" "
.030" "	.015" "	.015" "
.040" "	.020" "	.020" "
	.025" "	.030" "
	.030" "	.045" "
	.035" "	
	.045" "	

Piston Variation
(Letters Stamped on Piston Head)
For All Models and Piston Oversizes

AA—.00025" Under marked size.
A—Same as marked size.
BB—.00025" Over marked size.
B—.0005" Over marked size.
CC—.00075" Over marked size.
C—.001" Over marked size.
DD—.00125" Over marked size.
D—.0015" Over marked size.

Super Eight Note—Factory reground cylinder blocks (with Pistons, Pins, and Rings fitted) are furnished on an 'exchange' basis. See Cylinder Block Removal

1937-38-39 MODELS

SPECIAL RING INSTALLATIONS:—To correct piston slap and excessive oil consumption on engines with some service, manufacturer recommends that special Perfect Circle piston ring combination be installed as follows (piston ring grooves numbered from head toward skirt):

Six & Eight

#1—P.C. #200 (when piston expanders used) or
#1—P.C. #70 (when piston expanders not used).
#2—P.C. #X-90 Compression Ring.
#3—P.C. #X-90 Oil Ring.

NOTE—#200 ring must be installed with groove on inner edge toward top of piston.

Super Eight

#1—P.C. #70.
#2—P.C. #X-90 Compression Ring.
#3 & 4—P.C. #X-90 Oil Rings.

1937-38-39 MODELS

PISTON PIN BUSHING (SIX & EIGHT):—Formed by two split type bushings pressed in rod eye from opposite sides so as to form oil groove in center. Rifle-drilled oil passage in rod must open into this groove. New bushings should be burnished (Packard Tool ST-5008 (grind pilot end of tool to diameter of .861" so that it will enter 1939 type bushings) and then ream bushing to size for correct fit.

1939 MODELS

CONNECTING ROD 'PALNUTS' (SIX & EIGHT):—Special patented self-locking locknuts are used on connecting rod bolt nuts in place of cotter pins. To install, turn regular connecting rod bolt up to desired point, turn 'Palnut' on bolt (smooth side toward regular nut) until it contacts nut, then tighten Palnut ¼-⅓ additional turn to lock it in place.

1938 MODELS

CAMSHAFT & OIL PUMP GEAR CHANGE (SIX & EIGHT):—Late cars with suffix letter 'B' following engine number have forged steel camshaft (first cars with suffix letter 'A' had cast alloy iron type camshaft same as 1937 cars). **Oil pump drive gear must be same material as Camshaft.** Both type gears furnished for service. Note engine suffix letter when replacing oil pump drive gear.

1938 MODELS

EXHAUST VALVE GUIDE CHANGE TO PREVENT STICKING (SIX & EIGHT):—Late 1938 cars have shorter exhaust valve guide (top of guide 31/32" below top of valve seat with top of guide counterbored ¼" deep to diameter of ⅜"). All cars with longer first type guide (top of guide 23/32" below valve seat) should be re-worked with special Counterbore-and-Cutoff Tool SE-5123 to the same dimensions as the later type guide. If this tool not available, counterbore exhaust valve guides adjacent to dash to depth of ½" without cutting off top of guide.

1938 MODELS

VALVE LIFTERS (SIX & EIGHT):—Early cars with suffix letter 'A' following engine number have cast alloy iron camshaft and use steel valve lifters. Late cars with suffix letter 'B' have forged steel camshaft and chilled iron lifters. **Never use steel lifters with steel camshaft.** Either type lifter can be used on cast alloy iron camshafts. Note engine suffix letter when replacing valve lifters.

1937-38-39 MODELS

OIL PUMP INSTALLATION (SIX & EIGHT):—Install pump with driving slot parallel to center-line of camshaft with distributor rotor in line with #1 segment in cap. Recheck ignition timing.

ENGINE NUMBER:—First number 340,001 (901, 2 '32), 370,001 (1001, 2 '33), 374,001 (1100, 1, 2 '34). Stamped on left hand front engine support arm.

ENGINE:—Eight cylinder In Line, 'L' head type. Cylinders cast enbloc.

Dimensions—Bore, 3 3/16". Stroke, 5". Displacement, 320 cu. ins.

Horsepower—Rated 32.5. Developed 110 ('32), 120 ('33-34) at 3200 R.P.M.

Compression—Std. 6.0-1. Compression pressure, 95-100 lbs. at 125 R.P.M.
Optl. 6.36-1. Compression pressure, 123 lbs. at 125 R.P.M.

Pistons:—Permite aluminum alloy, steel strut, split skirt type.

Removal—Pistons removed from above, rods from below. Push piston up until pin exposed, remove locking ring, push pin out, remove piston from above, lower rod and remove from below.

Clearance—.0015" (skirt).

NOTE:—Istall pistons with slot toward valve side of engine.

Piston Rings:—Four rings per piston, all above pin. #1 to 3, compression rings. #4, oil control ring. Lower ring groove drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Groove Depth
Comp. (all)	⅛"	.007" min.	.1575"
Oil Cont. (#4)	5/32"	.007" min.	.1575"

Piston Pin:—Diameter, ⅞". Length, 2 47/64". Pin floats in piston and rod.

Pin Fit in Piston—Push fit.

Pin Fit in Rod—Hand push fit. End play, ⅛".

Connecting Rod:—Weight, 2 lbs., 6¾ ozs. Length, 10⅞".

Crankpin Journal Diameter—2 3/16".

Lower Bearing Type—Poured babbitt integral with rod and cap.

Clearance—.0015". Sideplay .003".

Adjustment—None (no shims). Replace rods. Do not file rod or cap.

NOTE:—Rods now installed with oil bleed holes (upper half lower bearing) toward valve side of engine.

Crankshaft:—Nine main bearing type.

Journal Sizes—2⅝" diameter (all bearings).

Bearing Type—Bronze-backed ('32), steel-backed ('33-34), babbitt-lined.

Clearance—.001".

Adjustment—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust—Taken by #7 main bearing. Endplay, .003"

Camshaft:—Drive, adjustable chain. Eight bearing type.

Chain—Morse #1866. Width, 1½". Length, 32" or 64 links. Pitch, .500".

Camshaft Setting—Sprokets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Chain Adjustment—Remove inspection plug on top surface of chain case at right of engine. Adjust chain whenever sideplay at this point exceeds ½". To adjust, loosen generator flange mounting screws, pull generator away from engine until chain sideplay is ¼", tighten mounting screws. With correct adjustment chain will operate noiselessly (if chain hums, back adjustment off slightly).

Valves:—	Head Dia.	Stem Dia.	Length	Seat Angle	Lift
Intake	1 21/32"	.3405"	7⅜"	45°	.358"
Exhaust	1 15/32"	.3405"	7⅜"	45°	.358"

Stem-to-Guide Clearance—.0025" (intake), .004" (exhaust).

Tappet Clearance—.004" (all valves '32), .004" Intake, .006" Exhaust (1933-34) with engine warm.

Valve Springs—73 lbs. at 3 1/16" (valve closed).

Valve Timing—901, 2 1932.

Intake Valve Open—20° Before TDC. Close—65° After LDC.
Exhaust Valves Open—65° Before LDC. Close—20° After TDC.

Valve Timing—1001, 2 ('33), 1100, 1, 2 ('34).

Intake Valves Open—30° Before TDC. Close—65° After LDC.
Exhaust Valves Open—65° Before LDC. Close—30° After TDC.

To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with the piston 20° or .1844" (1932), 30° or .4070" (1933-34) before top dead center when a point on the flywheel approximately 6.55 teeth (1932), 9.83 teeth (1933), 12 teeth (1934) before the dead center mark lines up with indicator on housing. Remove starter and sight flywheel through starter mounting hole when making this check.

Lubrication:—Full pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—35 lbs.

Oil Pressure Relief Valve—Operates at 35 lbs. Located on left hand side of crankcase. Adjustable by turning screw.

Capacity and Oil—8 qts. Use SAE #30 (normal temperatures—30° to 100°F) #40 (above 100°F), #20-W (0° to 60°F), #10-W (—15° to 40°F).

CLUTCH:—Long Model 11-A (901, 2 '32), 11-CB (1001, 2 '33), 12-CB (1100, 1, 2 '34). Single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.

Facings—Moulded type. Thickness .137" (all models). Inside Diameter 6½" (11-A, 11-CB), 7" (12-CB). Outside Diameter 11" (11-A, 11-CB), 12" (12-CB).

Adjustment—Clearance between pedal and underside of toeboard should be ½-1". Free movement of pedal should be 1½". To adjust, loosen locknut and turn turnbuckle on connector link between pedal and throw-out shaft lever.

STEERING:—Steering Gear—(1932-33) Gemmer Worm-and-Sector type, 1934) Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.

Kingpin Inclination—8½° croswise.

Caster—1° (1932), 3¼° (1933), 1½° (1934). Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1½° all models. No adjustment provided.

Toe In—0-1/16". Adjust in usual manner by loosening clamp bolt and turning tie rod.

BRAKES:—Service—(1932) Bendix Mechanical, three shoe type with Perrot control (1933-34). Bendix Mechanical, Duo-Servo, Single-anchor type with vacuum power operation. See article in Brake Section for complete adjustment directions. Hand lever applies all four service brakes.

Drum Diameter—16" (1932), 14" (1933-34).

Lining (1932)—Moulded type. Width 1¾". Thickness 3/16". Length 45 7/32" per wheel.

Lining (1933-34)—Moulded and semi-moulded type (Raybestos—primary, Hyco—secondary). Width 1¾" (left front wheel), 2¼" (all others). Thickness ¼". Length 30¼". per wheel.

Clearance—.010". between drum and lining for each shoe.

Hand Brake:—See Service Brakes and Service Brake Adjustment.

Power Unit:—Bendix plain type vacuum cylinder controlled by valve in brake pedal linkage. See article in Brake Section for complete data.

ENGINE NUMBER:—First number 193,001 (903, 4 '32), 750,001 (1003, 4 '33), 752,001 (1003, 4, 5 '34). Stamped on top of left hand front engine support arm.

ENGINE:—Eight cylinder, In Line, 'L' head type. Cylinders cast Enbloc.
Dimensions—Bore, 3½". Stroke, 5". Displacement, 384.8 cu. ins.
Horsepower—Rated 39.2. Developed 135 ('32), 145 ('33-34) at 3200 R.P.M.
Compression—Std. 6.0-1. Compression pressure, 95-100 lbs. at 125 R.P.M.
Optl. H.C. 6.38-1. Compression pressure, 123 lbs. at 125 R. P. M.

Pistons:—Permite aluminum alloy, steel strut, split skirt type.
Removal—Pistons and rods removed through top of engine.
Clearance—.0015" (skirt).
NOTE—Install pistons with slot toward valve side of engine.

Piston Rings:—Four rings per piston, all above pin, #1 to 3—compression rings, #4—oil control ring. Lower ring groove drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Groove Depth
Comp. (all)	⅛"	.007" min.	.1585"
Oil Cont. (#4)	5/32"	.007" min.	.1585"

Piston Pin:—Diameter, ⅞". Length, 3 3/64". Pin floats in piston and rod.
Pin Fit in Piston—Push fit.
Pin Fit in Rod—Hand push fit. Endplay, ⅛".

Connecting Rod:—Weight, 2 lbs., 13¾ ozs. Length, 10⅞".
Crankpin Journal Diameter—2 3/16".
Lower Bearing Type—Poured babbitt integral with rod and cap.
Clearance—.0015". Sideplay .003".
Adjustment—None (no shims). Replace rods. Do not file rod or cap.
NOTE:—Rods now installed with oil bleed holes (upper half lower bearing) toward valve side of engine.

Crankshaft:—Nine main bearing type.
Journal Sizes—2⅝" diameter (all bearings).
Bearing Type—Bronze-backed ('32), steel-backed ('33-34), babbitt-lined.
Clearance—.001".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by #7 main bearing. Endplay, .003".

Camshaft:—Eight bearing type. Camshaft drive—Adjustable chain.
Chain—Morse #1866. Width, 1½". Length, 32" or 64 links. Pitch, .500".
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across the shaft centers.
Chain Adjustment—Remove inspection plug on top surface of chain case at right of engine. Adjust chain whenever sideplay at this point exceeds ½". To adjust, loosen generator flange mounting screws, pull generator away from engine until chain sideplay is ¼", tighten mounting screws. With correct adjustment chain will operate noiselessly (if chain hums, back adjustment off slightly).

Valves:—	Head Dia.	Stem Dia.	Length	Seat Angle	Lift
Intake	1 13/16"	.3405"	7⅜"	45°	.358"
Exhaust	1 11/16"	.3405"	7⅜"	45°	.358"

Stem-to-Guide Clearance—.0025" (intake), .004" (exhaust).
Tappet Clearance—.004" (all valves '32), .004" Intake, .006" Exhaust (1933-34) with engine warm.
Valves Springs—73 pounds at 3 1/16" (valve closed).

Valve Timing—903, 4 1932.
Intake Valve Open—20° Before TDC. Close—65° After LDC.
Exhaust Valves Open—65° Before LDC. Close—20° After TDC.

Valve Timing—1003, 4 ('33), 1003, 4, 5 ('34).
Intake Valves Open—30° BTDC. Close—65° ALDC.
Exhaust Valves Open—65° BLDC. Close—30° ATDC.

To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with the piston 20° or .1844" (1932), 30° or .4070" (1933-34) before top dead center when a point on the flywheel approximately 6.55 teeth (1932), 9.83 teeth (1933), 12 teeth (1934) before the dead center mark lines up with indicator on housing. Remove starter and sight flywheel through starter mounting hole when making this check.

Lubrication:—Full pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—35 lbs.
Oil Pressure Relief Valve—Operates at 35 lbs. Located on left hand side of crankcase. Adjustable by turning screw.
Capacity and Oil—10 qts. Use SAE. #30 (normal temperatures—30° to 100°F), #40 (above 100°F), #20-W (0° to 60°F), #10-W (-15° to 40°F).

CLUTCH:—**(1932) Long Model 29-A.** Double plate, dry disc type. **(1933-34) Long Model 12-CB.** See articles in Clutch Section for complete relining and assembling directions.
Facings (29-A)—Moulded type, 4 required. Thickness .130". Inside Diameter 6¼". Outside Diameter 9⅞".
Facings (12-CB)—Moulded type, 2 required. Thickness .137". Inside Diameter 7". Outside Diameter 12".
Adjustment—Clearance between pedal and underside of toeboard should be ½-1". Free movement of pedal should be 1½". To adjust, loosen locknut and turn turnbuckle on connector link between pedal and throw-out shaft lever.

STEERING:—**Steering Gear**—(1932-33) Gemmer Worm-and-Sector type. (1934) Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment directions.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—8½° croswise.
Caster—1° (1932), 3¼° (1933), 1½° (1934). Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1½° all models. No adjustment provided.
Toe In—0-1/16". Adjust in usual manner by loosening clamp bolt and turning tie rod.

BRAKES:—**Service**—(1932) Bendix Mechanical, three shoe type with Perrot control (1933-34). Bendix Mechanical, Duo-Servo, Single-anchor type with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diamter—16" (1932), 14" (1933-34).
Lining (1932)—Moulded type. Width 2". Thickness 3/16". Length 45 7/32" per wheel.
Lining (1933-34)—Moulded and semi-moulded (Raybestos—primary, Hyco—Secondary). Width 1¾" (left front wheel), 2¼" (all others). Thickness ¼". Length 30¼" per wheel.
Clearance—.010". between drum and lining for each shoe.
Hand Brake:—See Service Brakes and Service Brake Adjustment.
Power Unit:—Bendix plain type vacuum cylinder controlled by valve in brake pedal linkage. See article in Brake Section for complete data.

ENGINE NUMBER:—First number 900,001 (905, 6 '32), 901,001 (1005, 6 '33), 901,601 (1107, 8 '34). Stamped on left hand cylinder block below head.

ENGINE:—Twelve cylinder, 67 degree, Modified 'L' head type. Both cylinder banks and crankcase cast enbloc.

Dimensions (1932)—Bore 3 7/16". Stroke 3½". Displacement 390 cubic inches.

Dimensions (1933-34)—Bore 3 7/16". Stroke 4". Displacement 445.5 cubic inches.

Rated Horsepower—54.68 (1932), 56.7 (1933-34).

Developed Horsepower—150 at 3600 R.P.M. (1932), 160 at 3600 R.P.M. (1933-34).

Compression—Std. 6.0-1. Compression pressure, 95-100 lbs. at 125 R.P.M.
Optl. H.C. 6.33-1. Compression pressure, 123 lbs. at 125 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

Pistons:—Permite (1932), Nelson Bohnalite (1933-34) aluminum alloy, Invar strut, split skirt type.

Weight—1½ pounds (with rings and pin).

Removal—Pistons removed through top; rods through bottom of engine.

Clearance—.0015" (skirt).

NOTE:—Install pistons with slot toward valve side of engine.

Piston Rings:—Four rings per piston, all above pin. #1 to 3, compression rings; #4, oil control ring. Lower ring groove drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Groove Depth
Comp. (all)	⅛"	.007" min.	.1582"
Oil Cont. (#4)	5/32"	.007" min.	.1582"

Piston Pin:—Diameter, ⅞". Length, 2 63/64". Pin floats in piston and rod.

Pin Fit in Piston—Push fit.

Pin Fit in Rod—Hand push fit. Endplay, ⅛".

Connecting Rod:—Weight, 2 lbs. 5 ozs. Length, 9⅛" (center-to-center).

Big End Bearing—Poured babbitt type.

Clearance:—.0015". Sideplay .003".

Adjustment—None (no shims). Replace rods. Do not file rods or caps.

NOTE:—Rods now installed with oil bleed hole (upper half lower bearing) toward valve side of engine.

Crankshaft:—Four main bearing type.

Journal Sizes—2¾" diameter (all bearings).

Bearing Type—Bronze backed (1932-33), steel-backed (1934), babbitt-lined.

Clearance—.001".

Adjustment—None (no shims). Replace removable bearings.

End Thrust—Taken by #1 (front) main bearing. Endplay, .003":

Camshaft:—Four bearing type. Camshaft drive, non-adjustable chain.

Chain—Whitney Type 595-X. Width, 1½". Length, 28" or 56 links. Pitch, .500".

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straight edge across the shaft centers.

Valves:—Valves are mounted at 20° angle to horizontal and are operated directly by rocker arms which bear on cam face. Camshaft is mounted between cylinder banks directly above crankshaft. Hydraulic valve tappet take-up is built in rocker arm shaft.

Valve	Head Diam.	Stem Diam.	Length	Seat Angle	Lift
Intake	1 21/32"	.3405"	6 35/64"	45°	5/16"
Exhaust	1 21/32"	.338"	6 35/64"	45°	5/16"

Stem-to-Guide Clearance—.0025" (intake), .005" (exhaust).

Tappet Clearance—None in service (hydraulic take-up). See article in Equipment Section for complete data.

Valve Springs—70 lbs. at 2 7/32" (valves closed).

Valve Timing

Intake Valves Open—At TDC. Intake Valves Close—45° ATDC.

Exhaust Valves Open—35° BLDC. Exhaust Valves Close—10° ATDC.

To Check Valve Timing—Turn engine over until piston No. 6R is on top dead center entering power stroke with mark 'IR-UDC' on vibration dampener at front of engine in line with pointer on chain case. No 1R intake valve should open at this point.

Lubrication:—Full Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—50 pounds.

Oil Pressure Relief Valve—Under plug on left hand side of crankcase below oil filler. Adjustable by turning screw.

Capacity and Oil—10 qts. Use SAE #30 (normal temperature ranges, 30° to 100° F), #40 (above 100° F), #20-W (0° to 60° F), #10-W (—15° to 40° F).

CLUTCH:—**(1932) Long Model 29-A.** Double plate, dry disc type. **(1933-34) Long Model 12-CB.** Single plate, dry disc type. See articles in Clutch Section for complete relining and assembling directions for each type.

Facings (29-A)—Moulded type, 4 required. Thickness .130". Inside Diameter 6¼". Outside Diameter 9¾".

Facings (12-CB)—Moulded type, 2 required. Thickness .137". Inside Diameter 7". Outside Diameter 12".

Adjustment—Clearance between pedal and underside of toeboard should be ½-1". Free movement of clutch pedal should be 1½". Adjust by loosening locknut and turning turnbuckle on connector link between pedal and throw-out shaft lever.

STEERING:—**Steering Gear (1932)**—Gemmer Worm-and-Sector type. **(1933-34)**—Gemmer Worm-and-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.

Kingpin Inclination—8½° crosswise.

Caster—1½°. Adjust be inserting wedge shims between spring and spring pad on axle.

Camber—1½°. No adjustment provided.

Toe In—1/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service (1932)**—Bendix Mechanical, three-shoe type with Perrot control. **1933-34)**—Bendix Mechanical, Duo-Servo, Single-anchor type with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—16" (1932), 15" (1933-34).

Lining (1932)—Moulded type. Width 2¼". Thickness ¼". Length 34" per wheel.

Lining (1933-34)—Moulded and semi-moulded type (Raybestos—primary, Hyco—secondary). Width 1⅞" (left front wheel), 2½" (all others). Thickness ¼". Length 32¼" per wheel.

Clearance—.010" between lining and drum for each shoe.

Hand Brake:—See Service Brakes and Service Brake adjustment.

Power Unit:—Bendix plain type vacuum cylinder controlled by valve in brake pedal linkage. See article in Brake Section for complete data.

ENGINE NUMBER:—First number, 1516. Stamped on boss on upper left hand corner of cylinder block.

ENGINE:—**Own.** 8 cylinder, In Line, 'L' head type.
Bore—3¼ . **Stroke**—3⅞".
Piston Displacement—257.16 cubic inches.
Rated Horsepower—33.8 A.M.A.
Developed Horsepower—110 at 3850 R.P.M.
Compression Ratio—6.5-1 Std., 7.0-1 Optl.
Compression Pressure—120 lbs. at 300 R.P.M. Std. 6.5-1 head.
Vacuum Reading—Gauge should show stead reading of 18-20" with engine idling.
NOTE:—Cylinder head is aluminum and special service tools must be used in tightening head bolts to avoid distortion and warping.

Pistons:—Nelson Bohnalite, Invar Strut, Split skirt type.
Replacement Pistons—*See Packard Shop Notes.*
Weight—17¼ ozs. stripped, 23 ozs. with rings and pin.
Removal—Pistons and rods removed from above.
Clearance—Skirt .0015" (see Fitting Pistons).
Fitting New Pistons—Use .0015" feeler ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be within 3-5 lbs.
Installing Pistons—Slots should be toward left or opposite side from valves.

Piston Rings:—Two compression, one oil control ring per piston, all above pin. Lower groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp	⅛"	.007-.012"	.002"
Oil Cont.	5/32"	.007-.015"	.0015"

Piston Pin:—Diameter ⅞". Length 2 51/64". Pin floats in piston and rod. Held by retaining rings at each end. Pin hole in connecting rod is bronze bushed. Pins furnished .003", .006" oversize.
Pin Fit in Piston—Palm push fit with piston at 160°F.
Pin Fit in Rod Bushing—Thumb push fit with both parts at room temperature (70°F).
NOTE—Finish ream bushings to .87515-.87485".

Connecting Rod:—Weight 29½ ozs. Length 7⅞".
Upper Bearing—Formed by two bronze bushings pressed in from opposite sides so as to form oil groove in center. Rifle-drilled piston pin oil passage in rod must open into this groove.
See Packard Shop Notes for Bushing Installation.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0015". Sideplay .004-.010".
Adjustment—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods—Identification mark on side of rod should be toward front of engine with oil bleed hole in lower bearing toward camshaft side.

Crankshaft:—Five bearing. Integral counterwights.
Journal Diameters—2¾" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.003".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by center bearing. Endplay .003-.008".

Camshaft:—5 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust—Taken by thrust plate in back of camshaft sprocket. Endplay .002-.004".
Timing Chain—Morse #1866RX. Width 1". Pitch .375". Length 21" or 58 links.
Camshaft Setting—With #1 piston on top dead center and #1 exhaust valve just closing, mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Lgth.
Intake	1 17/32"	11/32"	5⅝"
Exhaust	1 15/32"	11/32"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.0005-.0010"
Exhaust	45°	.300"	.0005-.0010"

Note on Stem Clearance—Stem clearance in guides should be measured at the bottom. New guides are finish reamed with a taper reamer after installation with .0035" greater clearance at top. Exhaust valve guides are counterbored ⅜" deep at top to provide .015" greater clearance.
Tappet Clearance—.007" Int., .009" Exh., Engine hot.
NOTE—Splasher in right front fender should be removed when valve adjustments are made.

Valve Springs—Intake and exhaust springs are

Interchangeable	Spring Pressure	Length
Valve Closed	40 lbs.	1⅝"
Valve Open	110 lbs.	1 5/16" approx.

Valve Timing—See camshaft setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Valve Timing—Set tappet clearance #1 exhaust valve at .013". This valve should close with piston 5° or .0092" past top dead center when point on flywheel 2½ graduations past #1 UP.DC. mark (top dead center mark) lines up with pointer in inspection hole in left front face of flywheel housing under starter. Reset tappet clearance at .009" with engine warm.
Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Lubrication:—Pressure. Gear type oil pump mounted on right side of crankcase.
Normal Oil Pressure—35 lbs.
Oil Pressure Relief Valve—Located on pump cover. Not adjustable. Replace relief valve spring if defective. Tension 6 lbs. compressed to 2".
Capacity and Oil—7 qts. Use SAE. #30 (60°F. and above), #20-W(32° to 75°F), #10-W(32° to —15°F).

CLUTCH:—**Long Model 10CF.** Semi-centrifugal, single plate, dry disc type. No adjustment for wear required. Weights formed on outer ends of clutch release levers increase pressure on pressure plate approximately 137% at 4000 R.P.M. See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment—Clearance between clutch pedal and toeboard must be ½" with clutch engaged. Free movement of clutch pedal must be 1½". To adjust, loosen locknut and turn nut on clutch pedal-to-lever connecting rod.
Clutch Facings—Woven asbestos, 2 required, 6" I.D., 10" O.D., .137" thick.
NOTE—Six crimped clock spring steel segments located bet. rear clutch facing and driven disc.

STEERING:—**Front Suspension**—Packard SafeTflex design, independent, linked parallelogram type with coil springs. Unlike other designs in that angle between two lower support arms is 90° with rear (torque) arm anchored to frame side rail at point slightly forward from dash. Upper support arms (shock absorber arms) are rubber bushed at outer ends and are positioned approximately midway between lower support arms.
See article in Mechanical Equipment Section for data.
Steering Knuckle Inclination—1°30' crosswise.
Caster—2°. No adjustment provided.
Camber—1°. No adjustment should be required. Adjustable by changing bushing in outer end of upper support arm (three interchangeable parts available providing five settings).
Toe In—0-⅛". Adjustable by changing length of tie rods. Each tie rod should be changed an equal amount and tie rods should be measured to make certain that lengths are equal.

Steering Gear:—Gemmer Model Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—12".
Lining—**Primary Multibestos**—DR, Secondary Multibestos—PRX. Width 1¾". Thickness 3/16". Length per wheel 26".
Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number, 385,501 (1200, 1, 2), 1,755,101 (1203, 4, 5). Stamped on left side of crankcase at front end.

ENGINE:—Eight cylinder, In Line, 'L' head type.

Bore—3 3/16" (1200, 1, 2), 3½" (1203, 4, 5).

Stroke—5" (all models).

Piston Displacement—320 cu. ins. (1200, 1, 2), 384.8 cu. ins. (1203, 4, 5).

Rated Horsepower—32.5 (1200, 1, 2), 39.2 (1203, 4, 5).

Developed Horsepower—130 at 3200 R.P.M. (1200, 1, 2), 150 at 3200 R.P.M. (1203, 4, 5).

Compression Ratio—Standard and optional cylinder heads of aluminum used as follows:

Model	Std. Head	Low Comp.	High Comp.
1200, 1, 2	6.5-1	6.0-1	7.0-1
1203, 4, 5	6.3-1	6.0-1	7.0-1

Compression Pressure—110 lbs. at cranking speed for standard heads.

Vacuum Reading—Gauge should show stead reading of 18-20" with engine idling.

Pistons:—Nelson Bohnalite, aluminum alloy, Invar Strut, split skirt type. Replacement pistons furnished in standard size and .003", .005", .010", .015", .020", .025", .030", .035", .045" oversize.

Weight—18.7 ozs. (1200, 1, 2), 21.9 ozs. (1203, 4, 5).

Removal—Pistons removed from top, rods from bottom on Model 1200, 1, 2 (push piston up until piston pin is exposed, remove locking ring and push out pin, remove piston, lower rod and remove from below. Use new locking rings when replacing pistons). Pistons and rods removed from above on Model 1203, 4, 5.

Clearance—Skirt .0015" See Fitting Pistons.

Fitting New Pistons—Use .0015" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot should be 6-8 lbs.

Installing Pistons—Slot should be on valve side of engine.

Piston Rings:—Three compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.007" min.	.145"
Oil Cont.	5/32"	.007" min.	.145"

Piston Pin:—Diameter ⅞". Length 2 47/64" (1200, 1, 2), 3 3/64" (1203, 4, 5). Pin floats in piston and rod. Held by locking rings at each end. Pins furnished for service .003", .006" oversize.

Pin Fit in Piston—Palm push fit with piston at 160°F.

Pin Fit in Rod Bushing—Thumb push fit with both parts at room temperature (70°F).

Connecting Rod:—Weight 41¼ ozs. (1200, 1, 2), 47½ ozs. (1203, 4, 5). Length 10⅞".

Crankpin Journal Diameters—2.1875".

Lower Bearing—Removable steel-backed, copper-lead alloy lined type. No shims.

Clearance—.0017-.0022". Sideplay .003" minimum.

Adjustment—None (no shims). Replace bearings. Do not file rods or bearing caps.

Crankshaft:—Nine bearing. Integral counterweights.

Journal Diameters—2.625" all bearings.

Bearing Type—Removable steel-backed, babbitt-lined type. No shims.

Clearance—.001" minimum.

Adjustment—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust—Taken by #7 bearing. Endplay .003" minimum.

Camshaft:—Chain driven with manual adjustment.

Timing Chain—Morse #1866. Width 1½". Pitch .500". Length 32" or 64 links.

Chain Adjustment—Loosen generator flange mounting screw, pull generator out or away from engine until sideplay as measured at chain inspection plug hole in top face of chain case is ¼", tighten mounting screws. Adjust chain whenever sideplay exceeds ½".

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that '00' marks are adjacent and are centered on a straightedge across the shaft centers.

Valves:—	Head Diam.	Stem Diam.	Lgth.
Intake (1200, 1, 2)	1 21/32"	.3405"	7⅜"
Exhaust " "	1 15/32"	.3405"	7⅜"
Intake (1203, 4, 5)	1 13/16"	.3405"	7⅜"
Exhaust " "	1 11/16"	.3405"	7⅜"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.358"	.0025" min.
Exhaust	45°	.358"	.0045" min.

Tappet Clearance—.004" Int., .006" Exh. engine warm.

Valve Springs—	Spring Pressure	Length
Valve Closed	73 lbs.	3 1/16"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 30° BTDC. Close 65° ALDC.
Exhaust Valves—Open 65° BLDC. Close 30° ATDC.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Lubrication:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure—35 lbs. min. at 1000 R.P.M.

Oil Pressure Relief Valve—Located on left side of crankcase. Operates at 35 lbs. Adjustable by turning screw.

Capacity and Oil—8 qts. (1200, 1, 2), 9½ qts. 1203, 4, 5). Use SAE. #30 (30° to 100°F—use #40 for temperatures above 100°F)), #20-W (0° to 60°F), #10-W (—15° to 40°F).

CLUTCH:—**Long, Model 12CB.** Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.

Clutch Pedal Adjustment—Clearance between pedal and toeboard should be ½-1". Free movement of pedal should be 1½". Adjust by turning turnbuckle on connecting rod at lower end of pedal.

Clutch Facings—Moulded type, 2 required, 7" I.D., 12" O.D., .137" thick.

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—9° crosswise.

Caster—1°. Adjustable by installing wedge shims between spring and spring pad on axle.

Camber—1°.

Toe In—0-1/16". Adjustable in usual manner by changing length of tie rod.

Steering Gear:—Gemmer Model Worm-and-Roller type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Bendix, Duo-Servo, Single Anchor, mechanically operated, vacuum power brakes. Hand lever applies all four service brakes. *See article in Mechanical Equipment Section for data.*

Drum Diameter—14".

Lining—Primary (Raybestos), Secondary (Hyco). Width 2¼" (except left front which is 1¾"). Thickness ¼". Length 30¼" per wheel.

Clearance—Free—at heel and toe of each shoe.

Hand Brake Adjustment:—With hand brake lever fully released and cross shaft against stop, remove all slack in cable by adjusting clevis position at cross shaft end of cable until clevis pin can just be inserted in cross lever. Check brakes making sure they are fully released with hand brake in off position. Adjustment for each wheel equalization should be made after drum lining has been worn in.

Power Unit:—Bendix plain tube type vacuum cylinder mounted on frame and linked to cross shaft lever. Controlled by valve built in brake pedal mechanism. *See article in Mechanical Equipment Section for data.*

ENGINE NUMBER:—First number, 903,101. Stamped on left cylinder block below head.

ENGINE:—Twelve cylinder, 67° Vee, modified 'L' head type. Both cylinder blocks and upper crankcase cast enbloc.

Bore—3 7/16". **Stroke**—4¼".

Piston Displacement—473 cubic inches.

Rated Horsepower—56.7 A.M.A.

Developed Horsepower—175 at 3200 R.P.M.

Compression Ratio—6.4-1 Std., 6.0-1 Low Comp., 7.0-1 High Comp. Optl. Cylinder heads are aluminum.

Compression Pressure—110 lbs. at cranking speed (125 R.P.M.) for Std. 6.4-1 head.

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Nelson Bohnalite, aluminum alloy, Invar Strut, split skirt type. Replacement pistons furnished in standard size and .003", .005", .010", .015", .020", .030", .045" oversize.

Weight—21.7 ounces.

Removal—Pistons removed through top, rods through bottom of engine (push pistons up until piston pin is exposed, take out locking rings, push out pin, lift out piston, lower rod and remove from below). Use new locking rings when installing pistons.

Clearance—Skirt .0015". See fitting pistons.

Fitting New Pistons—Use .0015" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot should be 6-8 lbs.

Installing Pistons—Slot should be toward left side (viewed from driver's seat) on all pistons.

Piston Rings:—Three compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Groove Depth
Comp. All	⅛"	.007" min.	.158"
Oil Cont.	5/32"	.007" min.	.158"

Piston Pin:—Diameter ⅞". Length 2 63/64". Pin floats in piston and rod. Held by retaining ring at each end. Pins furnished for service .003", .006" oversize.

Pin Fit in Piston—Palm push fit with piston at 160°F.

Pin Fit in Rod Bushing—Thumb push fit with both parts at room temperature (70°F).

Connecting Rod:—Weight 40⅝ ozs. Length 9".

Crankpin Journal Diameter—2½".

Lower Bearing—Removable steel-backed, copper-lead alloy lined type. No shims.

Clearance—.0017-.0022". Sideplay .008" minimum.
